2. Mercurial pill, $\frac{1}{2}$ oz.; water, 1 quart; boil to a pint.—*Dose*. A wine-glassful. Both were formerly taken for worms and the itch.

3. Corrosive sublimate, 1 gr.; (dissolved in)

spirit of wine, 30 drops; extract of sarsaparilla, 3 drs.; decoction of sarsaparilla, 8 fl. oz.; mix.—*Dose*. One large table-spoonful, 3 times a day; in syphilis and obstinate skin diseases.

Decoction of Mezereon. *Syn.* DECOCTUM MEZEREI (Ph. E. and Ph. D. 1826), L. *Prep.* (Ph. E.) Root-bark of mezereon, 2 drs.; liquorice root, 4 drs.; water, 1 quart; simmer to 1½ pint, and strain. Stimulant and sudorific.—*Dose*. A wine-glassful, or more, three or four times a day; in chronic rheumatism, scrofula, secondary syphilis, lepra, and some other cutaneous affections. Much boiling injures the virtues of mezereon. (See *below*.)

Decoction of Mezereon (Compound). *Syn.* DECOCTUM MEZEREI COMPOSITUM, L. *Prep.* (Van Mons.) Mezereon, 2 drs.; bitter sweet, 4 drs.; burdock, 2 oz.; water, 2 quarts; boil to 3 pints, add of liquorice root, 2 drs., and strain. As the last, and in obstinate diseases of the skin.

Decoction, Narcotic. *Syn.* DECOCTUM ANODYNUM, D. NARCOTICUM, L. *Prep.* (Hosp. Form.) Common nightshade (dried), 1 oz.; poppy heads, 3 in no.; water, 1 pint; boil 10 minutes, and strain. As an anodyne fomentation, used warm.

Decoction of Nitre. *Syn.* DECOCTUM NITROSUM, D. NITRATUM, D. POTASSÆ NITRATIS, L. *Prep.* 1. Nitre, ½ oz.; white sugar, 2 oz.; cochinal, 20 grs.; water, 1½ pint; boil a few minutes, and strain.

2. (Hosp. Form.) Barley-water, 1 pint; nitre, 5 drs.; dissolve. Diuretic, diaphoretic, and refrigerant. A wine-glassful, frequently; in gonorrhœa, sore throat, acute rheumatism, scurvy, &c.

Decoction of Oak Bark. *Syn.* DECOCTUM QUERCUS (Ph. L. E. & D.), L. *Prep.* 1. (Ph. L. & E.) Oak bark (bruised), 10 drs.; water, 1 quart; boil down to a pint, and strain.

2. (Ph. D.) Oak bark, 1½ oz.; water, 1½ pint; boil 10 minutes, and strain. Astringent. *Used* as a gargle in ulcerated sore throat, relaxation of the uvula, &c., and as a wash, and as an injection in piles, leucorrhœa, hæmorrhages, prolapsus ani, &c.

Decoction of Oats. *Syn.* WATER GRUEL; DECOCTUM AVENÆ, L. *Prep.* 1. (Gullen.) Oatmeal, 1 oz.; water, 3 quarts; boil to a quart, strain, and when cold, decant the clear liquid from the sediment.

2. (A. T. Thomson.) Washed groats, 4 oz.; water, 4 pints; boil to a quart. Nutritious and demulcent. Taken *ad libitum*, to promote the action of purgatives, and as an enema, either alone, or as a vehicle for more active substances. It is too thin for food. See GRUEL.

Decoction of Pareira. *Syn.* DECOCTUM PAREIRÆ (Ph. L.), L. *Prep.* 1. (Ph. L.) *Pareira brava* root (sliced), 10 drs.; water, 1½ pint; boil to a pint, and strain.

2. (Sir B. Brodie.) Pareira, 4 drs.; water,

3 pints; boil to a pint, as last. The above are given in gonorrhœa, leucorrhœa, and chronic inflammation of the bladder.—*Dose*. Of the first, ½ to 1 wine-glassful, 3 or 4 times a day; of the second, about twice that quantity, or more. It is commonly combined with some tincture of hyoscyamus; and when the triple phosphates are present in the urine, dilute hydrochloric or nitric acid may be added. See PAREIRA.

Decoction, Pec'toral. See DECOCTION OF BARLEY.

Decoction of Pellitory. DECOCTUM PYRETHRI, L. *Prep.* (Guy's Hosp.) Pellitory root, 1 oz.; water, 1½ pint; boil to a pint, and strain. *Used* as a gastric stimulant, and as a gargle in the relaxation of the uvula.

Decoction of Pomegranate. *Syn.* DECOCTUM GRANATI (Ph. L.), L. *Prep.* (Ph. L.) Pomegranate rind (fruit-bark), 2 oz.; distilled water, 1½ pint; boil to a pint, and strain. Astringent. *Used* as a gargle and injection, in sore throat, leucorrhœa, &c.; and internally, in diarrhœa, dysentery, &c.—*Dose*. 1 fl. oz., or more.

Decoction of Pomegranate Root. *Syn.* DECOCTUM GRANATI RADICIS (Ph. L.), L. *Prep.* 1. (Ph. L.) Root-bark of pomegranate (sliced), 2 oz.; water, 1 quart; boil to a pint, and strain.

2. (Collier.) Bark of the root, 2 oz.; water, 1 pint; boil to one half. This is the common form used in India.

Dose, &c. A wine-glassful, half-hourly, until the whole is taken, a light diet and a dose of castor oil having been taken the day previously. In tapeworm, Dr. Collier recommends the whole of the last preparation to be given at 2 doses, at the interval of 2 hours. It purges, and in 6 hours frequently expels the worm; if this does not take place, it should be persevered in. "Look for the head of the tænia (tapeworm); for if that is not expelled, you have done nothing." (Collier.) Oil of turpentine and kousoo are now more frequently given in tænia in this country.

Decoction of Poppies. *Syn.* DECOCTION OF POPPY-HEADS, FOMENTATION OF P.-H.; DECOCTUM PAPAVERIS (Ph. L. E. & D.), L. *Prep.* 1. (Ph. L.) Poppy-heads (bruised), 4 oz.; water, 2 quarts; boil for 15 minutes, and strain.

2. (Ph. E. & D.) As the last, but using only 3 pints of water. *Used* as an emollient fomentation, in painful swellings, excoriations, &c. The addition of a ¼ pint of vinegar is said to promote its efficacy.

Decoction of Quassia. *Syn.* DECOCTUM QUASSIÆ, L. *Prep.* From quassia chips (small), 1 dr.; water, 1½ pint; boil to a pint, and add syrup of orange peel, 2 oz.—*Dose*. A wine-glassful, occasionally, as a stomachic tonic. See INFUSIONS.

Decoction of Quince. *Syn.* DECOCTION OF QUINCE SEED, MUCILAGE OF Q. S.; DECOCTUM CYDONII (Ph. L.), L. *Prep.* From quince seeds,

2 dr.; water, 1 pint; boil for 10 minutes, and strain. *Used* as an emollient and sheathing application to abraded or wounded surfaces, as cracked lips, nipples, &c.; and to the skin in erysipelas, to painful hæmorrhoidal tumours, and the like. Prepared with a little less water, it is used by the hairdresser as 'bandoline' or 'fixateur.'

Decoction of Rice. *Syn.* RICE WATER, RICE DRINK; DECOCTUM ORYZÆ, L. *Prep.* Rice, 2 oz.; water, 1 quart; boil to one half, and strain. Demulcent. A good drink in fevers, coughs, &c., either alone or sweetened and flavoured with a little lemon peel.

Decoction of Sarsaparilla. *Syn.* DECOCTUM SASSAPARILLÆ (Ph. L. & E.), D. SARSAPARILLÆ (Ph. D.), L. *Prep.* 1. (Ph. L.) Sarsaparilla (sliced), 5 oz.; water, 2 quarts; boil to a quart, and strain.

2. (Ph. E.) Sarsaparilla, 5 oz.; boiling distilled water, 4 pints; macerate for 2 hours, in a vessel lightly covered, and placed in a warm situation; then take out the root, bruise it, return it again to the liquor, boil down to a quart, and strain.

3. (Ph. D.) Sarsaparilla, 2 oz.; boiling water, 1½ pint; digest an hour, boil 10 minutes, cool, and strain.

Obs. The medicinal virtues of sarsaparilla root reside wholly in the bark, or cortical portion; it is therefore quite unnecessary to bruise it, as directed in the Ph. E. By those houses which do largely in decoction of sarsaparilla, the root is seldom split or cut; the bundles in which it is made up being simply untied and spread open, to allow of the free exposure of every part to the solvent action of the water. By this plan the whole of the soluble portion of the bark is extracted, whilst the feculent matter that pervades the wood is only partially dissolved out. According to Soubeiran, a mere infusion is preferable. The dose is a teacupful to half a pint, 3 or 4 times a day.

An extemporaneous decoction of sarsaparilla is made by dissolving ½ oz. of the simple extract in 1 pint of hot water. See SARSAPARILLA, and *below*.

Decoction of Sarsaparilla (Concentrated). *Syn.* DECOCTUM SASSAPARILLÆ CONCENTRATUM, L. *Prep.* 1. (Wholesale.) Sarsaparilla (Jamaica), 10½ lbs., is placed in a large and well-cleaned copper boiler, and enough boiling water added to cover it; it is then left to macerate, without boiling, for 3 or 4 hours, after which it is boiled for about an hour, and the clear liquor drawn off into another clean copper pan; the root (after it has well drained) is then washed or 'sparged' with boiling water, until the latter runs off scarcely coloured; the washings are added to the decoction, and the whole evaporated as quickly as possible to 6½ pints; it is then set to cool, and rectified spirit of wine, 1½ pint, further added; after agitation, the whole is set aside in a well-corked bottle,

in a cool place, for a week. In a few days it is usually found as clear and brilliant as brandy, with very little sediment, and will keep for any length of time uninjured. Some manufacturers, instead of washing the root, give it a second and third water, boiling it each time and evaporating the mixed liquors.

2. (Extemporaneous.) Extract of sarsaparilla, 6½ oz.; water, 12 fl. oz.; dissolve, add rectified spirit, 2½ fl. oz., and water, q. s. to make the whole exactly measure a pint.

Obs. 1 drachm of this decoction, mixed with 7 drachms of water, forms a similar preparation to the Decoction Sarzæ of the Ph. L., and is now very frequently substituted for it in dispensing. See SARSAPARILLA, EXTRACTS, and *below*.

Decoction of Sarsaparilla (Compound). *Syn.* DECOCTUM SARZÆ COMPOSITUM (Ph. L. & E.), D. SARSAPARILLÆ C. (Ph. D.), L. *Prep.* 1. (Ph. L.) Decoction of sarsaparilla (boiling), 4 pints; sassafras chips, guaiacum wood (rasped), and fresh liquorice root (bruised), of each 10 drs.; mezereon (root-bark), 3 drs.; boil for 15 minutes, and strain.

2. (Ph. E.) As the last, but using 4 drs. of mezereon.

3. (Ph. D.) Sarsaparilla (sliced), 2 oz.; sassafras, guaiacum turnings, and liquorice root (bruised), of each, 2 dr.; mezereon root-bark, 1 dr.; boiling water, 1½ pint; digest for an hour, then boil for 10 minutes, cool, and strain.

4. (Extemporaneous.) Compound extract of sarsaparilla, 7½ drs.; boiling water, 1 pint; dissolve.

Obs. This decoction is an imitation of the once justly celebrated 'Lisbon Diet Drink.' It is alterative and diaphoretic.—*Dose.* A tea-cupful, or more, 3 or 4 times a day, either along with, or after, a mercurial course; and in syphilis, scurvy, scrofula, chronic rheumatism, lepra, psoriasis, and several other skin diseases, and especially in cachexia, or general bad habit of body. During its use the skin should be kept warm. See SARSAPARILLA and *below*.

Decoction of Sarsaparilla (Concentrated Compound). *Syn.* DECOCTUM SARZÆ COMPOSITUM CONCENTRATUM, D. SARSAPARILLÆ C. C., L. There is a very considerable trade done in this article, in consequence of compound decoction of sarsaparilla being taken in large doses, both alone and in combination with other remedies, and the pharmacopoeial preparation spoiling if kept longer than about 12 hours, in warm weather. Like the concentrated simple decoction, it is said to be of 8 times the usual strength, so that when mixed with 7 times its weight of water, it forms a similar preparation to the Decoction Sarzæ Compositum.—Ph. L.; for which it is very generally substituted in dispensing.

Prep. 1. (Wholesale.) Sarsaparilla (red Jamaica), 96 lbs.; mezereon root (not root-bark); 9 lbs.; liquorice root (bruised); 16 lbs. The me-

¹ For an explanation of the operation of 'sparging' see page 262.

zereon and liquorice are first laid (loosely) on the bottom of a clean copper pan, and the bundles of sarsaparilla (untied and loosened) packed over them, in horizontal layers, alternately at right angles with each other. Three or four boards, with as many iron $\frac{1}{2}$ -cwt. weights, are next placed on the top of the whole. Water is now run in, to about ten inches higher than the ingredients, and heat is applied until ebullition commences. The materials are now allowed to macerate, without boiling, for 3 or 4 hours, after which the liquor is gently boiled for about an hour, care being taken to add fresh water from time to time, so as to keep the whole well covered. The decoction is next run off, and set evaporating as quickly as possible. The ingredients are then washed with successive portions of boiling water, by allowing it to descend from a species of shower-bath, after the manner of 'sparging,' described under BREWING.¹ This is repeated until the water runs off nearly colourless, the smallest quantity being employed that will effect the object in view. The whole of the liquid is now evaporated without delay, until reduced to 8 $\frac{1}{2}$ galls., when, after cooling, 2 drs. of essential oil of sassafras, dissolved in 2 galls. of rectified spirit of wine, are added, and afterwards, 1 pint of essence of guaiacum. The liquid is then placed in a suitably sized barrel, set upon its head, and fitted with a small cock (not placed too near the bottom), and allowed to repose for a week, by which time it becomes clear and brilliant, and fit for sale. This is the form adopted by the large metropolitan drug-houses most celebrated for this preparation. The product that may be drawn off fit for sale is something over 10 galls. The residuum, forming the 'bottoms,' consists chiefly of fecula. The latter is well stirred up with 3 or 4 galls. of cold water, and allowed to settle. The clear decanted 'washings' are used as water or liquor in making the next batch of decoction.

2. (Extemporaneous.) Compound extract of sarsaparilla, 7 $\frac{1}{2}$ oz.; boiling water, 12 fl. oz.; dissolve, then add of rectified spirit of wine, 2 $\frac{1}{2}$ fl. oz.; mix well, and further add of water, q. s. to make the whole measure a pint.

Obs. To conduct this process successfully, several large copper pans are required; one of which (to boil the ingredients in) must be capable of containing from 140 to 150 gallons at the least, and the others must be sufficiently large to receive the liquors as they are drawn off. Those for the evaporation should be very shallow, in order that it may proceed rapidly; and the whole should be heated by steam. An excellent plan is, to employ large wooden vats, and to apply the heat by means of pipes laid along the bottom, and supplied with high-pressure steam. This method is less expensive than the use of double steam pans, as above. When essence of guaiacum is not used, 24 lbs. of guaiacum shavings, from which the dust has

been sifted, are boiled with the other ingredients, instead. Those desirous of using the proportions of the ingredients ordered by the Colleges, may do so by taking eight times the given quantities, and proceeding as above. The following are special preparations:—

FELTZ'S DECOCTION OF SARSAPARILLA. *Syn.* AP'ŌZEM OF FELTZ; DECOCTUM SARZÆ CUM ICHTHYOCOT'LÂ, L.; PTISANE DE FELTZ, Fr. *Prep.* From sarsaparilla (sliced), 3 oz.; isinglass and crude antimony (in powder), of each, $\frac{1}{2}$ oz.; water, 5 pints; boil to one half, and strain. *Used* in skin diseases.

JAUPERAND'S DECOCTION OF SARSAPARILLA. *Syn.* DECOCTUM SARZÆ CUM RADICE CHINÂ, L.; PTISANE DE JAUPERAND, Fr. *Prep.* (Bories.) Sarsaparilla and China root, of each, 2 oz.; senna and sassafras chips, of each, 1 oz.; rhubarb and Peruvian bark, of each, $\frac{1}{2}$ oz.; carbonate of potassa, 1 dr.; water, 2 galls.; simmer, gently, for several hours, and strain 12 pints; when cold, decant the clear.—*Dose.* 2 fl. oz., two or three times daily; in scrofula, &c.

VINACHE'S DECOCTION OF SARSAPARILLA. *Syn.* DECOCTUM SARZÆ CUM SENNÂ, L.; PTISANE DE VINACHE, Fr. *Prep.* (Foy.) Sarsaparilla, China wood, and guaiacum wood, of each, 1 $\frac{1}{2}$ oz.; crude antimony (tied in a rag), 2 oz.; water, 6 pints; macerate for 12 hours (7 in hot weather), boil to one half, add sassafras chips and senna, of each, $\frac{1}{2}$ oz., infuse 1 hour longer, and strain; when cold, decant the clear. Recommended in scrofula, secondary syphilis, and various cutaneous affections.

ZITTMANN'S DECOCTION OF SARSAPARILLA. *Syn.* DECOCTUM ZITTMANNI, L.; PTISANE DE ZITTMANN, Fr. *Prep.* 1. (STRONGER DECOCTION; D. Z. FORTÉ.—Ph. Bor. 1847.) Sarsaparilla, 12 oz.; water, 72 lbs. (say, 5 $\frac{3}{4}$ galls.); digest 24 hours, then add (suspended in a bag), white sugar and alum, of each, 6 drs.; calomel, 4 drs.; cinnabar, 1 dr.; boil to 24 lbs., adding towards the end of the process, senna, 3 oz.; liquorice root, 1 $\frac{1}{2}$ oz.; aniseed and fennel seed, of each, $\frac{1}{2}$ oz.; finally strain, with pressure and after some time decant the clear portion. The formula in the 'Ph. Suec.' 1845 is similar; that in the 'Hamburg Codex' directs only 24 lbs. of water to be used, and the whole to be reduced to 16 lbs.

2. (WEAKER DECOCTION; D. Z. TENUE.—Ph. Bor. 1847.) Add to the residuum (waste) of the last preparation, sarsaparilla, 6 oz.; water, 72 lbs. (say, 5 $\frac{3}{4}$ galls.); boil to 24 lbs.; adding towards the end of the process, lemon peel, cinnamon bark, liquorice root, and cardamoms (all bruised), of each, 3 drs.; press, strain, &c., as before. In the 'Ph. Suec.' 1845 double the above weights of lemon peel and liquorice root are ordered; and in the 'Hamburg Codex' (1845) 24 lbs. of water only are ordered, and the whole is to be boiled down to 16 lbs.

Obs. Both the above are used in Germany and on the Continent generally, in the same

¹ See page 382.

cases as those in which compound decoction of sarsaparilla is administered in England. They may be drunk almost *ad libitum*. A trace of mercury may be detected in the stronger decoction, when properly prepared. See Sarsaparilla.

Decoction of Sen'ega Root. *Syn.* DECOCTION OF AMERICAN SNAKE ROOT, D. OF RATTLE-SNAKE ROOT; DECOCTUM POLYGALÆ, D. SENEGÆ (Ph. L.), L. *Prep.* (Ph. L.) Senega or seneka root, 10 drs.; water, 1 quart; boil to a pint, and strain.—*Dose.* $\frac{1}{2}$ to 2 wine-glassfuls, three or four times daily; in humoral asthma, chronic cough, dropsy, &c. It is stimulant, expectorant, and diuretic, and, in large doses, emetic and cathartic. It is frequently conjoined with ammonia. It is the antidote employed by the Senega Indians against the bite of the rattlesnake. (Dr. Tennant.)

Decoction of Simarū'ba Bark. *Syn.* DECOCTUM SIMARUBÆ, L. *Prep.* (Dr. Wright.) Simaruba bark, 2 drs.; water, 24 fl. oz.; boil to one half, and strain. Tonic.—*Dose.* 1 to 2 fl. oz.; in chronic dysentery and diarrhoea.

Decoction of Squills (Compound). *Syn.* DECOCTUM SCILLÆ COMPOSITUM, L. *Prep.* (Ph. U.S. 1841.) Squills, 3 drs.; juniper berries, 4 oz.; snake root, 3 oz.; water, 4 lbs.; boil to one half, strain, and add of sweet spirits of nitre, 4 fl. oz. In chronic coughs and other chest affections, unaccompanied with active inflammatory symptoms.—*Dose.* 1 to 3 fl. oz., twice or thrice daily.

Decoction of Starch. *Syn.* DECOCTUM AM'YLI (Ph. L.), MUCILAGO AM'YLI (Ph. E. & D.), L. *Prep.* (Ph. L. & E.) Starch, $\frac{1}{2}$ oz.; add, gradually, water, 1 pint, and boil for a short time. The Dublin preparation is nearly twice as strong. *Used* as an enema in dysentery, diarrhoea, and excoriations of the rectum.

Decoction, Sudorific. *Syn.* DECOCTUM SUDORIFICUM, L. The old name of the compound decoctions of sarsaparilla and guaiacum.

Decoction of Suet. *Syn.* ARTIFICIAL GOAT'S MILK; DECOCTUM SE'VI, L. *Prep.* Suet, 1 oz.; tie it loosely in a piece of muslin and simmer it in cow's milk, 14 pint; adding towards the last, white sugar, $\frac{1}{2}$ oz. In scrofulous emaciation and phthisis; taken *ad libitum*.

Decoction of Tamarinds. *Syn.* DECOCTUM TAMARINDORUM, L. *Prep.* Tamarinds, 14 oz.; water, 1 pint; boil for 5 minutes, and strain. A pleasant drink in fevers, asthma, chronic coughs, &c.

Decoction of Tamarinds and Sen'na. *Syn.* DEC. TAMARINDORUM CUM SENNÂ (Ph. E. 1744), L. *Prep.* Tamarinds, 6 drs.; cream of tartar, 2 drs.; water, 14 pint; boil in a glazed earthen vessel until reduced to 16 oz.; then infuse therein for 12 hours, senna, 4 drs.; strain, and add of syrup of violets, 1 oz. A gentle aperient.—*Dose.* A wine-glassful, or more.

Decoction of Tar. *Syn.* TAR WATER; DECOCTUM P'ICIS LIQ'UIDÆ, L. *Prep.* Tar, 1 oz.; water, 14 pint; boil to 1 pint.—*Dose.* A pint, or more, daily; in chronic catarrh; and as a wash in chronic skin diseases, especially those of the head, in children.

Decoction, Ton'ic. *Syn.* STRENGTHENING DECOCTION; DECOCTUM ROBORANS, L. *Prep.* 1. Peruvian bark (bruised), $\frac{1}{2}$ oz.; Virginian snake root, 2 drs.; water, 1 pint; boil to one half, strain whilst hot, and add, spirit of cinnamon, 14 fl. oz.; diluted sulphuric acid, 14 dr.—*Dose.* 2 oz., two or three times a day.

2. Decoction of bark, 5 oz.; tincture of bark, 6 drs.; aromatic confection, $\frac{1}{2}$ dr.; sal-volatile, 1 dr.—*Dose.* 1 or 2 table-spoonfuls night and morning; especially in diarrhoea.

Decoction of Tormentil. *Syn.* DECOCTUM TORMENTIL'LE (Ph. L.), L. *Prep.* (Ph. L.) Tormentil root (bruised), 2 oz.; water, 14 pint; boil to a pint, and strain. Astringent.—*Dose.* 1 to 2 fl. oz., in chronic diarrhoea, &c.

Decoction of Tur'meric. *Syn.* DECOCTUM CURCUM'LE, L. *Prep.* From turmeric root (in powder), 14 oz.; water, 1 pint; boil for 5 minutes, and strain. A mild aromatic stimulant and stomachic.—*Dose.* A wine-glassful, *ad libitum*. It is principally used as a test for alkalies, which turn it brown. Unsized paper dipped into it and dried forms the turmeric test-paper of the chemist.

Decoction of Verbe'na. *Syn.* DECOCTUM VERBE'NÆ, L. From verbe'na (vervain), 2 oz.; water, 14 pint; boil to 1 pint, and strain.

Obs. The *Verbe'na officinalis* was formerly highly recommended by Etmuller, Hartman, De Haën, Morley, and others, in scrofula, cephalalgia, &c., but afterwards fell into neglect. More recently, a decoction of the plant has been highly extolled by Boshanov, and others, as an anti-febrile.

Decoction, Vul'nerary. *Syn.* DECOCTUM VULNERA'R'UM, L. *Prep.* From ground ivy and broad-leaved plantain, of each, $\frac{1}{2}$ oz.; water, 3 pints; boil to 1 quart, strain, and add sugar, 1 oz. A popular pectoral and tonic, especially in old coughs; also to heal wounds.—*Dose.* $\frac{1}{2}$ a teacupful or more, twice a day.

Decoction of Walnut Bark. *Syn.* DECOCTUM JUGLAND'IS, L. *Prep.* (Ph. Gen.) Green bark of walnuts, 1 oz.; water 1 pint; boil for 15 minutes, and strain. As an anti-syphilitic. Before the general introduction of sarsaparilla, it was much esteemed in most cases in which that drug is now taken.—*Dose, &c.* The same as those of comp. dec. of sarsaparilla. Pearson says, that "when the putamen (green rind) of the walnut has been omitted, either intentionally or by accident (from Decoction Lusi-tanicum), the same good effects have not followed its use as when it contained this ingredient."

Decoction of Walnut Leaves. *Syn.* DECOCTUM JUGLAND'IS FOLIO'RUM, L. *Prep.* (Negrier.) Walnut leaves, 1 handful; water, 1

quart; boil 15 minutes, and strain. Deter-
sive, diaphoretic, and alterative.—*Dose, &c.*
As the last, especially in chronic rheumatism,
secondary syphilis, &c.

Decoction of Waterdock. *Syn.* DECOCTUM
RUMICIS, D. R. AQUATICI, L. *Prep.* (A. T.
Thomson.) Root of common waterdock
(*Rumex obtusifolius*), 1 oz.; water, 1 pint;
boil for 10 minutes, and strain.

Obs. This decoction is astringent, and was
once much celebrated as a remedy for scurvy
and some other cutaneous affections. "It is
the only remedy which proves efficacious in
that disease, when the ulcers are healed, and
the patient is attacked with asthma." (Lin-
naeus, on the scurvy of the Laplanders.)

White Decoction (Sydenham's). *Syn.* HARTS-
HORN DRINK; MISTURA CORNU URSI. *Prep.*
Prepared burnt hartshorn, 2 oz.; gum arabic,
1 oz.; water, 3 pints; boil to 1 quart, and
strain. Mucilaginous; demulcent. Taken *ad
libitum*.

Decoction of Whortleberry. *Syn.* DECOCT-
ION OF BEAR-BERRY, D. OF UVA-URSI; DE-
COCTUM UVE URSI (Ph. L. & D.), L. *Prep.*
1. (Ph. L.) Whortleberry leaves, 1 oz.; water,
1½ pint; boil to a pint, and strain.

2. (Ph. D.) Uva-ursi (the leaves), ½ oz.;
water, ½ pint; boil 10 minutes, and strain.

Dose, &c. 1 to 3 fl. oz., two or three times
daily; in phthisis and purulent affections of
the urinary organs, unaccompanied with active
inflammation; especially in chronic affections
of the bladder.

Decoction of Willow Bark. *Syn.* DECOCTUM
SALICIS, D. S. CORTICIS, L. *Prep.* 1. (Wil-
kinson.) Willow bark (*Salix latifolia*),
bruised, 1½ oz.; macerate in water, 2 lbs., for
6 hours, then boil for 15 minutes, and strain.
Tonic, astringent, and febrifuge.—*Dose.* A
wine-glassful.

2. (Niemann.) Willow bark (*Salix alba*), 1½
oz.; water, ½ pint; boil to one half.—*Dose.* 1
to 2 fl. oz. Both are used as substitutes for
decoction of cinchona bark.

Decoction of Winter-green. *Syn.* DECOCT-
ION OF PYROLA, D. OF UMBELLATED WINTER-
GREEN, D. OF PIPISSEWA; DECOCTUM CHIMA-
PHILÆ (Ph. L.), D. PYROLÆ (Ph. D.), L. *Prep.* 1. (Ph. L.) Chimaphila (dried herb),
1 oz.; water, 1½ pint; boil to a pint, and
strain.

2. (Ph. D.) Winter-green (dried leaves),
½ oz.; water, ½ pint; boil 10 minutes in a
covered vessel, and strain. Tonic, stomachic,
alterative, and diuretic.—*Dose.* 1 to 2 fl. oz.;
in dropsies, scrofula, debility, loss of appetite,
&c.; and in those affections of the urinary
organs in which uva-ursi is commonly given.

Decoction of Wormseed. *Syn.* DECOCTUM
SANTONICI, L. *Prep.* 1. Wormseed, bruised,
2 oz.; water, 1 pint; boil down to 16 fl. oz.,
and strain.

2. (Dr. R. E. Griffith.) Fresh leaves of
wormseed (*Chenopodium anthelminticum*,—
Linn.), 1 oz.; water, 1 pint; orange peel, 2

drs.; boil (10 minutes), and strain. The
above are bitter, stomachic, and vermifuge
—*Dose.* A wine-glassful twice a day; in
worms. It is also used as an injection against
ascarides.

Decoction of Yarrow. *Syn.* DECOCTUM
MILLEFOLII, L. *Prep.* From milfoil or yarrow
tops, 1½ oz.; water, 1½ pint; boil to a pint,
and strain. Astringent, tonic, and vulnerary.
—*Dose.* A wine-glassful, thrice daily; in
dropsies, &c. It is also used as a fomentation
to bruises, &c.

DECOLORATION. The blanching or re-
moval of the natural colour of any substance.
Syrups, and many animal, vegetable, and
saline solutions, are decoloured or whitened
by agitation with animal charcoal, and sub-
sequent subsidence or filtration. Many fluids
rapidly lose their natural colour by exposure
to light, especially to the direct rays of the
sun. In this way castor, nut, poppy, and
several other oils, are whitened. Fish oils are
partially decolorised and decoloured by filtra-
tion through animal charcoal. Cottons and
linens are still commonly bleached by the
joint action of light, air, and moisture. The
peculiar way in which light produces this
effect has never been satisfactorily explained.
The decoloration of textile fabrics and solid
bodies generally is called bleaching. See
BLANCHING, BLEACHING, OILS, TALLOW,
SYRUPS, SUGAR, &c.

DECOMPOSITION (-zish'-un). In *che-
mistry*, the resolution of compounds into their
elements, or the alteration of their chemical
constitution in such a manner that new pro-
ducts are formed.

DEFECATION. The separation of a liquid
from its lees, dregs, or impurities, by sub-
sidence and decantation. It is commonly em-
ployed for the purification of saline solutions,
and glutinous or unctuous liquids, on the large
scale, in preference to filtration; than which
it is both more expeditious and inexpensive.
See CLARIFICATION, DECANTATION, FILTRA-
TION, &c.

DEFLAGRATION. The sudden combustion
of any substance, for the purpose of producing
some change in its composition, by the joint
action of heat and oxygen. The process is
commonly performed by projecting into a red-
hot crucible, in small portions at a time, a
mixture of about equal parts of nitre, and the
body to be oxidised.

DELIQUESCENCE. Spontaneous liquefac-
tion by absorption of the moisture of the at-
mosphere. Deliquescent salts are those which
by exposure gradually assume the liquid state.
They should all be kept in well-closed bottles
or jars.

DELIRIUM TREMENS. [L.] The mad-
ness of drunkards; a disease of the brain re-
sulting from the excessive and protracted use
of intoxicating liquors, particularly of ardent
spirits. The early symptoms are extreme
irritability and fretfulness, with unusual

mobility of the body. Sleeplessness and unpleasant dreams soon follow. At length frightful dreams and visions harass the patient. He sees remarkable sights, hears extraordinary sounds, and labours under all the strange delusions of insane persons, which, however vague and unfounded, operate on him with all the force of realities till he becomes furiously mad. The fit almost always comes on after hard drinking; and the hands are usually, but not always, tremulous. A similar affection is occasionally produced by the abuse of opium, excessive mental anxiety, night watching, or depletion. According to Dr. Armstrong, even respiring the fumes of ardent spirits will, under some circumstances, produce this disease. Persons who have undergone surgical operations under the influence of chloroform are more liable to attacks of this kind than other persons.

The treatment of delirium tremens consists mainly in the judicious use of opium, laudanum, or morphia, in rather large doses, frequently repeated. 30 to 60 drops of laudanum may be given every hour or two during the fit, its effects being carefully watched. The object is to produce quiet sleep, from which the patient usually wakes free from the worst symptoms of the disease. Diaphoretics and mild aperients may also be given, and a light, nutritious diet adopted throughout. Depletion, especially bleeding, should be particularly avoided. Alcoholic stimulants and wine, in certain cases, have proved useful. Under this treatment, the patient, unless of a very bad habit of body, or much debilitated by previous excesses, usually recovers. He is, however, very liable to relapses and subsequent attacks, which are best prevented by judicious moral management.

DELPHINIC ACID. *Syn.* PROCE'NIC ACID. A fatty acid, obtained by saponifying the oil of the *delphinus* or *porpoise*. According to recent experiments, it is identical with valeric acid.

DELPHIN'INE. *Syn.* DEL'PHINE, DEL'PHIA, DELPHIN'IA. An alkaloid discovered by Lassaigne and Feneulle in *Delphinium staphysagria* or *Stavesacre*.

Prep. 1. The husked seeds (in powder) are boiled in a little water, and pressed in a cloth; a little pure magnesia is then added to the filtered decoction, the whole is boiled for a few minutes, and refiltered; the residuum, after being well washed, is digested in boiling alcohol, which dissolves out the alkaloid, and gives it up again by gentle evaporation and cooling.

2. The bruised, but unshelled, seeds are digested in dilute sulphuric acid, the filtered liquor precipitated with carbonate of potassa, and the precipitate digested in alcohol as before.

3. (Parrish.) An alcoholic extract of the seeds is treated with dilute sulphuric acid, precipitated with an alkali, again dissolved in

dilute sulphuric acid; the colouring matter precipitated by a few drops of nitric acid, the alkaloid by potassa. The alkaloid is then dissolved in absolute alcohol, and the solution thus formed is evaporated; one pound yields about one drachm.

Prop., &c. A light-yellowish or white, odourless powder; extremely acid and bitter; scarcely soluble in water; dissolves in ether, and readily in alcohol; and has an alkaline reaction. Its alcoholic solution produces a burning and tingling sensation when rubbed on the skin, and a similar sensation is produced in various parts of the body when it is taken in doses of a few grains. It has been exhibited in neuralgia and rheumatism by Dr. Turnbull.—*Dose.* $\frac{1}{12}$ gr. every three hours, made into a pill with 1 gr., each, of the extracts of henbane and liquorice. It is also used externally under the form of ointment and lotion.

DEMUL'CENTS. In *medicine*, substances which are calculated to soften and lubricate the parts to which they are applied. Though having the same signification as the word **EMOLLIENTS**, it is desirable to restrict the latter term to such as are intended for external application, and to include under the above head only such as are intended for internal exhibition. The principal demulcents are gum arabic, gum tragacanth, liquorice, honey, arrow-root, pearl barley, isinglass, gelatine, milk, almonds, spermaceti, almond and olive oils, and most other mucilaginous, amylaceous, saccharine, and oily substances. For use, these are made into MUCILAGES, DECOCTIONS, EMULSIONS, or MILKS, with water, and form suitable beverages in dysentery, diarrhoea, catarrh, diseases of the urinary organs, and all other diseases where diluents are useful. See **EMOLLIENTS**.

DENSITY. Comparative masses of equal weights, or the quantity of matter contained in a given space. It is commonly used synonymously with **SPECIFIC GRAVITY**, which, however, refers to comparative weights of equal bulks. Thus, quicksilver is said to have a density greater than that of copper, and alcohol one less than that of oil of vitriol.

DENTIFRICES. *Syn.* DENTIFRICIA, •L. Substances applied to the teeth, to cleanse and beautify them. The most useful form of dentifrice is that of powder (**TOOTH POWDER**); but liquids (**TOOTH WASHES**), and electuaries (**TOOTH ELECTUARIES**, **TOOTH PASTES**), are also employed. The solid ingredients used in dentifrices should not be so hard or gritty as to injure the enamel of the teeth; nor so soft or adhesive as to adhere to the gums, after rinsing the mouth out with water. Pumice-stone (in fine powder) is one of those substances that acts entirely by mechanical attrition, and is hence an objectionable ingredient in tooth powder intended for daily use. It is, however, very generally present in the various advertised dentifrices, which are remarkable

for their rapid action in whitening the teeth. Bath brick is another substance of a similar nature to pumice, and, like that article, should be only occasionally employed. Cuttle-fish bone, coral, and prepared chalk, are also commonly used for the same purpose, but the last is rather too soft and absorbent to form the sole ingredient of a tooth powder. Charcoal, which is so very generally employed as a dentifrice, acts partly mechanically, and partly by its chemical property of destroying foul smells and arresting putrefaction. For this purpose it should be newly burnt, and kept in well-closed vessels, until used, as by exposure to the air it rapidly loses its antiseptic powers. Powdered rhatany, cinchona bark, and catechu, are used as astringents, and are very useful in foulness or sponginess of the gums. Myrrh and mastic are employed on account of their odour, and their presumed preservative action, and power of fixing loose teeth. Insoluble powders have been objected to on account of their being apt to accumulate between the folds of the gums and in the cracks of the teeth, and thus impart a disagreeable appearance to the mouth. To remedy this defect, a reddish or flesh-coloured tinge is commonly given to them with a little rose pink, red coral, or similar colouring substance, when any small portion that remains unwashed off is rendered less conspicuous. Some persons employ soluble substances as tooth powders, which are free from the above objection. Thus, sulphate of potash and cream of tartar are used for this purpose, because of the grittiness of their powders and their slight solubility in water. Phosphate of soda and common salt are also frequently employed as dentifrices, and possess the advantage of being readily removed from the mouth by means of a little water. Among these substances that chemically decolour and remove unpleasant odours, the only ones employed as dentifrices are charcoal and the chlorides of lime and soda. The first has been already noticed; the others may be used by brushing the teeth with water, to which a very little of their solutions has been added. A very weak solution of chloride of lime is commonly employed by smokers to remove the odour and colour imparted by tobacco to the teeth. Electuaries, made of honey and astringent substances, are frequently employed in discharges of the gums. The juice of the common strawberry has been recommended as an elegant natural dentifrice, as it readily dissolves the tartareous incrustations on the teeth, and imparts an agreeable odour to the breath. See **PASTE** and **POWDER** (Tooth), also **WASHES** (Mouth).

DENTINE. The tissue of which the teeth are composed.

DENTITION. See **TEETHING**.

DEOBSTRUENT. In medicine, a substance which removes obstructions, and opens the natural passages of the fluids of the body, as the pores, lacteals, and glands. Iodine, mer-

cury, sarsaparilla, and aperients, are deobstruents.

DEODORISER. Any substance having the power of destroying fetid effluvia. Chlorine, chloride of lime, chloride of zinc, nitrate of lead, sulphate of iron, and freshly burnt charcoal, are the most effective and convenient deodorisers. Peat charcoal has been highly recommended for deodorising manure, &c., on the large scale. When it is mixed with these substances, their fetor is immediately destroyed, and a compost produced, which may be substituted for guano for agricultural purposes. See **DISINFECTANT**.

DEOXIDATION. See **REDUCTION**.

DEPILATORY. A cosmetic employed to remove superfluous hairs from the human skin. Depilatories act either mechanically (**MECHANICAL DEPILATORIES**), or chemically (**CHEMICAL DEPILATORIES**). To the first class belong adhesive plasters, that, on their removal from the skin, bring away the hair with them. The second class includes all those substances which destroy the hair by their chemical action.

Lime or orpiment, and generally both of them, have formed the leading ingredients in depilatories, both in ancient and modern times. The first acts by its well-known causticity, and also, when an alkali is present, by reducing that also, either wholly or in part, to the caustic state. The action of the orpiment is of a less certain character, and its use is even dangerous when applied to a highly sensitive or an abraded surface. The addition of starch is to render the paste more adhesive and manageable.

In using the following preparations, those which are in the state of powder are mixed up with a little warm water to the consistency of a paste, and applied to the part. Sometimes soap lye is used for this purpose, and some persons spread the pulpy mass on a piece of paper, and apply it like a plaster. In 12 or 15 minutes, and sooner, if much smarting ensues, the whole should be washed off with warm water, and a little cold cream, lip-salve, or spermaceti cerate, applied to the part. The application of the liquid preparations is generally accompanied with gentle friction, care being taken to prevent them extending to the adjacent parts. All the following effect the object satisfactorily, with proper management; but some are much more effective than others. A small wooden or bone knife is the best for mixing them with. They must all be kept in well-stoppered bottles, and no liquid must be added to them until shortly before their application; and then no more should be mixed than is required for immediate use.

Depilatory, Arsenical. Orpiment (sulphide of arsenic) forms the principal ingredient in many fashionable depilatories, but its use is not free from danger. The following are well-known preparations:—

1. (COLLEY'S D.) From nitre and sulphur, of each, 1 part; orpiment, 3 parts; quicklime, 8 parts; soap lees, 32 parts; boil to the consistency of cream. Very caustic.

2. (DELCROIX'S D.; 'POUDRE SUBTILE.') Orpiment, 1 oz.; quicklime, 10 oz.; starch, 14 oz.

3. (ORIENTAL D.; ORIENTAL RUSMA.)—*a.* Quicklime, 3 oz.; orpiment, $\frac{1}{2}$ dr.; strong alkaline lye, 1 lb.; boil together in a clean iron vessel until a feather dipped into the liquor loses its flue.

b. From pearlash, 2 oz.; orpiment, 3 drs.; liquor of potassa, $\frac{1}{2}$ pint; boil together as before. One of the most caustic and consequently the most certain of depilatory preparations; but, with the rest of its class, open to the objections of containing orpiment. (See No. 7.)

4. (PASTE D.; 'PÂTE ÉPILATOIRE.') To No. 1 add of orris root, 3 parts.

5. (PLENCK'S D.; 'PASTA EPILATORIA.') Orpiment, 1 part; quicklime and starch, of each, 12 parts.

6. SOAP D.; 'SAVON ÉPILATOIRE.' Turkish depilatory and soft soap, equal parts. Must not be mixed until about to be applied. (See No. 7.)

7. (TURKISH D.; TURKISH RUSMA.) Orpiment, 1 part; quicklime, 9 parts. For use, it is mixed up with soap lees, and a little powdered starch.

Depilatory, Boudet's. *Prep.* Sulphide of sodium (crystallised), 3 parts; quicklime (in fine powder), 10 parts; starch, 10 parts; mix. To be mixed with water, and applied to the skin, and scraped off in 2 or 3 minutes with a wooden knife. Very effective and safe.

Depilatory, Cazenave's. *Syn.* MAHON'S D.; POMMADE ÉPILATOIRE DE CAZENAVE, Fr. *Prep.* Quicklime, 1 part; carbonate of soda, 2 parts; lard, 8 parts; mix. Applied as an ointment.

Depilatory, Chi'nese. *Prep.* 1. Quicklime, 8 oz.; pearlash (dry) and liver of sulphur, of each, 1 oz.; all reduced to a fine powder; mixed, and kept in a close bottle.

2. (ROSEATE D.) As No. 1., but coloured with a little rose pink or light red.

These preparations are applied in the same manner as Boudet's Depilatory.

Depilatory, Colley's. See ARSENICAL DEPI-LATORY (*above*).

Depilatory, Hydrosulphate of Lime. *Prep.* (Beasley.) Mix quicklime and water to a thick cream, and pass into the mixture 25 or 30 times its volume of sulphuretted hydrogen gas. When the gas ceases to be absorbed, stop the process. The pulpy mass is spread on paper, and applied for 12 or 15 minutes. It is very effective, but has a most disgusting smell. Spolascio's depilatory is a very similar preparation (see *below*).

Depilatory, Mechanical. *Syn.* DEPI-LATORY PLASTER. *Prep.* From pitch and resin, equal parts, melted together and spread on leather. Applied as a plaster.

Depilatory, Rayer's. *Prep.* Quicklime, 2 oz.; salt of tartar, 4 oz.; charcoal, $\frac{1}{4}$ oz. Less active than Chinese Depilatory.

Depilatory, Redwood's. *Prep.* A strong solution of sulphide of barium, made into a paste with powdered starch, and applied immediately. Mr. Redwood says this is "the best and safest depilatory."

Depilatory, Ro'seate. See CHINESE DEPI-LATORY (*above*).

Depilatory, Spolascio's. *Prep.* Freshly prepared sulphide of calcium and quicklime, equal parts. Almost equal to Redwood's (*above*).

DEPOSITION (of Metals). See ELECTRO-TYPE.

DER'BYSHIRE NECK. See GOITURE.

DESIC'CANTS. *Syn.* DESICCAN'TIA, L. In *pharmacology*, substances that check secretion and dry sores of abraded surfaces, without acting as styptics, or constricting the fibres of the parts to which they are applied. See ASTRINGENTS.

DESICCA'TION. *Syn.* ENSICCA'TION. The evaporation or drying off of the aqueous portion of solid bodies. Plants, and chemical preparations are deprived of their humidity by exposure to the sun, a current of dry air, an atmosphere rendered artificially dry by sulphuric acid, or by the direct application of heat by means of a water bath, a sand bath, or a common fire. Planks and timber are now seasoned, on the large scale, in this way, by which a condition may be produced, in 2 or 3 days, which on the old system is barely attainable in as many years. "Endeavours were made to enforce the importance and value of the desiccation of woods to the builder, cabinet maker, architect, and civil engineer, so long back as 1843, but without success. Since that period, certain persons have availed themselves, commercially, of our ideas and experiments on the subject, without any acknowledgment, either verbal or pecuniary." Cooley.

DESTEM'PER. *Syn.* DISTEMPER. Colours ground up with size, gum, or white of egg, and water, as in scene painting. The art of executing work in distemper, is called 'distemper painting.'

DETER'GENT. An agent having the power of removing offensive matter from the skin. The name is now generally restricted to applications that tend to cleanse foul wounds and ulcers.

Detergent, Collier's. *Prep.* From liquor of potassa, 2 fl. drs.; rose water, 5 $\frac{1}{2}$ fl. oz.; spirit of rosemary, $\frac{1}{2}$ fl. oz.; mix. One of the best applications known to free the head from scurf, when the hair is strong and healthy. The head should be afterwards sponged with clean, soft water.

DETONA'TION. See FULMINATING COM-POUNDS.

DEUTOX'IDE. See OXIDES.

DEW-POINT. The temperature at which dew begins to form, as observed by a ther-

mometer. It varies with the humidity of the atmosphere.

DEX'TRIN. $C_6H_{10}O_5$. *Syn.* STARCH GUM, DEXTRINA, DEXTRINUM, BRITISH GUM. A soluble substance resembling gum, formed by the action of dilute acids at the boiling temperature, and by infusion of malt, at about 160° Fahr., on starch. It is also formed when potato starch and some of the other farinas are exposed to a heat of about 400° . See DIASTASE and GUM (British).

DEX'TRO-RACEMIC ACID. See RACEMIC ACID.

DIABETES. See URINE.

DIACHYLON. See PLASTERS.

DIALY'SER. In *practical chemistry*, an instrument for separating 'crystalloids' from 'colloids,' introduced by the late Prof. Graham. In its most convenient form it consists of a hoop of gutta percha, over which a circular piece of parchment-paper is stretched. The paper is applied to the hoop while wet, and is kept stretched by a second hoop, by an elastic band, or by a few turns of string. The instrument, when complete, resembles an ordinary tambourine. It is distinguished as the 'HOOP DIALYSER.' The fluid to be 'dialysed' is poured into the hoop upon the surface of the parchment-paper, to a small depth only, such as half an inch, and the dialyser is then floated upon water in a large glass basin. Another form of dialyser, termed the 'BULB DIALYSER,' consists of a small glass bell-jar, the mouth of which is covered by a piece of parchment-paper. This is suspended or otherwise supported in a large vessel of water in such a manner that the parchment-paper septum just dips below the surface. See DIALYSIS (*below*), PARCHMENT-PAPER.

DIALYSIS. In *practical chemistry*, the method of separating substances by 'diffusion' through a septum of gelatinous matter. When a solution having a sp. gr. greater is introduced into a cylindrical glass vessel, and then water very cautiously poured upon it, in such a manner that the two layers of liquid remain unmoved, the substance dissolved in the lower liquid will gradually pass into the supernatant water, though the vessel may have been left undisturbed, and the temperature remain unchanged. The gradual passage of a dissolved substance from its original solution into pure water taking place, notwithstanding the higher sp. gr. of the substance which opposes this passage, is called the 'diffusion of liquids.' From the investigation of the phenomena of this diffusion, the late Prof. Graham derived the remarkable results upon which the method under notice is based. Different substances, when in solution of the same concentration, and under other similar circumstances, diffuse with very unequal velocity. "The range in the degree of diffusive mobility," says Prof. Graham, "exhibited by different substances, appears to be as wide as the scale of vapour-tensions. Thus, hydrate of potassa may be said

to possess double the velocity of diffusion of sulphate of potassa, and sulphate of potassa again double the velocity of sugar, alcohol, and sulphate of magnesia. But the substances named belong, as regards diffusion, to the more volatile class. The comparatively fixed class, as regards diffusion, is represented by a different order of chemical substances (marked out by the absence of the power to crystallise), which are slow in the extreme. Among the latter are hydrated silicic acid, hydrated alumina, and other metallic peroxides of the aluminous class, when they exist in the soluble form; with starch, dextrine, and the gums, caramel, tannin, albumen, gelatin, vegetable and animal extractive matters. Low diffusibility is not the only property which the bodies last enumerated possess in common. They are distinguished by the gelatinous character of their hydrates. Although often largely soluble in water, they are held in solution by a most feeble force. They appear singularly inert in the capacity of acids and bases, and in all the ordinary chemical relations. But, on the other hand, their peculiar physical aggregation, with the chemical indifference referred to, appears to be required in substances that can intervene in the organic processes of life. The plastic elements of the body are found in this class. As gelatin appears to be its type, it is proposed to designate substances of this class as 'COLLOIDS,' and to speak of their peculiar form as the 'colloidal condition of matter.' Opposed to the colloidal is the 'crystalline condition.' Substances affecting the latter form will be classed as 'CRYSTALLOIDS.' The distinction is, no doubt, one of intimate molecular constitution." A certain property of colloidal substances comes into play most opportunely in assisting diffusive separations. The jelly of starch, that of animal mucus, of pectin, of vegetable gelose, and other solid colloidal hydrates, all of which, strictly speaking, are insoluble in cold water, are themselves permeable when in mass, as water is, by the more highly diffusive class of substances. But such jellies greatly resist the passage of the less diffusible substances, and cut off entirely other colloid substances like themselves that may be in solution. A mere film of the jelly has the separating effect. Now, parchment-paper, when wetted, acts just like a layer of animal mucus or other hydrated colloid, by permitting the passage of crystalloids, but not of colloids, consequently this substance may be used for dialytic septa (see DIALYSER, *above*). The following experiments recorded by Graham will give some idea of the results which may be obtained by dialysis:—

1. Half a litre of urine was placed in a hoop dialyser, which was then floated on a considerable quantity of pure water. Dialysed for 24 hours, the urine gave its crystalloidal constituents to the external water. The latter, evaporated by a water bath, yielded a white

¹ "Philosophical Transactions" for 1861.

saline mass. From this mass urea was extracted by alcohol in so pure a condition as to appear in crystalline tufts upon the evaporation of the alcohol.

2. By pouring silicate of soda into diluted hydrochloric acid (the acid being maintained in large excess), a solution of silica is obtained. But in addition to hydrochloric acid, such a solution contains chloride of sodium, a salt which causes the silica to gelatinise when the solution is heated, and otherwise modifies its properties. Now, such a solution, placed for 24 hours in a dialyser of parchment-paper, was found to lose $5\frac{1}{2}\%$ of its silicic acid (silica) and $86\frac{1}{2}\%$ of its hydrochloric acid. After 4 days on the dialyser, the liquid ceased to be disturbed by nitrate of silver. All the chlorides were gone, with no further loss of silica. What remained was a pure solution of silicic acid, which could be boiled in a flask, and considerably concentrated, without change.

3. Half a litre of dark-coloured porter, with .05 grammes of arsenious acid added ($\frac{1}{10,000}$ th part of arsenious acid), was placed on a hoop dialyser, 8 inches in diameter, and the whole floated in an earthenware basin containing 2 or 3 litres of water. After 24 hours the latter fluid had acquired a slight tinge of yellow. It yielded, when concentrated and precipitated by sulphuretted hydrogen, upwards of one half of the original arsenious acid in a fit state for examination.

DIAMOND. The diamond is pure carbon, and differs from the carbon of charcoal and lampblack simply in being limpid, colourless, and highly refractive of light, properties which are generally referred to its crystalline form. The weight, and, consequently, the value of diamonds, is estimated in carats, one of which is equal to 4 grains; and the price of one diamond, compared to that of another of equal colour, transparency, purity, form, &c., is as the squares of the respective weights. The average price of ROUGH DIAMONDS, that are worth working, is about £2 for the first carat; that of a CUT DIAMOND is equal to that of a rough diamond of double weight, exclusive of the price of workmanship. "To estimate the value of a wrought diamond, ascertain its weight in carats, double that weight, and multiply the square of this product by £2." (Ure.) Thus, a cut diamond of—

1 carat is worth	£8
2 carats	£32
3 "	£72
4 "	£128

&c., &c. See CARBON, GEMS.

Diamond Dust. Genuine diamond dust is the powder produced by the abrasion of diamonds against each other in the process of cutting and polishing them. It possesses the valuable property of polishing the gems, and giving "the finest edge to every kind of cutlery." The discovery of the latter fact, a few years since, led certain dishonest persons to

extensively advertise spurious preparations, consisting chiefly of emery powder or powdered quartz, under the name of diamond dust. The factitious articles acquired a very short and bad notoriety. Instead of sharpening cutting instruments, they infallibly destroyed their edge, and were particularly unfortunate in converting razors into saws.

DIAPENTE. *Syn.* PULVIS DIAPENTE. *Prep.* 1. (Ph. E. 1744.) Bay-berries, birthwort, gentian, ivory dust, and myrrh, equal parts. An excellent warm tonic, especially useful in the debility and rickets of children. The substance sold under this name in the shops is an inferior mixture, used principally as a tonic in veterinary practice. The following are the forms commonly adopted in its preparation:—

2. Turmeric, 4 lbs.; laurel berries and mustard, of each, 3 lbs.; gentian, 2 lbs. (all in fine powder); mix.

3. Bay-berries, gentian, mustard, and turmeric, equal parts.

4. Gentian, 6 lbs.; bay-berries, 1 lb. This is the formula generally used by the farriers. Sometimes mustard, 1 lb., is added.

DIAPHORETICS. *Syn.* SUDORIFICS; DIA-PHORETICA, SUDORIFICA, L. Medicines which promote or increase the perspiration. Those that produce this effect in a very marked degree are more particularly called 'sudorifics.' The principal diaphoretics are:—warm diluents, as barley-water, gruel, tea, &c.; salts of the alkalies, as the citrates of potassa and soda, acetate of potassa, acetate and carbonate of ammonia, sal-ammoniac, nitre, &c.; preparations of antimony, as antimonial powder, tartar emetic, &c.; also alcohol, camphor, Dover's powder, ipecacuanha, opium, wine, &c.

The use of diaphoretics is indicated in nearly all diseases accompanied by fever and a dry skin, and particularly in febrile and pectoral affections.

DIAPHRAGM (frám). A partition through or across; a dividing substance. In *anatomy*, the term is applied to the midriff, a muscle separating the chest or thorax from the abdomen or lower belly. In *astronomy* and *optics*, the term is applied to a circular ring placed in a telescope or other instrument to cut off the marginal portions of a beam of light. In *electricity*, the name is commonly used to denote the porous partition, cell, or vessel that separates the fluid containing the positive plate from the fluid which surrounds the negative plate, in a constant voltaic battery. Thin partitions of sycamore, or other porous wood, are occasionally used, but cells made of thin biscuit ware are the most convenient and durable diaphragms. Plaster of Paris, animal membrane, coarse and tightly woven canvas, &c., are used also for the purpose. Plaster cells are also formed by surrounding an oiled cylinder of wood with a hoop of paper, and pouring plaster of Paris, mixed up with water, into the space between the two. See ELECTROTYPE.

DIARRHŒA. A purging or looseness of the bowels. The causes of diarrhœa are various, but among the most common are the presence of irritating matter, worms, or acidity in the stomach or bowels; and exposure to cold (especially cold to the feet) or sudden changes of climate or temperature.

Treatm. In general, it will be proper to administer a mild aperient, for which purpose rhubarb or castor oil is usually preferred. The dose of the first may be from 20 to 30 grains in sugar, or made into a bolus; that of the second, from $\frac{1}{4}$ oz. to $\frac{1}{2}$ oz., with a little mint or peppermint water. After the due operation of this medicine, opium, astringents, and absorbents, may be taken with advantage, but not in excessive doses, as is commonly the practice. The first and second are indicated when great irritability exists, and the third, in cases of diarrhœa arising from the presence of acidity. Chalk mixture, to which a few drops of laudanum have been added, or the compound powder of chalk and opium, are excellent medicines, and will generally quiet the bowels. A small piece of catechu or hard extract of logwood, sucked in the same way as a lozenge, is a pleasant method of taking either of these powerful astringents, and will generally cure cases of simple diarrhœa arising from excessive peristaltic motion, or want of tonicity of the muscular coats of the intestines.

In *bilious diarrhœa*, characterised by the bright yellowish-brown colour of the dejections, a dose of blue pill or calomel, assisted by mild diluents and demulcents, and warmth, generally proves efficacious. Small doses of opium are also useful in some cases.

In *catarrhal diarrhœa*, *chylous diarrhœa*, and the like varieties, characterised by the dejections being nearly colourless, and consisting chiefly of water and mucus; or white and milky, showing the entire absence of bile; or, being entirely liquid, limpid, and serous (in some cases resembling the washings of flesh), opinions are divided as to the treatment. The majority of the best authorities regard purging as injurious in these varieties, and rely chiefly on warm baths and warm fomentations, with the internal administration of mild salines and diaphoretics, followed by astringents, tonics, and occasional doses of opiates. *Choleraic diarrhœa* demands a nearly similar treatment.

The diet in every variety of diarrhœa should be light and non-irritating. Glutinous broths, beef-tea and arrow-root, are among the best articles which can be taken. To these may be added a little dry toast. Arrow-root (genuine), either with or without a spoonful of port wine or brandy (preferably the former), will of itself cure all ordinary cases of diarrhœa, if accompanied with repose and a recumbent posture.

Among external remedies, warm and stimulating fomentations, liniments, &c., to the epi-

gastrium and abdomen, will be found useful adjuncts to other treatment. A spoonful or two of laudanum, used as a friction, will generally allay pain, and in many cases settle the bowels when all other remedies have been tried in vain.

DI'ASTASE. A peculiar azotised substance, contained in malt, which effects the conversion of starch, first into dextrin, and then into grape sugar.

Prep. A cold infusion of malt is heated to 158° Fahr. (to coagulate in albumen); it is then allowed to cool, and alcohol is added to the filtered liquor, when diastase is precipitated, under the form of a tasteless white powder, which is freely soluble in water.

Prop., &c. Diastase seems to resemble vegetable albumen, but very little is known respecting it, as it has never been got in a state of purity. One part of diastase is capable of converting 2000 parts of starch into grape sugar. Malted barley is said to contain $\frac{1}{100}$ th part of this substance; yet this small portion is quite sufficient to convert the starch of the malt into sugar during the operation of mashing, in the manufacture of beer. See BREWING, DEXTREIN, &c.

DICTA'MIA. A nutritious, dietetic article. *Prep.* (Beasley.) Sugar, 7 oz.; potato arrow-root, 4 oz.; flour of brent barley (*Triticum monococcum*), 3 oz.; Trinidad and Granada chocolate, of each, 1 oz.; vanilla, 15 grs.; triturate together.

DIDYMIUM. Di. A rare metal, found associated with cerium and lanthanum in the Swedish mineral cerite. See CERIUM.

DIET. Food or victuals. In *medicine*, food regulated by certain rules, or prescribed for the cure or prevention of disease. The dietetic part of medicine is no inconsiderable branch, and deserves a much greater share of regard than it commonly meets with. A great variety of diseases might be removed by the observance of a proper diet and regimen, without the assistance of medicine, were it not for the impatience of the sufferers. On all occasions it may come in as a proper assistant to the cure, which sometimes cannot be performed without a due observance of the non-naturals.

Writers on dietetics (DIETETICA, L.) have taken much trouble to divide and classify the numerous articles of food suitable to the various conditions of the body in health and disease; but little practical advantage has resulted from their labours. Low diet, middle diet, full diet, milk diet, farinaceous diet, fruit diet, and vegetable diet, are terms which, under most circumstances, are sufficiently simple to be almost self-explanatory.

DIGESTION. In *chemistry* and *pharmacy*, the operation of exposing bodies to a gentle and continuous heat. The best digesters are thin glass flasks and beakers, and the most convenient source of heat is the sand bath. Digestion is often performed to soften and otherwise modify bodies that are to be distilled.

In *physiology*, the term is applied to the conversion of food into chyme, or the process of dissolving aliment in the stomach, and preparing it for circulation and nourishment. In *surgery*, digestion signifies a method of treating ulcers, wounds, &c. See DIGESTIVES (*below*).

DIGESTIVES. In *surgery*, substances which, when applied to wounds or tumours, induce or promote suppuration. All stimulating applications are of this class. Heat is a most powerful digestive agent. The action of digestives is opposed to that of DISCUTIENTS, which repel or resolve tumours and indurations.

DIGITA'LIN. *Syn.* DIGITA'LIA. A vegetable principle discovered by M. Royer in *Digitalis purpurea*, or purple foxglove.

Prep. 1. (Majendie.) Foxglove leaves (powdered), 1 lb., are digested in ether, first in the cold, and then heated under pressure; when the whole has again become cold, the liquor is filtered (rapidly), and the ether is distilled off in a water bath; the residuum is dissolved in water, the filtered solution treated with hydrated oxide of lead, the whole gently evaporated to dryness, and the dry residuum again digested in hot ether; from this solution the alkali is obtained, by evaporation and repeated resolutions, in a crystalline form.

2. (Homolle and Henry.) Foxglove leaves (carefully dried and powdered), $2\frac{1}{2}$ lbs., are digested in rectified spirit, and the tincture expressed in a tincture press; the spirit is then distilled off, and the residual extract treated with distilled water, $\frac{1}{2}$ pint, acidulated with about 2 fl. drs. of acetic acid, a gentle heat being employed; some animal charcoal is then added, and the whole filtered; the filtrate is then diluted with water, and partly neutralised with ammonia; a fresh-made, strong decoction of galls is next added; a copious precipitation of tannate of digitalin ensues; the precipitate is washed with water, and mixed with a little alcohol, after which it is triturated with litharge (in fine powder) and exposed to a gentle heat; the whole is now digested in alcohol, the tincture treated with animal charcoal, and evaporated; the dry residuum is, lastly, treated with cold sulphuric ether, which takes up some foreign matter, and leaves the digitalin. 2 lbs. 8 oz. of the dried leaves yield 140 to 150 grs. of the digitalin.

Prop., &c. White, inodorous, porous masses, or small scales; it crystallises with difficulty, is intensely bitter, and excites violent sneezing when smelled to; dissolves freely in alcohol; scarcely soluble in cold ether; and takes 2000 parts of water for its solution; it is neither basic nor alkaline; concentrated colourless hydrochloric acid dissolves it, forming a characteristic solution which passes from yellow to a fine green. (Homolle.) It is one of the most powerful of known poisons, being fully 100 times stronger than the powdered leaves of the dried plant. It is used in the same

cases.—*Dose.* $\frac{1}{10}$ to $\frac{1}{5}$ gr.; either made into pills or dissolved in alcohol and formed into a mixture. Owing to the difficulty and uncertainty connected with dispensing such small quantities, it is now seldom employed in this country.

DILL. *Syn.* ANETHUM (Ph. L. & E.), L. The fruit (seed) of *Anethum graveolens*, or garden dill, *Anethi fructus*, B. P. Dill is an aromatic stimulant and carminative. The Cossacks employ it as a condiment; and in this country it is frequently employed to heighten the relish of soups and pickles, especially cucumbers. DILL WATER is a favorite remedy of nurses to promote the secretion of milk, and to relieve the flatulence and griping of infants.—*Dose.* Of the powder, 10 grs. to $\frac{1}{2}$ dr., or more. Oil of dill (OLEUM ANETHI) and dill water (AQUA ANETHI) are official in the pharmacopœias.

DILUENTS. *Syn.* DILUENTIA, L. *Aqueous liquors*; so named because they increase the fluid portion of the blood. Tea, barley-water, water-gruel, and similar articles, are the most common diluents, after pure water. The copious use of diluents is recommended in all acute inflammatory diseases, not of a congestive character, and to promote the action of diuretics and sudorifics.

DINNER PILLS. See PILLS.

DIOS'MA. *Syn.* BOOKOO, BUKU; FOLIA BAROSMÆ, F. DIOSMÆ, L.; BUCHU (Ph. L.), BUCKU (Ph. E.), DIOSMA (Ph. L. 1836). "The leaves of *Barosma serratifolia*, *B. crenulata*, and *B. crenata*." (Ph. L.) These species were all included by De Candolle in the genus *Diosma*. Buchu is principally employed in chronic affections of the urino-genital organs, especially that of the mucous membrane of the bladder, attended with copious discharge of mucus.—*Dose.* 20 grs. to $\frac{1}{2}$ dr. of the powder, taken in wine; or made into an infusion or decoction.

The official buchu leaves are "glabrous, glandular; either linear-lanceolate with small serrations, or ovato-oblong, obtuse, crenated, ovate or obovate, serrated." (Ph. L.) Their odour somewhat resembles that of rue, and their taste is warm and mint-like.

DIOS'MINE. A bitter extractive matter obtained by Brande from buchu leaves. It is very soluble in water, but not in alcohol and ether.

DISCUTIENTS. In *surgery*, substances or agents which disperse or resolve tumours, &c. See DIGESTIVES.

DISINFECTANT. An agent which absorbs, neutralises, or destroys, putrescent effluvia and miasmata, and thus removes the causes of infection. The principal disinfectants are chlorine, the so-called chlorides of lime and soda, chloride of zinc, ozone, carbolic acid, the alkaline manganates and permanganates, peat charcoal, the fumes of nitric, nitrous, and sulphurous acids, heat, and ventilation. The last two are the most efficient and easily

applied. The clothing, bedding, &c., of patients labouring under contagious diseases may be effectually disinfected by exposure to a temperature a little higher than that of boiling water, for about an hour. Neither the texture nor colour of textile fabrics is injured by a heat of even 250° Fahr. (Dr. Henry.) It is a practice at some of the workhouses to bake the clothes of the paupers who have the itch, or who are infested with vermin. Quicklime rapidly absorbs carbonic acid, sulphuretted hydrogen, and several other noxious gases, and is therefore commonly used as a wash for the walls of buildings. Acetic acid, camphor, fragrant pastiles, cascarilla, brown paper, and other similar substances, are frequently burnt or volatilised by heat, for the purpose of disguising unpleasant odours. The sulphates of iron and lime have the property of rapidly destroying noxious effluvia. A quantity of either of these sulphates thrown into a cesspool, for instance, will in a few hours render the matter therein quite scentless. Of gaseous disinfectants, "sulphurous acid gas (obtained by burning sulphur) is preferable, on theoretical grounds, to chlorine. No agent checks so effectually the first development of animal and vegetable life. All animal odours and emanations are immediately and most effectually destroyed by it." (Graham.) See ANTISEPTIC, DEODORISER, FUMIGATION, INFECTION, OZONE, also the DISINFECTING COMPOUNDS given below.

Disinfecting Compounds. 1. (SIR WM. BURNETT'S DISINFECTING LIQUID.) A concentrated solution of chloride of zinc. See ZINC.

2. (COLLINS' DISINFECTING POWDER.) A mixture of dry chloride of lime, 2 parts, and burnt alum, 1 part. *Used* either dry or moistened with water. See LIME.

3. (CONDY'S DISINFECTING FLUIDS.) Solutions of the alkaline manganates and permanganates. See MANGANESE.

4. (ELLERMAN'S DEODORISING FLUID.) This is said to consist chiefly of the perchlorides and chlorides of iron and manganese.

"In a report addressed to the Metropolitan Board of Works in 1859, Drs. Hofmann and Frankland stated that the perchloride of iron was the cheapest and most efficient deodoriser that could be applied to sewage." (Beasley.)

5. (LASARRAQUE'S DISINFECTING SOLUTION; LIQUOR SODÆ CHLORINATÆ, Ph. L. & D.) A solution of chlorinated soda, or, as it is commonly called, 'chloride of soda.' M. Labarraque made known this valuable disinfectant in 1822, and obtained the prize of the French 'Society for Encouraging National Industry' for its introduction.

6. (LEDROYER'S DISINFECTING FLUID.) A solution of nitrate of lead, 1 part, in about 8 parts of water; or, of litharge, 1½ oz., in nitric acid (sp. gr. 1.38), 12 oz., previously diluted with water, 6 pints. Sp. gr. 1.40.

7. (SIRET'S DISINFECTING COMPOUNDS.)

—a. A mixture of sulphate of lime, 53 lbs., sulphate of iron, 40 lbs., sulphate of zinc, 7 lbs., and peat charcoal, 2 lbs., made into balls.

b. Sulphate of iron, 20 parts; sulphate of zinc, 10 parts; tan or waste oak-bark (in powder), 4 parts; tar and oil, of each, 1 part; as before. *Used* for deodorising cesspools, &c.

DISLOCATION. *Syn.* LUXATION; DISLOCATIO, L. The forcible displacement of a bone from its socket, either by violence or disease. The latter happens when the textures forming the joint have been destroyed by some independent organic affection. "A considerable share of anatomical knowledge is required to detect the nature of these accidents; and it is much to be lamented that students neglect to inform themselves sufficiently on the subject." (Sir A. Cooper.) In common cases, the bones may be frequently replaced by forcibly extending the limb. This should be done as early as possible, and before inflammation sets in. The latter should be combated by aperients, local bleeding, refrigerant lotions, &c. Dislocations frequently exist without the fact being suspected, the swelling and inflammation being referred to other causes.

DISPLACEMENT. See PERCOLATION.

DISTEMPER. A disease among dogs, usually characterised by a running from the nose and eyes, and a short dry cough; followed by wasting of the flesh, and loss of strength and spirits. At length the brain suffers, and fits, paralysis of the extremities, or convulsions come on. Laxatives and emetics are the best remedies. If there is much diarrhoea, astringents may be afterwards given. The violence of the fits may be mitigated by the administration of antispasmodics, and by the warm bath. The distemper is a contagious disease, and is generally fatal to weakly and very young dogs. Fits in the advanced stages of the disease are seldom followed by recovery. Impatience of light, red eyes, obstinate diarrhoea, spasmodic twitchings, a yellow colour of the skin, and a pustular eruption, are also bad symptoms.

Distemper Powders (Blane's). The basis of these is said to be '*aurum musivum*,' or bisulphide of tin. That of another advertised nostrum is a mixture of mercury and chalk, with a little rhubarb and ipecacuanha.

DISTILLATION. The evaporation and subsequent condensation of the vapour of fluids, by means of a still and refrigerator, or other similar apparatus. **DRY DISTILLATION** is a term applied to the distillation of substances *per se*, or without the addition of water or other volatile fluid. **DESTRUCTIVE DISTILLATION** is the distillation of substances at temperatures sufficiently high to decompose them, by which their elements are separated, or evolved in new combinations. **FRACTIONAL**

DISTILLATION is the separation of substances having different boiling-points, by distilling the mixture with a gradually increasing heat, and collecting the products which come over at different temperatures in separate receivers. See **HYDROCARBON, STILL, &c.**

Distillation. The art of the distiller; the manufacture of spirituous liquors as practised on the large scale.

The process of distillation, as carried on in the distilleries of Great Britain, may be divided into four general operations, viz.:—1. The mashing, or formation of a saccharine infusion from certain vegetable matters, as malt, barley, oats, rye, &c. 2. The cooling of this wort or liquor. 3. The fermentation, or process by which the sugar of the cooled wort is converted into alcohol. 4. The separation of the spirit so formed by means of a still and refrigerator. By the first operation, the materials for the formation of the alcohol are obtained; by the second, they are brought to a temperature most favorable to the transformation that takes place in the third, after which it only remains to free the product of the last operation from the foreign matter with which it is associated; this is done in the fourth, which, correctly speaking, constitutes the only part of the process which can be called distillation.

The general principles of the first three of the preceding operations are noticed in the articles **BREWING, FERMENTATION, &c.** It will there be seen, that the amylaceous or starchy matter of the grain is first 'saccharified,' and afterwards converted into alcohol, and that certain precautions are necessary to render the process successful and economical. In many of the distilleries of Great Britain molasses and analogous saccharine substances are employed, in which case the vegetable principle (sugar) essential to the formation of alcohol, is already present, and merely requires simple solution in water of a proper temperature, to be ready to be subjected to immediate fermentation. In general, however, the sources of spirit in England are the various kinds of grain; barley, rye, maize, and rice are those commonly employed. These are ground and mixed with bruised malt, in various proportions, and are mashed in a similar manner to malted grain. The fermentation is carried on until the density of the liquor ceases to lessen or 'attenuate,' which is determined by an instrument called a saccharometer. When this point is arrived at, the 'wash' is submitted to distillation, to prevent the access of the acetous fermentation, which would lessen its alcoholic value.

During the process of distilling off the spirit of the fermented 'wash' or 'wort,' a hydrometer is employed to ascertain the 'strength' of the liquor that passes over. As soon as this has fallen to a certain point, the operation is stopped, and the 'spent wash' removed. The spirits obtained by the first distillation are

generally called 'low wines,' and have a specific gravity of about .975. By rectification or 'doubling,' a crude milky spirit, abounding in oil, at first comes over, followed by clear spirit, which is received in a separate vessel. The process is continued until the alcoholic content of the distilled liquor has considerably diminished, when the remaining weak spirit that distils over, called 'faints,' is caught separately, and mixed with the low wines, preparatory to another distillation. The strongest spirit passes over first, and the condensed liquor gradually becomes weaker, until it ceases to contain alcohol. By receiving in separate vessels any given portion of the product, spirit of any required strength, within certain limits, may be obtained. The same object is more conveniently effected by surrounding the top of the capital of the still with a water bath, of a temperature corresponding to that of alcoholic vapour of the strength it is desired to obtain. Thus, if we keep the temperature of the water at about 198° Fahr., we shall obtain proof spirit; if at 192°, a spirit 20 o. p.; and so on for other strengths.

It is found from experience, and is readily accounted for by theory, that the lower the temperature at which the distillation is conducted, the stronger will be the product, and the less quantity of oil or other volatile matter will come over along with it. To promote this, it has been proposed to carry on the process *in vacuo*, but on the large scale this has never been adopted. The distillation of the wash is usually performed in a separate set of stills to those employed for the rectification of the low wines. For very strong and tasteless spirit, a third and even a fourth rectification is employed, conjointly with other methods, to abstract the water, and to remove any foreign matter that vitiates its odour or flavour. A portion of soap is generally put into the still with the wash, to prevent excessive frothing.

We have said that the processes of mashing, &c., in the distillery, are similar to those adopted in brewing beer. We may add, that as richness in alcohol, and not flavour, is the object aimed at in the distiller's wash, not only is a large quantity of unmalted grain employed, but the process of boiling the wort with hops is omitted altogether. The wort is commonly 'set' at 70° Fahr., and the fermentation and attenuation of the liquor pushed as far as possible by large and repeated doses of the best 'top-yeast' of the porter brewers.

It often happens that raw spirit prepared from damaged grain is contaminated with a highly acid and volatile fatty substance, which is powerfully intoxicating, and irritating to the eyes and nostrils, and possesses an odour very similar to that of an alcoholic solution of cyanogen. This may be got rid of by dilution with water and skilful rectification, when most of it passes over with the first and last 'runnings,' the intermediate portion being less loaded with

it. Another plan is to filter the spirit successively through 6 or 7 separate vessels containing pine or willow charcoal, before rectifying it. In some distilleries the contaminated spirit is well agitated with a considerable quantity of olive oil, and after repose decanted, diluted with water, and rectified as before. The ordinary corn oil or fusel oil of raw spirit is generally, for the most part, intercepted by a self-regulating bath arranged between the still-head and the refrigerator.

The quantity of spirit obtained from various substances, and even from pure sugar, depends upon the skill with which the several operations are conducted. By theory, pure sugar should yield 51% of alcohol; but in practice 11·925 galls. of proof spirit is the largest quantity which has yet been obtained from 112 lbs. of sugar. By the revenue authorities this weight of sugar is estimated to afford 11½ galls. of proof spirit. The average product is, perhaps, about 1 gal. of spirit of this strength for every 10 lbs. of sugar. According to Harmstadt, 100 lbs. of starch yield 35 lbs. of alcohol, or 7·8 galls. of proof spirit; and 100 lbs. of the following grains produce the accompanying quantities by weight of spirit of sp. gr. '9427, or containing 45% of pure alcohol:—wheat, 40 to 45%; rye, 36 to 42%; barley, 40%; oats, 36%; buckwheat, 40%; maize, 40%; the mean being 3·47 galls. of proof spirit. It is found that a bushel of good malt yields 2 galls. of proof spirit, and that the largest quantity of proof spirit obtained from raw grain, mashed with $\frac{1}{3}$ or $\frac{1}{4}$ of malt, does not exceed 22 galls. per quarter.

The distiller is allowed to produce worts from any substance, and at any specific gravity, provided such gravity can be correctly ascertained by the saccharometer approved of by the Board of Inland Revenue. He is not, however, allowed to mash and distil at the same time. See ALCOHOL, BRANDY, FERMENTATION, FUSEL OIL, GIN, STILL, &c.*

DISTORTIONS. See SPINE, STRABISMUS, SURGERY (Popular), &c.

DIURE'SIS. See URINE.

DIURETICS. *Syn.* DIURÆTICA, L. Medicines which promote the secretion of urine. The principal diuretics are—aqueous fluids, which act by increasing the watery portion of the blood, and—substances which promote the action of the kidneys. Most of the first produce copious diuresis, if the skin is kept cool. Among the last are acetate, bitartrate, and nitrate of potassa; oils of juniper, turpentine, cajuput, and copaiba; dilute spirit, and sweet spirits of nitre; decoction of common broom, &c.

DIVIDIVI. An astringent substance imported from Jamaica. It contains above 5% of tannin; whilst gall-nuts contain less than 3·5%, and the best oak-bark only 1·35%. Hence its value in tanning.

DOBEREINER'S LAMP. A portable apparatus for obtaining instantaneous light by the

action of a jet of hydrogen on a small piece of spongy platinum.

DOCTIMACY or **DOCIMASTIC ART.** See ASSAYING.

DOORS. Much annoyance is sometimes experienced from the creaking of doors. This may be prevented by rubbing a little soap, or a mixture of tallow and black-lead on the hinges; or by applying to them with a feather a little sweet oil, once or twice a year. The trifling trouble and expense (a penny or two a twelvemonth) will be amply repaid by their noiselessness and greater durability. To prevent the noise of doors slamming, a small piece of vulcanised India rubber, cork, or leather, may be placed so as to receive the shock.

DOSE. In medicine the quantity taken or prescribed at one time. The doses of medicinals vary with the sex, age, temperament, constitutional strength, habituation, and idiosyncrasies of individuals. Different circumstances, especially of climate, exercise an important influence on the activity of medicines. Thus, the inhabitants of England and the northern countries of Europe bear much larger doses in their own climates, than when they remove to warmer latitudes. Warmth, indeed, appears to promote the action of most medicinals, whilst cold acts in a contrary way. Nor does the same rule apply to all medicines. Calomel, for instance, is generally borne better by children than by adults; while opium affects them more powerfully, and requires the dose to be diminished considerably below that indicated by mere calculation or analogy with other medicines.

Prescribers ought not to forget that the action of medicines is not simply proportioned to the amount, but that each remedy has a dose below which it either produces no effect or one contrary to that which we desire it to produce. Dr. Paris remarks, "that powerful doses are disposed to produce local rather than general effects;" and Dr. Barlow gives it as his opinion that "practitioners often err, especially in the treatment of chronic maladies, from requiring an obvious effect from each dose administered." Adult women are said to require only three fourths the full dose for men. The following rules and tables have been framed, chiefly with reference to age; but, as Dr. R. E. Griffith correctly observes, "no scheme can be devised, founded on age alone, to which there are not many exceptions."

I. Formula of Dr. YOUNG.

For children under 12 years, the doses of most medicines must be diminished in the proportion of the age to the age increased by 12. Thus, at 2 years, the dose will be 1·7th of that for an adult,

$$\text{for } \frac{2}{2 + 12} = 1\text{-}7\text{th.}$$

II. *Posological Table of GAUBIUS.*

For an adult, suppose the dose to be 1, or 1 drachm.

Under 1 year will require	$\frac{1}{12}$ or 5 grains.
" 2 years "	$\frac{1}{6}$ or 8 grains.
" 3 " "	$\frac{1}{4}$ or 10 grains.
" 4 " "	$\frac{1}{3}$ or 15 grains.
" 7 " "	$\frac{1}{2}$ or 1 scruple.
" 14 " "	$\frac{1}{2}$ or $\frac{1}{2}$ drachm.
" 20 " "	$\frac{3}{4}$ or 2 scruples.
" 21 to 60, the full dose, or 1 or 1 drachm.	

Above this age an inverse gradation must be observed.

III. *Posological Table of PHOEBUS.*

Age—Years	80	65	50	25	40	20	16	12	8	5	2
Doses	$\frac{5}{8}$	$\frac{3}{4}$	$\frac{7}{8}$	1	$\frac{7}{8}$	$\frac{3}{4}$	$\frac{5}{8}$	$\frac{1}{2}$	$\frac{3}{8}$	$\frac{1}{4}$	
" Months	12	6	2	1							
Doses	$\frac{1}{2}$	$\frac{1}{3}$	$\frac{1}{4}$	$\frac{1}{5}$	$\frac{1}{6}$						

DOUCHE. [Fr.] *Syn.* DOUCHE BATH. A species of bath much employed by hydropathists, both for the relief of local affections, and to give a healthy stimulus to the whole system. The douche consists of a single jet of cold water, varying in size from the thickness of a quill to that of a man's arm; it is projected with great force, either from above, below, or on one side, upon a particular part of the body. See BATH (Shower).

DOVER'S POWDERS. See POWDER.

DRACONINE. *Syn.* DRACONINE, RED RESIN OF DRAGON'S BLOOD. A peculiar vegetable principle discovered by M. Melandre in dragon's blood.

Prep. Dragon's blood is dissolved in alcohol, the solution filtered, concentrated, and precipitated with cold water; the red, spongy precipitate is well washed, neutralised with dilute sulphuric acid, again liberated, and well washed with water.

Prop., &c. Draconine has a fine red colour; is tasteless, inodorous, and flexible; it fuses at 131° Fahr. The smallest quantity of carbonate of lime in filtering paper may be detected by sulphate of draconine, the yellow colour instantly turning red.

DRAGON'S BLOOD. *Syn.* SANGUIS DRACONIS, L. A rich red-coloured resin, obtained from various species of the genus *Calamus*. Its colour, in the lump, is a dark brownish-red; in powder, bright red. It is friable, breaks with a shining fracture, and has a sp. gr. not higher than 1.196 or 1.197. When pure, it readily dissolves in alcohol, ether, and oils, yielding rich red, transparent solutions. Adulterated and factitious dragon's blood is only partly soluble, and lacks the rich colour of the genuine article. Dragon's blood is chiefly used to tinge varnishes and lacquers.

Dragon's Blood, Factitious. *Prep.* 1. Shell-lac, 4 lbs.; melt, remove from the fire, and add, Canada balsam, 6 oz., and gum benzoin, 2 oz.;

mix well, stir in red sander's wood, $1\frac{1}{2}$ lb., and Venetian red, $\frac{3}{4}$ lb. (both in fine powder); and form the mass into sticks.

2. As the last, omitting the red Venetian.

DRAUGHT. *Syn.* HAUSTUS, L. A single dose of liquid medicine, usually dispensed in one- and-a-half-ounce or two-ounce phials. Draughts are almost exclusively extemporaneous compounds, and differ from 'mixtures' only in containing one dose; whereas mixtures contain several. The latter have now very generally superseded draughts among all but the higher classes, when the dose is to be frequently repeated. Draughts possess the advantages of extreme convenience, and, from only one phial being opened at a time, of preserving the preparation better than when it is exposed to the air by the frequent removal of the cork. They are usually taken from a wine-glass, which they about $\frac{2}{3}$ fill.

In the preparation of draughts the same precautions are observed as are pointed out under MIXTURE; regard being had to the increased volume of the dose. The ingredients of a six-ounce mixture, for example, containing (say) 12 doses, may be equally distributed among a dozen draught-phials, after which each may be filled up with distilled water, or any other simple vehicle. In most cases, a little syrup may be advantageously added. In many instances no addition will be required, the doses of each form of preparation being the same.

The following are useful formulae, which will serve as examples for others of the class. The number might be easily multiplied, and, indeed, might be extended so as to include $\frac{1}{4}$ ths of the whole materia medica; but such a plan would lead to useless repetitions, and occupy much space. See MIXTURE, PRESCRIBING, &c.

Draught, Abernethy's. See ABERNETHY MEDICINES and MIXTURE.

Draught, Acetate of Ammo'nia. *Syn.* HAUSTUS AMMONIÆ ACETATIS, L. *Prep.* 1. (St. B. Hosp.) Solution of acetate of ammonia, 4 fl. drs.; water to make $1\frac{1}{2}$ fl. oz.

2. (Dr. Paris.) Camphor mixture, $1\frac{1}{2}$ fl. oz.; liquor of acetate of ammonia, 4 fl. drs.; antimonial wine, 20 drops; mix. As a refrigerant and diaphoretic in febrile affections; taken late in the evening.

Draught, Acetate of Potas'sa. *Syn.* HAUSTUS POTASSÆ ACETATIS, L. *Prep.* (Mid. Hosp.) Acetate of potassa, 30 grs.; bicarbonate of potassa, 20 grs.; peppermint water, 1 fl. oz. Diuretic, antacid, and laxative.

Draught, Ammoniacal. *Syn.* HAUSTUS AMMONIACALIS, H. AMMONIÆ, L. *Prep.* (Brande.) Liquor of ammonia, 20 to 30 drops; compound tincture of cardamoms and tincture of gentian, of each, $\frac{1}{2}$ fl. dr.; camphor mixture, $1\frac{1}{2}$ fl. oz. An aromatic absorbent and stomachic; in heartburn, acidity, low spirits, &c.

Draught, Anodyne. *Syn.* HAUSTUS ANODYNUS, L. *Prep.* 1. Tincture of opium, 15

drops; pimento water and syrup of poppies, of each, 2 drs.; water, 1 fl. oz.

2. (Copland.) Nitre, 6 grs.; laudanum, 12 drops; compound spirit of ether, 1 fl. dr.; syrup of poppies, 2 fl. drs.; camphor mixture, 9 fl. drs.

3. (Ellis.) Tincture of opium, 15 to 25 drops; syrup of poppies, 2 fl. drs.; spirit of cinnamon, 1 fl. dr.; distilled water, 1½ fl. oz.

4. As the above, but substituting a like quantity of solution of either acetate or hydrochlorate of morphia in lieu of the laudanum. All the above are given as soothing draughts to allay pain and produce sleep, especially the last thing at night. No. 4 is to be preferred if there are febrile symptoms present.

Draught, Antac'id. *Syn.* HAUSTUS ANTACIDUS, L. *Prep.* 1. Bicarbonate of soda, 20 grs.; tincture of calumba, 3 fl. drs.; tincture of hops, 1 fl. dr.; syrup of orange peel, 2 fl. drs.; water, 6 fl. drs. To improve the appetite in heartburn and dyspepsia; taken 1 hour before a meal.

2. Liqueur of ammonia, 16 drops; syrup of saffron, 2 fl. drs.; infusion of gentian, 3 fl. drs.; water, 7 fl. drs. As the last, taken occasionally, especially in debility, low spirits, &c.

3. (Collier.) Compound tincture of cardamoms, 1 fl. dr.; solution of bicarbonate of magnesia (fluid magnesia), 9 fl. drs.; simple syrup, 2 fl. drs. Twice a day; in dyspepsia, heartburn, &c., especially in gouty patients.

4. (A. T. Thomson.) Magnesia, 1 dr.; peppermint water, 1½ fl. oz.; tincture of orange peel, 1 fl. dr. In dyspepsia, &c., with acidity or diarrhoea.

5. As No. 1, but using bicarbonate of potassa for bicarbonate of soda. In acidity, diarrhoea, &c., accompanied by great irritability of the coats of the stomach.

6. Prepared chalk, 30 grs.; spirit of nutmeg and tincture of opium, of each, 12 to 20 drops; syrup of saffron, 3 drs.; cinnamon water, 1 fl. oz. In acidity, with extreme looseness of the bowels.

Draught, Anti-arthritis. *Syn.* HAUSTUS ANTI-ARTHRITICUS, L. *Prep.* 1. Tincture of colchicum seeds (Ph. L.), 1 to 1½ fl. dr.; syrup of orange peel 2½ fl. drs.; water, 1 fl. oz. In gout; taken over-night, followed by another in the morning.

2. (Brande.) Wine of colchicum, ½ fl. dr.; carbonate of magnesia, 15 grs.; cinnamon water, ½ fl. oz.; water, 1 fl. oz. As the last.

3. (Sir C. Scudamore.) Magnesia, 18 grs.; Epsom salts, 1½ dr.; vinegar of colchicum, 1½ fl. dr.; simple syrup, 1 fl. dr.; cinnamon water, 9 fl. drs. As the last.

4. (Sir H. Hallford's GOUT PREVENTIVE.) From compound infusion of gentian, 1½ fl. oz.; tincture of rhubarb, 1 fl. dr.; bicarbonate of potassa, 15 grs.

Draught, Anti-asthmatic. *Syn.* HAUSTUS ANTI-ASTHMATICUS, L. *Prep.* Vinegar of

squills, ½ fl. dr.; ipecacuanha wine, 15 drops; cinnamon water, 1½ fl. oz. Expectorant. One to be taken three times daily during the attack.

Draught, Anti-emetic. *Syn.* HAUSTUS ANTI-EMETICUS, L. *Prep.* 1. Juice of 1 lemon; liquor opii sedativus, 10 drops (or laudanum, 15 drops); ether, 20 drops; simple syrup, 2 drs.; water, q. s.

2. (HAUSTUS ANTI-EMETICUS RIVERII, — P.C.) Bicarbonate of potassa, 30 grs.; lemon juice, 4 drs.; syrup of lemon, 1 oz.; water, 3 oz.; mix quickly, and tie down the cork. To check nausea and vomiting. The last is best given effervescent.

Draught, Anti-hyster'ic. *Syn.* HAUSTUS ANTI-HYSTERICUS, L. *Prep.* Cyanide of potassium, 1 gr.; lettuce water (distilled), 2 fl. oz.; syrup of orange flowers, 1½ oz.; water, 5½ fl. oz.; for 6 draughts. One to be taken when the fit is expected, and a second in half an hour. Should the fit come on, the dose may be repeated at intervals of about 15 minutes until 3 or 4 have been altogether administered. The symptoms, however intense, are generally either at once arrested, or greatly alleviated by this treatment.

Draught, Antilith'ic. *Syn.* HAUSTUS ANTI-LITHICUS, L. *Prep.* 1. (Venables.) Borax, 8 grs.; bicarbonate of soda, 10 grs.; aerated water, 8 fl. oz. For a draught; in red gravel.

2. (Dr. Paris.) Carbonate of soda, 12 grs.; tincture of calumba, 1 fl. dr.; infusion of quassia, 1 fl. oz.; water, 3 fl. drs. In dyspepsia and gravel, attended with the lithic acid diathesis.

Draught, Anti-neuralgic. *Syn.* HAUSTUS ANTI-NEURALGICUS, H. NARCOTINÆ, L. *Prep.* (Jeston.) Narcotine, 2 grs.; diluted sulphuric acid, 20 drops; infusion of roses, 1½ fl. oz. One every 2 hours in the intermissions of neuralgia.

Draught, Antisep'tic. *Syn.* HAUSTUS ANTI-SEPTICUS, L. *Prep.* (Dr. Collier.) Decoction of yellow bark, 1 fl. oz.; tincture of opium, 5 drops; spirit of pimento and water, of each, 2 fl. drs. In putrid fevers, gangrene, &c.

Draught, Antispasmod'ic. *Syn.* HAUSTUS ANTISPASMODICUS, L. *Prep.* 1. (Dr. Collier.) Tincture of castor, 1 fl. dr.; sulphuric ether, 10 drops; peppermint water, 11 fl. drs.; mix. In hysteria, and that species of irregular muscular action dependent on debility.

2. (Dr. Gregory.) Fetid spirit of ammonia, ½ to 1 fl. dr.; camphor mixture, 10 fl. drs.; syrup of saffron, 1 fl. dr. In cases complicated with low spirits, debility, &c.

3. (A. T. Thomson.) Musk mixture, 14 fl. drs.; liquor of ammonia, 16 drops; tincture of castor, 1 fl. dr.; syrup of poppies, ½ fl. dr.; mix. Three or four times daily, in hysteria and convulsive affections, after the bowels have been well cleared by some aperient.

4. (A. T. Thomson.) Oil of aniseed, 10 drops; magnesia, 20 grs.; tincture of senba,

2 fl. drs.; peppermint water, 10 fl. drs.; mix. In flatulence and spasms of the stomach.

Draught, Ap'rient. *Syn.* HAUSTUS APERIENTIS, L. *Prep.* 1. (Paris.) Infusion of senna, 1 fl. oz.; tincture of senna, tincture of jalap, and syrup of senna, of each, 1 fl. dr.; tartrate of potassa, 1 dr.; mix.

2. (Ryan.) Epsom salts, 4 drs.; tincture of senna, 1½ fl. dr.; syrup of ginger, 1 fl. dr.; spirit of sal-volatile, 20 drops; infusion of senna, 1½ fl. oz.

3. (Thomson.) Tartrate of potassa, 3 drs.; tincture of senna and syrup of saffron, of each, 1 dr.; infusion of senna, 1½ oz. The above are good aperients, and in their composition and action resemble the ordinary "black draught."

4. (EFFERVESCING A. D.)—*a.* (Dr. Barker.) Bisulphate of potassa, 73 grs.; carbonate of soda, 72 grs.; water, q. s.; dissolve the two in separate glasses, mix the solutions, and drink whilst effervescing, in the same way as soda water.

b. (W. Cooley.) Bicarbonate of soda, 1 dr.; potassio-tartrate of soda, 2 drs.; dissolve in about 1-3rd of a glassful of cold water; and pour it on another like quantity of water, holding in solution tartaric acid, 40 grs., and syrup of orange peel, 1½ fl. dr.; and drink it instantly.

c. (Paris.) Potassio-tartrate of soda, 2 drs.; bicarbonate of soda, 40 grs.; dissolve, and add lemon juice, 1 or 2 table-spoonfuls.

d. (Young.) Cream of tartar, 3 drs.; carbonate of soda, 2½ drs.; throw them into a soda-water bottle three parts filled with cold water, cork immediately, and wire down the cork. The last three are examples of FACITIOUS EFFERVESCING SEIDLITZ WATER, and are good saline aperients. The method of taking them may be varied by mixing the dry ingredients (in fine powder) on a piece of paper, and throwing the mixture suddenly into a tumbler 2-3rds filled with water, and drinking the liquid whilst effervescing. See CATHARTIC D. (*below*).

Draught, Ap'petite. See DINNER DRAUGHT.

Draught, Aromatic. *Syn.* AROMATIC ANT-ACID DRAUGHT; HAUSTUS AROMATICUS, L. *Prep.* 1. Aromatic confection, 1 dr.; spirit of sal-volatile, ½ dr.; syrup of saffron, 2 drs.; pimento water, 9 fl. drs. Excellent in dyspepsia, with acidity, and in diarrhoea, preceded by an aperient.

2. (H. AROM. CUM RHEO.—St. B. Hosp.) Aromatic confection, 1 dr.; infusion of rhubarb and cinnamon water, of each, 6 fl. drs. In diarrhoea and dyspepsia, especially when there is acidity and deficiency of bile.

Draught, Astrin'gent. *Syn.* HAUSTUS ASTRINGENS, L. *Prep.* 1. Tannin, 3 grs.; rectified spirit, 1 fl. dr.; simple syrup, 2 fl. drs.; water, 6 fl. drs.

2. (Dr. Paris.) Chalk mixture, 1½ fl. oz.; tincture of catechu, 1 fl. dr.; laudanum, 15 drops.

3. (Thomson.) Extract of logwood, 12 grs.; tincture of catechu, 1 fl. dr.; cinnamon water, 15 fl. drs. The above are excellent remedies in diarrhoea (preceded by a purgative), and in dysentery, &c. One may be taken after each motion.

Draught, Black. See MIXTURE.

Draught, Cam'phor. *Syn.* HAUSTUS CAMPHORÆ, L. *Prep.* (Guy's Hosp.) Camphor, 6 grs.; rectified spirit, q. s. to powder; white sugar, 1 dr.; mucilage, 3 drs.; water, 1½ fl. oz. Anodyne and diaphoretic, &c.

Draught, Castor Oil. *Syn.* HAUSTUS OLEI RICINI, L. *Prep.* (Guy's Hosp.) Castor oil, 4 drs.; yolk of egg, q. s. (2 in no.); simple syrup, 1 fl. dr.; cassia or cinnamon water, 1 fl. oz. Aperient.

Draught, Cathartic. *Syn.* HAUSTUS CATHARTICUS, L. The following are given as additions to those under APERIENT D., and other heads:—*Prep.* 1. (Dr. Thomson.) Tartrate of potassa, 5 drs.; tincture of senna, 1 fl. dr.; infusion of senna, 14½ fl. drs.; syrup of saffron, ½ fl. dr.; mix. In acute diseases, taken early in the morning.

2. (Thomson.) Epsom salts and manna, of each, 2 drs.; infusion of roses, 14 fl. drs.; dilute sulphuric acid, 10 drops. In inflammatory affections, and to check vomiting in low fevers.

3. (Thomson.) Carbonate of magnesia, 1 dr.; powdered rhubarb, 20 grs.; peppermint water, 12 fl. drs. In dyspepsia, attended with costiveness and acidity, taken an hour before dinner.

4. (Thomson.) Castor oil, 5 fl. drs.; powdered gum, 20 grs.; rose water, 1 fl. oz.; compound tincture of lavender, 8 drops; syrup of poppies, 1 fl. dr. In colic and calculus. The above differ from aperient draughts simply in their greater strength.

Draught, Chalk. *Syn.* HAUSTUS CRETÆ, L. *Prep.* 1. From powdered gum, chalk, and simple syrup, of each, 1 dr.; aromatic water (as that of caraway, cinnamon, nutmeg, pimento, or peppermint), 1½ fl. oz.

2. (CHALYBEATED C. D.; HAUSTUS CRETA ET FERRI, L.—Paris.) Chalk mixture, 7 fl. drs.; compound mixture of iron, 3 fl. drs.; sesquicarbonate of ammonia, 5 or 6 grs. In diarrhoea, particularly in that arising from debility and *anæmia*.

3. (C. D. WITH RHUBARB; HAUSTUS CRETÆ CUM RHEO, L.)—*a.* Simple chalk mixture (see *above*), 1½ fl. oz.; powdered rhubarb, 12 grs.

b. (Lond. Hosp.) Commercial powder of chalk with opium, 12 grs.; rhubarb, 15 grs.; syrup of saffron and compound tincture of cardamoms, of each, 1 dr.; caraway water, 10 fl. drs. In heartburn, dyspepsia, and certain forms of diarrhoea.

Draught, Chlorine. *Syn.* HAUSTUS CHLORINÆ, L. *Prep.* (Copland.) Chlorine water, ½ fl. dr.; water, 1½ fl. oz.; mix, and add of syrup of poppies, ½ fl. dr. One every 6 hours;

in the worst form of typhus fever, and other putrid diseases, &c.

Draught, Cit'rate of Ammo'nia. *Syn.* HAUSTUS AMMONIÆ CITRATIS, H. A. SESQUICARBONATIS EFFERVESCENS, L. *Prep.* (Guy's Hosp.) Sesquicarbonate of ammonia, 20 grs.; water, 1 fl. oz.; dissolve, and add of lemon juice, $\frac{1}{2}$ fl. oz. An agreeable, cooling, saline draught in febrile cases.

Draught, Cit'rate of Potas'sa. *Syn.* HAUSTUS POTASSÆ CITRATIS, L. *Prep.* From carbonate of potassa, 24 grs. (or bicarbonate, 29 grs.); water, 1 fl. oz.; dissolve, and add of lemon juice, 5 fl. drs. As the last. 20 grs. of citric acid may be used instead of the lemon juice.

Draught, Col'chicum. See ANTI-ARTHRITIC DRAUGHT.

Draught, Copai'ba. *Syn.* HAUSTUS COPAIBÆ L. *Prep.* (St. B. Hosp.) Balsam of copaiba, $\frac{1}{2}$ fl. dr.; mucilage (thick), 4 fl. drs.; pimento water, 3 fl. drs.; water, 5 fl. drs. In gonorrhœa, &c.

Draught, Cough. See MIXTURE.

Draught, Diaphoret'ic. *Syn.* HAUSTUS DIAPHORETICUS, L. *Prep.* 1. (Collier.) Infusion of serpentry, $1\frac{1}{2}$ fl. oz.; tincture of serpentry, 1 fl. dr. Topic and diaphoretic.

2. (Thomson.) Sesquicarbonate of potassa, 20 grs.; fresh lemon juice, 4 fl. drs.; tartrate of antimony, $\frac{1}{2}$ gr.; water, 11 fl. drs.; syrup of poppies, 1 fl. dr. Antifebrile and diaphoretic.

3. (Thomson.) Liquor of acetate of ammonia, 6 fl. drs.; camphor mixture, 10 fl. drs.; nitrate of potassa, 10 grs.; syrup of tolu, $\frac{1}{2}$ fl. oz. Anodyne and diaphoretic. All the above are used in inflammatory affections.

Draught, Din'ner. *Syn.* APPETITE DRAUGHT; HAUSTUS DICTUS ANTE CIBUM. **Prep.* 1. Tinctures of cascarrilla, hops, and rhubarb, of each, 1 fl. dr.; spirit of sal-volatile, $\frac{1}{2}$ fl. dr.; tincture of capsicum, 20 drops; syrup of orange peel, 2 drs.; water, $1\frac{1}{2}$ fl. oz.
2. Compound tincture of gentian, $\frac{1}{2}$ fl. oz.; sal-volatile, $\frac{1}{2}$ a teaspoonful; cinnamon water, 1 fl. oz.; compound tincture of cardamoms, 1 teaspoonful. Either of the above to be taken an hour before a meal.

Draught, Diuretic. *Syn.* HAUSTUS DIURETICUS, L. *Prep.* 1. (Collier.) Tincture of jalap, 2 fl. drs.; vinegar of squills, 1 fl. dr.; peppermint water, 10 fl. drs.; mix.

2. (Copland.) Acetate of potassa, $\frac{1}{2}$ dr.; infusion of quassia and cinnamon water, of each, 6 fl. drs.; vinegar of squills and sweet spirits of nitre, of each, $\frac{1}{2}$ fl. dr.

3. (Thomson.) Nitre, 8 grs.; tincture of digitalis, 16 drops; infusion of roses, 13 fl. drs.; syrup of roses, 1 fl. dr.

4. (Turner.) Nitre and powdered gum, of each, 15 grs.; almond mixture, $1\frac{1}{2}$ fl. oz. The above are used as diuretics in dropsy; the last, also in scurvy, and in the incontinence of urine of children.

Draught, Donovan's. *Syn.* DRAUGHT OF

HYDRIODATE OF ARSENIC AND MERCURY; HAUSTUS HYDRIODATIS ARSENICI ET HYDRARGYRI, L. *Prep.* (Donovan.) Liquor of hydriodate of arsenic and mercury (Donovan's), 2 fl. drs.; distilled water, $3\frac{1}{2}$ fl. oz.; syrup of ginger, $\frac{1}{2}$ fl. oz.; mix for 4 draughts. One, night and morning; in lepra, lupus, psoriasis, and some other obstinate cutaneous affections. It must not be allowed to touch anything metallic.

Draught, Efferves'cing. *Prep.* (Lond. Hosp.) Sesquicarbonate of soda, 30 grs.; water or peppermint water, $1\frac{1}{2}$ fl. oz.; syrup of orange peel, 2 fl. drs.; tincture of calumba, $\frac{1}{2}$ fl. dr.; tartaric or citric acid, 25 grs.; add the acid last, and drink whilst effervescing. Stomachic, tonic, and anti-emetic; in acidity, dyspepsia, &c. (See *antè*.)

Draught, Emet'ic. *Syn.* HAUSTUS EMETICUS, L. *Prep.* 1. Sulphate of zinc, 15 grs. to 30 grs.; water, 9 fl. drs.; dissolve. In cases of poisoning, and at the commencement of an attack of ague.

2. (Copland.) Ipecacuanha, 30 grs.; sesquicarbonate of ammonia, 20 grs.; tincture of capsicum, 30 drops; oil of chamomile, 10 drops; mint water, 2 fl. oz. As a stimulant emetic in cases of poisoning by laudanum or other narcotics.

3. (Guy's Hosp.) Antimonial wine, 2 fl. drs.; ipecacuanha wine, 6 fl. drs.; water, 4 fl. drs. For unloading the stomach in ordinary cases.

4. (Mid. Hosp.) Tartar emetic, 1 gr.; ipecacuanha, 20 grs.; syrup, 2 fl. drs.; water, 10 fl. drs. As the last.

5. (Dr. Pickford.) Sulphate of zinc, 20 grs.; sulphate of magnesia, 4 drs.; water, $1\frac{1}{2}$ oz. When it is also desired to act rapidly on the bowels.

6. (Rodier.) Sulphate of copper, 10 grs.; water, 2 fl. oz. In poisoning by laudanum.

7. (Sprague.) Ipecacuanha, 30 grs.; sesquicarbonate of ammonia, 20 grs.; tincture of capsicum, 1 fl. dr.; peppermint water, 3 fl. oz. In poisoning by narcotics.

8. (A. T. Thomson.) Ipecacuanha, 20 grs.; ipecacuanha wine, 2 fl. drs.; water, 10 fl. drs. For unloading the stomach in ordinary cases.

9. (Trousseau.) Ipecacuanha, 8 grs.; syrup of ipecacuanha, 1 fl. oz.; water, q. s. for 4 draughts. One every 10 minutes, until vomiting occurs.

Draught, Ether. *Syn.* HAUSTUS ÆTHEREUS, L. *Prep.* (Néligan.) Sulphuric ether, 1 fl. dr.; spermaceti, 3 grs.; rub together (expertly), and add of peppermint water, 10 fl. drs. An excellent stimulant and antispasmodic, febrile symptoms being absent.

Draught, Expect'orant. *Syn.* HAUSTUS EXPECTORANS, L. *Prep.* 1. (Collier.) Mixtures of ammoniacum and almonds, of each, 6 fl. drs.; tincture of squills, 12 drops. In hoarseness, chronic coughs, &c.

Draught, Hen'bane. *Syn.* HAUSTUS HYOS-

CYAMI, L. *Prep.* 1. Tincture of henbane, 30 to 60 drops; syrup of saffron, 1 fl. dr.; water, 10 fl. drs. Anodyne and soporific. *Used* to allay nervous excitement, and induce sleep, when laudanum is inadmissible.

2. (HENBANE AND SQUILLS D.; HAUSTUS HYOSCYAMI CUM SCILLA, L.—Dr. Bree.) Extract of henbane, 3 grs.; tincture of squills, 10 drops; dilute nitric acid, 6 drops; water, 1½ fl. oz. Anodyne and expectorant; in asthmas, chronic coughs, &c.

Draught, Hydrocyan'ic. *Syn.* HAUSTUS HYDROCYANICUS, L. *Prep.* 1. (Donovan.) Cyanide of potassium, 1 gr.; syrup of lemons, ½ fl. oz.; distilled water, 7½ fl. oz. For 8 draughts. One for a dose.

2. (Dr. S. Dickson.) Medicinal hydrocyanic acid (Ph. L.), 15 drops; liquor of ammonia, 20 drops; syrup of orange flowers (or simple syrup), 3 fl. drs.; water, 8½ fl. oz.; mix, and divide into 6 draughts. One, two, or three times a day; in gastrodynia, and all those nameless nervous and hysterical affections arising from excessive irritability, mental anxiety, &c. In a case that came under our notice, in which life was an absolute burden to the patient, relief was afforded by the first draught, and 4 or 5 effected a comparative cure, although almost every other remedy had been tried in vain.

Draught, Laennec's. *Syn.* LAENNEC'S CONTRA-STIMULANT DRAUGHT; HAUSTUS CONTRASTIMULANS, L. *Prep.* From tartar emetic, 2 grs.; syrup of poppies, 2 fl. drs.; orange-flower water, 1½ fl. oz. Every two hours in pneumonia, &c.

Draught, Lax'ative. *Syn.* HAUSTUS LAXANS, L. *Prep.* 1. See APERIENT DRAUGHTS.

2. (Dr. Copland.) Infusion of senna and compound infusion of gentian, of each, 6 fl. drs.; sulphate of potassa, 20 to 30 grs.; extract of taraxacum, 30 to 40 grs.; compound tincture of cardamoms, 1½ fl. dr. Aperient, stomachic, and alterative.

Draught, Morphia. *Syn.* HAUSTUS MORPHIÆ, L. *Prep.* (Brera.) Morphia, ¼ gr.; syrup of poppies, 1 fl. dr.; water, 11 fl. oz. Two or three drops of acetic acid may be advantageously added. At bed-time, as a soporific.

Draught, Narcotic. *Syn.* HAUSTUS NARCOTICUS, H. OPIATUS, L. *Prep.* 1. (St. B. Hosp.) Laudanum, 12 to 20 drops; syrup of red poppies, 1 fl. dr.; pimento water, 3 fl. drs.; water, 1 fl. oz. To induce sleep in slight cases, when fever is absent.

2. (A. T. Thomson.) Camphor mixture, 1½ fl. oz.; laudanum, 35 drops; sulphuric ether and syrup of saffron, of each, 1 fl. dr. In intermittent headache.

3. (Thomson.) Carbonate of ammonia, 15 grs.; fresh lemon juice, ½ fl. oz.; water, 1 fl. oz.; spirit of nutmeg, 1 fl. dr.; syrup of orange peel, ½ fl. dr.; tincture of hemlock, 10 drops. In diseases of increased irritability.

4. (Thomson.) Carbonate of potassa, 20 grs.;

fresh lemon juice, ½ fl. oz.; peppermint water, 1 fl. oz.; laudanum, 25 drops; syrup of tolu, ½ fl. dr. To procure sleep in the majority of diseases. (See *above*.)

Draught, Nux Vom'ica. *Syn.* HAUSTUS NUCIS VOMICÆ, L. *Prep.* (Dr. Joy.) Nux vomica (in fine powder), 3 grs.; powdered gum, 2 drs.; compound tincture of cardamoms, 1 fl. dr.; cinnamon water, 10 fl. drs. Diuretic, narcotic, stimulant, and tonic; in paralysis, impotence, debility, &c., unaccompanied by inflammation of the nervous centres. See STRYCHNIA.

Draught, Refri'gerant. *Syn.* HAUSTUS REFRIGERANS, L. *Prep.* 1. Carbonate of potassa, 20 grs.; syrup of orange peel, 1 fl. dr.; spirit of nutmeg, ½ fl. dr.; water, 1½ fl. oz.

2. (Thomson.) Nitre, 12 grs.; almond mixture, 1½ fl. oz.; syrup of tolu, 1 fl. oz.

3. (Collier.) Carbonate of potassa, 20 grs.; antimonial wine, 20 drops; syrup of orange peel, 1 fl. dr.; tincture of orange peel, ½ fl. dr.; water, 1½ fl. oz.; mix, and add a large tablespoonful of lemon juice. In inflammatory diseases, &c.

Draught, Saline'. See EFFERVESCING DRAUGHT, &c.

Draught, Stomach'ic. See DINNER DRAUGHT, &c.

Draught, Ton'ic. *Syn.* STRENGTHENING DRAUGHT; HAUSTUS TONICUS, L. *Prep.* 1. (Collier.) Disulphate of quinine, 2 grs.; tincture of orange peel, 1 fl. dr.; diluted sulphuric acid, 5 drops; laudanum, 10 drops; infusion of cascarilla, 1½ fl. oz. In pyrosis, &c., 1 hour before dinner.

2. (A. T. Thomson.) Infusion of yellow bark, 1½ fl. oz.; compound tincture of cinchona, 1 fl. dr.; powdered cinchona, 40 grs.; syrup of orange peel, ½ fl. dr. In intermittents and acute rheumatism.

3. (Thomson.) Infusion of cascarilla, 1½ fl. oz.; tincture of cascarilla and ginger, of each, 1 fl. dr. In dyspepsia, arising from intemperance.

4. (Walton.) Infusion of cascarilla, 9 fl. drs.; tinctures of rhubarb and ginger, of each, 1 fl. dr.; syrup of saffron, ½ fl. dr.; ammonio-citrate of iron, 6 grs.; tincture of capsicum, 5 drops. In anæmia, and debility accompanied by paleness and relaxation.

Draught, Vermifuge. *Syn.* HAUSTUS VERMIFUGUS, H. ANTHELMINTICUS, L. *Prep.* (M. Levacher.) Castor oil, 4 drs.; essence of turpentine, 2 drs.; mint water, 2 fl. oz.; syrup, 1 fl. oz.; powdered gum, 2 drs.; for an emulsion. In tapeworm.

DRAWINGS. Chalk and pencil drawings may be fixed, so as not to suffer from slight abrasion, by washing them with skimmed milk, or with water holding in solution a little isinglass or gum. When the first is used, great care must be taken to deprive it of the whole of the cream, as the latter substance would cause the drawing to look streaky. An easy way of applying these fluids is to pour them

into a shallow vessel, and to lay the drawing flat upon the surface of the liquid; after which it should be gently removed and placed on white blotting-paper, in an inclined position, to drain and dry.

DRENCHES. *Syn.* **DRINKS.** In *veterinary practice*, these terms are applied to liquid medicines or mixtures which are administered to horses and neat cattle, and chiefly to the latter. A drench for a HORSE should not be less than half a pint, nor more than a quart; about a pint is, perhaps, the best quantity; that for a COW or OX should measure about a quart, and not more than about 5 half-pints. See **VETERINARY MEDICINE**.

DRESSING. In the *industrial arts*, a preparation of gum, starch, size, &c., employed in stiffening or 'finishing off' textile fabrics and paper. In *surgery*, the term is appropriated to any application to a wound or sore, made by means of lint, linen, or leather. **SIMPLE DRESSING** is simple cerate or spermaceti cerate. Among *cooks*, the stuffing of fowls, pork, veal, &c., is commonly called 'dressing.'

DRINKS (Summer). See **GINGER BEER**, **LEMONADE**, **SHERBET**, &c.

DROP. See **MEASURES**.

DROPS (Confectionery). These are confections of which the principal basis is sugar. They differ from lozenges chiefly in the ingredients being combined by the aid of heat. Occasionally, they are medicated.

Prep. Double refined sugar is reduced to powder, and passed through a hair sieve (not too fine), and afterwards through a gauze sieve, to take out the fine dust, which would destroy the beauty of the drop. It is then put into a clean pan, and moistened with any favorite aromatic, as rose or orange-flower water, added slowly, stirring it with a paddle all the time, from which the sugar will fall as soon as it is moist enough, without sticking. The colouring (if any) is next added, in the liquid state, or in very fine powder. A small, polished copper, or tinned-copper pan, furnished with a lip, is now one half or three parts filled with the paste, and placed over the fire, or over the hole of a stove, or preferably on a sand bath, and the mixture stirred with a little bone or glass spatula until it becomes liquid. As soon as it almost boils, it is taken from the fire, and if it is too moist, a little more powdered sugar is added, and the whole stirred, until it is of such a consistence as to run without too much extension. A tin plate, very clean and smooth, and very slightly oiled, being now ready, the pan is taken in the left hand, and a bit of bright iron, copper, or silver wire, about 4 inches long, in the right. The melted sugar is next allowed to fall regularly on the tin plate, the wire being used to remove the drop from the lip of the pan. In two or three hours afterwards the drops are taken off with the blade of a knife, and are at once put into bottles or tins. On the large scale, 'confectionery drops' are moulded by a machine

consisting essentially of two metal rollers covered with hollows. A sheet of the warm and soft composition, on being passed between the rollers, is at once converted into a batch of symmetrical drops, the upper and lower halves being moulded by the corresponding hollows of the upper and lower rollers. See **CANDY-ING**, **CONFECTION**, **ESSENCE**, **STAINS** (Confectioner's), **SUGAR PLUMS**.

The following are a few of the principal *confectionery drops* kept in the shops:—

Drops, Acidulated. *Syn.* **ACID DROPS.** *Prep.* Tartaric acid, $\frac{1}{2}$ oz., dissolved in a very little water, is added to each lb. of sugar, as above; with essence of lemon, orange, or jargonelle pear, to flavour, as desired.

Drops, Chocolate. *Prep.* Chocolate, 1 oz., is reduced to fine powder by scraping, and added to powdered white sugar, 1 lb.; when the mixture is made into drops as above, care being taken to avoid heating it a second time.

Drops, Coffee. *Prep.* A clarified, concentrated infusion of coffee, 1 oz., is used for each lb. of sugar.

Drops, Fruit. These are prepared according to the general description. (See *above*.) The flavouring essences (volatile oils or essences of lemon, orange, citron, raspberry, jargonelle pear, &c.) not being added until the sugar is melted, to avoid, as much as possible, loss by evaporation. The colouring matter may be any of the transparent 'stains' usually employed for cakes, jellies, and confectionery. In this way are made the majority of the first-class fruit drops and bon-bons of the sugar-bakers. In some cases the plan is varied by adding the clarified concentrated juice, or jelly of the fruit, to the sugar. One variety of raspberry and currant (red and black) drops are made in this way.

Drops, Ginger. *Prep.* From essence or tincture of ginger, as above. An inferior kind is made in the way described under **GINGER CANDY**.

Drops, Jargonelle. Fruit drops flavoured with essence of jargonelle pear (**SOLUTION OF ACETATE OF AMYLE**).

Drops, Lemon. Acidulated drops flavoured with essence of lemon. They are usually stained with an infusion of turmeric. (See *above*.)

Drops, Peppermint. From the whitest refined sugar, flavoured with English oil of peppermint or its spirituous solution (essence of peppermint), or with peppermint water.

Drops, Raspberry. See **FRUIT DROPS** (*above*).

DROPS (Medicated). *Syn.* **GUTTÆ, L.** This term is commonly applied to compound medicines that are only taken in small doses. At the present time they are almost exclusively confined to empirical and domestic medicine. The plan of directing liquids to be measured by dropping is objectionable, because the drops of different fluids vary in size, and are also further influenced by the size of the bottle and

the shape of its neck, as well as the quantity of liquid it is poured from. See *ESSENCE*, and *below*.

Drops, Acoustic. *Syn.* ACOUSTIC BALSAM; GUTTÆ ACOUSTICÆ, BALSAMUM ACOUSTICUM, L. *Prep.* 1. Oil of almonds, 1 oz.; laudanum and oil of turpentine, of each, 1 dr.; mix. For hardened wax, and to allay pain.

2. Tinctures of benzoin, castor, and opium, of each, 1 fl. oz.; essential oil of assafoetida, 5 drops. As the last, and in deafness arising from debility of the organism.

3. (Baumé's.) Tinctures of ambergris, assafoetida, castor, and opium, of each, 1 oz.; terebinthinated balsam of sulphur and oil of rue, of each, 15 drops. In atonic deafness.

4. (Bouchardat.) Compound spirit of balm, 2½ drs.; oil of almonds, 5 drs.; ox-gall, 10 drs.; creasote, 10 or 20 drops. In cases complicated with hardened wax, fetid discharges, &c.

5. (Dr. Hugh Smith.) Ox-gall, 3 drs.; balsam of Peru, 1 dr. In fetid ulcerations of the ear. One or two drops of the above are poured into the ear; or a piece of cotton wool moistened therewith is introduced instead. The last is the safest plan.

6. Glycerin, either alone or diluted with water. In deficiency of the natural secretions of the ear; used in sufficient quantity to moisten the first passages. See *DEAFNESS*, GLYCERIN.

Drops, A'gue. *Prep.* From white arsenic, 1 gr.; hot water, 1 oz.; dissolve.—*Dose.* ½ to 1 teaspoonful, twice a day. See *SOLUTION* (Arsenite of Potassa).

Drops, An'odyne. *Syn.* GUTTÆ ANODYNÆ, L. The solutions of acetate and hydrochlorate of morphia are commonly vended in the shops under this name.

Drops, Ant'acid. *Syn.* GUTTÆ ANTACIDÆ, L. *Prep.* (U. C. Hosp.) Liquor of potassa, 3 fl. oz.; powdered myrrh, 1 oz.; triturate together until thoroughly incorporated, add of liquor of ammonia, 1 fl. oz., mix well, place the mixture in a stoppered bottle, and the next day decant the clear portion. Antacid, tonic, and stomachic; useful in various indications.—*Dose.* 10 to 20 drops, or more, in water.

Drops, Antihyster'ic. *Syn.* GUTTÆ ANTIHYSTERICÆ, L. *Prep.* Cyanide of potassium, 2 grs.; rectified spirit, 5 fl. drs.; syrup of orange flowers, 3 fl. drs.—*Dose.* 10 drops to ½ teaspoonful, when the attack is expected, and repeated occasionally as required; in hysterical affections, gastrodynia, &c.

Drops, Antiscorb'utic. *Syn.* GUTTÆ ANTISCORBUTICÆ, L. *Prep.* 1. Expressed juice of water-cress, 2 fl. oz.; salt of tartar, 1 oz.; agitate together occasionally for a few hours, and in 2 or 3 days decant the clear.—*Dose.* 12 or 15 drops, to a teaspoonful, twice a day, in a cupful of new milk.

2. Citrate of potassa, 4 drs.; ammonio-citrate of iron, 2 drs.; water, 10 fl. drs.—*Dose.* As the last, in water.

3. (GREEN'S ANTISCORBUTIC DROPS.) Merely a disguised solution of corrosive sublimate. Most of the other 'antiscorbutic' and 'anti-venereal drops' advertised by quacks have a like composition.

Drops, Antiscrof'ulous. *Syn.* GUTTÆ ANTISCROFULOSÆ, L. *Prep.* 1. Iodine, 10 grs.; iodide of potassium, 1 dr.; water, 1 fl. oz.

2. (Augustin.) Chlorides of iron and barium, of each, ½ dr.; distilled water, 1 fl. oz.—*Dose.* 10 to 30 drops, 2 or 3 times a day.

Drops, Antispasmod'ic. *Syn.* GUTTÆ ANTISPASMODICÆ, L. *Prep.* Tinctures of castor, valerian, and assafoetida, of each, 2 drs.; tincture of capsicum and balsam of Peru, of each, 1 dr.; camphor, 20 grs.; acetate of morphia, 3 grs.—*Dose.* 10 to 20 drops, as required.

Drops, Bateman's. See *PECTORAL DROPS*.

Drops, Battley's. See *LIQUOR OPII SEDATIVUS*.

Drops, Bitter. *Syn.* GUTTÆ AMARÆ, L.; GOUTTES AMÈRES, Fr. *Prep.* From nux vomica (rasped), 1 lb.; liquor of potassa, ½ fl. oz.; bistre, 1 dr.; compound spirit of wormwood, 32 fl. oz.; digest 10 days, express the tincture, and filter. A most unscientific preparation; said to be tonic and stomachic.—*Dose.* 1 to 8 drops in water or any bitter infusion. In large doses it is *poisonous*.

Drop, Black. *Syn.* ARMSTRONG'S BLACK DROP, LANCASTER'S B. D., QUAKER'S B. D., TOUSTALL'S B. D., BRAITHWAITE'S GENUINE B. D.; GUTTA NIGRA, L. This celebrated preparation was originally prepared nearly a century and a half ago by Edward Toustall, a medical practitioner, in the county of Durham, and one of the Society of Friends. The formula passing into the possession of a relative of his (John Walton, of Shildon), was found among his brother's papers, and, by the permission of Thomas Richardson, of Bishop's Wearmouth, one of his executors, was handed to Dr. Armstrong, who subsequently published it in his work on typhus fever.

Prep. 1. (Original formula.) Opium (sliced), ½ lb.; good verjuice, 3 pints; nutmegs, 1½ oz.; saffron, ½ oz.; boil them to a proper thickness; then add, of sugar, ¼ lb., and yeast, 2 teaspoonfuls. Set the whole in a warm place, near the fire, for 6 or 8 weeks, then place it in the open air until it becomes of the consistence of a syrup; lastly, decant, filter, and bottle it up, adding a little sugar to each bottle. To yield 2 pints of strained liquor.

2. (ACETUM OPII, L.—Ph. U. S.) Opium 8 oz.; nutmeg 1½ oz. (both in coarse powder); saffron, ½ oz.; distilled vinegar, 24 fl. oz.; digest on a sand bath with a gentle heat for 48 hours, and strain; digest the residuum with an equal quantity of distilled vinegar for 24 hours; then put the whole into a percolator, and return the filtered liquid as it passes until it runs clear; afterwards pour on the material fresh distilled vinegar, until 48 fl. oz. of filtered liquor shall be obtained; in this dissolves sugar,

12 oz., and gently evaporate the whole to 52 fl. oz.

3. (Wholesale.) Opium, 10 oz., and distilled vinegar, 1 quart, are digested together for about a fortnight, and after sufficient repose the clear portion is decanted. This is the form commonly adopted by the wholesale trade in England.—*Dose.* 5 to 10 drops. It is usually considered to be of fully 4 times the strength of laudanum.

Drops, Carminative. *Syn.* GUTTÆ CARMINATIVÆ, L. *Prep.* (Radius.) Oil of mace, 1 dr.; nitric ether, 3 drs.—*Dose.* 6 to 10 drops on sugar; in flatulent colic, &c.

Drops, Chamomile. See ESSENCE.

Drops, Dalby's. See PATENT MEDICINES (Dalby's Carminative).

Drops, Durande's. *Syn.* GUTTÆ ÆTHERIS TEREBINTHINATÆ, L. *Prep.* (M. Durande.) Rectified sulphuric acid, 3 parts; oil of turpentine, 1 part.—*Dose.* 20 to 30 drops, or more; in the passing of gall-stones.

Drops, Dutch. *Syn.* HAERLEM DROPS, TURPENTINE DROPS; BALSAMUM TEREBINTHINÆ, L. The genuine or imported 'Dutch Drops' is the residuum of the rectification of oil of turpentine. It is also prepared by distilling resin, and collecting the product in different portions. At first a white, then a yellow, and lastly a red oil, comes over. The last is the balsam. The article commonly sold under the name in this country is prepared by one or other of the following formulæ:—

1. Oil of turpentine, tincture of guaiacum, and sweet spirit of nitre, of each, 1 oz.; oils of amber and cloves, of each, 15 drops.

2. Balsam of sulphur, 1 part; oil of turpentine, 5 parts. This last is the form most generally employed. They are all regarded by those who use them as detergent, diuretic, stimulant, and vulnerary.

Drops, Female. *Syn.* EMMENAGOGUE DROPS; GUTTÆ EMMENAGOGÆ, L. *Prep.* (Brande.) Compound tincture of aloes and tincture of valerian, of each, 2 fl. oz.; tincture of sesquichloride of iron, 1 fl. oz.—*Dose.* A teaspoonful in water or chamomile tea; in obstructed menstruation, &c.

Drops, Fit. *Syn.* SOOT DROPS; TINCTURA FULIGINIS, GUTTÆ F., L. *Prep.* From wood-soot, 2 oz.; sal-ammoniac, 1 oz.; salt of tartar, ½ lb.; soft water, 4 lbs.; digest a week and filter. Reputed antispasmodic, and also useful in scurvy and certain skin diseases.—*Dose.* A teaspoonful or more, occasionally, in water.

Drops, Golden. *Syn.* DE LA MOTTE'S G. D.; BESTUCHEFF'S NERVOUS TINCTURE; GUTTÆ AURÆ, L.; ELIXIR D'OR, GOUTTES D'OR DU GÉNÉRAL LAMOTTE, Fr. *Prep.* 1. (Original.) Chloride of iron (obtained by distilling iron pyrites with twice its weight of corrosive sublimate), 3 oz.; alcohol, 7 oz.; expose the mixture in a closely stoppered bottle to the rays of the sun until it becomes decoloured.

2. Chloride of iron, 1 part; alcohol and ether, of each, 3 parts. These drops have the

remarkable property of losing their yellow colour in the sun, and recovering it in the shade. They are taken in gout, hypochondriasis, and nervous complaints, in *doses* of from 10 to 60 drops.

Drops, Hooping-Cough. *Syn.* GUTTÆ ANTI-PERTUSSIOÆ, L. *Prep.* 1. (Dr. Graves.) Tincture of assafoetida and compound tincture of camphor, of each, ½ fl. oz.; compound tincture of bark, 5 fl. oz.—*Dose.* A teaspoonful, 2 or 3 times a day.

2. (Potestates Succini.) Oil of amber, 1 oz.; carbonate (not sesquicarb.) of ammonia, ½ oz.; strongest rectified spirit (alcohol), ½ pint; digest 3 or 4 days, and decant the clear portion. *Dose.* 10 drops to 1 dr., applied as a friction.

Drops, Infantile. Several anodyne, carminative, and absorbent preparations, which pass by this name, will be found under MIXTURES, &c.

Drops, Jes'uits'. *Syn.* ELIXIR ANTIVENEREUM, L. *Prep.* 1. Gum guaiacum, 7 oz.; balsam of Peru, 4 drs.; root of sarsaparilla, 5 oz.; rectified spirit of wine, 1 quart; digest for 14 days.

2. (Quincy.) Copaiba, 1 oz.; gum guaiacum, 2 drs.; oil of sassafras, 1 dr.; salt of tartar, ½ dr.; rectified spirit, 5 fl. oz.; digest a week.

3. (Walker's.) Copaiba, 6 oz.; gum guaiacum, 1 oz.; chio turpentine and salt of tartar, of each, ½ oz.; cochineal, 1 dr.; rectified spirit, 1 quart; digest a week. See TINCTURE OF BENZOIN (Comp.).

Drops, Kœchlin's. *Prep.* (Augustin.) Solution of ammonio-chloride of copper and mercury, 1 fl. dr.; water, 10 fl. drs. In obstinate venereal affections, scrofula, &c.—*Dose.* A teaspoonful after each meal.

Drops, Lavender. *Syn.* RED DROPS; GUTTÆ LAVENDULÆ, L. The same as compound tincture of lavender.

Drops, Life. *Syn.* SALMON'S DROPS OF LIFE; GUTTÆ VITÆ, L. *Prep.* Tincture of castor, 8 fl. oz.; antimonial wine and water, of each 1 lb.; opium, 3 oz.; saffron, ½ oz.; cochineal, camphor, and nutmegs, of each, 2 drs.; digest for 10 days and filter. Anodyne and diaphoretic.—*Dose.* 20 to 60 drops.

Drops, Mercu'rial. *Syn.* GUTTÆ HYDRARGYRI BICHLORIDI, L. *Prep.* 1. Bichloride of mercury, 2 grs.; hydrochloric acid, 3 drops; rectified spirit and distilled water, of each, ½ fl. oz.—*Dose.* 12 to 20 drops.

2. Bichloride of mercury, 2 grs.; sal-ammoniac, 3 grs.; compound decoction of sarsaparilla, 2 fl. oz.—*Dose.* A teaspoonful.

3. (Sir A. Cooper.) Corrosive sublimate, 1 gr.; dilute hydrochloric acid, ½ dr.; dissolve, and add, tincture of bark, 2 fl. oz.—*Dose.* As the last. They are all taken 2 or 3 times daily, as alteratives in scrofula, syphilis, cancer, &c. It should not be measured in a metal spoon.

Drops, Norris's. An aqueous solution of

tartar emetic, mixed with spirit of wine, and coloured.

Drops, Odontalgic. *Syn.* TOOTH-ACHE DROPS; *GUTTÆ ODONTALGICÆ*, L. *Prep.* 1. (Dr. Blake.) Alum (in fine powder), 1 dr.; sweet spirit of nitre, 7 fl. drs.; agitate together occasionally for an hour.

2. (Dr. Copland.) Powdered opium and camphor, of each, 10 grs.; oils of cloves and cajeput, of each, 1 dr.; highly rectified spirit and sulphuric ether, of each, $\frac{1}{2}$ fl. oz.

3. (Cottreau.) A saturated ethereal solution of camphor, to which a few drops of liquor of ammonia is added.

4. (Dr. R. E. Griffith.) Wine of opium, Hoffman's anodyne, and oil of peppermint, equal parts. *Used* as a friction on the cheek or gum, as well as applied to the teeth.

5. (Perry's.) A concentrated ethereal tincture of camphor and pellitory.

6. (Righini.) Creasote, 6 drs.; rectified spirit, 4 drs.; tincture of cochineal, 2 drs.; oil of peppermint, $\frac{1}{2}$ dr.

Obs. The above are applied to the tooth with a camel-hair pencil, or a little wad of lint or cotton wool is moistened with them, and placed in or against the tooth.

Drops, Pectoral. *Syn.* BATEMAN'S P. D.; *GUTTÆ PECTORALES*, L. *Prep.* 1. Paregoric, 10 fl. oz.; tincture of castor, 4 fl. oz.; laudanum, 1 fl. oz.; tincture of saffron or of cochineal, $\frac{1}{2}$ fl. oz.; oil of aniseed, 15 drops.

2. Castor, 1 oz.; oil of aniseed, 1 dr.; camphor, 5 drs.; cochineal, $1\frac{1}{2}$ dr.; opium, $\frac{3}{4}$ oz.; treacle, 1 lb.; proof spirit, 1 gal.; digest for a week.

3. (Phil. Coll. of Pharm.) Camphor, catechu, powdered opium, and red sanders wood, of each, 2 oz.; oil of aniseed, 4 fl. drs.; proof spirit, 4 old wine-gallons; digest 10 days, and filter.—*Dose.* A teaspoonful, or more, in coughs, colds, hoarseness, &c., assisted by an aperient.

Drops, Rheumatic. *Syn.* *GUTTÆ RHEUMATICÆ*, L. *Prep.* 1. Iodide of potassium, 1 dr.; tincture of guaiacum, 2 fl. oz.; dissolve.—*Dose.* 20 to 30 drops. In both chronic and occasional rheumatism, assisted with the copious use of lemon juice.

2. (Lampadius.) Bisulphuret of carbon and ether, of each, 2 fl. drs.—*Dose.* 6 to 12 drops, on sugar, or in milk.

3. (Wutzer.) Bisulphuret of carbon, 1 fl. dr.; alcohol, 2 fl. drs.—*Dose.* As No. 2. The last two are sudorific, alterative, resolvent, and emmenagogue, and, besides rheumatism, have been used with advantage in amenorrhœa, in some cutaneous affections, in glandular swellings, &c.

Drops, Rousseau's. See WINE OF OPIUM (by Fermentation).

Drops, Sedative. *Syn.* *GUTTÆ SEDATIVÆ*, L. The solutions of acetate and hydrochlorate of morphia, black drop, Rousseau's drop, and Batley's liquor opii sedativus, are frequently sold under this name by the druggists. The

anti-hysterical drops (*antè*) is also an excellent sedative.

Drops, Spilbury's. *Prep.* 1. (Dr. Paris.) From bichloride of mercury, gentian root, and dried orange peel, of each, 2 drs.; precipitated sulphuret of antimony and red sanders wood, of each, 1 dr.; proof spirit, 16 fl. oz.; digest ten days, and strain.

2. Levigated crocus metallorum ('crocus of antimony'), 6 drs.; corrosive sublimate, 45 grs.; red sanders, $\frac{1}{2}$ dr.; gentian root and dried orange peel, of each 2 drs.; brandy (or equal parts of rect. sp. and water), 16 fl. oz.; digest as before.—*Dose.* 5 to 30 drops; as an antiscorbutic, &c.

Drops, Steel. See TINCTURE OF SESQUICHLORIDE OF IRON.

Drops, Tonic. *Prep.* (Collier.) Elixir of vitriol, 2 fl. dr.; tincture of calumba, 6 fl. drs. A teaspoonful three times daily, in a wine-glassful of cold water.

Drops, Torrington's. See TINCTURE OF BENZOIN (Comp.).

Drops, Van Swieten's. An aromatised solution of corrosive sublimate.

Drop, Ward's White. *Prep.* From quicksilver, 4 oz.; nitric acid, 16 fl. oz.; dissolve, add sesquicarbonate of ammonia, 7 oz.; evaporate and crystallise; then dissolve the resulting salt by the heat of a sand bath, in 4 times its weight of rose-water. Very poisonous.—*Dose.* 5 to 15 drops, as an antiscorbutic, antivenereal, &c.

Drops, Worm. *Syn.* *GUTTÆ ANTHELMINTICÆ*, G. VERMIFUGÆ, L. *Prep.* 1. Creasote, 1 dr.; oil of turpentine, 7 fl. drs.—*Dose.* A teaspoonful, 3 or 4 times a day.

2. (Peschier.) Oil of male-fern, 3 fl. drs.; rectified oil of turpentine, 5 fl. drs. As the last; in tape-worm.

3. (Schwartz.) Barbadoes tar, 1 fl. oz.; tincture of assafœtida, $1\frac{1}{2}$ fl. oz.—*Dose.* 30 to 40 drops, three times a day; in tape-worm.

DROPS (Scouring). *Prep.* 1. Oil of turpentine and oil of lemons, equal parts. Both of the ingredients should have been recently distilled or rectified.

2. Oil of lemon bottoms, $1\frac{1}{2}$ lb.; oil of turpentine, 1 quart; mix well, and distil by the heat of a sand bath, until 3 pints have come over, or as long as the distillate is clear, pale, and sweet. *Used* to remove paint, grease, &c., from cloth.

DROPSY. *Syn.* *HYDROPS*, L. 'An unnatural collection of aqueous fluid in any part of the body. Dropsy has received different names, according to the part of the body affected by the disease. When it occurs in the cellular membrane it is called ANASARCA; when in the cavity of the abdomen, ASCITES; in the cavity of the cranium, HYDROCEPHALUS; in the scrotum, HYDROCELE; in the uterus, HYDROMETRA; and in the chest, HYDROTHORAX. Dropsy is mostly a symptom of extreme debility and a broken-down constitution, and

frequently follows lengthened attacks of exhausting chronic diseases.

The treatment of dropsy, perhaps, more than any other disease, depends upon the circumstances with which it is connected, and, more especially, upon those which have caused it. The acute inflammatory forms of dropsy generally require depletion. In most other cases, tonics may be advantageously administered. To promote the absorption of the accumulated fluids, diuretics are commonly resorted to. Confirmed dropsy (especially HYDROCEPHALUS and HYDROTHORAX), occurring in patients either much debilitated by previous disease or of a bad habit of body, is seldom curable.

DROWNING. The cause of death from submersion in water is the entire seclusion of air from the lungs, by which the aëration of the venous blood is prevented. In consequence of this deprivation of air, venous blood circulates through the arterial system, whilst the pulmonary vein ceases to convey oxygenated blood to the heart. Under ordinary circumstances, in the course of 4 or 5 minutes after the access of air has been cut off, life becomes extinct. Many cases have, nevertheless, occurred of persons being submerged for 15 or 20 minutes, and even longer, and where perfect insensibility has existed, in which recovery has taken place.

Prez. The specific gravity of the human body is less than that of water, so long as the lungs are partially filled with air; and this difference is sufficient to keep the body floating with the mouth and nostrils free for respiration, provided the face is turned upwards by throwing the head back on the shoulders, by which the weight of the head is sustained by the water. When a person throws himself into the water, the body rises rapidly to the surface and assumes nearly the erect position, the upper part of the head, down to a little below the eyes, remaining above the surface of the water. This arises from the greater density of the legs and thighs compared to that of the chest, which acts as a species of float or buoy to the rest of the body. In this situation the head may be thrown back, so that the face may form the exposed portion, as before mentioned, when respiration may be carried on without inconvenience in still water, and regularly, but sufficiently, so as to sustain life for some time, even in a rough sea. The adoption of this simple precaution would have saved thousands of valuable lives.

Another point which should be remembered by every person in danger of drowning is, that there is always a considerable amount of residual air in the lungs, in a nearly deoxidised state, and that if this air is expelled by two or three forced inspirations, and a deep inspiration is then taken, a larger quantity of vital air will be introduced into the lungs, and the blood will continue aërated for a proportionally longer time; and, consequently, a longer

period will elapse before another inspiration will be required. If we prepare ourselves by taking two or three forced inspirations, and then take a full inspiration, we may remain for $1\frac{1}{2}$ or 2 minutes before a second attempt at respiration need be made. This is the plan adopted by the pearl fishers, and other divers who are remarkable for remaining beneath the surface of the water for some time. A person in danger of shipwreck, or expecting immediate submersion, in any other situation, should have recourse to this expedient, which would prevent the dreadful effects of attempting respiration whilst under water.

Treat. The first object is the restoration of the animal heat. For this purpose, the wet clothes should be removed, and the body, after being well dried, surrounded with warm air. In the absence of a warm-air bath, the body may be laid between well-heated blankets, and bottles of hot water applied to the feet and armpits. Gentle friction with warm flannel or the hands should also be assiduously employed. Meanwhile attempts should be made to excite respiration artificially; and when the apparatus is at hand, slight shocks of electricity should be kept up at the same time. On the appearance of returning life, such as sighing or convulsive twitching, a vein may be opened. The throat may be tickled with the finger or a feather, to excite vomiting, and a teaspoonful of warm water administered. If the power of swallowing exists, a table-spoonful of warm wine or brandy-and-water may be given. Even if no symptom of returning animation appear, these means of recovery should be persisted in for three or four hours.

In the treatment of this species of asphyxia, nasal stimulants, as ammonia, aromatic vinegar, &c., should be avoided, as well as the injection of tobacco smoke, both of which have been found highly prejudicial. The practice of holding the body with the head downwards, which is sometimes adopted by the vulgar and ignorant, under the idea of allowing the water to run out by the mouth, is still more dangerous and absurd. The supposition that water is inhaled by drowning persons, instead of air, is perfectly fallacious. The peculiar mechanism of the glottis, or upper portion of the wind-pipe, is such as to prevent, by the spasmodic closure of the epiglottis, the entrance of more than a very trifling and accidental quantity of water, which is altogether too insignificant to produce any very injurious effects. See ASPHYXIA.

DRUGS. Substances used in medicine, sold by druggists, and compounded by apothecaries and physicians. Our continental neighbours, wiser than ourselves, not merely require that persons engaged in selling and dispensing drugs and pharmaceutical preparations shall be fully qualified by previous education and training for the task, but also that the various articles they sell and use shall be commercially pure and of the proper quality. In the United

States of America this subject has also engaged the attention of the government and legislature. Under the Act of the 26th June, 1848, inspectors were appointed to examine the quality of imported articles of this class, before allowing them to pass the Customs for home use. An abridged copy of the order addressed to the "collectors and other officers under this act" is appended, and will be useful to the reader, as assisting to establish a standard by which the value of the substances named therein may be estimated.

TREASURY DEPARTMENT, June 4th, 1853.

The following articles are to be entitled to entry when ascertained by analysis to afford the per-centages as under, viz.:—

ALOES, 80% of pure aloetic extract.
ASSAETIDA, 50% of its peculiar bitter resin, and 3% of volatile oil.
CINCHONA BARK, 1% of pure quinine, or 2% of the several alkaloids, as quina, cinchona, guanidine, aricine, &c.

BENZON, 80% of benzoic resin.
Do 12% of benzoic acid.
COLOCYNTH, 12% of colocynthis.
ELATERIUM, 30% of elaterine.
GALBANUM, 60% of resin.

Do 10% of gum, and 6% volatile oil.
GAMBAGE, 70% of pure gamboge resin, and 2% of gum.
GUAJACUM, 80% of pure guaiacum resin.
GUM AMMONIACUM, 70% of resin, and 1% of gum.
JALAP, 11% of pure jalap resin.
MYRRH, 30% of pure resin, and 50% of gum.
OPIMUM, 9% of pure morphia.

RHUBARB, 40% of soluble matter.
SAGAPENUM, 50% of resin, 30% of gum, and 30% of volatile oil.
SCAMMONY, 70% of pure scammony resin.
SENNA, 28% of soluble matter.

Medicinal leaves, flowers, barks, roots, extracts, &c., not specified above, must be, when imported, in perfect condition, and of as recent collection and preparation as practicable.

Pharmaceutical and chemical preparations, whether crystallised or otherwise, used in medicine, to be pure, and of a proper consistence and strength, as well as of perfect manufacture, conformably with the standard authorities named in the Act; and must, in no instance contain over 3% of excess of moisture or water of crystallisation.

Essential or volatile oils, and expressed oils used in medicine, must be pure and of the standard sp. gr. noticed and declared in the dispensaries named in the above Act.

"Patent" or "Secret Medicines" are by law subject to the same examination as other medicinal preparations, and cannot be permitted to pass the Custom-house for home consumption, but must be rejected and condemned, unless the special examiner is satisfied, after due investigation, that they are fit and safe to be used for medical purposes.

An appeal from the examiner to the collector to be admitted within 10 days.

JAMES GUTHRIE,
Secretary to the Treasury.

DRUMMOND LIGHT. See **LIGHT** (Artificial).

DRUNK'ENNESS. See **ABSTINENCE**, **INTEMPERANCE**, &c.

DRY'ERS (Painter's). *Prep.* 1. Litharge (best) ground to a paste with drying oil. For dark colours.

2. From white copperas and drying oil; as the last.

3. From sugar of lead and drying oil. The last two are for pale colours.

¹ Of whatever denomination.

² Root or powder.

³ Only Turkey, East Indian, and Russian, admissible.

4. From white copperas and sugar of lead, of each, 1 lb.; pure white lead, 2 lbs. For 'whites,' and opaque light colours, grays, &c. Dryers are employed, as the name implies, to increase the drying and hardening properties of oil paints. A little is beat up with them at the time of mixing them with the oil and turpentine for use.

DRY'ING. See **DESICCATION**, &c.

DRY'ING-OIL. See **OILS**.

DRY-ROT. A peculiar disease that attacks wood, and renders it brittle and rotten. It is generally caused by dampness and the subsequent development of the spores of fungi, particularly those of *Merulius lacrymans* and *vastator* and *Polyporus destructor*. The dry-rot principally attacks 'ill-seasoned' timber, and more particularly that of ships and badly ventilated buildings.

Prev. Various means have been proposed to prevent the attacks of dry-rot, and to arrest its progress when it has commenced, among which the process called 'KYANIZING' (Kyan's patent) is that most generally known and most extensively adopted. It consists in immersing the timber in a bath of corrosive sublimate. The process termed 'PAYNZING' (Payne's patent) consists in first filling the pores with a solution of chloride of calcium, under pressure, and next forcing in a solution of sulphate of iron, by which an insoluble sulphate of lime is formed in the body of the wood, which is thus rendered nearly as hard as stone. Wood so prepared is now largely employed in our public works and railways. Sir W. Burnett's process (patented in 1836) consists in impregnating the timber with a solution of chloride of zinc. Mr. J. Bethell's process (patented in 1838) consists in thoroughly impregnating the wood with oil of tar containing creasote and a crude solution of acetate of iron, commonly called 'pyrolignite of iron.' The impregnation is effected in a strong cylindrical vessel, connected with a powerful air-pump, so that in the first instance, a vacuum being formed, and subsequently a pressure of several atmospheres applied, the liquid may as much as possible be forced into all the pores of the wood. The above processes for 'seasoning' preserve the timber not only from dry-rot, but from the influence of the weather and the attacks of insects and worms.

DUB'BING. *Prep.* 1. By boiling the waste cuttings of sheep-skins in crude cod oil. 2. Black resin, 2 lbs.; tallow, 1 lb.; crude cod oil or train oil, 1 gal.; boil to a proper consistence. *Used* by the curriers to dress leather, and by shoemakers and others to soften leather, and to render boots and shoes waterproof.

DUCK. See **POULTRY**.

DUCTILITY is the property of being drawn out in length without breaking. See **METALS**.

DULCAMA'RA. See **NIGHTSHADES** (Woody).

DUMB'NESS. *Syn.* **APHONIA**, &c. As speech is an acquired and imitative faculty, persons who are either born deaf or become so in early

infancy are also, necessarily, dumb. The first step in treating dumbness must therefore be directed to the removal of the deafness on which the imperfection rests. The exertions of modern philanthropists have, however, been so far successful in such cases, as to enable the deaf-mute to converse with those around him by signs.* Those interested in the subject may consult an admirable treatise on 'Deaf-dumbness,' by M. E. Hubert-Valleroux, of which an excellent translation appeared in the 'Medical Circular,' vol. ii, for 1853. See DEAFNESS.

DUNGING. *Syn.* CLEANSING. One of the principal processes in the arts of calico printing and dyeing, its object being to free the cloth from loose matters, which would interfere with the dyeing. After the thickened mordants have been applied to the fabric, and properly fixed, it is necessary to remove the now useless thickening matter, together with the excess of mordant, which has not come into actual contact with the cloth. Formerly, a bath formed of cow-dung, diffused through hot water (130° to 212° Fahr.) was always used to wash away these loose matters; but now various manufactured substances are successfully employed for the purpose. The best dung substitutes are the arsenite and arseniate of soda, the silicate of soda, and phosphate of lime. Experience proves that, in the case of these substitutes, a final wince in cow-dung before dyeing is advantageous. A process very similar to 'dunning' is employed after dyeing, to clear and give purity to the undyed parts. This subsequent process is distinguished by the term 'clearing.' Cow-dung has been used in 'clearing' operations, but its employment is not to be recommended. Bran scalded and mixed with water is employed for certain goods, but bleaching powder is the most generally used 'clearing agent.'

DUTCH LIQUID. See OLEFIANT GAS.

DYEING. The act of tinging or colouring absorbent materials, by impregnating them with solutions of colouring matters or dye-stuffs. The colouring matters which impart their tints without the intervention of other substances are called 'substantive colours;' while those which require such aid are called 'adjective colours.' The bodies employed to fix and develop the latter class are called 'mordants.' The exact way in which dye-stuffs act upon fibrous materials has not yet been investigated as fully as it deserves; the generally received opinion is that the fibre has a chemical affinity for the colouring matter in the case of substantive dyes, and likewise for the mordant, which, in its turn, has an affinity for the colouring matter of adjective dyes. Another opinion is that the fibres have pores, which, when expanded by heat or chemical agents, admit particles of colouring matter. However this may be, it is certain that different materials 'take' dyes in different proportions; thus, silk and wool take the

coal-tar dyes in the most perfect manner, but cotton requires the intervention of a most powerful mineral or animal mordant. Wool takes the colouring matters of most dye-stuffs so well that the deepest tints can readily be produced. SILK and COTTON are dyed with greater difficulty, whilst LINEN shows still less disposition to take dyes. The operations which take place in dyeing are 'mordanting,' 'ageing,' 'dunning,' 'dyeing,' and 'clearing.' The first of these operations is noticed under MORDANT. After the fabric has been mordanted, it is generally hung up in a room through which a current of steam and air is passing, by means of which the union between the fibre and the mordant is quickened very considerably. This exposure to moist air is the step in the process to which the term 'ageing' is applied. The operations of 'dunning' and 'clearing' are noticed above (see DUNGING). The 'dyeing' proper, which follows the 'dunning,' is effected by running the fabric through the solution of the dye-stuff, the colour being modified more or less by the nature of the mordant used. Under the names of the different colours the means used to dye such colours are minutely described. See BLACK DYE, BLUE DYE, &c.

The following particulars respecting the production of the more common colours may prove interesting to the reader who merely requires some general information on the subject:—

BLACK is usually produced by logwood or galls with an iron mordant. Common black silks are dyed with logwood and fustic, iron being used as a mordant. The best silks are dyed black on a blue ground. Woollen goods are first dyed blue with indigo, and afterwards with sumac, logwood, and green or blue copers. Cotton and linen goods are dyed black in a very similar manner.

BLUE is commonly produced from indigo, either in the form of sulphate or in aqueous solution. Prussian blue, with a persalt of iron or tin as a mordant, gives a very splendid dark blue. Of late several blues of novel shades have been produced from coal-tar.

RED is obtained in various shades by using cochineal, safflower, lac-dye, madder, or logwood, with a tin mordant.

PURPLE. Until the last few years the dyer was dependent for his purples on orchil or cudbeer, but he has now at his disposal the magnificent series of aniline, or coal-tar, colours, ranging from the most delicate violet, or 'mauve,' to the full crimson-purple, known as 'magenta.' See PURPLE DYE.

YELLOW. The most important yellow dyes are made from quercitron, fustic, turmeric, arnotto, and French and Persian berries. For further information, see BLEACHING, CALICO-PRINTING, &c.

DYER'S SPIRITS. See TIN MORDANTS.

DYES. See DYEING, and the names of the principal colours.

DYE-STUFFS. The colouring material

used in dyeing are so called. The more important of them are noticed under the respective names.

DYSENTERY. *Syn.* BLOODY FLUX; DYSENTERIA, L. A disease arising from inflammation of the mucous membrane of the large intestines, and characterised by stools consisting chiefly of blood and mucus, or other morbid matter, accompanied with griping of the bowels, and followed by tenesmus. There is generally more or less fever, and the natural faces are either retained or discharged in small, hard balls (*scydbala*). The common causes of this disease are marsh miasma, improper diet, excessive exhaustion, and fatigue, and, above all, exposure to the cold and damp air of night after a hot day.

Treat. The common dysentery of this country generally gives way to gentle aperients (castor oil or salts-and-manna), to cleanse the bowels, followed by mild opiates or morphia, to allay irritation. The chronic symptoms, which frequently hang about for some time, are best combated by mild tonics and vegetable bitters (bark, calumba, cascarrilla). Occasionally, chalybeates (ammonia-citrate of iron, lactate of iron, wine of iron, saccharine carbonate of iron) will be found useful during convalescence. Throughout, the diet should be light and nutritious.

The contagious dysentery, of camps and hot climates, is a severe and often fatal disease, in which the preceding symptoms are complicated with remittent or typhoid fever. Its treatment is tedious and difficult, and depends chiefly on judiciously meeting the several symptoms as they develop themselves. Aperients, diaphoretics, and nauseants, followed by tonics, are the remedies generally relied on. The febrile symptoms must be treated according to their inflammatory or putrid tendency. This variety of the disease frequently gives rise to organic diseases of the abdominal viscera, dropsy, &c. It is regarded by some as contagious, but without sufficient reason.

DYSMENORRHOEA. See MENSTRUATION.

DYSPEPSIA. [L.] *Syn.* DYSPEPSY, INDIGESTION. This complaint pervades every rank of society, and is, perhaps, of all others, the most general. Few indeed are there who wholly escape it, in one or other of its forms. The common symptoms of dyspepsia are—want of appetite, sudden and transient distensions of the stomach, frequent eructations, heartburn, stomachic pains, occasional vomiting, and, frequently, costiveness or diarrhoea. Sometimes the head is affected, and dimness of sight, double vision, muscæ volitantes, and slight vertigo, are experienced, along with a multitude of other symptoms, depending on a derangement of the functions of the nervous system.

The causes of dyspepsia are numerous. In the higher ranks of society it is a common consequence of over-indulgence in the luxuries of the table, of late hours, or of the want of

proper exercise, both of body and mind. In the studious, and those who lead a sedentary life, it is usually caused by excessive mental exertion or anxiety, or by the fatigues of business, and the want of sufficient bodily exertion and of pure air. In the lower orders of society it generally results from inebriety, or a deficiency of proper food and clothing, bad ventilation, &c.; and is not unfrequently occasioned by the physical powers being over-taxed, especially soon after meals.

The treatment of dyspepsia depends less on medicine than on the adoption of regular habits of life. Moderation in eating, drinking, and the indulgence of the passions; early rising, due exercise, and retiring to rest at an early hour, will do much to restore the tone both of the stomach and nerves. Excessive study and mental exertion should be avoided, and recourse should frequently be had to society and amusements of a lively and interesting character. If the bowels are confined, mild aperients should be taken, and if diarrhoea is present, antacids and absorbents may be had recourse to with advantage. The stomach may be strengthened by the use of mild bitters, tonics, and stimulants, and sea bathing, or the shower or tepid bath, may be taken, when convenient, to strengthen the nervous system. When dyspepsia is a secondary or symptomatic disease, the cause should be sought out, and the treatment varied accordingly. Among the aperient medicines most suitable to dyspepsia may be mentioned—Epsom salts, phosphate of soda, and Seidlitz powders, each of which should be taken largely diluted with water. An occasional dose of the '*Abermethy Medicines*' (which see) has also been recommended. Among antacids, are the bicarbonates and carbonates of potassa and soda, either of which may be taken in doses of half a teaspoonful dissolved in water; or if the spirits are depressed, one or two teaspoonfuls of spirit of sal-volatile will be more appropriate; and in cases accompanied by diarrhoea, a little prepared chalk. As bitters, the compound infusion of orange peel, or of gentian, are excellent. As tonics, small doses of bark, or of sulphate of quinine, to which chalybeates may be added, if there is pallor of countenance, or a low pulse, with no disposition to fever or headache.

When dyspepsia is complicated with hysteria, hypochondriasis, or chlorosis, the treatment noticed under those heads may be conjoined to that above recommended. When it depends on constipation, or a deficiency of bile, the mildest and most effective of all remedies will be found supplied in inspissated ox-gall. "In all cases of incipient constipation, ox-gall is a remedy of undoubted efficacy; and even in protracted cases, when hope has almost fled—but where evidences of strangulation are not unequivocally manifested—it should never be omitted by the practitioner. In habitual or chronic constipation, accompanied by indi-

gestion, clay-coloured stools, and a feeling of oppression after food has been taken, it acts with almost specific certainty. When, however, the liver begins to assume its healthy action, its employment should be discontinued, and it will then produce all the symptoms of regurgitation of bile into the stomach. This state will be readily recognised as a favorable omen of returning power." (Dr. Allnatt.)

DYSPNŒA. Difficulty of breathing. It is generally symptomatic of some other affections. When it occurs in persons of a nervous or irritable habit of body, perfect quiet, a semi-recumbent posture, fresh air, and some small doses of ether, ammonia, or opium, will generally effect a cure. Those of a full habit require aperients and depletion. To prevent attacks of the kind, excess in eating and drinking, and the use of stimulants, should be avoided.

DYSURŒIA. [L.] *Syn.* DYSURŒY. Difficult urination. It is generally symptomatic of disease of the kidneys, bladder, or urethra. The treatment depends on the exciting cause.

EAR (Inflammation of). *Syn.* OTITIS, L. This affection, when it attacks the internal part of the ear, is generally accompanied with confusion of sound, deafness, and more or less fever. It is most frequent among children, and is commonly produced by exposure to draughts of cold air, and, occasionally, by foreign matters, as cherry-stones, insects, &c., having got into the external ear. In such cases, the removal of the offensive matter, and due attention to warmth and cleanliness, with a dose of laxative medicine, will be all the treatment required. The pain may generally be relieved by throwing warm water into the ear by means of a syringe, and fomenting the surrounding parts with decoction of poppy-heads and chamomile flowers. Should this treatment not succeed, a drop or two of laudanum, with one drop of oil of cloves and a little oil of almonds, may be dropped in the ear, and a piece of cotton wool introduced afterwards. Cases of acute inflammation of the internal ear are occasionally met with in adults, which assume a very serious character, and demand the most careful treatment. See DEAFNESS.

Earache. Pain in the ear may arise from various causes, amongst which, in the absence of organic disease, cold, and that peculiar derangement of health popularly called 'nervousness,' are the most common. In the one case, the proper remedy is warmth; in the other, the attention should be directed to the restoration of the body to the healthy standard.

EARTHS. In *chemistry*, a group of metallic oxides. The principal earths are baryta, strontia, lime, magnesia, alumina, berylla or glucina, yttria, zirconia, and thorina. The first four are termed ALKALINE EARTHS; the remainder, together with the oxides of the very rare metals erbium, terbium, norium, cerium,

lanthanum, and didymium, constitute the EARTHS PROPER.

The term *earth* was very loosely applied by the older chemical and pharmaceutical writers, and the practice is still common among the vulgar at the present day. Thus, ABSORBENT EARTH (chalk); ALUMINOUS E., ARGILLACEOUS E. (alumina); BOLAR E. (bole); BONE-E. (phosphate of lime); FULLER'S E. (an absorbent clay); HEAVY E. (baryta); JAPAN E., or TERRA JAPONICA (catechu); SEALED E. (bole), &c., are names even now frequently encountered both in trade and in books.

EAU. (Fr.) Water. This word, like its English synonym, is applied to numerous substances, differing in their composition, sensible properties, and uses, of which the following are a few useful examples:—EAU DOUCE, fresh or river water; EAU DE MER, sea or salt water; EAU DE FONTAINE, EAU DE SOURCE, spring water; EAU DE PUIS, well or pump water; EAU DE RIVIÈRE, river water; EAU DISTILLÉE, distilled water; EAU DE ROSE, rose water; EAU DE VIE, brandy; EAU DE COLOGNE, Cologne water; EAU D'HONGRIE, Hungary water; EAU BÉNITE, holy water; EAU FORTE, aquafortis; EAU DE SAVON, soap-suds; EAU DE SENTEUR, scented water, &c.

Eaux, in perfumery, are solutions of the fragrant essential oils in spirit, as eau de Cologne, eau de bouquet, &c.; or they are distilled waters, largely charged with the odorous principles of plants, as eau de rose, eau de fleurs d'oranges, &c.

Eaux, of the liqueuriste, are aromatised spirits or cordials.

Eau Medicinales are either simple watery solutions (HYDROLÉS, HYDROLATURES, SOLUTIONS PAR L'EAU), or distilled water (EAUX DISTILLÉES); or they are vinous or alcoholic tinctures or solutions of essential oils, aromatics, or more active drugs. See CORDIALS, HAIR DYES, PERFUMERY, SPIRITS, TINCTURES, WATERS, &c.

EB'LANINE. The yellowish-red, crystallisable, solid substance, which is left behind in the retort, when wood spirit is rectified from quicklime. It is insoluble in water, and sublimes without fusion at 273° Fahr.

EB'ONY. The wood of the *Diospyrus Melanoxylon*, an East Indian tree, of the natural order *Ebenaceæ*. Two other species of the same genus, namely, *Diospyrus Ebenus* and *D. Ebenaster*, yield respectively MAURITIUS EBONY and the BASTARD EBONY of Ceylon. Pale-coloured woods are stained in imitation of ebony (FACITIOUS EBONY), by washing them with or steeping them in a strong decoction of logwood or of galls, and, when dry, washing them over with a solution of sulphate or acetate of iron. They are then rinsed in clean water, and the process is repeated, if required. The wood is lastly polished or varnished.

EBRI'ETY. See INTOXICATION.

EBULLI'TION. The state of boiling, or

the agitation of a liquid arising from its rapid conversion into vapour by heat. Ebullition occurs in different liquids at very different temperatures, such temperatures being called their 'boiling-points.' Under the same circumstances the boiling-points are constant, and by observing them the chemist is often able to distinguish liquids which much resemble each other. The boiling-point of the same liquid may, however, vary considerably under different circumstances. The causes which induce variation are increased or diminished atmospheric pressure, the greater or less depth of the liquid, and the character of the containing vessel. Thus, boiling water is colder by some degrees when the barometer is low, in bad weather, or at the top of a hill, than when the barometer is higher, in fine weather, or at the bottom of a valley or mine. There is a very simple and beautiful experiment, illustrative of the effect of diminished pressure in lowering the boiling-point of a liquid. A little water is made to boil for a few minutes in a flask or retort placed over a lamp, until the air has been expelled, and the steam issues freely from the neck. A tightly fitting cork is then inserted, and the lamp at the same moment withdrawn. When the ebullition ceases, it may be renewed at pleasure for a considerable time by the affusion of cold water, which, by condensing the vapour within, occasions a partial vacuum. Liquids in general boil from 60° to 140° lower than their ordinary boiling-points when heated *in vacuo*.

The following table furnishes very exact information respecting the effect of increasing pressure upon the boiling-point of water:—

TABLE I.—*Boiling-points of Water at different Pressures.* By MR. C. GREVILLE WILLIAMS.

Boiling-point ° Fahr.	Barometer Inches.	Boiling-point ° Fahr.	Barometer Inches.
184	16.676	200	23.454
185	17.047	201	23.937
186	17.421	202	24.441
187	17.803	203	25.014
188	18.196	204	25.468
189	18.593	205	25.992
190	18.992	206	26.529
191	19.407	207	27.068
192	19.822	208	27.614
193	20.254	209	28.183
194	20.687	210	28.744
195	21.124	211	29.331
196	21.576	212	29.922
197	22.030	213	30.516
198	22.498	214	31.120
199	22.965	215	31.730

Boiling water contained in a deep vessel is hotter than that in a shallow one, on account of the greater resistance in the one case than the other to the escape of the steam. It is also found that fluids boil at a lower tempe-

ture and more quietly in vessels with rough and spicular surfaces, than in those with smooth or polished ones. The boiling-point of water, as marked on the scale of the thermometer, is 212° Fahr., but in glass vessels, under common circumstances, it varies from 212.54° to 215.6°; whilst in perfectly pure and smooth glass vessels water may be heated to 221° Fahr. without boiling. That the elevation of the boiling-point in this case is due to the nature of the surface, may be at once demonstrated by throwing into water, about to boil in a glass matrass, a little iron filings or coarsely powdered glass, when ebullition will commence with almost explosive violence, at the same time that the temperature of the fluid will sink about 2° Fahr.

The boiling-point of water contained in ordinary vessels may be raised considerably above 212° Fahr., by the addition of saline matter, as will be seen in the following table, extracted from Mr. C. G. Williams's excellent 'Handbook of Chemical manipulation:—'

TABLE II.—*Boiling-points of Saturated Solutions of various Salts at the ordinary Atmospheric Pressure.* By C. G. WILLIAMS.

Name of Salt.	Boiling-point.
Chloride of calcium	355° Fahr.
Acetate of soda	256 "
Nitrate of soda	246 "
Sal-ammoniac	236 "
Common salt	224 "
Cream of tartar	214 "

The above solutions are suitable for chemical baths. With the exception of the first, they furnish in their boiling-points temperatures, as nearly as can be obtained, 10° above each other. They were chosen by Mr. Williams because, in 'fractionating' volatile substances, it is usual to separate the distilled products by differences of temperature equal to 10° Fahr. In long operations it is found inconvenient to employ a saturated saline solution for a bath (by which the highest temperature would be obtained), as the constant evaporation of the water induces the crystallisation of the salt. It is hence usual to keep it considerably below that point.

The following table, compiled chiefly from the pages of Dr. Miller's 'Elements of Chemistry,' gives the boiling-points of several interesting substances.

TABLE III.—*Boiling-points of various Liquids at the ordinary Atmospheric Pressure.*

Name of Substance.	Boiling-point.
Liquid carbonic acid	—108° Fahr.
Liquid sulphurous acid	+ 17.6 "
Chloric ether	51.9 "
Aldehyd	69.4 "
Ether	94.8 "
Bisulphuret of carbon	118.5 "
Bromine	145.4 "

<i>Name of Substance.</i>	<i>Boiling-point.</i>
Wood spirit	149.9 Fahr.
Alcohol (sp. gr. .815)	173.1 "
Benzol	176.8 "
Dutch liquid	184.7 "
Acetic acid	243.1 "
Sulphur (melted)	609 "
Mercury	662 "

EBULLIOSCOPE. *Syn.* EBULLITION ALCOHOLOMETER, THERMO-ALCOHOLOMETER. "This instrument is essentially a thermometer, and its application to alcoholometry is based upon the fact that the boiling-point of a spirituous liquid is scarcely altered by the presence, within certain limits, of the substances which may be dissolved in it, and which, by increasing its specific gravity, render the ordinary alcoholometers or hydrometers useless for the purpose of indicating its alcoholic richness. The ebullioscope was invented by the Abbé Brossard-Vidal, of Toulon, and in its original form consisted of a spirit-lamp surmounted by a small boiler, into which a large cylindrical glass bulb was plunged, having an upright stem of such calibre that the quicksilver contained in them, by its expansion and ascent when heated, raised before it a little glass float in the stem, which was connected by a thread with a similar glass bead, hanging in the air. This thread passed round a pulley, which, turning with the motion of the beads, caused an index to move along a graduated circular scale, which represented on its face the percentage of absolute alcohol in spirituous liquors of different boiling-points. This form of the apparatus being found inconvenient and liable to get disarranged, various improvements were made in it by MM. Conaty, Lerebour, and others. The modification of the instrument now in use, and known as Field's PATENT ALCOHOLOMETER, was made by the late Dr. Ure, and can scarcely be improved on. It consists of a thermometer having a very minute bore and a large bulb, similar to that employed to determine the height of mountains from the boiling-point of water, but instead of thermometric degrees being marked upon the scale the per-centage under proof is placed on the left-hand side of the stem, and the per-centage content of proof spirit on the right-hand side. These commence at 178.5° Fahr., the temperature at which 'proof spirit' boils, and which here forms the bottom of the scale. The succeeding numbers are based upon the boiling-points of mixtures of alcohol and water. The little boiler being charged, and about a teaspoonful of salt (35 grs.) being added, to prevent loss of alcohol by evaporation, the thermometer is set in its place, and the spirit-lamp lighted. When the mercury begins to rise out of the bulb of the thermometer, the 'damper-plate' is pushed in a little way, to moderate the heat. The eye is now kept steadily on the instrument, and as soon as the liquor boils freely, and the mercury

becomes stationary in the stem, the indicator is carefully noted, and the damper-plate pushed home to extinguish the flame.

"The ebullioscope is adjusted to the mean boiling-point of water under an atmospheric pressure of 29.5 inches. When the pressure is either higher or lower, both water and alcohol boil at a somewhat different temperature, to meet which a barometrical equation is attached to the thermometer by means of a small subsidiary scale. It is therefore necessary, prior to commencing the operation of testing any liquor, to charge the little boiler with pure water only, and to fix the thermometer in its place. When the water boils freely, the mercury becomes stationary in the stem, exactly opposite the true barometrical indication at the time. Should this be against the line 29.5, no correction will be required; but should it stand at any other line, above or below, then the various boiling-points will bear reference to that boiling-point only. In the latter case, the boiling-point of the water on the barometrical indicator must be set against the boiling-point of the liquid on the scale, when opposite the line —29.5 will be found the true strength. Thus:—the barometer being at 30 inches, and the indication or boiling-point being 72 u. p., 80 on the indicator must be placed against 72 u. p. on the thermometer, when against the line of 29.5 will be seen 69.6 u. p., the real strength of the sample tested.

"When a spirit is stronger than the 'excise proof,' its boiling-point varies too little with its alterations of strength to render the ebullioscope of much practical value. To make it applicable to the stronger spirits, it is therefore necessary to dilute them with exactly their own bulk of pure water before testing them, and then to double the resulting indication, as suggested by Dr. Ure. Our own plan is always to do this when the spirit is stronger than 20 u. p.

"By means of the ebullioscope the alcoholic content of beer, wines, and spirits, of every variety and class, may be readily determined with sufficient accuracy for all practical purposes; and by methods which we shall hereafter point out, the amount of saccharine extractive, or sugar, in cordialised spirit, malt liquors and wines, may also be ascertained.

"The ebullioscope (Field's ALCOHOLOMETER) employed by us in numerous and extensive investigations connected with public hygiene, was made by Mr. Long, of Little Tower Street, and is an instrument which should be in the hands of every wine and spirit merchant and licensed victualler, as well as every private gentleman who feels interested in the quality of the liquors in his cellar. The instrument is accompanied by a useful little pamphlet of directions and tables, which has been very accurately got up, as we understand, by the late Dr. Ure, expressly for Mr. Long." (A. J. Cooley.)

EDULCORATION. The affusion of water on any substance for the purpose of removing the portion soluble in that fluid. Edulcoration is usually performed by agitating or triturating the article with water, and removing the latter, after subsidence, by decantation or filtration. It is the method commonly adopted to purify precipitates and other powders which are insoluble in water. The washing-bottle is a most useful instrument for the edulcoration of precipitates. In its simplest form, it is a bottle fitted with two bent glass tubes, one drawn to a fine point and reaching to the bottom of the bottle, the other only entering the cork a few inches. By blowing down the latter tube, the water is forced out of the former in a fine stream.

EEL. *Syn.* *ANGUILLA*, L. A family of fishes belonging to the 'apodal' section of the *malacopterygii*. At least three species of eels are found in this country—the 'sharp-nosed,' the 'broad-nosed,' and the 'snig.' The first, which is common in streams and lakes, attains the greatest size—sometimes 25 lbs. or even 30 lbs. The 'snig' is considered superior to other kinds for the table. As articles of food, eels are said to be laxative and far from wholesome. The fat (*EEL FAT*; *ADEPS ANGUILLÆ*, *OLEUM A.*) is among the simples of the Ph. L. 1618, and was formerly considered 'good against stripes,' and is even now used by the vulgar as a friction for stiff joints. For the table, eels are generally dressed by stewing, frying, baking, or potting, which is done in the usual way, the fish being cut into pieces 2 or 3 inches long, and melted butter, onions, sweet herbs, and anchovy sauce, added at will. The *CONGER EEL* is a distinct and gigantic species of the same family. Its flesh is coarse and oily, but is much esteemed by the inhabitants of the southern coast of Devon, on which it abounds.

EFFERVES'CENCE. The rapid escape of gas in small bubbles from a liquid. See *DRAUGHT, POWDER, &c.*

EFFLORES'CENCE. The spontaneous conversion of a crystalline solid into a dry pulverulent form. Crystals which in a dry atmosphere lose their water of crystallisation, and become crusted over with a mealy powder, are said to be *EFFLORESCENT*.

EGG. *Syn.* *OVUM*, L. A body produced in the females of birds and certain other animals, containing an 'embryo' of the same species, or body, from which a similar animal may ultimately be produced. The eggs of the common domestic fowl are nutritious and easily digestible; and when lightly cooked by boiling, and eaten with a little salt, are admirably adapted as an aliment for the sick and delicate. When boiled hard or fried, they are rendered less digestible, and possess no advantage in this respect over butcher's meat. A new-laid egg, beaten up in a cup of tea, coffee, or chocolate, is an excellent ingredient in the breakfast of a person with a poor appetite, and is very

supporting. A glass of wine, beer, or porter, similarly treated, along with a biscuit, has been recommended as a light and nutritious luncheon or supper, well suited to the debilitated and dyspeptic. Raw eggs may be advantageously substituted for cod-liver oil in all the cases in which this last is ordered, occurring in persons with delicate or irritable stomachs. The addition of fresh salad oil vastly increases their medicinal virtues. A fresh egg is said to contain about the same amount of nourishment as 1½ oz. of fresh meat and 1 oz. of wheaten bread, but in a more digestible form.

Egg, White of (*ALBUMEN OVI*), is official in the B. P. Yolk of egg (*VITELLUS OVI*) is an ingredient in the *BRANDY MIXTURE* (*MISTURA SPIRITUS VINI GALLICI*) of the London College. It is also a popular application to chaps, cracked nipples, abrasions, &c., and is largely used to render oleaginous substances miscible with water, in the preparation of emulsions.

The average weight of the new-laid egg of a hen is about 2½ oz., and its sp. gr. is 1.080 to 1.090; the white generally weighs about 1½ oz.; the yolk, a little under ¾ oz.; and the shell and skin, ¼ oz. Dr. Prout found that an egg, on being kept for 2 years in a dry situation, lost 544 $\frac{3}{10}$ grs., from the evaporation of a portion of its water through the shell. By boiling in water an egg loses from 20 to 30 of its weight.

Choice. The larger end of a new-laid egg feels cold when placed against the tongue. New-laid eggs appear semi-transparent when placed between the eye and a strong light, and have a small and perceptible division of the skin from the shell, which is filled with air. This mode of examination among the trade is called 'candling.' When they shake they are stale. The eggs of turkeys and pea-hens are much esteemed for some purposes; those of ducks and geese are coarse and inferior.

Pres. Eggs may be preserved for any length of time by excluding them from the air. One of the cleanest and easiest methods of doing this is to pack them with the small end downwards, in clean dry salt, in barrels or tubs, and to place them in a cool and dry situation. We have eaten eggs thus preserved that were more than a twelvemonth old, and that had been for some months on shipboard, in a tropical climate, and which yet retained all the peculiar sweetness of new-laid eggs. With a like intention, eggs are placed in vessels containing milk of lime, or strong brine, or are rubbed over with butter, lard, or gum water, all of which act by excluding the air. Eggs for keeping should never be laid on their sides, and when kept in the air should be occasionally turned to prevent the yolk attaching itself to the side, instead of floating in the albumen. Some persons place the eggs in a netting, or on a sieve or colander, and immerse them for an instant in a caldron of boiling water, before packing them away. The practice of packing eggs in damp straw, or anything else that can

convey a flavour, should be carefully avoided. The shells of eggs are porous, and readily admit the passage of gaseous substances, especially of fetid odours. It is from inattention to this point that a large portion of the eggs imported from the coast of France have a less delicate flavour than those of our poultry yards. Damp chopped straw, as well as most other organic substances exposed to warmth and moisture, readily ferment or putrefy; and during fermentation a considerable increase of temperature takes place, as any one may readily perceive by examining the common hotbeds in our gardens, which are merely masses of organic matter in a state of decomposition. Eggs, as long as they retain the embryo of the future chick, in a vital state, possess in themselves a certain degree of warmth, which tends materially to promote the decomposition of the substances they are packed in, particularly in the presence of moisture.

Egg, Elastic. Take a good and sound egg, place it in strong vinegar, and allow it to remain for 12 hours; it will then become quite soft and elastic. In this state it can be squeezed into a tolerably wide-mouthed bottle; when in, it must be covered with water, having a little soda dissolved in it. In a few hours the egg will be restored to nearly its original solidity; after which the liquid may be poured off, and the bottle dried, the whole being kept as a curiosity to puzzle one's friends for an explanation how the egg got there. ('Parlour Pastime.')

Egg Flip. *Prep.* 1. Beer, 1 pint; eggs, 3 in no.; sugar, 2 oz.; nutmeg and ginger, q. s. to flavour; the eggs are broken into one half of the beer, the sugar added, and the whole beaten well together; the mixture is then placed in a clean warmer and heated over the fire to nearly the boiling-point, and stirred one way all the time, care being taken not to let it either boil or curdle; the other portion of the beer and the spices are then added, and the whole mixed well together.

2. As above, but adding a glass of spirit. Some persons also add a little lemon peel.

Egg, Glaire of. *Prep.* Separate the whites from the yolks, and whisk them to a froth, let them stand 24 hours, and strain them through muslin. *Used* as a glaze or varnish by bookbinders and others.

Egg, Liquid. *Prep.* (Jaync.) From lime, 1 bushel (slaked with water); common salt, 2 or 3 lbs.; cream of tartar, $\frac{1}{2}$ lb.; water, q. s. to form a mixture strong enough to float an egg. *Used* to preserve eggs, which it is stated it will do for two years, by simply keeping them in it. Once patented. Simple milk of lime answers quite as well.

Egg Wine. As egg flip, but using equal parts of white wine and water, instead of beer.

ELAIDINE. A fatty compound of elaidic acid and glycerin, formed by the action of

nitrous acid or nitrate of mercury on olive oil. It is neutral; melts at 90° Fahr.; and is very soluble in ether, scarcely so in alcohol. It is one of the components of CITRINE OINTMENT. By saponification it is resolved into its two constituents.

ELATIN. See OLEIN.

ELAIOMETER. *Syn.* OLEOMETER. An instrument for ascertaining the specific gravity of oils. See HYDROMETER and OIL.

ELALDEHYD. A peculiar crystalline substance which forms in ALDEHYD when kept for some weeks at a temperature of 32° Fahr. It melts into a colourless liquid at about 38°, in which state it is miscible with water, alcohol, and ether. It is isomeric with aldehyd, but its vapour has about three times the density of that substance, whilst it neither combines with ammonia nor comports itself with potassa and solution of silver like aldehyd.

ELAOP'TENE. See OIL (Volatile).

ELATERIN. *Syn.* MOMORDICINE. The active principle of ELATERIUM. It was discovered by Dr. Clutterbuck in 1819, but first obtained in a state of purity in 1830, by the late Mr. Hennel.

Prep. 1. (Dr. Morries.) Elaterium is digested in hot alcohol, the resulting tincture filtered, evaporated to the consistence of thin oil, and then thrown into boiling distilled water. When the whole is cold, the precipitate is collected and purified by redissolving it in alcohol and precipitation by water, as before.

2. (Hennel.) The alcoholic extract of elaterium is digested in ether, and the residuum dissolved in hot alcohol; crystals form as the solution cools.

3. An alcoholic tincture is evaporated to the consistence of a syrup, and thrown into a mixture of equal parts of liquor of potassa and water at a boiling temperature. Almost pure elaterin separates as the liquid cools.

Obs. Elaterin forms delicate, white, silky crystals, having a bitter taste; it is fusible at about 365° Fahr.; tastes bitter; odourless; neutral; insoluble in water; and dissolves readily in hot alcohol. Its medicinal action is similar to that of elaterium, differing only in its greater activity.—*Dose.* $\frac{1}{16}$ gr. to $\frac{1}{8}$ gr.

ELATERIUM. *Syn.* SQUIRTING CUCUMBER. In *pharmacy*, 'the fresh unripe fruit' of the wild cucumber, '*Echium officinarum*—Richard,' Ph. L. (*Momordica Elaterium*, Linn.). According to present usage, the word is more generally applied to the feculence deposited from the juice of the wild cucumber. It is thus applied in Ph. E. & D. (See *below*.)

Elaterium. B. P. *Syn.* EXTRACT OF ELATERIUM, E. OF SQUIRTING CUCUMBER; EXTRACTUM ELATERII (Ph. L.), ELATERIUM (Ph. E. & D.), L. The feculence of the juice of the above fruit.

Prep. 1. (Ph. L.) Slice wild cucumber before it is quite ripe in the long direction, and strain the juice, very gently expressed, through a fine hair sieve; then set it aside for some hours, until the thicker part has subsided. The thinner supernatant fluid being rejected, dry the thicker portion with a gentle heat. The processes of the other colleges are essentially the same.¹

2. (Dr. Clutterbuck.) The cucumbers (fully ripe) are cut longitudinally, and sprinkled with cold water, and the juice allowed to strain through a fine sieve into an earthenware vessel. The seeds and surrounding pulp are next placed on the sieve, with the split fruit, and washed repeatedly with cold water. The washings being received in the same vessel with the juice, the whole is allowed to repose for a few hours, when the clear portion is decanted and the sediment spread thinly on fine linen, and dried by exposure to the air and a gentle heat, avoiding the sunshine or a bright light. Quality very fine. Forty fruits, by this process, yield only 6 grs. of elaterium.

3. (Apothecaries' Hall.) The fruit, slit into halves, is placed in hempen or horsehair bags, and submitted to slight pressure in a tincture press. The juice, as it runs off, passes through a fine hair sieve into a cylindrical glass jug or jar, where it is allowed to remain for two hours, when the clear supernatant liquor is poured off, and the thick portion containing the sediment is poured on a paper filter, supported on linen, and allowed to drain, after which it is dried by a gentle heat in a stove. The product has a green colour, and constitutes the finest elaterium of commerce. A darker and inferior article is obtained from the liquor, poured from the first sediment by placing it in shallow pans, and allowing it again to deposit.

Prop., &c. Elaterium is sold in thin cakes, and when pure has a pale-gray or greenish-gray colour, floats on water, is easily pulverised by pressure, and forms with rectified spirit a rich, green-coloured tincture. Elaterium obtained as a second deposit (ELATERIUM NIGRUM), is dark and inferior. Alcohol dissolves from 50% to 60% of good elaterium. "When exhausted by rectified spirit, the solution, concentrated, and poured into hot dilute solution of potassa, deposits, on cooling, minute silky, colourless crystals (of ELATERIN), weighing from $\frac{1}{4}$ th to $\frac{1}{2}$ th of the elaterium operated on." (Ph. E.)

Obs. To procure a fine sample of elaterium, it is necessary to remove it as soon as it is deposited, as a heavy mucilage falls down soon afterwards, which materially injures its quality and appearance. English elaterium is the

best. The foreign is uniformly adulterated with chalk or starch, and coloured with sap green.

Dose. $\frac{1}{10}$ gr. to $\frac{1}{2}$ gr., formed into a pill with extract of gentian and liquorice powder; as a hydragogue and cathartic in dropsies, twice a day, repeated every other day for a week or ten days. Its use must be avoided when there is much debility or any inflammatory symptoms. Larger doses than $\frac{1}{2}$ gr. of pure elaterium are poisonous. The *antidotes* are emetics, followed by demulcents, opium, and stimulants.

ELDER. *Syn.* SAMBUCUS (Ph. L. & E.), L. A large shrub or small tree belonging to the natural order *Caprifoliaceae*. It is indigenous in Europe, and has long been valued for its medicinal properties. "The recent flowers of the *Sambucus nigra*" (Ph. L.) or common elder are regarded as diaphoretic and pectoral, and a distilled water (ELDER-FLOWER WATER; AQUA SAMBUCI) is made of them. The inner bark of the same tree is purgative and emetic, and is used in dropsy; the leaves are purgative; the juice of the fresh berries is made into wine (ELDER WINE), and is largely used to make FACTITIOUS PORT WINE, and to adulterate the real wine. See WATERS (Distilled).

ELECAMPANE. *Syn.* INULA (Ph. L.), L. "The root of *Inula Helenium*" (Ph. L.). A plant of the nat. order *Compositae*. Tonic, diaphoretic, and expectorant.—*Dose.* 20 grs. to 1 dr., or more, either in the form of powder or decoction; in catarrh, dyspepsia, &c. It is now seldom used.

ELECTRIC. *Syn.* ELECTRICAL. Exhibiting the effects of ELECTRICITY when 'excited' by friction; pertaining to, derived from, or produced by electricity.

Electric. *Syn.* INSULATOR, NON-CONDUCTOR. A substance which may under ordinary circumstances be readily made to evince electrical properties by friction. Electrics do not transmit, or conduct, electricity; whilst, on the other hand, ANELECTRICS are good transmitters or conductors of electrical action. The most perfect electrics are shell-lac, sulphur, amber, jet, resinous bodies, gums, gun-cotton, glass, silk, diamond, agate, and tourmaline; dry fur, hair, wood, feathers, and paper; turpentine and various oils; dry atmospheric air and other gases, steam of high elasticity, and ice at 0° Fahr. The most perfect anelectrics or conductors are the metals, charcoal, and saline fluids.

Electric Eel. The *Gynotus electricus*, a fish having the power of giving violent electric 'shocks'; which power it exerts for killing or stunning its prey. It is an inhabitant of the fresh-water lakes and rivers of the warmer regions of America, Africa, and Asia.

Electrical Machine. An instrument for the excitation and collection of electricity. The term is only applied to contrivances in which friction is the immediate cause of the electrical disturbance; those which act through chemical

¹ At the Mitcham Gardens, elaterium is manufactured in much the same way, only that considerable force is used in the expression of the juice, and the product therefore less potent, though more in quantity. The manufacture usually commences about the second week in September. (Dr. Royle.)

force, magnetism, or heat, being known by various distinctive names, as 'voltaic battery,' 'electro-magnetic machine,' 'induction-coil,' 'thermo-electric pile,' &c.

The electrical machines in common use are composed of a hollow glass cylinder, or circular plate of glass, turning on an axis, and rubbing against two or more leather rubbers covered with silk, the electricity being collected by sharp points fixed in a metal rod standing on a glass pillar. A description of these instruments, however, would be out of place in the present work, which does not aim at giving information that may be easily obtained from other sources.

Cylinder machines are seldom made of greater size than 13 inches by 9, and are about as powerful as an 18-inch plate machine. The latter are commonly made up to 3 and 4 feet diameter, and will, with a suitable condenser, give 15-inch sparks in air.

ELECTRICITY (*-trîs'-it-e*). The name given primarily to one of the great forces of nature, and secondarily to that department of *physical science* which embraces all that is known respecting this particular force. Many theories respecting the nature of electricity have been advanced for the purpose of explaining electrical phenomena. The theory of Dr. Franklin supposed the existence of a single homogeneous, imponderable fluid, of extreme tenuity and elasticity, in a state of equable distribution throughout the material world. This fluid is assumed to be repulsive of its own particles, but attractive of all other matter. When distributed in bodies, in quantities proportionate to their capacities or attraction for it, such bodies are said to be in their 'natural state.' When we increase or diminish the natural quantity of electricity in any substance, excitation is the result, and the substance, if 'overcharged,' is said to be electrified 'positively'; or if 'undercharged,' 'negatively.' These theories, and all others based upon the assumption that electricity is a form of matter, have been found to be inadequate for the elucidation of electrical phenomena.

At the present day, however, two kinds of electric forces are recognised, and distinguished as negative and positive, but they are both assumed to be analogous in principle, and very generally assumed to be simply due to different, analogous motions of matter. For a full exposition, however, the reader must refer to some of the especial works on the subject.

ELECTRO-CHEMISTRY. That branch of chemistry which treats of the agency of electricity in effecting chemical changes.

ELECTRO-ETCHING. See **ETCHING**.

ELECTROLYSIS (*-trîl'-e-sis*). Electro-chemical decomposition. The voltaic current has the power of loosening and separating the constituents of certain compound bodies when these are interposed in the circuit. The substances which are thus susceptible of decomposition are termed electrolytes. They are all

binary compounds, containing single equivalents of their components, which are held together by very powerful affinities. The amount of electrical power required to effect decomposition varies greatly with different electrolytes: solution of iodide of potassium, melted chloride of lead, hydrochloric acid, water mixed with a little sulphuric acid, and pure water, demand very different degrees of decomposing force, the resistance increasing from the first-mentioned substance to the last, which latter it has been denied can be decomposed. One of the indispensable conditions of electrolysis is fluidity. When a liquid is electrolysed its components are disengaged solely at the limiting surfaces, where, according to the usual figurative mode of speech, the current enters and leaves the liquid, all the intermediate portions appearing quiescent. The terms 'anode' and 'cathode' have been proposed respectively for the surfaces which are supposed to receive and let out the current of positive electricity. The anode is therefore directly against or opposite the positive pole of the battery, or, according to the improved nomenclature, the positive electrode; and the cathode against the negative pole, or electrode. The bodies which are set free by the action of the current are termed ions; those which go to the anode and appear at the positive electrode being distinguished by the term anions, and those which go to the cathode and appear at the negative electrode by the term cations. This nomenclature has, however, been but partially adopted, and is making but slow way, if any, many preferring the old terms of electro-positive for anions, and electro-negative for cations.

The relative decomposing effects produced by the same current in different electrolytes are exactly expressed by the chemical equivalents of the electrolytes. Thus, if a current be made to traverse acidulated water, iodide of potassium, and chloride of lead, these three electrolytes will suffer decomposition at the same time, but by no means to the same extent; for the current which decomposes but 9 parts of water will separate into their elements 166 parts of iodide of potassium and 139 parts of chloride of lead. The electrolysis of metallic salts is now carried out on a large scale in the beautiful arts, which we notice under the general head of **ELECTROTYPING**.

ELECTRO-PLATING and **GILDING**. See **ELECTROTYPING**.

ELECTROPHORUS. A simple instrument for exciting electricity, generally used in the chemical laboratory for charging small Leyden jars when gases have to be exploded by the electric spark. To construct it, a plate of tinned iron is made into a circle of about 12 inches diameter; a raised border is then turned up for about half an inch, and the extreme edge is turned outwards over a wire to avoid a sharp border. A mixture of equal parts by weight of shell-lac, Venice turpentine, and resin, is made by gently heating them together

with stirring until well fused and thoroughly incorporated. This composition is poured into the plate, to quite fill it, and kept melted until all bubbles have disappeared. Another portion of the instrument, serving the same purpose as the conductor of an electric machine, is a circle of wood, rather smaller than the resinous plate, rounded at the edge, and neatly covered with tin-foil. An insulating handle, formed of a piece of stout glass rod, is cemented into the centre of this wooden disc. Before using the instrument it must be carefully dried and slightly warmed. The resinous surface is excited by beating it obliquely with a folded piece of warm flannel. When this has been done for about a minute, the warm, dry cover of the instrument is to be placed upon the resinous plate, and touched with the finger. If the cover is then raised a few inches, and the knuckle approached, a powerful spark of positive electricity will pass; and if the cover be again replaced, touched, and raised, a second spark will pass. This may be repeated many times without again exciting the resinous plate. By receiving the sparks with the knobs of a Leyden jar, a charge strong enough to give a powerful shock, or explode a gaseous mixture, may be rapidly obtained. Other forms have been given to the instrument, but the essential part of every one is a plate of some resinous substance.

ELECTROTYPE. *Syn.* ELECTRO-METALLURGY, GALVAN'O-PLASTIC. The art of working in metals by the aid of electricity. Strictly speaking, the term electrotype is only applicable to one branch of 'electro-metallurgy'—that which relates to the production of copies of engraved plates, medals, coins, and other works—but it is now commonly employed in the sense indicated by our definition. According to this extended signification of the term, the art of electrotype includes ELECTRO-PLATING and ELECTRO-GILDING.

General principles.—If a current from a voltaic battery be passed, by means of platinum electrodes, through water to which some sulphuric acid has been added, electrolysis takes place, hydrogen appearing at the cathode, and oxygen at the anode. If into the acid liquid some crystals of sulphate of copper be now thrown, electrolysis will still go on, but only one of the elements of the water, namely, oxygen, will be evolved; for the hydrogen, on being released, will take the place of the copper in the solution, and the copper thus liberated will be deposited on the platinum plate or wire which constitutes the negative electrode. This experiment may be continued until all the copper is abstracted from the solution. Let this experiment be repeated with a copper plate for the positive electrode, and it will be found that neither of the gases will be evolved. The hydrogen, as before, will take the place of the copper in the solution; the oxygen, instead of escaping at the anode, will combine with

the copper of the electrode and the sulphuric acid to form sulphate of copper. The chemical forces called into action by the current are so beautifully balanced, that in the last experiment the quantity of copper supplied by the positive electrode exactly equals the quantity withdrawn from the solution and deposited upon the negative electrode. The whole art of electrotype consists in applying the metals thus released from their solutions to artistic or useful purposes. To obtain compact and brilliant deposits, many precautions have to be observed. The solutions must be kept saturated, or nearly so; the mould to be copied, or object to be coated, must not be too small in proportion to the size of the zinc plate of the battery; in fine, the power employed must be carefully regulated according to the work to be done. In all arrangements the moulds or objects which receive the deposits act as negative electrodes, and are consequently in connection with the zinc of the battery or generating cell.

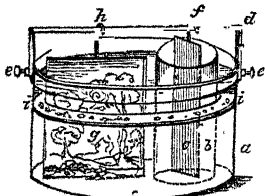

Electrotype processes. Although reguline deposits of many metals can be obtained through the agency of voltaic electricity, we shall only treat of those of copper, silver, gold, and platinum. When copper is deposited, the object is generally to produce a substantial copy of a medal, an engraved plate, or other work of art; but when solutions containing the precious metals are electrolysed, the deposits are nearly always used for covering the surface of inferior metals. We shall notice the operations connected with the deposition of copper, and those relating to electro-plating under separate heads.

1. DEPOSITION OF COPPER:—

The moulds or models intended to receive the deposited metal may be formed of various materials. For medals and similar small works, moulds of fusible metal, white wax, stearine, stearic acid, and gutta percha, are commonly used. The first are formed by dropping or pressing the medals to be copied upon the melted metal, taking care that the former are quite cold, and that the surface of the metal is bright or free from oxide. To make a mould in gutta percha, the material must be softened in warm water, and then pressed upon the medal by means of a strong screw press. With the other materials the manipulation is very easy. A ribbon of cardboard or thick paper is placed round the medal, so as to form a rim; the material, which has been melted in an earthen vessel, is then poured on, and allowed to remain until quite cold and hard, when it is cautiously removed. For large works, moulds of plaster of Paris are usually employed; these require to be saturated with wax or tallow, by standing them in a shallow vessel containing these substances in a melted state. For copying seals and small coins, impressions in ordinary sealing-wax may be used as electrotype moulds. Non-

metallic moulds must be coated with some substance which has the property of conducting electricity, before they can be used as negative electrodes. The substance commonly employed is plumbago or black-lead. It must be in the condition of an impalpable powder. It is rubbed briskly over the surface of the mould (wax, tearine, plaster, &c.) by means of a strong, fine camel-hair brush, till the whole presents the well-known black-lead polish. The adhesion of the plumbago may be often promoted by breathing slightly on the mould. To cause it to adhere to sealing-wax impressions, the wax may be slightly moistened with spirits of wine, or exposed to the vapour of ether. Delicate moulds and objects, which cannot well be black-leaded, may be covered with a conducting film of silver, by first dipping them in bisulphuret of carbon holding about $\frac{2}{3}$ th part of phosphorus in solution, and then, after a few seconds, immersing them in a weak solution of nitrate of silver, and allowing them to dry in the light. Metallic moulds require no preparation.

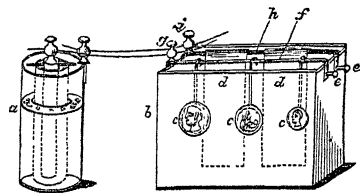

The voltaic apparatus used may now be described. The single-cell arrangement, used for small works, is formed on the principle of Daniell's Constant Battery. It consists of a vessel of glass, earthenware, or wood, containing a smaller cell of thin biscuit ware, or other porous material; a rod or plate of amalgamated zinc, placed within the porous cell, and a wire connecting the zinc with the mould to be copied; the latter being placed in the outer vessel. The annexed figure represents a convenient form of the single-cell:—

- a. An oval vessel of salt-glazed earthenware or wood nearly filled with a saturated solution of sulphate of copper.
- b. A porous diaphragm, containing the cylinder or plate of zinc (c), and filled with dilute sulphuric acid.
- d. A small bar of brass or copper, fastened to the vessel by the binding screws (e, e), and supporting the plate of zinc (c), by the hook of copper wire (f), and the mould (g), by the hook (h).
- i. A small shelf or partition to support crystals of sulphate of copper, to keep up the strength of the solution.

The battery arrangement has many advantages over that described above, and should always be employed when large objects are to be electrotyped, or when a number of small moulds are to be operated upon. In this arrangement the copper solution is electrolysed in a separate vessel, termed the decomposition cell, and the current generated by one or more cells of a Daniell's or Smee's battery. This

arrangement is shown in the following engraving:—

- a. A constant battery cell.
- b. Decomposition cell; a cubical vessel made of wood or earthenware, and filled with a mixture of 1 part of dilute sulphuric acid (1 acid + 9 water), and 2 parts of saturated solution of sulphate of copper, by measure.
- c, c. Moulds suspended to the brass rod (f), and connected with the zinc or positive element of the battery (a), by means of the screw (g).
- d, d. Pieces of sheet copper suspended on the brass rod (h), and connected with the zinc end of the battery, by means of the screw (i), employed to keep up the strength of the cupreous solution in the decomposition cell.

To connect the moulds with the zinc or positive element, stout copper wires or strips of thin sheet copper are employed. In the case of a non-metallic mould, the wire must lead directly to the plumbagoed surface, or, what amounts to the same thing, the plumbago must be extended to the point of attachment. The connecting wires, and the backs and edges of metallic moulds, must be covered with sealing-wax varnish, or other non-conducting substance, to prevent them receiving the deposit. Before a mould is placed in the copper solution it is advisable that everything should be arranged, so that the immersion may occasion immediate voltaic action. If the connection between the zinc and the mould is not effected until after the immersion, the solution may act chemically on the surface of the mould, and cause the deposit to appear dark and dirty. When a mould has remained in the solution long enough to receive a complete coating of copper, it may be lifted out with impunity for examination. If everything is going on well, the deposited metal will present a brilliant, light, copper-coloured surface. When sufficiently thick, the deposit is removed with care, washed, and placed to dry. Electrotype medals may be polished with wash-leather and the plate brush, or bronzed. Various natural objects, such as insects, fruits, &c.; small works of art, such as busts and statuettes; chemical vessels, particularly glass flasks and retorts; and numerous classes of articles, may be rendered less fragile by coating them with copper by the electrotype process.

II. DEPOSITION OF THE PRECIOUS METALS.—

The solutions generally employed as electrolytes from which silver and gold are respectively separated, are those of the argento-

cyanide and the auro-cyanide of potassium. These compounds are what chemists call double salts; for instance, cyanide of potassium is simply a compound of potassium and cyanogen; but argento-cyanide of potassium is cyanide of silver united with cyanide of potassium. When a solution of this double salt is electrolysed silver appears at one electrode and cyanogen at the other, while a proportionate amount of the simple cyanide of potassium is formed in the solution. But if the positive electrode is of silver, the cyanogen combines with it, and forms cyanide of silver, which unites with the liberated cyanide of potassium, and so keeps up the strength of the solution.

As in the deposition of copper, the apparatus used for plating or gilding may be the single cell or the decomposition cell and battery. The necessity of economising solutions of silver and gold has, however, led to certain modifications in the apparatus. The single-cell arrangement consists, as before (see *above*), of an outer vessel of glass or earthenware, containing a cell of porous biscuit ware; but the object to be silvered or gilded is placed, with the cyanide solution in the latter, while the zinc is placed in the outer vessel, with the dilute sulphuric acid.¹ The zinc is usually employed in the form of a cylinder, completely surrounding the porous cell. In the battery arrangement the decomposition cell may be of porcelain or glass; the silver or gold employed to keep up the strength of the solution may be in plates, wires, or ingots. For plating small objects, a single cell of a Daniell's battery will afford ample decomposing power; gilding may be better accomplished by using 3 such cells. The battery arrangement is much more convenient, effective, and economical than the single-cell arrangement.

On a large scale, electro-plating is carried out in oblong vats, occasionally holding from 200 to 250 gallons of solution. Silver plates, connected with a powerful voltaic or magneto-electric battery, are placed at intervals in the vats; they form the positive electrodes, and correspond in extent of surface with the articles to be coated, and face them on both sides. The articles (tea-pots, cruet-frames, forks, spoons, &c.) act as the negative electrodes, and are suspended by copper wires from brass rods laid lengthways over the vats, and connected with the battery. The articles plated are usually formed of nickel silver or German silver, which is chosen on account of its silvery whiteness, a quality of great importance when portions of the coating of noble metal have been worn away by use.

To prepare the articles for plating, they are first boiled in a solution of potassa, to free them from grease; they are then quickly dipped in

¹ The strength of the acid water acting upon the zinc must be regulated according to the work to be done. If the action between the acid and the zinc be too energetic, the electricity developed will be more than sufficient to release pure metal, and hydrogen will be evolved, which will interfere with the deposition.

red nitrous acid, to remove any oxide that may have formed on the surface, and after this well washed in water, to remove every trace of acid. They are then suspended from copper wires, and dipped into a solution of mercury in cyanide of potassium, or some other mercurial solution, and afterwards washed in water, as before. The amalgamation of the surface effected by the last operation promotes the adhesion of the film of silver. The articles having been weighed, are now immersed in the silvering solution, and left until a sufficient amount of silver has been deposited on them. Their condition at any time may be ascertained by weighing a test-object removed from the solution. In some electro-plating establishments the silvering solution is kept constantly stirred by simple mechanical arrangements; in others, continual motion is given to the suspended articles. On being removed from the vats the plated articles are well brushed with brushes of fine brass wire attached to a lathe, and cleaned with fine Calais sand; they are afterwards polished on revolving brushes with rottenstone, then by hand with soft leather and rouge, and, lastly, with the naked female hand. A lasting polish is given to some articles by burnishing with a burnisher formed of highly polished hardened steel, bloodstone, agate, or flint. The process of electro-gilding on the large scale is nearly the same as that of electro-plating or silvering, but, of course, plates of gold are suspended in the solution instead of silver plates.

Various solutions for silvering, plating, and platinising, have been recommended. We give below those generally employed.

1. Solvent solution. Cyanide of potassium, 2 oz.; distilled water or rain water, 1 pint; dissolve. • Other proportions may be employed. *Used* as a general solvent for salts of silver, gold, and platinum.

2. Silver solution. Oxide of silver?² (not dried), 1 oz.; the solvent solution (No. 1), 1 pint. *Used* for the single-cell apparatus; its strength being maintained as the deposition proceeds by a fresh supply of oxide from time to time.

Cyanide of silver dissolved in solvent solution (No. 1). This is the solution generally employed for plating with a separate decomposition cell.

3. Gold solution. Add to a pint of No. 1 oxide of gold, $\frac{1}{2}$ oz. *Used* in the same manner as the second silver solution.

Cyanide of gold dissolved in solution of cyanide of potassium (No. 1). *Used* as last.

4. Platinum solution. The double chloride of platinum and potassium, dissolved in solution of caustic potassa. Other solutions have been proposed, but this appears to be decomposed with the greatest ease.

The above sketch of the electrotype art is

² Precipitated from pure solution of nitrate of silver by excess of lime water. It should be well washed, and preserved in bottles with distilled water.

necessarily very imperfect. For minute details respecting manipulation, the reader is referred to the excellent treatises on the subject that have been written.

ELECTUARY. *Syn.* ELECTUARIUM, L. Electuaries (ELECTUARIA) are formed of light powders, generally vegetable, mixed up with honey, syrup, or sugar, to the consistence of a stiff paste. In the present Pharmacopoeia they are included under the title Confection, but this arrangement is manifestly improper, as the words are not synonymous. In Conserves and Confections, the addition of the saccharine matter is in much larger proportion, and is designed to preserve the vegetable matter; in Electuaries, the syrup is designed merely to communicate the required form. (Dr. Murray.)

The preparation of electuaries is similar to that of confections and conserves, and the same precautions must be observed to reduce the dry ingredients to very fine powder before adding them to the syrup or other substances used to give them form. Care must also be taken to diffuse the ingredients equally through every portion of the mass, by patient and laborious stirring. The neglect of this point has often led to disagreeable consequences, from some portion of the electuary being nearly inert, while another portion has possessed increased activity. See CONFECTION, CONSERVE, LINCTUS, &c.

Electuary of Ac'etate of Potassa. See CONSERVE.

Electuary of Al'um. *Syn.* ELECTUARIUM ALUMINIS, L. *Prep.* 1. (Phæbus.) Alum, 1 dr.; extract of logwood, 4 drs.; balsam of Peru, 6 drops; water of sage, q. s. Astringent and antiseptic; in diarrhœa, sponginess of the gums, &c.

2. (St. Marie.) Alum, 1 dr.; catechu and extract of bark, of each, 2 drs.; conserve of roses, 6 drs.; simple syrup, q. s.—*Dose.* A teaspoonful, every 4 hours; in chronic diarrhœa, leucorrhœa, hemorrhages, &c. See CONFECTION.

Electuary, An'odyne. *Syn.* ELECTUARIUM ANODYNUM, L. *Prep.* See CONFECTION OF OPIUM.

Electuary, Ar'abic. *Syn.* ELECTUARIUM SARZE COMPOSITUM, E. ARABICUM, L.; ELECTUAIRE ARABIQUE, Fr. *Prep.* From sarsaparilla, 5 oz.; genna and China root, of each, 3 oz.; dried walnut peel, 1 oz. (all in fine powder); honey, q. s.—*Dose.* 1 to 4 drs. See TRAITEMENT ARABIQUE.

Electuary, Aromat'ic. *Syn.* ELECTUARIUM AROMATICUM (Ph. E.). This preparation differs from the aromatic confection of the other British colleges, in not containing chalk. It is aromatic and stomachic, but not antacid or absorbent. See CONFECTION.

Electuary, Bath. *Syn.* ELECTUARIUM ANTICACHECTICUM, E. MARTIALE, E. FERRI COMPOSITUM, L. *Prep.* From blacksmiths' clinkers, reduced to an impalpable powder, and made

into an electuary with honey or treacle, q. s.; afterwards adding powdered ginger and carbonate of magnesia, of each, 1 oz., to every lb. of the mixture.—*Dose.* A teaspoonful night and morning every day, for 3 or 4 days, and again, after an equal interval, as long as thought necessary; as a chalybeate tonic, and in worms.

Electuary of Bitar'trate of Potas'sa. *Syn.* ELECTUARIUM POTASSÆ TARTRATIS, L. *Prep.* (Monro.) Cream of Tartar, 1 oz.; powdered ginger and conserve of roses, of each, 1 dr.; syrup of orange peel, q. s.—*Dose.* 1 to 3 drs.; as a hydragogue purge. It is also a useful laxative in common cases. See CONFECTION OF CREAM OF TARTAR.

Electuary, Black. *Syn.* TROUSSEAU'S ELECTUARY, TROUSSEAU'S BLACK TONIC; ELECTUARIUM NIGRUM, E. FERRI TANNATIS, L. *Prep.* From sesquichloride of iron, 4 drs.; tannin, 1 dr.; confection of roses, 2 oz.; syrup of orange peel, 1 oz. Tonic and astringent.—*Dose.* 5 to 30 grs.

Electuary of Black Pep'per. See CONFECTION OF PEPPER.

Electuary of Burnt Sponge. *Syn.* ELECTUARIUM SPONGIÆ USTÆ, L. *Prep.* (Hulse.) Burnt sponge, 10 grs.; rhubarb, 4 grs.; conserve of roses, q. s. For a *dose*, to be taken night and morning; in scrofula, glandular swellings, &c. See CONFECTION OF SPONGE.

Electuary of Cas'sia. *Syn.* ELECTUARIUM CASSIÆ (Ph. D. 1826.), E. C. FISTULÆ (Ph. E.), L. *Prep.* (Ph. D. 1826.) Fresh cassia pulp and syrup of orange, of each, $\frac{1}{2}$ lb.; manna, 2 oz.; tamarind pulp, 1 oz.; mix, and evaporate to a proper consistence.—*Dose.* 2 drs. to 1 oz.; as a gentle laxative for children, or as a vehicle for other cathartics. That of the shops is commonly made with equal parts of tamarind and cassia pulps, mixed with $\frac{1}{4}$ th of manna, and flavoured with a few drops of tincture of orange peel, without any evaporation. See CONFECTION.

Electuary of Cat'echu. *Syn.* ELECTUARIUM CATECHU, CONFECTION C., C. JAPONICA, L. *Prep.* (Ph. E.) Powdered catechu and kino, of each, 4 oz.; cinnamon and nutmegs, of each, 1 oz.; opium (dissolved in a little sherry), $1\frac{1}{2}$ dr.; syrup of red roses (evaporated to the consistence of honey), $1\frac{1}{2}$ pint. See CONFECTION, and below.

Electuary of Catechu (Compound). *Syn.* ELECTUARIUM CATECHU COMPOSITUM (Ph. D.). See CONFECTIONS. Both the above are astringent, aromatic, and anodyne.—*Dose.* 15 grs. to 1 dr., or more; in diarrhœa, dysentery, &c.

Electuary, Cathar'tic. *Syn.* ELECTUARIUM CATHARTICUM, L. *Prep.* 1. Confection of senna, $1\frac{1}{2}$ oz.; flowers of sulphur, $\frac{1}{2}$ oz.; syrup of roses or of orange peel, q. s.—*Dose.* A teaspoonful, 3 or 4 times a day, in piles; or, 2 to 3 teaspoonfuls, as a gentle laxative for females, and in skin diseases, gonorrhœa, &c. A mild and excellent medicine. It may be safely given in larger doses.

2. (Brera.) Aloes, 8 grs.; cream of tartar, 2 drs.; honey, q. s. For a *dose*. In amenorrhœa, attributed to abdominal engorgement.

Electuary, Cephalic. *Syn.* ELECTUARIUM CEPHALIUM, E. VALERIANÆ COMPOSITUM, L. *Prep.* (Hosp. F.) Valerian root and mistletoe of the oak, of each, 1 oz.; honey, 1½ oz.; tincture of henbane, q. s. to make an electuary. In nervous and rheumatic headache, &c.; assisted by an aperient.

Electuary of Char'coal. *Syn.* ELECTUARIUM CARBONIS, E. CARBONII, CONFECTIO C., L. *Prep.* 1. (Hosp. F.) Confection of senna, 2 oz.; fresh burnt charcoal, ½ oz.; carbonate of soda, ¼ oz.; syrup of orange peel, q. s.

2. (Radius.) Electuary of senna, 2 oz.; powdered charcoal and carbonate of soda, of each, 1 dr. Both the above are given in obstinate constipation.—*Dose.* 1 to 3 teaspoonfuls twice a day. See TOOTH ELECTUARY.

Electuary for Chol'era. *Syn.* ELECTUARIUM ANTI-CHOLERIUM, L. The preparations that come under this name are numerous, including aromatic confection, and several like absorbent or astringent preparations. This name has been given to the American remedy for cholera, noticed at page 335.

Electuary of Cincho'na Bark. *Syn.* ELECTUARY OF BARK; ELECTUARIUM CINCHONÆ, L. *Prep.* 1. From yellow bark and simple syrup, of each, 1 oz.; conserve of red roses and confection of orange peel, of each, ½ oz., Tonic and febrifuge.—*Dose.* 1 to 4 drs.; in debility, agues, &c.

2. (Radius.) Peruvian bark, 1 oz.; syrup of orange peel, q. s. As the last.—*Dose.* A teaspoonful or more, 3 or 4 times daily. (See *below*.)

Electuary of Cinchona (Compound). *Syn.* ELECTUARIUM CINCHONÆ COMPOSITUM, L. *Prep.* 1. (ACIDULATED,—Copland.) Yellow bark, 1 oz.; confection of roses, ½ oz.; diluted sulphuric acid, 1 dr.; syrup of ginger, 1½ oz.

2. (ASTRINGENT,—Saunders.) Powdered Peruvian bark, orange peel, and conserves of roses and hips, of each, 6 drs.; crabs' eyes (or prepared chalk), 2 drs.; syrup of catechu, q. s.—*Dose.* A teaspoonful, 2 or 3 times daily; in chronic diarrhœa, &c.

3. (WITH CATECHU,—Pierquin.) Peruvian bark, 1 oz.; catechu and balsam of tolu, of each, 1 dr.; syrup of comfrey (*Symphytum officinale*,—Linn.), q. s.—*Dose.* As the last; in spitting of blood, hæmorrhages, &c.

4. (WITH CLOVES,—Dewees.) Peruvian bark, 2 oz.; cloves, 1 dr. (better, 4 drs.); simple syrup, q. s. A piece the size of a walnut, every hour or two, during the intermission of an ague.

5. (WITH IRON,—Cadet.) Peruvian bark, 6 drs.; oxide of iron and confection of opium, of each, 2 drs.; syrup of cinnamon, q. s.—*Dose.* A teaspoonful, or more, twice a day; in dropsy of the belly, after the evacuation of the fluid, and as a tonic in debility, accom-

panied by nervous excitement, &c., in the absence of fever.

6. (Quarin's.) Red bark, 1 oz.; ammoniated iron, 1 dr.; made into an electuary with equal parts of oxymel of squills and syrup of the 'five roots' (diuretic). Tonic, febrifuge, and pectoral.

7. (WITH SAL-AMMONIAC,—R Cod.) Gray bark, 2½ oz.; hydrochlorate of ammonia, 1 dr.; honey and syrup of wormwood, of each, 2 oz. In intermittents occurring in scrofulous subjects.

8. (WITH SODA,—P. Cod.) Powdered cinchona, 1 oz.; carbonate of soda, 2 drs.; thin mucilage, of each, 2 drs.; extract of opium, and stomachic.—*Dose.* 2 drs., 2 or 3 times a day; in agues, complicated with acidity and dyspepsia.

9. (WITH SULPHUR,—Cadet.) Peruvian bark, 1 dr.; sulphur, crabs' eyes (chalk), and spermaceti, of each, 2 drs.; extract of opium, 4 drs.; conserve of roses, 4 drs.; syrup of milfoil, q. s. Highly praised in debility from phthisis.—*Dose.* A teaspoonful, 2 or 3 times a day, assisted with the liberal use of raw or lightly boiled eggs and cod-liver oil.

10. (WITH TIN,—Cadet.) Peruvian bark, 1 oz.; tin filings and valerian root, of each, ½ oz.; syrup of saffron, q. s. In epilepsy, worms, &c.—*Dose.* A teaspoonful, morning and evening. See CONFECTIO OF BARK.

Electuary of Copai'ba. *Syn.* ELECTUARIUM COPAIBÆ, L. *Prep.* 1. Copaiba and powdered cubebs, equal parts; conserves of roses and orange peel, of each (in equal quantities), q. s.

2. (Caspar.) Blanched almonds, 6 drs.; powdered marsh-mallow root, 1 dr.; catechu, ½ dr.; balsam of copaiba, 3 drs.

3. (Ricord.) Confection of almonds, 1 oz.; copaiba, ½ oz.; hard extract of rhatany, 3 drs.; syrup of orange peel, q. s. All the above are excellent in gonorrhœa, gleet, &c. The last two agree better with the stomach than most other like preparations.—*Dose.* 1 teaspoonful, or more (rapidly increased to 2 or 3 drs.), 3 or 4 times daily. See CONFECTIO.

Electuary of Cow'hage. *Syn.* ELECTUARIUM DOLICHOS, E. MUCUNÆ, L. *Prep.* 1. Dip the pods of dolichos in treacle, allow them to drain a moment, and then scrape off the hairs for use.

2. (Chamberlain.) As the last, nearly.

3. (Correa.) Cowhage (the hairs or setæ), 40 grs.; syrup, ½ oz.

4. (Ellis.) Cowhage (hairs), 1 dr.; honey, q. s.

5. (Guy's Hosp.) Cowhage (hairs), any quantity, made into an electuary with treacle, q. s. In worms.—*Dose.* For a child, a teaspoonful; for an adult, a table-spoonful; in the morning, fasting, and at night, for 3 or 4 days; followed by a dose of castor oil, to which a teaspoonful of turpentine may be advantageously added. See COWHAGE.

Electuary of Cubebs. *Syn.* ELECTUARIUM

CUBEBAE, L. *Prep.* 1. See ELECTUARY OF COPAIBA.

2. (Beral.) Cubebs and copaiba, of each, 2 oz.; powdered alum, 1 oz.; extract of opium, 5 or 6 grs.; mix.

3. (Bouchardat.) Cubebs, $1\frac{1}{2}$ oz.; copaiba, 1 oz.; sweet spirit of nitre, $\frac{1}{2}$ fl. dr.; oil of peppermint, 8 or 10 drops; powdered sugar, q. s.

4. (Radius.) Cubebs, $\frac{1}{2}$ oz.; honey, 1 oz. In gonorrhoea, mucous discharges from the vagina, bladder, &c.—*Dose.* 1 teaspoonful, afterwards increased to 2 or 3 teaspoonfuls, twice or thrice daily. See CONFECTION OF COPAIBA, ELECTUARY OF C., &c.

Electuary, Demulcent. *Syn.* ELECTUARIUM DEMULCENS, L. *Prep.* From spermaceti, syrup of poppies, and syrup of tolu, of each, 2 drs.; powdered gum tragacanth, 1 dr.; confection of roses, 6 drs.; nitre, $\frac{1}{2}$ dr.—*Dose.* A piece the size of a small filbert, frequently; as a pectoral and demulcent in coughs, hoarseness, &c.

Electuary, Deobstruent. *Syn.* ELECTUARIUM DEOBSTRUENS, L. *Prep.* (Copland.) Confection of senna, $1\frac{1}{2}$ oz.; cream of tartar, 1 oz.; sulphur and syrup of ginger, of each, 6 drs.; borax, 3 drs.; syrup of poppies, 2 drs.—*Dose.* A teaspoonful, or more, nightly; in the obstinate constipation of females, painful and suppressed menstruation, &c.

Electuary for Dysentery. *Syn.* ELECTUARIUM ANTI-DYSENTERICUM (Ph. E. 1744), L. *Electuary* of catechu, mixed with half its weight of Locatel's balsam.

Electuary, Emmenagogue. *Syn.* ELECTUARIUM EMMENAGOGICUM, L. *Prep.* From myrrh, 1 dr.; ammoniated iron, 1 scrup.; syrup of ginger, q. s. to mix.—*Dose.* $\frac{1}{2}$ dr. to 1 dr., night and morning; in deficient or suppressed menstruation.

Electuary for Epilepsy. *Syn.* ELECTUARIUM ANTI-EPILEPTICUM, L. *Prep.* 1. See ELECTUARY OF CINCHONA (Comp.), No. 10.

2. (Dr. Mead.) Powdered cinchona, 1 oz.; valerian and tin (both in powder), of each, $\frac{1}{2}$ oz.; syrup, q. s. to mix.—*Dose.* A teaspoonful, night and morning.

Electuary, Febrifuge. See ELECTUARY OF CINCHONA, &c.

Electuary of Indigo. *Syn.* ELECTUARIUM INDIGI, E. P. INDICI, L. *Prep.* (Phœbus.) Powdered indigo, 4 drs.; aromatic powder, $\frac{1}{2}$ dr.; syrup, 1 fl. oz. or q. s. In spasmodic diseases, especially in epilepsy, chorea, and hysteria, and the convulsions of children. It has also been used with advantage in that species of impotence in which strychnia is useful. The above quantity is to be all taken, in divided doses, during the day. To be of permanent advantage, it should be continued for several weeks.

Electuary of Ipecacuanha. See CONFECTION.

Electuary of Jalap. See CONFECTION.

Electuary of Kermes. MARMELADE DE ZA-

NETTI; ELECTUARIUM KERMETIS, E. K. MINERALIS, L. *Prep.* From manna, 4 oz.; pulp of cassia and oil of almonds, of each, 2 oz.; butter of cacao, $\frac{1}{2}$ oz.; Kermes mineral, 10 grs.; syrup of marsh-mallow, 3 fl. oz.; syrup of orange flower, q. s. A diaphoretic laxative.—*Dose.* 1 to 4 teaspoonfuls, or more.

Electuary of Laurel Berries. See CONFECTION OF RUE.

Electuary, Lenitive. See CONFECTION OF SENNA.

Electuary, Mahomed's. *Prep.* 1. From grocer's currants, 2 oz.; powdered senna, $\frac{1}{2}$ oz.; powdered ginger, 1 dr.; finely powdered capicum and cloves, of each, 20 grs.; croton oil, 3 drops; conserve of roses and syrup of saffron, of each, in equal parts, q. s. to mix.

2. (Bateman.) Currants, 1 oz.; senna, $\frac{1}{2}$ oz.; ginger, $\frac{1}{2}$ dr.; syrup of roses, q. s.; croton oil, 1 drop.—*Dose.* 1 or 2 teaspoonfuls, early in the morning; in dyspepsia and habitual constipation. The first formulary produces a most useful medicine, particularly for free-livers.

Electuary of Male Fern. *Syn.* ELECTUARIUM FELICIS MARIS, L. *Prep.* 1. Powder of male fern, 3 drs.; conserve of roses, 1 oz.

2. (Radius.) Ethereal extract of male fern, $\frac{1}{2}$ dr.; honey of roses, 1 oz. The half of either to be taken at night, and the remainder the next morning. In worms.

Electuary of Nitre. *Syn.* ELECTUARIUM POTASSÆ NITRATIS, L. *Prep.* (Hosp. F.) Nitre, 3 drs.; confection of roses, 2 oz.—*Dose.* A piece of the size of a filbert, where the use of nitre is indicated. See CONFECTION.

Electuary of Opium. See CONFECTION OF OPIUM.

Electuary, Pectoral. *Syn.* ELECTUARIUM PECTORALE, L. *Prep.* 1. (Ph. E. 1744.) From conserve of roses, 2 oz.; compound powder of tragacanth, 4 drs.; flowers of benzoin, 1 dr.; syrup of tolu, q. s.—*Dose.* A little, *ad libitum*.

2. Oxymel of squills, syrup of marsh-mallows, mucilage of gum arabic, and syrup of tolu, of each, $\frac{1}{2}$ oz.; powdered lump sugar, 2 oz. As the last.

Electuary of Pepper. See CONFECTION, and *above*.

Electuary for Piles. *Syn.* ELECTUARIUM HÆMORRHOÏDATE, L. *Prep.* 1. See CONFECTION AND ELECTUARY OF PEPPER.

2. (Dr. Copland.) Cream of tartar, 1 oz.; precipitated sulphur (pure), 3 drs.; confection of senna, 2 oz.; syrup of orange peel or ginger, q. s. to mix.

3. (Dr. Graves.) Confection of senna and sulphur, of each, 1 oz.; balsam of copaiba and cream of tartar, of each, $\frac{1}{2}$ oz.; jalap and ginger, of each, 1 dr.; syrup of orange peel, q. s.

4. (Hosp. F.) Confection of senna 2 oz.; black pepper and precipitated sulphur, of each, $\frac{1}{2}$ oz.; oil of cubebs, 1 dr.; syrup, q. s. The last three are useful laxatives in piles, and by

their preventing the accumulation and hardening of the fæces, often remove the affection.—*Dose.* A teaspoonful, three or four times a day. From the difficulty experienced in procuring pure precipitated sulphur, washed sublimed sulphur may be advantageously substituted.

Electuary of Pomegranate. *Syn.* ELECTUARIUM GRANATI, L. *Prep.* 1. From the root-bark, 1 dr.; assafœtida, $\frac{1}{2}$ dr.; croton oil, 6 drops; conserve of roses, 1 oz.—*Dose.* A teaspoonful, night and morning.

2. (Radius.) Extract of the root-bark, 6 drs.; lemon juice, 2 fl. drs.; linden water, 3 fl. drs.; gum tragacanth, q. s. to make an electuary. One half to be taken at once; the remainder in an hour. Both are given in tape-worm.

Electuary of Rhubarb. *Syn.* ELECTUARIUM RHEI, L. *Prep.* (Saunders.) Powdered rhubarb, $\frac{1}{2}$ dr.; sulphate of potassa, 1 dr.; cream of tartar, 4 drs.; pulp of tamarinds, 2 oz.—*Dose.* A teaspoonful, as a mild stomachic laxative.

Electuary of Scam'mony. See CONFECTION.

Electuary for Scur'vy. See CONSERVE (Antiscorbutic).

Electuary of Sen'na. See CONFECTION OF SENNA.

Electuary of Squills. *Syn.* ELECTUARIUM SCILLÆ, L. *Prep.* 1. Oxyinel of squills, 2 fl. oz.; cream of tartar and powdered sugar, of each, $\frac{1}{2}$ oz.—*Dose.* 1 to 2 teaspoonfuls, as a laxative and expectorant; in old coughs, &c.

2. (Radius.) Squills, nitre, gum ammoniacum, and tartrate (bitartrate) of potassa, of each, 2 drs.; sal-ammoniac, 20 grs.; syrup of cinnamon, q. s.—*Dose.* 2 drs., three times a day; in dropsies. See CONSERVE OF SQUILLS.

Electuary of Steel. *Syn.* ELECTUARIUM FERRI, E. CHALYBEATUM, L. *Prep.* 1. (Dr. Collier.) Potassio-tartrate of iron, $\frac{1}{2}$ oz.; confection of roses, 1 oz.; syrup, q. s. to mix.

2. (Collier.) Precipitated sesquioxide of iron, 1 oz.; honey, 2 oz.; ginger syrup, $\frac{1}{2}$ fl. oz. Both the above are tonic and emmenagogue.—*Dose.* One teaspoonful, thrice a day. See CONFECTION.

Electuary, Stimulant. *Syn.* ELECTUARIUM STIMULANS, L. *Prep.* From gum ammoniacum (strained), 1 oz.; vinegar of squills, $\frac{1}{2}$ oz.; mixed with a gentle heat, and spread on leather. Applied to the chest or pit of the stomach, as a mild counter-irritant and antispasmodic; and as a discutient to tumid glands and indolent tumours. It is wrongly called an electuary.

Electuary, Stomach'ic. *Syn.* DINNER ELECTUARY; ELECTUARIUM STOMACHICUM, CONFECTION STOMACHICA, L. *Prep.* 1. Rhubarb, gentio, and extract of chamomile, of each, 1 dr.; confection of orange peel, 4 drs.; syrup, q. s.

2. Rhubarb and gentian, of each, $\frac{1}{2}$ dr.; extract of hops and powdered capsicum, of each, $\frac{1}{2}$ dr.; oil of chamomile, 12 drops; con-

fection of hips and syrup of orange peel, of each, $\frac{1}{2}$ oz.

3. Green peppermint, lump sugar, and confection of orange peel, equal parts.—*Dose.* A teaspoonful, an hour before a meal. They are all excellent stomachics, and are useful to improve the appetite, and in dyspepsia.

Electuary of Sulphur. See CONFECTION OF SULPHUR, and *below*.

Electuary of Sulphur (Compound). *Syn.* ELECTUARIUM SULPHURIS COMPOSITUM, L. *Prep.* 1. Sulphur, $\frac{3}{4}$ oz.; cream of tartar, 1 oz.; confections of senna and black pepper, of each, 2 oz.; syrup of ginger, 1 fl. oz. An excellent medicine in piles.—*Dose.* A teaspoonful, twice a day.

2. (WITH BORAX.) Flowers of sulphur, 1 oz.; cream of tartar, $\frac{1}{2}$ oz.; borax, $\frac{1}{2}$ oz.; confection of senna, $2\frac{1}{2}$ oz.; syrup of orange peel, q. s. to mix.—*Dose.* 1 to 3 teaspoonfuls, in diseases of the uterine organs and lower bowels. See CONFECTION.

Electuary for the Teeth. *Syn.* ELECTUARIUM DENTIFRICUM, L. See TOOTH PASTE, DENTIFRICE, &c.

Electuary of Tin. See CONFECTION OF TIN, and *below*.

Electuary of Tin (Compound). *Syn.* ELECTUARIUM STANNI COMPOSITUM, L. *Prep.* 1. Powdered tin, 1 oz.; confection of oil of turpentine, 2 oz.

2. (Dr. Cheston.) Tin filings, 4 drs.; carbonate of iron (sesquioxide), 1 dr.; conserve of wormwood, 3 drs.

3. (Foy.) Powder of tin, 1 oz.; extract of wormwood and powdered jalap, of each, 1 dr.; compound syrup of chicory, q. s. In worms.—*Dose.* A table-spoonful, or more, for 2 or 3 successive mornings, fasting; followed by a purge.

Electuary of Turpentine. *Syn.* ELECTUARIUM TEREBINTHINÆ, L. *Prep.* 1. (St. B. Hosp.) Common turpentine, 1 oz.; honey, 2 oz.—*Dose.* 1 to 2 teaspoonfuls; in complaints of the urinary organs, worms, &c.

2. (Radius.) Turpentine, soap, and rhubarb, of each, 1 dr.; syrup of wormwood, q. s.—*Dose.* Three teaspoonfuls a day; in dropsy, worms, &c.

3. (E. OLEI TEREBINTHINÆ, — Copland.) As Confection of Turpentine.—Ph. D. See CONFECTION.

Electuary, Vermifuge. *Syn.* ELECTUARIUM ANTHELMINTICUM, E. VERMIFUGUM, L. *Prep.* 1. (Bresmer.) Worm-seed and tansy-seed, of each, 4 drs.; powdered valerian root, 2 drs.; jalap and sulphate of potassa, of each, $\frac{1}{2}$ to 2 drs.; oxyinel of squills, q. s. to mix.—*Dose.* A teaspoonful, or more; repeated night and morning, followed by a brisk purge.

2. (Rosenstein.) Worm-seed, 10 grs.; sulphate of iron, 4 grs.; jalap and honey, of each, 20 grs. For two doses, as the last. 2 or 3 drs. of confection of senna are often substituted for the jalap and honey.

3. (Foy.) Aloes, $\frac{1}{2}$ oz.; common salt, 3 drs.;

flour, 2 oz.; honey, q. s. to form a stiff paste. *Used* as a suppository in ascarides.

4. Flowers of sulphur, 4 oz.; powdered jalap, 1 oz.; powdered bark, 1 oz.; syrup of buckthorn, q. s.—*Dose*. Two or three teaspoonfuls, every morning early. See CONFECTION AND ELECTUARY OF TIN, TURPENTINE, WORMSEED, &c.

Electuary for Worms. See VERMIFUGE ELECTUARY (*above*).

ELEMENTS. *Syn.* ELEMENTARY BODIES, SIMPLE B.; ELEMENTA, L. In chemistry, those substances or bodies which have hitherto resisted every attempt which has been made to decompose them, or to resolve them into simpler forms of matter. Earth, air, fire, and water, were regarded by the ancients as simple bodies, of which all others are composed, and they still constitute the 'four elements' of the vulgar. The imaginary principles or elements of the alchemists were termed salt, sulphur, and mercury. About sixty-four different kinds of matter are at present recognised as elementary bodies. They are substances having the most diverse characters. The great majority exist in the solid state; bromine and mercury are liquid; while oxygen, hydrogen, nitrogen, and chlorine, are gaseous. About four fifths of the elements are metallic, as instanced by gold, silver, copper, iron, &c.; the remainder are non-metallic, as instanced by carbon, sulphur, phosphorus, &c. A list of the known elements is given under the head of ATOMIC WEIGHTS (which see).

EL'EMI. *Syn.* GUM ELEMI; ELEMI (B.P.). "A terebinthinate concretion, from an uncertain plant." (Ph. L.) MEXICAN ELEMI is known to be the produce of a species of the genus *Elaphrium*. MANILLA ELEMI is probably the product of *Canarium commune*.

Prop., &c. The elemi of commerce is of a pale-yellow colour, brittle without, but soft and tough within; it has a warm bitter taste, and a fragrant aromatic smell, partaking of fennel and juniper. It is only partially transparent even in thin plates, is very fusible, and has a density a little greater than that of water. It contains 12½ per cent. of volatile oil (oil of elemi). It is used to give toughness to lacquers and varnishes, and in medicine in the preparation of ELEMI OINTMENT.

Pur. The elemi of the shops is often adulterated, but more frequently a factitious kind is sold for the genuine gum. This fraud may be detected by exposing the suspected article to heat, along with a little water, when the factitious fragrance of the spurious article evaporates, and the coarse terebinthinate smell of the resin used to adulterate it, or which is sold for it, becomes readily distinguishable.

Elemi, Factitious. *Prep.* 1. Yellow resin, 8 lbs.; melt, add Canada balsam, 2 lbs.; withdraw the vessel from the heat, and further add, of oil of juniper, 2 drs.; oil of sweet fennel, 1 dr.; oil of nutmeg, ½ dr.

2. Yellow resin, 7 lbs.; Canada balsam, 1 lb.;

juniper oil bottoms, 4 drs.; oil of mace, 3 drs.; mix as before.

EL'EMIN. The crystalline resin of gum elemi.

ELIX'IR. In *pharmacy*, a name formerly applied to various compound tinctures, and to preparations supposed to contain the quintessence of other substances. (It is still applied to several popular remedies.) The elixirs of the alchemists were solutions employed in their fruitless attempts to transmute the baser metals into gold.

Elixir, Ac'id. *Syn.* ELIXIR ACIDUM, L. *Prep.* 1. (Dippell's.) Sulphuric acid, 1 part, dropped gradually into rectified spirit of wine, 5 parts; placed in a large flask, and afterwards coloured by digestion on animal kermes and saffron, of each, 1 part.

2. (Haller's,—Ph. Sax. 1837.) From sulphuric acid and rectified spirit, of each, 1 part; as before.

3. (Vogler's.) From sulphuric acid and nitrous ether, equal parts, as above. Astringent and antiseptic.—*Dose*. A few drops, in water.

Elixir of Al'o'es. *Syn.* COMPOUND TINCTURE OF ALOES; ELIXIR ALOËS, L. See TINCTURE.

Elixir of Aloes (Compound). *Syn.* ELIXIR ALOËS COMPOSITUM, L. *Prep.* (Dr. Copland.) Acetate of potassa, inspissated ox-gall, socotrine aloes, and myrrh, of each, 2 drs.; hay saffron, 1 dr.; brandy (or proof spirit), 2½ fl. oz.; digest a week, and strain. Stomachic and laxative.—*Dose*. A teaspoonful, or more; in dyspepsia, constipation, &c.

Elixir, Anti-asthmatic. *Syn.* ELIXIR ANTI-ASTHMATICUM, L. *Prep.* 1. Oil of aniseed, camphor, and balsam of tolu, of each, 1 oz.; cochineal, 1 dr.; proof spirit, 1 gal.; digest a week, and filter.

2. As the last, adding powdered opium, 1½ oz.—*Dose*. A teaspoonful, to allay irritation, assisted by an occasional dose of aperient medicine; in asthma, chronic coughs, &c.

3. (Boerhaave's.) Aniseed, asarabacca, elecampane, liquorice root, orris root, and sweet flag (calamus), of each, equal parts; made into a tincture, with brandy.—*Dose*. 20 to 40 drops.

Elixir, Anti-scorfulous. *Syn.* ELIXIR ANTI-SCROFULOSUM, L. *Prep.* 1. (P. Cod.) The ammoniated tincture of gentian. See TINCTURE.

2. (Desforges.) Guaiacum, 5 oz.; cinchona bark and pellitory, of each, 3 oz.; cloves, 5 drs.; orange peel and benzoin, of each, 2 drs.; hay saffron, ½ dr.; rectified spirit and brandy, of each, ½ pint; digest a week, and filter. *Used* as an application to scorbutic gums.

Elixir, Boerhaave's Asthmatic. See ANTI-ASTHMATIC ELIXIR (*above*).

Elixir, Boerhaave's Visceral. *Syn.* ELIXIR BOERHAAVII, E. B. VISCERALE, L. *Prep.* (Ph. Han.) Aloes, myrrh, and saffron, of each, 1 oz.; tartrate of potassa, 2 oz.; alcohol (strongest rectified spirit), 14 oz.; water, 1 oz.; macerate

3 days, and filter. This preparation "has been highly praised in visceral obstruction." (Dr. Griffith.)—*Dose*. 1 to 3 teaspoonfuls.

Elixir, Clauder's. *Syn.* ELIXIR CLAUDERI, L. 1. (Fideret.) Salt of tartar, sal-ammoniac, strained aloes, and myrrh, of each, 1 oz.; elder-flower water, 1½ pint, digest, with agitation, for 24 hours, and filter.

2. (Parrish.) Carbonate of potassa, 1 oz.; aloes, guaiacum, myrrh, saffron, and rhubarb (contused), of each, 2 drs.; water, 18 fl. oz. Macerate a few days, and decant.—*Dose*. 1 to 2 teaspoonfuls; in amenorrhœa, constipation, scurvy, visceral obstructions, &c.

Elixir, Cough. *Syn.* ELIXIR ANTI-CATARHAE, L. *Prep*. 1. See ANTI-ASTHMATIC ELIXIR.

2. (Hufeland.) Extracts of blessed thistle and dulcamara, of each, 1 dr.; cherry-laurel water, 1 fl. dr.; fennel water, 1 fl. oz.—*Dose*. 1 to 2 teaspoonfuls, 3 or 4 times a day. It is a most useful remedy in coughs occurring in nervous, hysterical, or irritable patients. See ELIXIR OF IPECACUANHA, LETTSOM'S ELIXIR, &c. (*below*).

Elixir, Daffy's. *Syn.* ELIXIR SALUTIS, E. SENNÆ COMPOSITUM, TINCTURA SENNÆ COMPOSITA, L. This is an aromatised and sweetened tincture of senna, to which other cathartics are generally added. Nearly every drug-house has its own formula for this article. The following are those employed in the London trade:—

Prep. 1. East India senna, 1½ lb.; jalap, 5 oz.; coriander seed and aniseed, of each, ½ lb.; rhubarb, ¼ lb.; red sanders wood, 2 oz.; salt of tartar, 2 oz.; treacle, 7 lbs.; rectified spirit of wine, 2½ galls.; water, 3½ galls. All the solids are well bruised, and macerated in the mixed fluids for 14 days, when the whole is pressed, and strained through a flannel bag. It is too glutinous to run through filtering paper.

2. Senna, rhubarb, and aniseed, of each, 2 lbs.; jalap and caraways, of each, 1 lb.; red sanders wood, ½ lb.; brown sugar, 7 lbs.; proof spirit, 10 galls.; as the last.

3. Senna, 56 lbs.; aniseed, 7 lbs.; rhubarb (East India), 14 lbs.; coriander seed, 6 lbs.; caraway seed and red sanders wood, of each, 5 lbs.; cassia bark and jalap, of each, 3 lbs.; proof spirit, 100 galls.; digest for 14 days, press, strain, and add molasses, 84 lbs.; mix well, and either clarify or strain through flannel.

4. For proof spirit in the last two formulæ, equal parts of spirit of wine and water are employed by the smaller houses.

5. (Redwood.) Senna, ½ lb.; aniseed, caraways, and jalap, of each, 1 oz. 2 drs.; juniper berries, 2½ oz.; proof spirit, 6 pints; macerate for 14 days, then add of treacle, 10½ oz.; water, 1 lb. 5 oz.; mix and strain.

6. (Dicey's.) Senna, 1 lb.; guaiacum shavings, elecampane root (dried), aniseed, caraway seed, coriander seed, and liquorice root, of each,

¼ lb.; stoned raisins, 2 lbs.; proof spirit or brandy, 9 quarts; macerate for 10 days.

7. (Swinton's.) Senna, 1 lb.; jalap, 3 lbs.; coriander seed, caraway seed, liquorice root, and elecampane root, of each, 4 oz.; moist sugar, 2 lbs.; rectified spirit of wine and water, of each, 1 gal.; as the last.

Obs. Daffy's elixir is a favorite purge with drunkards, and is a common and very popular remedy in flatulent colic, dyspepsia, diarrhœa, &c.—*Dose*. 1 to 4 table-spoonfuls, or more.

Elixir, Devil's. *Syn.* ELIXIR CAPSICI COMPOSITUM, L. *Prep*. From pods of capsicum, and cloves (bruised), of each, 1 oz.; ginger and saffron, of each, 3 oz.; cantharides, 5 drs.; proof spirit, 7 lbs.; digest for 10 days.—*Dose*. ½ dr. to 3 drs., in mixtures. It is stimulating, anti-choleraic, and aphrodisiac.

Elixir of Garlic. *Syn.* ELIXIR ALLII, L. *Prep*. From garlic roots (bruised), 80 in no.; rectified spirit, 1 pint; digest, distil to dryness, and repeat the process with the same spirit from fresh roots, a second and a third time; lastly, add camphor, 2 dr. Diaphoretic and pectoral.—*Dose*. A teaspoonful, twice a day; in asthma, old coughs, diarrhœa from debility, &c.

Elixir, Garus's. *Syn.* ELIXIR GARII, L.; ELIXIR DE GARUS, Fr. *Prep*. 1. Myrrh, 1 oz.; aloes and saffron, of each, ½ oz.; cinnamon, cloves, and nutmeg, of each, 1 dr.; proof spirit, 1 quart; digest a week, add water, 5 fl. oz., and distil over 1 quart; to the distillate (ALCOOLAT DE GARUS) add of syrup of maidenhair, 2 lbs.; orange-flower water, 1½ fl. oz.

2. (Foy.) Compound tincture of saffron, 8 pints; syrup of maidenhair, 10 pints; mix; add caramel, q. s. to colour, dissolved in orange-flower water, ½ pint.

3. (P. Cod.) Aloes and saffron, of each, 1 oz.; myrrh, cinnamon, and cloves, of each, ½ oz.; nutmeg, ½ dr.; proof spirit, 12 pints; orange-flower water, 16 fl. oz.; macerate 2 days, distil 6 pints, and add to the distillate (ALCOOLAT DE GARUS), of syrup of capillaire, 7½ pints; and colour with saffron, q. s.

4. (Soubiran.) Sœcotrine aloes and saffron, of each, 1 oz.; myrrh, canella alba, citron, and nutmegs, of each, ½ oz.; spirit (sp. gr. '923), 20 lbs.; orange-flower water, 16 fl. oz.; macerate as last, distil 10 lbs., and add to the distillate (ALCOOLAT DE GARUS), of syrup of capillaire, 12½ lbs.; orange-flower water, 8 fl. oz.; with saffron q. s. to colour.

5. (Thierry.) Aloes, myrrh, and saffron, of each, 2 drs.; nutmeg, 4 drs.; canella alba and cloves, of each, 1 oz.; spirit ('864), 13 lbs.; draw over 12 lbs. of 'alcoolat'; add to the residue of the distillation, rose water, 10 lbs.; distil 6 lbs., and add as much of this aromatic water to the alcoolat as will raise its sp. gr. to '890. Then to every 11 lbs. of the above mixed liquor, add of simple syrup, 15 lbs.; tincture of vanilla and orange peel, of each, 2½ fl. oz.; fresh milk (skimmed), 1 lb.; and tincture

of saffron, q. s. to colour; digest with agitation for two days, and filter. *Used* as a stomachic, carminative, and stimulant, in doses of a wine-glassful. That prepared without distillation forms an excellent stomachic purge. With the exception of that from the 2nd formula, the products may be regarded as agreeable cordial liquors, rather than medicines. It is much employed on the Continent.

Elixir of Gold. *Syn.* ELIXIR AURI, L.; ELIXIR D'OR, Fr. *Prep.* 1. De la Motte's Golden Drops.

2. Terchloride of gold, 20 grs.; rectified spirit, 6 fl. drs.; ether, 3 fl. drs.; dissolve.—*Dose.* 5 to 15 drops, taken in distilled water; in gout, scrofula, nervous diseases, cancer, indurated glands, secondary syphilis, &c. This last preparation is often confounded with the *gouttes d'or du Général de la Motte*; but the two are evidently distinct articles. See DROPS.

Elixir, Haller's. See ACID ELIXIR (*above*).

Elixir, Hoffman's Visceral. *Syn.* ELIXIR HOFFMANNI, E. H. VISCERALE, L. *Prep.* 1. As ELIXIR OF ORANGE-PEEL.—Ph. Bor. 1847.

2. Thin outside peel of orange (dried), myrrh, and centaury, of each, 2 drs.; extracts of carduus benedictus, cascarrilla, and gentian, of each, 1 dr.; white wine (sherry), 1 quart. Aromatic and stomachic.—*Dose.* A dessert-spoonful, or more.

Elixir of Ipecacuanha. *Syn.* ELIXIR IPECACUANHE, L. *Prep.* (Cadet.) Powdered ipecacuanha and balsam of tolu, of each, 4 drs.; flowers of benzoin, opium, and saffron, of each, 2 drs.; oil of aniseed, 1 dr.; camphor, 40 grs.; alcohol (rectified spirit), 1½ pint; digest a week, and filter.—*Dose.* 1 to 2 drs., as a stimulant, diaphoretic, expectorant, and stomachic; in chronic coughs, asthmas, and old colds, and in certain forms of deficient appetite, dyspepsia, diarrhoea, &c.

Elixir of Jalap. *Syn.* ELIXIR JALAPÆ COMPOSITUM, L. *Prep.* From jalap, 4 oz.; scammony, 4 drs.; gamboge, 2 drs.; proof spirit, 1 quart.—*Dose.* ½ dr. to 3 drs., as a purgative; especially in worms.

Elixir, Lettsom's. *Prep.* (Augustin.) Oil of aniseed, 1 dr.; camphor, 1½ dr.; benzoic acid, opium, and saffron, of each, 2 drs.; ipecacuanha and balsam of tolu, of each, 4 drs.; rectified spirit, 2 lbs.; digest 10 days, and filter.—*Dose.* 5 to 15 drops, for a child; ½ to 1 teaspoonful, for an adult; in ordinary coughs, hooping-cough, &c.

Elixir, Live-long. *Syn.* ELIXIR OF LONG LIFE; E. LONGÆ VITÆ, L. *Prep.* 1. See TINCTURE OF RHUBARB AND ALOES.

2. (ELIXIR VITÆ MATTHEOLI.) A mixture of several aromatics and stimulants, made with rectified spirit.

Elixir of Myrrh. *Syn.* ELIXIR MYRRHÆ, L. See TINCTURE OF SAVINE (Comp.).—Ph. L. 1788.

Elixir d'Or. See ELIXIR OF GOLD.

Elixir of Orange Peel. *Syn.* ELIXIR AURANTHORUM COMPOSITUM, L. *Prep.* 1. (Ph.

Bor. 1847.) Orange peel, 6 oz.; cinnamon, 2 oz.; carbonate of potassa, 1 oz.; Madeira wine, 4 lbs.; macerate 6 days, express the tincture, and add of extracts of buckbean, cascarrilla, gentian, and wormwood, of each, 1 oz.; dissolve, and after repose for subsidence, decant and filter. An excellent aromatic bitter and stomachic.

2. (Moscati.) Orange peel, 1 oz.; cascarrilla, ½ oz.; waters of citron peel and wormwood, and rectified spirit, of each, ½ pint; digest a week. Resembles the last.—*Dose* (of either). A table-spoonful to a wine-glassful.

Elixir, Paregoric. *Syn.* ELIXIR PAREGORICUM, L. See TINCTURE OF CAMPHOR (Comp.).

Elixir, Paregoric (Scotch). *Syn.* ELIXIR PAREGORICUM SCOTICUM, L. See TINCTURE OF OPIUM (Ammoniated).

Elixir, Pectoral. *Syn.* ELIXIR PECTORALE, L. (Ph. E. 1745.) Balsam of tolu, 2 oz.; gum benzoin, 1½ oz.; saffron, ½ oz.; rectified spirit, 32 fl. oz.; digest in a gentle heat for 4 days, and filter.—*Dose.* ½ to 1 teaspoonful. (See *above*.)

Elixir, Polychrest. *Syn.* ELIXIR POLYCHRESTON, L. *Prep.* (Ph. E. 1745.) Guaiacum (gum), 6 oz.; balsam of Peru, ½ oz.; rectified spirit, 23 fl. oz.; digest as last, strain, and add oil of sassafras, 2 fl. drs. Pectoral and antirheumatic.—*Dose.* 10 to 60 drops, or more.

Elixir, Paracelsus's. See ELIXIR PROPRIETATIS (*below*).

Elixir Proprieta'tis. [L.] *Syn.* PARACEL-SUS'S ELIXIR OF PROPRIETY; ELIXIR DE PROPRIÉTÉ DE PARACELSE, Fr. An old preparation, nearly corresponding to the compound tincture of aloes of modern pharmacy, and which is now sold for it. *Prep.* 1. (Soubeiran.) Tincture of myrrh, 4 oz.; tinctures of aloes and saffron, of each, 3 oz. ('Trait. Pharm.' 1847.)

2. (ELIXIR PROPRIETATIS CUM ACIDO).—*a.* The last, slightly acidulated with oil of vitriol, and filtered.

b.—Ph. Bor. 1847.—Aloes and myrrh, of each, 2 oz.; saffron, 1 oz.; spirit (sp. gr. '900), 2 lbs.; dilute sulphuric acid (1 to 5), 2 oz.; macerate 4 days, and filter.

3. (ELIXIR PROPRIETATIS TARTARIZATUM; E. P. ALKALIZATUM.) From elixir proprieta'tis, alkalisied with salt of tartar, and filtered. The last two are old preparations, now seldom inquired for in this country, except in places remote from London.

Elixir, Radcliffe's. *Prep.* 1. From socotrine aloes, 6 drs.; rhubarb, 1 dr.; cinnamon (cassia), cochineal, and zedoary root, of each, ½ dr.; syrup of buckthorn, 2 fl. oz.; brandy, 1½ pint; digest 10 days, and strain.

2. As the last, but substituting proof spirit, 1 pint, and water, ½ pint, for the brandy. Aromatic, stomachic, and aperient.—*Dose.* 1 to 4 drs.; in similar cases to those in which 'DAFFY'S ELIXIR' is taken.

Elixir of Roses. *Syn.* ELIXIR ROSÆ, L.

Prep. 1. Eau de rose, 2 fl. oz.; spirits of horseradish and scurvy grass, of each, 1 fl. oz.; otto of roses, 3 drops; camphor and cochineal (both in powder), 12 grs.; powdered sugar-candy, $\frac{1}{2}$ oz.; digest, with frequent agitation, for a week, and after repose decant the clear, and strain through a piece of muslin. *Used* as an elegant application in scurvy of the gums, and also to perfume the breath.

2. (Beasley.) Cinnamon, 3 oz.; ginger, 2 oz.; cloves, 1 dr.; essence of peppermint, 1 oz.; oil of orange peel, 1 dr.; otto of roses, 15 (? 25) drops; rectified spirit, $2\frac{1}{2}$ pints; digest 15 days, and filter. *Used* as a tooth cosmetic.

Elixir Sa'crum. Tincture of aloes and rhubarb.

Elixir Saln'tis. *Syn.* ELIXIR OF HEALTH. The compound tincture of senna of old pharmacy. See DAFY'S ELIXIR.

Elixir of Scammony. *Syn.* ELIXIR SCAMMONII, L. *Prep.* (Guibourt.) Scammony (pure), 2 drs.; proof spirit, 8 fl. oz.; mix in a suitable vessel, apply heat, set the spirit on fire, and add of sugar, 4 oz.; when the whole is dissolved (melted down), extinguish the flame, and further add of syrup of violets, 2 fl. oz.; mix well, and after sufficient repose decant the clear portion from the dregs. The product should be 12 oz., containing 12 grs. of scammony per oz.—*Dose.* 1 to 2 dessert-spoonfuls in milk or aromatised water; or made into an emulsion with aromatics; in worms, &c.

Elixir, Squire's. *Prep.* 1. (Original Formula.) Aurum musivum, 3 oz.; opium, 2 oz.; camphor, 1 oz.; cochineal, $\frac{1}{2}$ oz.; sweet fennel, $\frac{1}{2}$ oz.; tincture of serpentary, 1 pint (old meas.); spirit of aniseed, 1 gal. (old meas.); sugar, 1 lb.; dissolved in water, 1 pint (old meas.); digest 10 days, and filter.

2. Powdered opium, 2 oz.; ginger, red sanders wood, and camphor, of each, 1 oz.; oil of aniseed, $\frac{1}{2}$ oz.; oil of sweet fennel, $\frac{1}{2}$ dr.; tincture of serpentary, 1 pint; proof spirit, 5 pints; water, 1 quart; as last. Stimulant, anodyne, diaphoretic, and pectoral.—*Dose.* 1 to 2 teaspoonfuls; in chest affections, nervous headaches, &c., in the absence of inflammatory symptoms.

Elixir, Stomach'ic. Compound tincture of gentian was formerly so called.

Elixir, Stoughton's. *Prep.* 1. Raisins (stoned and bruised), 1 lb.; gentian root, $\frac{1}{2}$ lb.; dried orange peel, 6 oz.; serpentary, $\frac{1}{2}$ lb.; calamus aromaticus, $\frac{1}{2}$ oz.; cardamoms, $\frac{1}{2}$ oz.; sugar colouring, $\frac{1}{2}$ pint; brandy or proof spirit, 2 galls.; digest a week, and strain.

2. Tincture of gentian (compound), and brandy or proof spirit, of each, 1 quart; tincture of serpentary and syrup of saffron, of each, 1 pint; tinctures of aloes and rhubarb, of each, $\frac{1}{2}$ pint; bitter almonds (bruised), 8 in no.; digest as before.

3. (Foy.) Aloes and cascarilla, of each, 1 dr.; rhubarb, 4 drs.; gentian, germander, dried orange peel, and wormwood, of each, 6 drs.;

rectified spirit, 32 fl. oz.; as before. Stimulant, tonic, and stomachic.—*Dose.* 20 drops to a teaspoonful.

Elixir, Ton'ic. *Syn.* ELIXIR BOBORANS. See TINCTURE OF CROWN BARK (Comp.,—Ph. Bor. 1847).

Elixir, Tooth. *Syn.* ELIXIR DENTIFRICUM, L. *Prep.* 1. (Lefandinière's.) Guaiacum raspings and cloves, of each, 1 oz.; pellitory of Spain and nutmeg, of each, 2 drs.; oil of rosemary, 20 drops; bergamotte, 10 or 12 drops; brandy, 1 quart; macerate a fortnight, and filter.

2. Cinnamon, cloves, and nutmeg, of each, 1 dr.; vanilla, $\frac{1}{2}$ dr.; camphor, 10 grs.; tincture of pellitory, 2 fl. oz.; brandy or proof spirit, $\frac{1}{2}$ pint; digest as before. See ANTI-SCORBUTIC and ROSE ELIXIRS (above).

Elixir, Vis'eral. *Syn.* ELIXIR VISCERALE, L. See BOERHAAVE'S and HOFFMAN'S ELIXIRS (above).

Elixir of Vitriol. 1. The old name for aromatic SULPHURIC ACID (which see).

2. (Mynsicht's.) See TINCTURE (Acid Aromatic).

3. (Scourer's.) Dilute sulphuric acid (1 to 5). *Used* to scour metals.

4. (SWEET E. OF V.; E. VITRIOLI DULCI, L.) The old name for aromatic SPIRIT OF ETHER (which see).

5. (Virgani's.) *Prep.* From spirit of sulphuric ether, 2 lbs.; aromatic tincture, 3 lbs.

Elixir, Woroneje. Capsicum, 1 oz.; nitre, $\frac{1}{2}$ oz.; sal-ammoniac, 2 drs.; nitro-hydrochloric acid, 2 fl. drs.; vinegar, $\frac{1}{2}$ pint; native white or rose naphtha, or petroleum, $\frac{1}{2}$ fl. dr.; olive oil, 1 fl. oz.; oil of peppermint (Mitcham), 15 fl. oz.; strongest rectified spirit, 6 quarts; digest 12 days, with constant agitation, and filter.—*Dose.* 2 teaspoonfuls, every 15 minutes; in cholera, diarrhoea, &c.

ELLAGIC ACID. $\text{HC}_7\text{H}_3\text{O}_4$. Aq. When an aqueous infusion of nut-galls is left for some time exposed to the atmosphere, the tannic acid gradually disappears, and is replaced by gallic acid, and an insoluble gray powder, to which the term ellagic acid was applied by Chevreul. It is soluble in alkalis, forming salts, and is precipitated by acids.

ELM. *Syn.* ULMUS, L. A genus of trees forming the type of the natural order *Ulmaceae*. The interior bark of the *Ulmus campestris*, or common small-leaved elm (*Umi cortex*), is officinal in B. P. This substance is demulcent, diaphoretic, and diuretic, and slightly febrifuge, astringent, and tonic. It has been employed in agues, and as a substitute for sarsaparilla in cutaneous eruptions, but is now little used. The leaves of the elm tree are reported to be vulnerary. See DECOCTION and ULMINE.

ELUTRIATION. Cleansing by washing. The term is commonly applied to the operation of washing insoluble powders with water, to separate them from foreign matter, or the coarser portion. It is usually performed by

grinding or triturating the mass with a little water, until reduced to a very fine powder, and this paste is suddenly diffused through a large quantity of water, contained in a deep vessel, from which, after the subsidence of the grosser portion, the liquid is poured into another vessel, and allowed to deposit the fine powder it still holds in suspension. When this has taken place, the clear supernatant liquor is decanted, and the sediment drained and dried. The coarse sediment deposited in the first vessel is now submitted to a fresh grinding and diffusion through water, and the entire operation is repeated, until the whole of the pulverisable portion is washed over. The proper length of time for the liquid to remain in the first vessel depends solely on the density of the powder and the degree of fineness required in the product; heavy powders subsiding almost immediately, while light ones often take several minutes to deposit the coarser portion. Sometimes three or more vessels are employed, and the muddy liquor, after remaining a short time in the first, is poured into the next one, and this, in a short time longer, into the third, and so on, until the last vessel is filled, by which means powders of different degrees of fineness are obtained, that deposited in the last vessel being in the minutest state of division. The elutriated paste or moist powder is then drained, and dried. On the small scale, the trituration is performed with a stone and muller, or in a mortar; on the large scale, in a mill, driven by either horse or steam power. Antimony, chalk, bistre, and other pigments, as well as various other substances insoluble in or unacted on by water, are commonly obtained in the state of an impalpable powder by elutriation, or 'washing over,' as it is called by amateurs and operatives.

ELYDORIC PAINTING. A method of painting invented by M. Vincent, of Montpetit, in which the pigments are mixed up with an emulsion of oil and water. It is said to add the fresh appearance of water colours, and the finish of miniature painting, to the mellowness of oil colours.

EMBALMING. *Syn.* MUMMIFICATION. The preservation of the dead bodies of animals. See MUMMY and PUTREFACTION.

EMBOSMING. The formation of ornamental figures in relief on cloth, leather, paper, and wood, has now been brought to such perfection, as to place this species of decoration within the reach of almost every class of society. EMBOSSED CLOTH and PAPER are now employed by the bookbinder to cover even the low-priced volumes that pass through his hands; whilst the EMBOSSED LEATHER that encloses the album or ornaments our furniture, frequently bears the richest patterns of the arabesque or moresque. Cloth and paper are usually embossed by machinery; leather and wood, more frequently by hand labour.

EMBROCATION. *Syn.* EMBROCATIO, L.

A fluid medicine for external and local use. Embrocations do not differ, materially, from liniments and lotions, and are applied in the same manner. (See those preparations, and *below*.)

Embrocation, Guestonian. *Syn.* EMBROCATIO TEREBINTHINÆ CUM ACIDO, L. *Prep.* (Dr. Paris.) Oil of turpentine and olive oil, of each, 1½ oz.; dilute sulphuric acid, 3 fl. drs.; agitate together until mixed. *Used in* rheumatism, &c.

Embrocation, Lynch's. Olive oil (coloured with alkanet root), 5 fl. oz.; oils of amber, rosemary, and turpentine, of each, 1 dr. *In* bruises, rheumatism, &c.

Embrocation, Roche's. *Prep.* 1. (Dr. Paris.) Olive oil, mixed with half its weight of the oils of cloves and amber.

2. Olive oil, 2 oz.; oil of amber, 1 oz.; oils of cloves and lemons, of each, 1 dr. *For* whooping-cough.

Embrocation, Ward's. See ESSENCE.

EMBROIDERY. Gold and silver fancy work of this description may be cleaned with a little spirit of wine, either alone or diluted with an equal weight of water. Gin is frequently used for the same purpose. The common practice of using alkaline or acid liquors is very injurious, and frequently destroys the beauty of the articles instead of cleaning them.

EMERALD. *Syn.* SMARAGDUS; EMBRAUDE, Fr. This beautiful deep-green gem ranks next to the diamond in value. The finest are brought from Peru, but fair varieties are found in Bavaria, Siberia, and India. A fine emerald weighing 4 or 5 grs. is worth as many pounds; one of 10 grs., about £2 per gr.; one of 15 grs., £3 to £4 per gr.; and so on in proportion to the increase in size. One of 24 gr., if of pure water, is worth about £100. According to the analysis of Vauquelin, the purest specimens consist of 65 parts silica, 14 alumina, 13 glucina, 2.56 lime, and 3.50 oxide of chromium, to which last the gem owes its rich green colour. See BERYL, GEMS, PASTES, &c.

Emerald Green. See GREEN PIGMENTS.

EMERY is an impure, amorphous, compact, and opaque variety of corundum, and consists of alumina, with a small per-centage of silica and peroxide of iron. It occurs in Spain, the isles of Greece, and other localities, and derives its name from Cape Emeri, in the island of Naxos. Its hardness is so great, that it scratches and wears down nearly all minerals except the diamond; hence the use of its powder for cutting and polishing glass and various other hard substances. For commercial purposes, the lumps of emery, as taken from the mine, are broken into pieces about the size of a hen's egg, which are then crushed under stampers, similar to those used for pounding metallic ores. The coarse powder is then sifted through sieves covered with wire-cloth of different degrees of fineness, by which

it is sorted into different sizes. In this state it forms the emery of the shops, or flour emery. For delicate purposes, it is afterwards prepared by elutriation.

Emery Cakes are formed by melting emery flour with a little bees' wax, and after thorough admixture, forming it into solid lumps of suitable sizes. *Used* to dress the edges of buff and glaze wheels.

Emery Cloth is prepared by brushing the surface of thin cotton cloth over with liquid glue, and sifting the emery powder over the surface while still warm.

Emery Paper is made in the same way as emery cloth. Both are used either with or without oil, in the same way as glass paper.

Emery Sticks are made of pieces of wood in the same way, and are used for the same purposes, as emery paper.

Emery Stones are formed of emery, of the requisite coarseness, mixed with about half its weight of good Stourbridge loam, and water q. s. to make a stiff paste, which is forced into metallic moulds by a powerful press. The pieces, when thoroughly dry, are exposed in a muffle for a short time to a temperature just under a full white heat. In this way 'discs' and 'laps' are generally made. For 'wheels,' only $\frac{1}{4}$ th of loam is used. Another method, applicable for 'cutting-stones' generally, is to press the flour emery, previously moistened with water, into moulds, with strong pressure, as before, without any other addition, and then to fire it at nearly a full white heat.

EMETIA. *Syn.* EMETIN, EMETINA. A feebly basic or alkaloidal body, existing in and forming the active principle of ipecacuanha.

Prep. 1. (Medicinal—EMETIC EXTRACT).—*a.* Ipecacuanha (in coarse powder) is digested first in ether, and then in rectified spirit for 3 or 4 days; the alcoholic tincture is next expressed and evaporated (distilled) to dryness; the residuum is dissolved in distilled water, and the solution precipitated with acetate of lead; the precipitate is then diffused through distilled water, in a tall glass vessel, and sulphuretted hydrogen is passed through it, to throw down the lead; after which the liquor is decanted, filtered, evaporated to the consistence of a thick syrup, and spread in a thin layer on warm plates of glass, and allowed to dry in a current of warm air, or by a gentle heat in a stove. The maceration in ether is frequently omitted.

b. Ipecacuanha, 1 part; rectified spirit ('835), 7 parts; make a tincture, distil off the spirit, dissolve in cold distilled water, 5 parts; filter the solution, and evaporate, &c., as before. Inferior to the last.

c. (P. Cod.) As the last, nearly.

Obs. Medicinal or impure emetia is brownish red, deliquescent, and emetic in doses of $\frac{1}{4}$ to $\frac{1}{2}$ gr.

2. (Pure).—*a.* Ipecacuanha (in coarse powder), 1 part, is digested for 24 hours in distilled water, 10 parts; together with calcined

magnesia, added in slight excess; the deposit is then thrown on a filter, washed carefully with very cold water, and dried; it is next dissolved in rectified spirit and neutralised with dilute sulphuric acid; the filtered solution is decoloured with animal charcoal, again filtered, and again precipitated by digestion with magnesia; the last deposit forms a colourless solution with rectified spirit, which, by gentle evaporation, gives up its emetia as a yellowish-white pulverulent mass, which may be rendered perfectly white by redissolving it in alcohol, &c., as before. The process is rendered easier by first digesting the powdered ipecacuanha in ether.

b. (P. Cod.) Alcoholic extract of ipecacuanha, 1 part; water, 10 parts; dissolve, filter; add calcined magnesia, 1 part; evaporate to dryness, wash the product on a filter with very cold water, 5 parts; dry it again, and dissolve it in boiling alcohol; evaporate the filtered tincture to dryness, redissolve the residuum in a little water, acidulate (slightly) with dilute sulphuric acid, decolour with animal charcoal, filter, precipitate with liquor of ammonia, and dry the precipitate by a gentle heat.

c. (Ph. Suec. 1845.) Powdered ipecacuanha, 1 part; water acidulated with sulphuric acid, 6 parts; digest, filter; add lime, 1 part, and evaporate to dryness over a water bath; the residuum is then exhausted with boiling rectified spirit, and otherwise treated as in the last formula.

Prop., &c. Pure emetia is white, pulverulent, inodorous, and bitter; fusible at 122° Fahr.; very soluble in alcohol and boiling water, but only slightly so in ether, oils, and cold water. It restores the blue colour of reddened litmus, and partially neutralises the acids, forming scarcely crystallisable salts. It is reddened by nitric acid, and this red colour is deepened by ammonia. Tincture of iodine produces a reddish precipitate in an alcoholic solution of emetia. With tincture of galls this solution behaves like morphia; but, unlike the last substance, the salts of iron produce no change of colour in it. These reactions, combined with its emetic properties, are sufficient for its identification.—*Dose.* White and pure emetia is emetic in doses of $\frac{1}{16}$ to $\frac{1}{8}$ gr. The large doses ordered in certain pharmaceutical compilations, evidently in error of the difference between the strengths of the pure and the impure or medicinal emetia, have, in several cases which have been reported on, produced very serious consequences.

EMETICS. *Syn.* VOMITS, ANACATHARTICS; ANACATHARTICA, EMETICA, VOMITORIA, L. Medicines which induce vomiting. The principal emetics are ipecacuanha and tartarised antimony, and their preparations; and the sulphates of zinc and copper. Of these the first is commonly employed either in substance or infused in wine (ipecacuanha wine), when it is merely wished to evacuate the contents of the stomach, when that organ is in a dis-

ordered state or overloaded with food; and is the one most adapted, in ordinary cases, for children and females. Tartar emetic (tartarated antimony) (dissolved in water) and antimonial wine, either alone or combined with ipecacuanha, are preferable at the commencement of fevers and other inflammatory disorders, in consequence of the nausea, relaxation, and depression of the muscular power and circulation which commonly follow their use. When poison has been taken, sulphate of zinc is generally preferred as an emetic, on account of the promptness and completeness of its action, and its effects ceasing as soon as it is ejected from the stomach. Sulphate of copper is employed in the same cases as sulphate of zinc, but its action is more violent and disagreeable, whilst its intense metallic taste is a great objection to its use. 25 to 30 grs. of either of the above sulphates are dissolved in 3 or 4 fl. oz. of warm water, and a fourth of the solution is given every ten minutes, until copious vomiting ensues. In the absence of other substances, when an immediate emetic is required, a teaspoonful of flour of mustard (an article always at hand), stirred up with half a pint of warm water, and drank at a draught, will generally act easily and effectively, and relieve the stomach before other remedies can be obtained and applied.

The operation of emetics is powerfully promoted by drinking copiously of diluents, especially of warm or tepid water. The latter, in fact, is itself an emetic, when taken in quantity. Its use will also prevent that dreadful straining and retching, which make emetics so much dreaded by the nervous and delicate.

The timely administration of an emetic at the commencement of fevers and other inflammatory affections, will frequently cause copious diaphoresis, and produce a cure, or at least greatly mitigate the severity of the symptoms. Dropsies have also been cured by vomiting; and swelled testicle, bubo, and other glandular swellings, have occasionally been dispersed by the action of emetics. Visceral obstructions, in both sexes, have also yielded to the same treatment. Small and repeated doses of emetics are frequently administered, with advantage, to produce nausea, in many diseases of the lungs and stomach. Certain chronic and obstinate diseases, as rheumatism and asthma, are sometimes relieved by emetics, when every other line of treatment has failed.

Emetics should be avoided in plethoric habits, in hernia, pregnancy, and whenever visceral inflammation is suspected. They should also be given with great caution to young children and females, and to the nervous and delicate. In such cases, wine or powder of ipecacuanha should alone be employed.

Emetic Cups. *Syn.* ANTIMONIAL CUPS; *POCULA EMETICA, CALICES VOMITORII, L.* Small cups made of metallic antimony. Wine

left in them for 10 or 12 hours becomes emetic.

Emetic Tartar. See ANTIMONY, TARTARATED.

EM'ETINE. See EMETIA.

EMMENAGOGUES. *Syn.* EMMENAGOGA, *L.* Medicines which are considered to have the power of promoting the menstrual discharge when either retained or suspended. There are, probably, few remedies which exert this specific power on the uterus, the majority of repeated emmenagogues acting rather by their influence on the system generally, or on parts contiguous to the uterus, than in the uterus itself. Among the substances usually arranged under this class are—aloes, black hellebore, birthwort, borax, cubeb, ergot, gamboge, gin, iodide of potassium, iodine, madder, mercurials, the peppers, rue, savine, stimulants (generally), stimulating diuretics, stinking goosefoot, stinking orache, wine, &c.

Of the above, ergot and madder are the only articles which exercise a direct power on the uterus, and that rather in increasing its expulsive energy than in promoting the menstrual function, though they are advantageously employed for the latter purpose. Several of the other substances named are drastic purgatives, or possess cerebro-spinal properties, or local powers of irritation, by which they increase the pelvic circulation, or produce excitement in the neighbouring parts, in many cases of a dangerous and irreparable character. Hence many writers on pharmacology deny the existence of emmenagogues.

To ensure the successful administration of this class of medicines, the system must be previously prepared for their use by invigorating it, if there is either relaxation or debility; and an opposite course should be pursued when there is an undue degree of arterial action. In the majority of cases, the restoration of the discharge is rather attributable to a proper regulation of the system than to any specific power in the medicine administered.

EMOLLIENTS. *Syn.* EMOLLIENTIA, *L.* In pharmacy and therapeutics, demulcents of an oleaginous, saponaceous, or emulsive character, applied to surfaces (generally external), to soften and relax their fibres. See DEMULCENTS.

EMUL'SIN. *Syn.* SYNAPTASE. An azotised substance, forming a large proportion of the white pulp of both bitter and sweet almonds. It is yellowish-white, soluble in cold water, and coagulated by heat and alcohol. Its most remarkable property is its action on amygdalin, by which the volatile oil of almonds and hydrocyanic acid, with other products, are formed. It has never been obtained in a state of purity.

EMULSION. *Syn.* EMULSIO, *L.* A milky fluid, formed by the mechanical admixture of oil and water, by means of some other substance that possesses the power of combining

with both. The emulsions of the Pharmacopœia are in the 'British Pharmacopœia' included in the class *Mistura* (which see).

In the preparation of emulsions, the oily or resinous ingredients are usually suspended by means of mucilage of gum arabic, almonds, or yolk of egg. 1 dr. of the first, made with equal parts of gum and water; 1 oz. of the second (usually 26 in number); and one in no. of the last, will form 2 drs. of any oil into an emulsion with about 1 oz. of water, gradually added. In some cases, instead of the above substances, a little liquor of potassa is employed, by which a saponaceous emulsion is formed. In all cases, the mucilage or other viscid substance should be put into the mortar before anything else. The oil or resinous matter may then be very gradually rubbed in, taking care not to add it more quickly than it can be subdued by the pestle; and if, during this part of the manipulation, the mixture should begin to assume a breaking or curdling appearance at the edges, a few drops of water must be immediately incorporated with it, before adding the remainder of the oil. From the want of this precaution, it is common for an emulsion suddenly to lose its tenacious consistence in the mortar, and it is then in vain to endeavour to restore it. After the oil is thoroughly incorporated, some care is requisite to avoid separating it again by too hasty an effusion of the water or other fluid of the mixture. If any alcoholic or acid liquid is to be added, it must be at the very end of the process. Indeed, the addition of an acid liquid, even a slightly acescent syrup, will often entirely destroy an emulsion. Mixtures of copaiba are frequently spoiled by the addition of spirit of nitric ether; a misfortune which might be avoided by first diluting it with one or two parts of water.

An excellent method of preparing emulsions of resins and gum-resins, is to put the article into a marble or wedgwood mortar, and to pour over it about 4 times its weight of rectified spirit, which is then to be ignited, and the mixture triturated until an equal consistence is obtained. The liquid is then to be added gradually, and the whole patiently triturated or shaken until cold. Yolk of egg or mucilage may be added to the fluid resin or gum-resin, if desired, as in the common method, but an excellent emulsion may be made without them.

The presence of soluble salts in an emulsion is apt to occasion the separation of the oleaginous portion. Spirit produces the same effect in those which are made with yolk or mucilage; and acids in those made with an alkali. The addition of these substances to emulsions should be therefore avoided as much as possible. Emulsions of wax, spermaceti, oil of turpentine, and balsam of copaiba, are the most readily and completely formed with yolk of egg. Volatile oils are more readily made into emulsions if mixed with an equal volume of

some simple fixed oil, before proceeding to operate on them. Scammony is generally formed into an emulsion with milk; and resin of jalap, with almonds and water.

The following formulæ, for certain emulsions, are merely given here for examples. Various others will be found under MIXTURE, LOTION, WASH, &c.

Emulsion of Almonds. *Syn.* MILK OF ALMONDS, ALMOND MIXTURE; EMULSIO AMYGDALÆ, MISTURA A., L. *Prep.* 1. Blanched almonds, 1 oz.; beat them to a smooth paste, add, gradually, water, $\frac{1}{2}$ pint; and when the whole is thoroughly incorporated, strain through a piece of gauze.

2. As the last, adding sugar, 1 oz.; or syrup (either simple or flavoured), $\frac{1}{2}$ fl. oz. See EMULSION OF OIL OF ALMONDS (*below*).

Emulsion of Assafœtida. *Syn.* EMULSIO ASSAFÆTIDÆ, MISTURA A., L. *Prep.* (Duclo.) Assafœtida, 1 oz.; powdered gum, 2 oz.; oil of almonds, $3\frac{1}{2}$ fl. oz.; water, 6 fl. oz. Antispasmodic.—*Dose.* 1 or 2 table-spoonfuls; in hysterical affections, &c.

Emulsion of Camphor. *Syn.* EMULSIO CAMPHORÆ, E. CAMPHORATA, MISTURA CAMPHORÆ (Ph. E.), L. *Prep.* 1. (Ph. Cast. Ruth. 1840.) Camphor, $\frac{1}{2}$ dr.; triturate with milk, $\frac{1}{2}$ fl. oz.; gradually added; then further add of water, $7\frac{1}{2}$ fl. oz.

2. (Ph. E.) Camphor, 20 grs.; lump sugar, $\frac{1}{2}$ oz.; triturate together, and add of blanched almonds, $\frac{1}{2}$ oz.; again triturate, then gradually add of water, 1 pint. Stimulant, antispasmodic, and diaphoretic.—*Dose.* 1 fl. oz. to 2 fl. oz.

Emulsion of Castor Oil. *Syn.* EMULSIO OLEI RICINI, MISTURA O. R., L. *Prep.* 1. Castor oil, 1 oz.; thick mucilage, $\frac{1}{2}$ oz.; syrup of orange peel, 1 fl. oz.; water, 6 fl. oz.

2. As the last, but using milk instead of water.—*Dose.* One third; as an aperient for females who object to taking the unprepared oil.

Emulsion of Copai'ba. *Syn.* EMULSION OF CAPIV; EMULSIO COPAIBÆ, MISTURA C., L. *Prep.* 1. Balsam of copaiba and syrup of orange peel, of each, 2 oz.; yolks of 5 eggs; milk, 14 fl. oz.

2. (Beral.) Copaiba and mucilage, of each, 2 oz.; water, 12 fl. oz.—*Dose.* $\frac{1}{2}$ oz. to 1 oz., 2 or 3 times a day; where the use of copaiba is indicated.

Emulsion of Gum. *Syn.* EMULSIO ACACIÆ, MISTURA ACACIÆ (Ph. E.), L. *Prep.* From sweet almonds (blanched), 10 drs.; white sugar, 5 drs.; mucilage, 3 fl. oz.; water, 1 quart. Demulcent. In coughs, &c., *ad libitum*.

Emulsion of Oil of Almonds. *Syn.* EMULSIO OLEI AMYGDALÆ, L. *Prep.* From oil of almonds, 3 drs.; thick mucilage and simple syrup, of each, 5 drs.; rose water, 1 fl. oz.; distilled water, 3 or 4 fl. oz. An elegant and efficient substitute for almond milk. See EMULSION OF ALMONDS (*above*).

Emulsion of Peru'vian Balsam. *Syn.* **EMULSIO BALSAMICA, E. BALSAMI PERUVIANI,****L. Prep.** 1. As emulsion of copaiba.2. (Hosp. F.) Balsam of Peru, $\frac{1}{2}$ oz.; oil of almonds, 6 drs.; powdered gum, 1 oz.; triturate together, and add, gradually, rose water, 4 fl. oz.—*Dose.* 1 or 2 table-spoonfuls; in old asthmas, chronic coughs, winter coughs, &c.**Emulsion of Scam'mony.** *Syn.* **EMULSIO SCAMMONTII, MISTURA S. (Ph. E.), L. Prep.**

1. (Ph. E.) Resin of scammony, 7 grs.; new milk, 3 fl. oz. For a dose.

2. (Planche.) Aleppo scammony, 7 grs.; sugar, 2 drs.; new milk, 3 fl. oz.; cherry-laurel water, 5 drops. For a dose. Purgative; in torpor of the intestines, dropsy, worms, &c. The formula of the Paris Codex is similar.

Emulsion of Spermac'ei. *Syn.* **EMULSIO CETACEI, MISTURA C., L. Prep.** As emulsion of wax. Demulcent.**Emulsion of Turpentine.** *Syn.* **EMULSIO TEREBINTHINÆ, MISTURA T., L. Prep.** 1.Chio turpentine, 2 drs.; white sugar, 1 oz.; yolk of 1 egg; milk of almonds, 4 fl. oz. In gleet.—*Dose.* 2 table-spoonfuls, 3 or 4 times a day.2. (Clossius.) Venice turpentine, $1\frac{1}{2}$ dr.; yolk of 1 egg; peppermint water, $4\frac{1}{4}$ fl. oz. (See *below*.)**Emulsion of Oil of Turpentine.** *Syn.* **EMULSIO OLEI TEREBINTHINÆ, MISTURA O. T., L. Prep.** (Carmichael.) Rectified oil ofturpentine, 1 fl. oz.; yolk of 2 eggs; emulsion of almonds, 4 fl. oz.; syrup of orange peel, 2 fl. oz.; spirit of lavender, 4 fl. drs.; oil of cinnamon, 5 or 6 drops.—*Dose.* 1 fl. oz., twice or thrice a day; in nephritic pains, and that variety of ophthalmia termed iriditis. (See *above*.)**Emulsion of Wax.** *Syn.* **EMULSIO CERÆ, E. CERÆ ALBÆ, MISTURA C., LAC C., L. Prep.**(Guibourt.) White wax, 1 oz.; powdered gum, $1\frac{1}{2}$ dr.; water, $2\frac{1}{4}$ fl. oz.; simple syrup, 4 fl. oz.; put the syrup and gum into a warm mortar, add the wax, and triturate with a warm pestle until united; then add the water (warm) gradually, and continue the agitation till the whole is quite cold. Demulcent. *Ad libitum.***ENAMEL.** A species of vitreous varnish, coloured with metallic oxides, applied in a thin stratum to brightly polished metallic surfaces (copper or gold), on which it is fused by the flame of a lamp urged by the blowpipe, or by the heat of a small furnace.

The basis of all enamels is a highly transparent and fusible glass, called 'frit,' 'flux,' or 'paste,' which readily receives a colour on the addition of metallic oxides. It may be made by one or other of the following formulas:—

Prep. 1. Red lead, 16 parts; calcined borax, 3 parts; powdered flint glass, 12 parts; powdered flints, 4 parts; fuse in a Hessian

crucible for 12 hours, then pour it out into water, and reduce it to a powder in a biscuit-ware mortar.

2. Tin, 3 parts; lead, 10 parts; mix, calcine in an iron pot at a dull cherry-red heat, and scrape off the oxide as it forms, observing to obtain it quite free from undecomposed metal; then reduce it to fine powder by grinding and elutriation. In this state it is known among enamellers as 'flux' or 'calcine.' 4 parts of this 'calcine' are next mixed with an equal weight of pure sand or powdered flints, and 1 part of sea salt, or other alkaline matter; the mixture is then partially fused in a Hessian crucible, by which it undergoes semi-vitrification.

3. (Chaptal.) Lead and tin, equal parts; calcine as above, and take of the mixed oxides or 'calcine' and ground flints, of each, 1 part; pure carbonate of potash, 2 parts; and proceed as before.

4. (Wynn.) Flint glass, 3 oz.; red lead, 1 oz.; as last.

5. (Wynn.) Red lead, 18 parts; borax (not calcined), 11 parts; flint glass, 16 parts; as last.

6. (Wynn.) Powdered flints, 10 parts; nitre and white arsenic, of each, 1 part; as last.

Obs. The precise qualities of the products of the above processes depend greatly upon the duration and degree of heat employed. By increasing the quantity of sand, glass, or flux, the enamel is rendered more fusible, and the opacity and whiteness is increased by the addition of oxide of tin. The use of borax should be avoided, or it should be used sparingly, as it is apt to make the enamel effloresce and lose colour.**Enamel, Black.** *Prep.* 1. Calcined iron (protoxide), 12 parts; oxide of cobalt, 1 part; mix, add an equal weight of white flux, and fuse, as before.

2. (Clouet.) Pure clay, 3 parts; protoxide of iron, 1 part. A fine black.

3. Peroxide of manganese, 3 parts; zaffre, 1 part; mix, and add it, as required, to white flux.

Enamel, Blue. *Prep.* 1. White 'frit' or 'flux,' coloured with oxide of cobalt.

2. Sand, red lead, and nitre, of each, 10 parts; flint glass or ground flints, 20 parts; oxide of cobalt, 1 part, more or less; depending on the desired depth of colour.

Enamel, Brown. *Prep.* 1. Manganese, 5 parts; red lead, 16 parts; flint powder, 8 parts; as before.

2. (Wynn.) Manganese, 9 parts; red lead, 34 parts; flint powder, 16 parts.

3. Red lead and calcined iron, of each, 1 part; antimony, litharge, and sand, of each 2 parts. To be added in any required proportion to white 'frit,' according to the colour desired. A little oxide of cobalt or zaffre is frequently added to alter the shade.

Enamel, Green. *Prep.* 1. 'Flux' or 'frit,' 2 lbs.; black oxide of copper, 1 oz.; as before,

2. As the last, but adding red oxide of iron, $\frac{1}{2}$ dr. Less decisive.

3. Copper dust and litharge, of each, 2 oz.; nitre, 1 oz.; sand, 4 oz.; 'flux' or 'frit,' q. s.

4. From transparent 'frit,' any quantity; oxide of chromium, q. s. to colour. Colour superb; it will stand a great heat; in common hands, however, it frequently turns on the dead-leaf tinge.

5. Transparent 'flux,' 5 oz.; black oxide of copper, 20 to 40 grs.; oxide of chromium, 2 grs. Resembles the emerald.

6. From blue and yellow enamel mixed in the required proportions.

Enamel, Olive. *Prep.* Blue enamel, 2 parts; black and yellow enamel, of each, 1 part. See BROWN ENAMEL.

Enamel, Orange. *Prep.* 1. Red lead, 12 parts; red sulphate of iron and oxide of antimony, of each, 1 part; flint powder, 3 parts; calcine together, powder, and melt with 'flux,' 50 parts.

2. (Wynn.) Red lead, 12 parts; oxide of antimony, 4 parts; flint powder, 3 parts; red sulphate of iron, 1 part; calcine, then add 'flux,' 5 parts, to every 2 parts of this mixture.

Enamel, Purple. *Prep.* 1. 'Flux' or 'frit,' coloured with oxide of gold, purple precipitate of cassius, or peroxide of manganese.

2. Sulphur, nitre, green vitriol, antimony, and oxide of tin, of each, 1 lb.; red lead, 60 lbs.; mix, fuse, cool, powder, and add rose copper (red oxide), 19 oz.; saffre, 1 oz.; crocus parts, $1\frac{1}{2}$ oz.; borax, 3 oz.; and of a compound formed of gold, silver, and mercury, 2 lb.; fuse, stirring the melted mass with a copper rod all the time, then place it in crucibles, and submit them to the action of a reverberatory furnace for 24 hours. This is said to be the purple enamel used in the mosaic pictures in St. Peter's at Rome.

Enamel, Red. *Prep.* 1. 'Paste' or 'flux,' coloured with the red oxide or protoxide of copper. Should the colour pass into the green or brown, from the partial peroxidation of the copper, from the heat being raised too high, the red colour may be restored by the addition of any carbonaceous matter, as tallow, or charcoal.

2. By tinging the glass or 'flux' with the salts of gold, or with the purple precipitate of cassius. These substances produce shades of red, inclining to crimson or purple of the most exquisite hue. The enamel often comes from the fire quite colourless, and afterwards receives its rich hue at the lamp.

(Wynn.) Sulphate of iron (calcined), 1 part; a mixture of 6 parts of 'flux' (No. 5), and 1 of colcothar, 3 parts. Dark red.

(Wynn.) Red sulphate of iron, 2 parts; 'flux' (No. 1), 6 parts; white lead, 3 parts. Light red.

Enamel, Rose-coloured. *Prep.* Purple enamel

(or its elements), 3 parts; 'flux,' 90 parts; mix, and add silver leaf or oxide of silver, 1 part, or less.

Enamel, Transpare'nt. The 'frit' or 'flux' described *above*.

Enamel, Violet. *Prep.* 1. Purple enamel, 2 parts; red enamel (No. 2), 3 parts; 'frit,' 6 parts.

2. Saline or alkaline 'frit' or 'flux,' any quantity; peroxide of manganese, q. s. to colour. As the tint depends on the metal being at the maximum of oxidation, contact with oily or carbonaceous substances should be particularly avoided.

Enamel, White. *Prep.* 1. 'Calcine' (from 2 parts of tin and 1 part of lead), 1 part; fine crystal glass or 'frit,' 2 parts; manganese, a few grains; powder, mix, melt, and pour the fused mass into clean water; again powder, and fuse, and repeat the whole process 3 or 4 times, avoiding contamination with smoke, dirt, or oxide of iron. A fine dead white.

2. Washed diaphoretic antimony, 1 part; fine glass (free from lead), 3 parts; mix, and proceed as before. Very fine.

3. Lead, 30 parts; tin, 33 parts; calcine as before, then fuse 50 parts of this 'calcine' with an equal weight of flints, in powder, and 100 parts of salt of tartar. A fine dead white enamel.

Obs. For white enamel, the articles must be perfectly free from foreign admixture, as this would impart a colour. When well managed, either of the above forms will produce a paste that will rival the OPAL.

Enamel, Yellow. Superior yellow enamels are less easily produced than those of most other colours; they require very little flux, and that mostly of a metallic nature. The following come highly recommended by experienced artists:—

Prep. 1. From 'frit' or 'flux,' fused with oxide of lead, and a little red oxide of iron.

2. Lead, tin ashes, litharge, antimony, and sand, of each, 1 oz.; nitre, 4 oz.; mix, fuse, and powder; and add the product to 'flux' or 'frit,' q. s.

3. White oxide of antimony, alum, and sal-ammoniac, of each, 1 part; pure carbonate of lead, 1 to 3 parts, or q. s. (all in powder); mix, and expose them to a heat sufficiently high to decompose the sal-ammoniac. *Used* as the last. Very bright coloured.

4. (Wynn.) Red lead, 8 oz.; oxide of antimony, and tin, calcined together, of each, 1 oz.; mix, and add of 'flux' (No. 5), 15 oz.; mix well and fuse.

5. Pure oxide of silver added to the metallic 'fluxes.' The salts of silver are also used, but are more difficult to manage. If a thin film of oxide of silver be spread over the surface of the enamel to be coloured, exposed to a moderate heat, then withdrawn, and the film of reduced silver on the surface removed, the part under will be found tinged of a fine yellow. (Clouet.)

ENCAUSTIC. See PAINTING (Encaustic).
ENEMA. *Syn.* CLYSTER; **ENEMA** (*pl.* ENEMATA), L. A medicine, usually liquid (sometimes gaseous), thrown into the rectum or lower bowels.

Clysters usually consist of some weak glutinous or mucilaginous fluid, to which the active ingredients are added; or a decoction or infusion is made of the medicaments, which is then used, either alone, or after the addition of a little gum, starch, or sugar. The proper vehicle for astringent vegetable matter, metallic salts, and the mineral acids, is pure water. Oleaginous and resinous substances are made into emulsions before being employed for enemas. In all cases the fluid is administered warm. The quantity of fluid forming a clyster, for an adult, may vary from $\frac{1}{2}$ to $\frac{3}{4}$ pint; that for an infant within a month old, should be about 1 fl. oz.; for a child of one year, about $2\frac{1}{2}$ fl. oz.; from one to seven years, from 3 or 4 fl. oz.; and from seven to twelve or fourteen, 6 or 7 fl. oz.; after that age to puberty, $\frac{1}{2}$ pint may be employed.

The quantity or dose of the active ingredients in a clyster should be 4 or 5 times as great as that of the same medicines when taken by the mouth; as it is generally regarded that the susceptibility of the rectum is only $\frac{1}{4}$ th that of the stomach, and that to exert a like absorbent action it occupies 5 times as long as the latter viscous. The dose, and the interval between its repetition, should, therefore, be proportionately increased. Narcotics, as opium, tobacco, &c., should, however, be given in only twice or thrice the quantity that would be exhibited in the usual manner.

Enemata are usually administered by means of a syringe, bladder, or elastic bag, furnished with a rectum tube; but many ingenious and elegant pieces of mechanism, adapted for self-administration, are made by the instrument makers. Great care should be taken to avoid injuring the coats of the rectum by the use of a rough or improperly shaped pipe, or one that is too long. The extremity of the pipe or tube should also be perfectly smooth and well rounded (rather spherical than pointed), and in using it no force should be employed. A neglect of this point often produces very serious consequences, especially in young children.

Tobacco smoke may be administered by means of a double pair of bellows, supplied with air from a small funnel under which the herb is burning, and gaseous matter, by connecting the rectum tube with a small gasometer, exerting a trifling pressure on the confined gas.

The number of substances employed in the preparation of enemata is very great. The following are some of them, arranged according to their effects:—

1. (Anodyne and Narcotic.) Opium, henbane, &c., are employed to allay spasms of the bowels, stomach, uterus, bladder, &c.

2. (Aperient or Cathartic.) Aloes, colocynth,

senna, various purging salts, gruel, decoction of marshmallows, decoction of linseed, warm water, &c., are commonly employed to promote the peristaltic action of the bowels, or to destroy worms.

3. (Demulcent and Emollient.) Decoction of starch, gum, isinglass, glue, &c., either alone or combined with opium, are used to protect the coats of the intestines, and to allay irritation; and also to restrain diarrhoea, especially, when combined with astringents, as logwood, catechu, or oak bark.

4. (Nutrient.) Animal jelly, soups, broths, milks, &c., are frequently used as injections to convey nourishment to the body.

5. (Sedative.) Tobacco infusion or smoke, and tartar emetic (in solution), are employed to relax the powers of the body, to remove spasms, depress the circulation, and to produce syncope.

Enemata or clysters are now very frequently employed in our large towns, especially among the higher classes; but a great prejudice exists among many persons against their use, arising from a fastidious and mistaken delicacy. The introduction of improved apparatus of late years, by which the administration of these remedies is attended with less difficulty and exposure than formerly, has removed much of the repugnance which previously existed.

Clysters are invaluable when it is necessary to evacuate the bowels as speedily as possible, and when the stomach will not bear the administration of a purgative by the mouth, as well as in cases requiring a direct medication of the lower bowels, as in dysentery, colic, &c. As a mere laxative, an injection of tepid water, milk-and-water, or water gruel, will generally be found sufficient. By the addition of 1 or 2 table-spoonfuls of common salt, Epsom salts, salad oil, or molasses, to this laxative enema, it will form an excellent purgative one, which will, in most cases, induce a full discharge. In all cases, the patient should be directed to retain the injection for as long a time as possible, and not to attempt to empty his bowels immediately after the reception of the medicine. "In irritation of the bladder, rectum, or uterus, an anodyne injection or enema often affords much relief. In diseases of the lower bowels, clysters are also of almost indispensable utility, as also in the dislodgment of ascarides seated in the rectum; nor are they less beneficial in those cases of sudden sinking of the powers of life, where deglutition is impossible, and yet a prompt stimulating impression is requisite to save the patient; under such circumstances, clysters of some of the diffusible stimuli have proved of the greatest benefit."

The injection of large quantities of liquid matter into the bowels, as well as the constant use of clysters (even of warm water only), is deemed by the highest medical authorities to be injurious, and, occasionally, dangerous. The practice should not, therefore, be allowed to grow into a habit. The bowels continue to

accustomed to a stimulant cease to act without one. The same remarks apply to aperients taken by the mouth.

The following formulæ embrace the whole of the enemata (ENEMATATA) of the 'British Pharmacopœia,' as well as a few others in common use:—

Enema of Albu'men. *Syn.* ENEMA ALBUMINIS, L. *Prep.* (Ricord.) Infusion of linseed, 12 oz.; whites of 2 or 3 eggs; mix. In chronic diarrhœa, and as a nutrient clyster in debility from stomach diseases. The reason for rejecting the yolks of the eggs is not very obvious, as the preparation is much more effective with them.

Enema of Aloës. *Syn.* ENEMA ALOËS (B.P.), L. *Prep.* From aloes, 2 scrup.; carbonate of potassa, 15 grs.; mucilage of starch, $\frac{1}{2}$ pint. In ascariæ, atonic amenorrhœa, &c. It should not be employed when irritability of the rectum, bladder, or genitals, exists; nor in piles, or when there is a tendency to prolapsus ani or prolapsus uteri.

Enema, An'odyne. See ENEMA OF OPIUM.

Enema, Antispasmod'ic. *Syn.* ENEMA ANTISPASMODICUM, L. *Prep.* From tincture of assafoetida, 3 fl. drs.; laudanum, 30 to 60 drops; water gruel or barley water, $\frac{1}{2}$ pint. In spasmodic affections of the bowels. (See below.)

Enema of Assafoet'ida. *Syn.* FETID CLYSTER, ANTISPASMODIC O.; ENEMA ASSAFOETIDA (B.P.), E. FETIDUM (Ph. E. & D.), L. *Prep.* 1. (B.P.) Assafoetida, 30 grs.; water, 4 oz.; rub together until mixed.

2. (Ph. E.) To cathartic enema (Ph. E.), add of tincture of assafoetida, 2 fl. drs.

3. (Ph. D.) Warm water, 12 fl. oz.; tincture of assafoetida, 2 fl. drs.
4. (St. B. Hosp.) Assafoetida, 2 drs.; yolk of an egg; barley water, 7 fl. oz. Stimulant, antispasmodic, and carminative. An excellent remedy in hysteria, flatulent colic, hooping-cough, infantile convulsions, worms in the lower bowels, &c. See HOOPING-COUGH ENEMA.

Enema, Astrin'gent. *Syn.* ENEMA ASTRINGENS, L. *Prep.* 1. Tincture of catechu, 1 fl. oz.; barley water, 9 fl. oz.

2. Extract of rhatany, 2 drs.; syrup, or made starch, 2 oz.; water, 7 fl. oz.

3. Decoction of galls, oak-bark, pomegranate, or other like astringent substance, 3 or 4 fl. oz.; water or barley water, 6 or 7 fl. oz.

4. (Hosp. F.) Electuary of catechu, 2 drs.; water and lime water, of each, $4\frac{1}{2}$ fl. oz. In diarrhœa, &c., arising from a relaxed condition of the coats of the lower bowels; and in fissures of the anus, &c.

Enema of Cam'phor. *Syn.* ENEMA CAMPHORE, L. *Prep.* 1. Camphor liniment, 4 fl. drs.; yolks of 2 eggs; water gruel, 7 fl. oz.

2. Camphor, 1 dr.; rectified spirit, 2 drs.; triturate till dissolved, then add, gradually, of simple syrup, 1 oz.; when thoroughly incorporated, further add of thin gruel, 7 fl. oz.

Anodyne, antispasmodic, and diuretic. In difficult or obstructed micturition.

Enema of Castor Oil. *Syn.* ENEMA OLEI RICINI, L. *Prep.* 1. (Hosp. F.) Castor oil and mucilage, of each, 1 oz.; gruel, $\frac{1}{2}$ pint.

2. Castor oil, 1 oz.; liquor potassa, 2 fl. dr.; triturate, and add of honey, 1 oz.; when mixed, further add of hot gruel, $\frac{1}{2}$ pint; and agitate until cool enough to be administered.

Enema, Cathar'tic. *Syn.* PURGATIVE CLYSTER; ENEMA CATHARTICUM (B.P., Ph. E. & D.), E. LAXATIVUM, E. PURGATIVUM, L. These have been already alluded to. By increasing the quantity of the active ingredients, a mild laxative or aperient clyster is converted into an active purgative or cathartic one.

Prep. 1. (Ph. E.) Senna, $\frac{1}{2}$ oz.; boiling water, 16 fl. oz.; infuse an hour, then add of Epsom salts, $\frac{1}{2}$ oz.; sugar, 1 oz.; when dissolved, further add of olive oil, 1 oz.; and mix them by agitation.

2. (Ph. D.) Epsom salts, 1 oz.; olive oil, 1 fl. oz.; mucilage of barley, 16 fl. oz. Same as enema of sulphate of magnesia, B.P., except that in the latter mucilage of starch is substituted for mucilage of barley.

3. (Ph. D. 1826.) * Manna, 1 oz.; compound decoction of chamomile, $\frac{1}{2}$ pint; dissolve, and add, of olive oil, 1 oz.; Epsom salts, $\frac{1}{2}$ oz.

4. Compound decoction of mallows, $\frac{1}{2}$ pint; Epsom salts, $\frac{1}{2}$ oz.; sweet oil, 2 fl. oz.; mix, as above.

Obs. The above are employed in all ordinary cases where the use of an immediate cathartic is indicated.

Enema of Chlo'ride of Lime. *Syn.* ENEMA CHLORIDI CALCIS, E. ANTIPUTRESCENS, L. *Prep.* 1. Chloride of lime, 10 grs.; tepid water, 1 fl. oz.; triturate, then add of barley water, or plain tepid water, 7 fl. oz.

2. (Pereira.) Chloride of lime, 10 to 15 grs., added to a common enema. As a deodoriser, when the alvine evacuations are unusually fetid.

Enema for Col'ic. * *Syn.* ENEMA ANTICOLICUM, L. *Prep.* From oil of cajeput or peppermint, 15 drops; dissolved in sweet spirit of nitre, 60 drops; laudanum, 35 drops; infusion of chamomile, $\frac{1}{2}$ pint.

* **Enema of Colocynth.** *Syn.* ENEMA COLOCYNTHIDIS (Ph. L.), L. *Prep.* 1. (Ph. L.) Extract of colocynth, $\frac{1}{2}$ dr.; soft soap, 1 oz.; triturate, and add of water, 1 pint.

2. (Ph. L. 1836.) As the last, but using compound extract of colocynth.

3. (Guy's Hosp.) Colocynth pulp, 1 dr.; water, $\frac{1}{2}$ pint; boil so as to strain $\frac{1}{2}$ pint; and add of common salt, $\frac{1}{2}$ oz.; syrup of buckthorn, 1 fl. oz. An efficient enema in colic and obstinate constipation, in the absence of spasms and inflammatory symptoms.

Enema, Com'mon. *Syn.* ENEMA COMMUNE, L. Gruel or br

but on some extraordinary condition of the air. When a disease is peculiar to a people or nation, and appears to depend on local causes, it is said to be 'ENDEMIC' or 'ENCHORIAL.' Thus, Asiatic cholera may be taken as an example of the first, and the agues of low countries, and the goitre of the Alps, as examples of the other.

EPIGAS'TRIC. In *anatomy*, pertaining to the **EPIGAS'TRUM**, or the part of the abdomen over the stomach.

EPILEP'SY. *Syn.* FALLING SICKNESS; **EPILEPSIA**, **MORBUS CADUCUS**, *L.* The popular name of this disease arises from the patient, when attacked by it, suddenly falling to the ground. The other leading symptoms consist of convulsions, stupor, and, generally, frothing at the mouth. It comes on by fits, which after a time go off, leaving a certain amount of lassitude and drowsiness behind. Sometimes certain peculiar symptoms precede the attack. Among these, a sensation of coldness or of a current of cold air from the extremities of the body towards the head (**AURA EPILEPTICA**), palpitation, flatulency, stupor, and an indescribable cloud or depression, are the most common. The occurrence of these symptoms are not, however, uniform, even in the same patient; but it generally happens that the party falls down suddenly, and without the slightest warning.

Epilepsy is often symptomatic of other affections, as excessive irritation of the primæ viæ from worms, indigestible or noxious food, or poison; or it depends on local injuries, particularly those of the head, accompanied with lodgments of water on the brain, tumours, pressure, &c. Violent affections of the nervous system, sudden frights or fits of passion, violent mental emotions, the sudden suppression of old evacuations, and in childhood difficult teething, are also common causes of sympathetic epilepsy. Occasionally it arises from mobility of the sensorium, induced by plethora, or by excessive debility. In such cases the treatment must be energetically directed to the removal of the exciting cause.

When epilepsy occurs as an idiopathic or primary affection, or cannot be referred to any apparent cause, more especially when the attack commences about the age of puberty, and the fits are frequent, it is generally hereditary, and there is great danger of its terminating either in apoplexy, or lunacy, or imbecility.

The treatment of idiopathic epilepsy is principally directed to the improvement of the general health, and the diminution of nervous irritability by sedatives and tonics. Among the first, camphor, ether, henbane, hemlock, musk, oil of cajuput, opium, and morphia, and, more recently, hydrocyanic acid, have been principally relied on. Among the second, bark, cascarrilla, quinine, strychnia, valerian, the sulphate of iron, zinc, and copper, arsenious acid, and nitrate of silver, have each their

zealous advocates. The objection against the last preparation is the danger of its disfiguring the patient, by tinging the skin of a permanent dull, leaden hue. In cases accompanied with plethora, a low diet, daily out-of-door exercise, and the frequent use of aperients, with occasional blistering, cupping, and other depletive measures, are indicated; whilst in those marked by inanition and debility, an entirely opposite course must be adopted. When the disease is complicated with syphilis, a mild course of mercury may be given; and when with scrofula, iodine, iodide of potassium, or cod-liver oil, assisted by sea-bathing, will be proper.

Among other methods of treatment may be mentioned the administration of an active emetic or purgative, twice weekly, in the morning, when the stomach is empty. The first has now few supporters; but the second is said to be often productive of great benefit.

During a fit of epilepsy the only thing that can be done for the patient is to prevent the sufferer injuring himself, and to loosen every part of his dress that presses on his head, neck, or chest. When premonitory symptoms occur, a brisk emetic, a large dose of laudanum and ether, a cold plunge or shower bath (when not contra-indicated), or anything else which gives a sudden shock to the system or raises its tone, frequently prevents the accession of the fit.

Epilepsy more frequently attacks children than adults, and boys than girls. "Its returns are (frequently) periodical, and its paroxysms commence more frequently in the night than in the day, being somewhat connected with sleep." It is sometimes counterfeited by street impostors in order to excite the charity of the passers-by.

EPIPAS'TICS. See **BLISTER** and **VESICANT**.

EPITHEM. *Syn.* **EPITHEMA**, *L.* Any external liquid medicine for local application; as an embrocation or lotion. Some writers confine the term to those preparations which are intended to be applied by means of a cloth dipped into them. See **LINIMENT**, **LOTION**, &c.

Epithem, Astrin'gent. *Syn.* **EPITHEMA ASTRINGENS**, *L. Prep.* 1. Powdered ice, 7 dr.; powdered catechu, 1 dr.; mix.

2. (Brera.) Powdered bole and rhatany, of each, 1 oz.; vinegar of roses, q. s. to form a paste. Both are applied to the nostrils and forehead to stop bleeding at the nose.

Epithem, Gly'cerin. *Syn.* **EPITHEMA GLYCERINE**, *L. Prep.* (Mr. Startin.) Glycerin, 1 oz.; rose water and lime water, of each, 3 or 4 fl. oz.; powdered gum tragacanth, q. s. to form a thin mucilage. In scalds, burns, and excoriations.

Epithem, Vesica'ting. *Syn.* **EPITHEMA VESICATORIUM**, *L. Prep.* 1. (Alibert.) Rye or barley meal, made into a paste with vinegar, and 30 to 40 grs. or more of powdered Spanish flies sprinkled over the surface.

2. (Ph. L. 1746.) Spanish flies (in fine powder) and wheat flour, equal parts, made into a paste with vinegar, q. s. As a blister.

Epithem, Volatile. *Syn.* EPITHEMA VOLATILE, E. AMMONIÆ, L. *Prep.* (Ph. L. 1764.) Common turpentine and water of ammonia, equal parts. An excellent counter-irritant; either with or without the addition of a little olive oil.

EQUISETIC ACID. In *chemistry*, a substance identical with ACONITIC ACID (which *see*).

EQUIVALENT. (EQUIVALENCY.) In modern *chemistry*, the equivalent of a body is that weight of it which will exactly replace in a compound 1 atom of hydrogen, or 1 atom of either of the other monivalent elements (*see* Table, *below*).

Table of the Elements, arranged according to their Equivalency.

Monivalent.	Divalent.	Trivalent.	Tetrivalent	Pentivalent.	Hexivalent.
Hydrogen	Oxygen	Boron	Carbon	Nitrogen	Sulphur
Fluorine	Barium	Gold	Silicon	Phosphorus	Selenium
Chlorine	Strontium		Tin	Vanadium	Tellurium
Bromine	Calcium		Titanium	Arsenic	Tungsten
Iodine	Magnesium		Thorium	Antimony	Molybdenum
Cesium	Zinc		Niobium	Bismuth	Osmium
Rubidium	Didymium		Tantalum		Iridium
Potassium	Lanthanum		Zirconium		Ruthenium
Sodium	Yttrium		Aluminium		Rhodium
Lithium	Glucinum		Platinum		Chromium
Thallium	Cadmium		Palladium		Manganese
Silver	Mercury		Lead		Iron
	Copper				Cobalt
					Nickel
					Uranium
					Cerium

Monivalent elements are those which replace one atom of hydrogen in chemical combinations in the ratios of their atomic weights.

One atom of a divalent, trivalent, tetrivalent, pentavalent, and hexivalent element replaces respectively, or is equivalent to, two, three, four, five, or six atoms of hydrogen or of any other monivalent element. (For further information on this subject consult the works on chemistry by Fownes, Miller, Kay-Shuttleworth, &c.)

ERETUM. According to Prof. Mosander, the substance usually called yttria is a mixture of the oxides of three metals—yttrium, erbium, and terbium, which differ in the character of their salts, and in some other important particulars. The first is a powerful base; the others, very weak ones. The latter are separated with extreme difficulty, and possess no practical importance.

EREMACAU'SIS. Slow burning; decay. This expression was applied by Liebig to the peculiar decomposition which moist organic matter undergoes, when freely exposed to the air, by the oxygen of which it is gradually burned or destroyed, without any sensible elevation of temperature. *See* PUTREFACTION.

ERGOT. *Syn.* ERGOT OF RYE, SPURRED RYE, HORNED R., COCKSPUR R., OBSTETRICAL R.; ERGOTA (B.P.), L. The diseased seeds of *Secale cereale* (Linn.), or common rye.

Ergot of rye deteriorates greatly by age,

being subject to the attacks of a description of acarus resembling the cheese mite, but much smaller, which destroys the whole of the internal portion of the grain, leaving nothing but the shell, and a considerable quantity of excrementitious matter. To prevent this, the ergot should be well dried, and then placed in bottles or tin canisters, and closely preserved from the air. The addition of a few cloves, or drops of the oil of cloves, or strong acetic acid, or a little camphor, or camphorated spirit of wine, will preserve this substance for years in close vessels. M. Martin proposes to steep the dry ergot in strong mucilage, and then to dry it on a sheet of white iron. This operation he repeats once or oftener, and finally preserves the prepared and thoroughly dried ergot in a well-corked glass flask. ('*Jour. de Chimie Méd.*') The wholesale druggists generally keep it in well-covered tin canisters or tin boxes.

Ergot of rye is much used to restrain uterine hemorrhage, and to accelerate the contraction of the uterus in protracted labour. It is also much used as an emmenagogue.—*Dose.* To facilitate labour, 20 to 30 grs., either in powder or made into an infusion; repeated at intervals of 20 or 30 minutes until 3 or 4 scruples have been taken. In other cases (leucorrhœa, hæmorrhages, &c.) the *dose* is 5 to 12 grs. three times daily, for a period not longer than a week or ten days at a time. *See* DECOCTION, EXTRACT, INFUSION, OIL, TINCTURE, &c.

ERGOTINE. *Syn.* ERGOTINA, L. *Prep.*

1. (Bonjean's.) Powdered ergot is exhausted with cold water, by displacement, and the resulting solution is heated in a water bath to about 200° Fahr., and filtered; the filtered liquor is then evaporated to the consistence of a syrup, and when cold, is treated with rectified spirit, in considerable excess, to precipitate its gummy matter; after repose, the clear portion is decanted, by the heat of a water bath, to the consistence of a soft extract. *Prod.* 15%. According to M. Bonjean, this preparation possesses all the 'hæmostatic' without any of the 'poisonous' qualities of ergot. It has a reddish-brown colour, a bitter taste, and an odour somewhat resembling that of roasted meat. Its aqueous solution is red, limpid, and transparent. *Dose.* 4 to 10 grs., either made into a pill or dissolved in water.

2. (Wigger's.) Powdered ergot is first digested in ether, to remove the fatty matter, and then in boiling alcohol; the alcoholic tincture is evaporated, and the resulting extract treated with water; the undissolved portion, dissolved in hot alcohol and filtered, yields pure ergotine by gentle evaporation. *Prod.* 1½%. It has a brownish-red colour; is resinous, acrid, bitter, insoluble in water and ether, soluble in alcohol, and poisonous. It evolves a peculiar odour when warmed. Its therapeutical action has not been determined. See **EXTRACT.**

ERRHINES. *Syn.* ERRHINA, L. Substances applied to the pituitary membrane of the nose, for the purpose of producing an increased discharge of nasal mucus. When they are given to excite sneezing, they are called **STERNUTATORIES** or **PTARMICS**. Asarabacca, euphorbium, several of the *labiate* (herbs & vel flores), sal-ammoniac, powdered sugar, subsulphate of mercury, tobacco, and white hellebore, are the principal substances of this class.

Errhines act as local irritants, and are occasionally employed in chronic affections of the eyes, face, ears and brain; as in amaurosis, ophthalmia, deafness, weak sight, headache, &c.

Errhine, Al'um. *Syn.* ERRHINUM ALUMINIS, L. *Prep.* (Radius.) Alum and Armenian bole, of each, 1 dr.; kino, ½ dr.; red oxide of iron, 2 drs.; (all in powder;) mix and triturate. In bleeding at the nose. A little is snuffed up the nostrils.

Errhine, Hæmostatic. *Syn.* ERRHINUM HÆMOSTATICUM, L. *Prep.* From powdered catechu, 1 dr.; opium, 5 grs.; sugar, 2 drs. As the last.

ERUPTIONS (of the Skin). For brevity and convenience, these cutaneous affections may be divided into 5 classes:—

Eruptions, Animal'cular. These are due to the presence of minute parasites (ACARI), which burrow and breed in the scarf-skin, and occasion much local irritation. See **ITCH.**

Eruptions, Pap'ular. *Syn.* DRY PIMPLES.

In these the surface is raised into little elevations or pimples, which sometimes show themselves on the surface, and at others are only appreciable by the touch. They are usually accompanied with a greater or less degree of cutaneous irritation and troublesome itching, in attempting to relieve which they are frequently converted into disagreeable and painful sores and excoriations, which are often difficult to heal.

Treat. In simple cases, where there is not much disarrangement of the general health, these eruptions commonly yield to the occasional use of mild saline aperients, and warm or tepid bathing, or frequent abluition with warm soap and water. Sea-bathing is also a powerful remedy. Stimulants of all kinds should be avoided, and ripe fruit and vegetables should form a prominent part of the diet. Lemonade, made by squeezing a lemon into a tumbler of water, and sweetening the mixture with a little sugar, is one of the best beverages on these occasions. To relieve the itching, brisk friction with a soft flesh-brush may be had recourse to, followed by the use of a lotion formed by adding the juice of a lemon or a wine-glassful of distilled vinegar, to ½ of a pint or a pint of water, either with or without the addition of a table-spoonful of glycerine. Occasional single pimples, depending on local causes, generally require no particular treatment. See **LICHEN**, **PRURIGO**, **RED GUM**, and **TOOTH-RASH.**

Eruptions, Pus'tular. *Syn.* MATTERTY PIMPLES. These are distinguished by the pimples (pustules) containing an opaque yellow fluid or matter (pus, lymph). "They are generally developed on a ground of inflamed skin; and the degree of this inflammation of the skin is the basis of their division into two groups, termed technically 'IMPETIGO' and 'ECTHYMA.' The former presents the slighter degree of inflammation, and, sometimes, there is scarcely any redness of the skin; the latter is always accompanied by considerable inflammation and redness." "The little bubbles attain their full size in the course of two or three days, and either dry up without breaking, or more frequently burst and then dry, forming a hard crust, which offers considerable variety of colour, being sometimes yellowish, sometimes brownish, and sometimes almost black." The latter form is popularly known as 'crusted tetter.' In ecthyma the pustules "are generally of the size of a split pea, and surrounded at their base by a broad halo of redness. They are usually separate, not clustered like impetigo, scattered over various parts of the body, and followed either by a hard black crust or by a sore."

Treat. The inflammation and pain may be generally alleviated by the application of a lotion formed of rectified spirit of wine, 1 part; and water, 5 or 6 parts; to which a table-spoonful of distilled vinegar is often added. The crusts or scabs, when they be-

come hard or troublesome, may be removed by a warm fomentation or an emollient poultice; a little simple cerate being afterwards applied to allay irritation. When the constitution is full and inflammatory (as it usually is in impetigo), a depletive treatment may be adopted; when it is low and debilitated (as it usually is in ecchyma), tonics and a more liberal diet, with the free use of lemon juice diluted with water, as a beverage, should be had recourse to. Sea-bathing is also highly useful. See TETTERS.

Eruptions, Scarf. *Syn.* DRY TETTER. This is a form of inflammatory condition of the true skin (DERMA), which commonly makes its appearance as a small dull red, salmon-red, or liver-coloured spot, slightly raised above the level of the surrounding skin, constituting a broad, flat, pimple-like prominence, about the size of a split pea. Upon the surface of this prominence the scarf-skin becomes slightly roughened, and after a little while a very distinct but circular scale is produced, which increases in thickness by the addition of fresh layers, and after assuming various colours in different varieties of the disease, ultimately separates and falls off, either leaving a permanently bare surface, or being followed by crops of other like scales, which also fall off, and are replaced in rapid succession. This class of eruptions is more obstinate than any of the other varieties, and often defies medical skill. Each particular form generally requires special treatment. In all, however, endeavours should be made to restore the general health of the body in the manner which existing circumstances may indicate. The red meats, ripe fruit, and antiscorbutic vegetables, should form a large portion of the diet; and sea-bathing, or shower, sulphuretted, or ioduretted baths, should be taken daily, if possible. Dry friction with a flesh-brush, and daily exercise to perspiration, are also highly recommended. See LEPROSY, PSORIASIS, TETTERS, &c.

Eruptions, Vesicular. *Syn.* WATERY PIMPLES. These consist of little vesicles or bladders, filled with a small quantity of a transparent and colourless liquid. They result from a similar action to that which produces ordinary blisters. Inflammation is excited in the sensitive skin by an inward or outward cause, and the inflamed vessels pour out the watery part of the blood, and so raise the scarf-skin from off the sensitive layer, in the form of a small dome, which in some situations is conical, in others a segment of a sphere." They present great variety in point of number and size; some are so minute as to be scarcely discernible without close inspection, whilst others increase to the magnitude of a hen's egg. They are numerous in the inverse ratio of their size; the smaller ones being very abundant, and the larger ones scanty and few.

Treat. This consists chiefly in the due attention to the general principles of health—cleanliness, exercise, food, and raiment, as

already pointed out, assisted by such special remedies as the particular case or circumstances may demand. Antiphlogistics or tonics must be had recourse to, according to the condition of the system, and local irritation allayed by the usual means. Simple cases frequently yield to a dose or two of some saline aperient and a change of diet. See ERYSIPELAS, PEMPHIGUS, RUPTA, TETTERS, and SKIN.

ERVALENTA. The meal of lentils (*Ervum lens*,—Linn.), variously doctored with other substances. In some cases the article sold under the name does not contain a particle of lentil meal.

Prep. 1. (Paris Ervalenta.) Indian-corn meal (fine), and bean flour, of each, 14 lbs.; salt and sugar, of each, 1 lb.; mix, and pass the compound through a sieve.

2. (Warton's.) Lentil powder, 1 part; durra or Turkey millet flour (*Sorghum vulgare*), 2 parts. Some persons assert that it contains a large quantity of the flour of Indian corn. See REVALENTA and LENTILS.

ERYNGO. *Syn.* ERYNGIUM, L. The root of the *Eryngium campestre*, a plant common in middle and southern Europe. It is sweet, aromatic, and tonic, and formerly enjoyed much repute in gonorrhœa, suppressed menstruation, and visceral obstructions generally, especially those of the gall-bladder, liver, and uterus. Candied eryngo (ERYNGIUM CONDITUM, ERYNGII RADIX CONDITA), according to Lindley, "has the credit of being a decided aphrodisiac," and has a considerable sale. *Eryngium aquaticum* (bitter snake-weed) and *E. maritimum* (sea eryngo, sea holly) furnish the eryngo of the Ph. U. S. See CANDY.

ERYSIPELAS. *Syn.* ST. ANTHONY'S FIRE, THE ROSE. A peculiar form of inflammation, which chiefly attacks the skin, and is generally accompanied or followed by an eruption of a very red colour, sometimes vesicular, and by tumefaction. It commonly attacks the head and face, and is at its height from the third to the sixth day, but the duration and progress of the symptoms are variable. From the eighth to the twelfth day the eruption usually scabs or scales off. Sometimes suppuration occurs, especially of the eyelids and scalp, and during the latter stages of the disease there is, in general, a tendency to debility. In many cases erysipelas is attended by typhoid symptoms, and is then a dangerous and often fatal disease.

Treat. Aperients and diaphoretics, assisted by a cooling diet. When the inflammatory symptoms run high, blistering and cupping are frequently had recourse to. Local irritation may be subdued by milk-and-water, or cooling or evaporating lotions, or by sprinkling starch, hair-powder, or arrow-root, on the part. The tendency to debility in the latter stages should be combated with bark, quinine, or other like tonics. When shiverings, sickness, and delirium, attend the height of the dis-

order, wine, bark, ammonia, and other stimulants, are usually prescribed, and depletion must be avoided. The same treatment is also adopted in the gangrenous forms of the disease, to which doses of opium and calomel are also commonly added. When suppuration and sloughing of the cellular membrane have taken place, it is usual to make incisions to give exit to the discharge, and relieve the tension of the limb. These may be about $1\frac{1}{2}$ inch in length, and from 2 to 4 inches apart, and should be made in the direction of the long dimensions of the limb. Mr. Higginbottom, of Nottingham, applies (freely) lunar caustic to the inflamed skin, and also to the healthy skin, to the extent of an inch or more beyond it. The result, in many cases, is a complete change of action in the part, and a resolution of the disease. Iodine paint is often successfully used in the same way.

Erysipelas is generally symptomatic of a debilitated or bad constitution. It is also a common sequel of surgical operations in crowded and ill-ventilated hospitals, where it often appears to be contagious. In these cases cleanliness, ventilation, and change of air, are the only remedies. We need scarcely add, that this disease should never be tampered with, but the best medical advice sought, whenever it can be procured.

ERYTHORETIN. *Syn.* RED RESIN OF RHUBARB. A yellow or reddish-yellow substance, forming one of the three resins found by Schläsberger and Döpping in rhubarb. It is very soluble in alcohol; less so in ether; with ammonia and potassa it forms soluble compounds of a rich purple colour. See RHUBARB.

ERYTHRIC ACID. *Prep.* The lichen *Rocella tinctoria* (Canary or herb-archil) is boiled with milk of lime, and the filtered solution precipitated with hydrochloric acid; the dried precipitate is dissolved in warm alcohol, and filtered; as the solution cools, crystals of erythric acid are deposited.

Prep., &c. Feebly acid; colourless; inodorous; scarcely soluble in water; soluble in alcohol and ether; chloride of lime turns its solutions of a blood-red colour.

ERYTHRINE, AMARYTHRINE, ERYTHRILINE, PSEUDO-ERYTHRINE, and TELERYTHRINE. Substances obtained by Kane and Heeren from *Rocella tinctoria*, *Palmetia roccella*, *Leconara Tartarea*, &c. They are of little practical importance.

ESCHAROTICS. *Syn.* ESCHAROTICA, L. Substances that destroy the texture of living organic bodies, with the production of an 'eschar' or 'scab.' Escharotics have been divided into two classes—*mechanical* and *chemical*. Among the former are actual cauteries, as a heated iron, moxas, &c.; among the latter are all those substances commonly known as caustics. Some writers have subdivided chemical escharotics into *exuding escharotics*, as blue vitriol, red precipitate, burnt alum,

&c.; and into *CAUSTIC ESCHAROTICS*, as lunar caustic, pure potassa, strong sulphuric acid, nitric acid, &c.; but these distinctions possess little practical value. "In cauterising with a heated iron, this should be at a white heat, as, at this temperature, it occasions less pain to the patient, from its causing an immediate death of the parts to which it is applied." "The surrounding surface should be protected by some non-conductor of heat, but not by wet paper or cloth, as the sudden extrication of steam will produce a blistered surface around the burn, and will much increase the pain." (Dr. R. E. Griffith.) See CAUSTIC, SOLUTION, &c.

ES'CULENTS. Substances used for food. The more important esculents are noticed under their respective heads.

ESCU'LIC ACID. A peculiar acid found by M. Bussy in the bark of the horse-chestnut. It is but little known, and has not been applied to any use.

ESPRIT. [Fr.] SPIRIT. This term is commonly applied to alcoholic solutions of the essential oils, and to various odorous and aromatic essences sold by the perfumers and druggists as articles of the toilet. See ESSENCE, SPIRIT, &c.

ES'SENCE. *Syn.* ESSENTIA, L. The active and characteristic portion of a substance, or that on which its most remarkable properties depend. The term has been very loosely applied to various preparations presumed to contain these essential principles or qualities, disencumbered of grosser matter. Modern systematic writers generally restrict its application to the volatile oils obtained from vegetable substances by distillation, or to a strong solution of them in alcohol. In pharmacy and perfumery, the word 'essence' is applied to concentrated preparations that differ vastly from each other. Thus, concentrated effusions, decoctions, liquors, solutions, and tinctures, are frequently called 'essences' by those who vend them; but the term 'fluid extracts' would be more appropriate, if those already mentioned are not deemed sufficiently showy and attractive. We shall here confine ourselves to a brief notice of the principal compound essences, or those that undergo some preparation beyond being merely extracted from vegetables by distillation along with water. The latter will be considered under the article OIL.

The concentrated preparations of the pharmacologist, termed 'essences,' are mostly prepared by digesting the active ingredient or ingredients in rectified spirit of wine, either with or without the addition of a certain portion of water; or they are extemporaneously formed by dissolving a portion of the essential oil of such substances in the spirit. In this way are made the essences of lavender, musk, ginger, &c. When it is desired only to obtain the aromatic and volatile portion of the ingredients, the latter are usually digested in the spirit for a few days, and then submitted to distillation,

when the alcohol comes over loaded with aromatic essential oil, or other volatile matter. In this way are prepared most of the fragrant essences of the perfumer and druggist, when simple solution of the essential oils in alcohol is not resorted to. In many cases the active principles of the ingredients are partly volatile and partly fixed, or at least do not readily volatilise at the temperature at which alcohol distills over. This is the case, for instance, with the active portion of ergot and Jamaica ginger. In such cases digestion alone should be adopted. When the principle of organic substances, of which it is desired to obtain a concentrated solution, are resinous or oily, or little soluble in weak spirit (which is mostly the case), the strongest rectified spirit of wine should alone be employed. In the preparation of essences without distillation, the method by percolation or displacement is preferable to that of simple maceration and expression, when the nature of the ingredients and other circumstances render it applicable, as it is not only more economical, but a more concentrated solution may thereby be obtained. At the same time, however, the reader should remember, that this mode of operating requires much greater experience and skill to ensure success than the former method. This clumsiness of manipulation is the common cause of the failures which are so frequently met with in the preparation of these articles.

The ingredients for the preparation of essences must undergo the same operations of bruising, powdering, or slicing, as directed under 'TINCTURE,' previous to digestion in the spirit, or other menstruum; and the length of time they should be allowed to infuse, when this method alone is adopted, should not be less than ten days; but this time may be advantageously extended to a fortnight, or even longer. During the whole of this period frequent agitation should be employed, and when the ingredients are so bulky as to absorb the whole of the fluid, the vessel which contains them should be securely fastened by a bung or stopper covered with bladder, and inverted every alternate day. By this means every portion of the ingredients will be equally exposed to the action of the menstruum. In all such cases the method of displacement, or percolation, is preferable. For the essences used as perfumes and for flavouring, not only must the spirit be perfectly tasteless and scentless, but it must be also quite devoid of colour.

The following formulæ embrace most of the essences met with in the shops. Those not found among them may be readily prepared by applying the general directions given above, or by employing the formula given for the preparation of the essence of some similar substance, merely varying the characteristic ingredient. Thus, were it desired to form an essence of ambergris or of myrrh, and no formulæ could be found for these preparations, the tyro would consider in what menstruum

the active principles of these substances were most soluble. This, he would immediately see by reference to their properties, is rectified spirit of wine. He would next have to decide on the proper strength of his essence. In this he must be guided, either by the strength of the like preparations of other makers, or by his own judgment of what would be useful, novel, or convenient. Suppose he decided that his essence should represent 1-10th of its weight of the solid ingredient. He would then take 2 oz. of ambergris or myrrh, and 20 oz. of rectified spirit, which he would digest together for 10 days or a fortnight in the manner described above. Had the required preparation been an essence of senna, (for example), he would probably recollect, or might easily ascertain by reference, that the active properties of senna are soluble in both water and weak spirit. Then, to make an essence 4 times as strong as the tincture of the pharmacopœia, 7 oz. of senna, and 1 pint of proof spirit, should be employed, with due digestion, as before.¹ The same applies to other preparations. See CONCENTRATION, DECOCTION, INFUSION, LIQUOR, SPIRIT, TINCTURE, &c.

Essence of Aconite. *Syn.* ESSENTIA ACONITI, L. *Prep.* From aconite (herb, dried and powdered), 8 oz.; rectified spirit, 16 oz.; macerate for 4 days at a temperature of 68° Fahr., press, and strain; the marc or residuum is again macerated with (a little) spirit, and pressed as before, so that the weight of the mixed tinctures may amount to double that of the herb.—*Dose.* 3 to 6 drops. See TINCTURE.

Essence of Allspice. *Syn.* ESSENCE OF PIMENTO; ESSENTIA PIMENTÆ, L. *Prep.* From essential oil of pimento or allspice, 1 fl. oz.; strongest rectified spirit of wine, 1 pint; agitate until perfectly united, and the next day decant the clear portion, if there is any sediment. *Used* to make pimento water, and by cooks and confectioners as a 'flavouring.'

Essence of Almonds. *Syn.* ESSENCE OF BITTER ALMONDS, E. OF PEACH KERNELS, E. OF RATAFIA, E. OF NOYEAU, QUINTESSENCE OF N. ALMOND FLAVOUR; ESSENTIA AMYGDALÆ, E. A. AMARÆ, L. *Prep.* 1. From essential oil of almonds, as the last.

2. (Pereira.) Essential oil of almonds, 1 fl. oz.; rectified spirit, 7 fl. oz.

Uses, &c. It is added to wine, cordials, perfumery, pastry, &c., to impart an agreeable nutty flavour or aroma. It is also employed to prepare cherry-laurel, peach-kernel, and bitter-almond water. A large quantity is consumed by the confectioners, and by wine merchants to 'improve' their sherries, and to give Cape wine a sherry flavour. It should be used in very small quantities, as it is very powerful, and, in quantity, poisonous. A few drops are sufficient for several pounds of pastry. The first formula is that used in trade. The second is sometimes used by the druggists, and is occasionally vended under the name of 'CON-

¹ See directions given under TINCTURE.

CENTRATED ESSENCE OF BITTER ALMONDS,⁷ &c. The directions for purifying the almond oil from hydrocyanic acid before dissolving it in the spirit, given in more than one recent book of receipts, are absurd, as in this way the oil loses much of its characteristic odour and flavour, and by keeping gradually becomes nearly destitute of both. See ESSENTIAL OIL.

Essence of Ambergris. *Syn.* ESSENTIA AMBRÆ-GRISÆ, E. A. SIMPLEX, TINCTURA A. CONCENTRATA, L. *Prep.* 1. Ambergris (cut very small), 5 drs.; rectified spirit, 1 pint; place them in a strong bottle or tin can, secure the mouth very firmly, and expose it to the heat of the sun, or in an equally warm situation, for 1 or 2 months, frequently shaking it during the time; lastly, decant, and filter through paper.

2. (Guibourt.) Ambergris, 1 dr.; rectified spirit, 3 oz.; digest 10 or 12 days.

3. (Redwood.) Ambergris, 2½ drs.; rectified spirit, 1 pint; macerate for 14 days. Chiefly used as an element in other perfumes. The first is the formula employed by the London houses.

Essence of Ambergris and Musk. *Syn.* CONCENTRATED TINCTURE OF A. AND M.; E. AMBRÆ-GRISÆ (ODORATA), E. A. ET MOSCH, E. REGIA, L.; ESSENCE ROYALE, Fr. *Prep.* 1. Ambergris (cut small), ½ oz.; 1 or 2 fresh-emptied musk-pods (or musk, 12 grs.); rectified spirit, 1 pint; proceed as in No. 1 (*above*).

2. Ambergris, 2½ oz.; bladder musk, ½ oz.; spirit of ambrette (purple sweet sultan), 1 gal.; as last.

3. Ambergris, 2½ oz.; bladder musk, 1 oz.; spirit of ambrette, 1 gal.; as before. The fragrance of the above, especially of the last two, is very powerful, and is much esteemed.

4. Ambergris, ½ oz.; musk and lumpy sugar, of each, ¼ oz.; triturate together in a wedge-wood-ware mortar, adding oil of cloves, 20 drops; true balsam of Peru, 30 drops, and enough essence of jasmine or tuberose to convert it into a perfectly smooth paste; then put it into a strong bottle with rectified spirit, 1 quart; observing, before adding the whole of the last, to rinse the mortar out well with it, that nothing may be lost; lastly digest for 6 or 8 weeks, as directed in No. 1 (*above*).

5. Ambergris, 4 drs.; musk, 1½ dr.; sand, 3 oz.; triturate, then add, of oil of cinnamon, 1 dr.; oil of rhodium, ½ dr.; essence of roses and eau fleurs d'orange, of each, ¼ pint; rectified spirit, 1½ pint; digest as before (or not less than 14 days), and decant and filter. The last two are very fine, though, inferior to Nos. 2 and 3.

6. To the last (No. 5), add civet, 1 dr.; salt of tartar, 3 drs.; and an additional pint of rectified spirit. Inferior to the above, but cheaper.

Obs. Essence of ambergris is used as a perfume, and is added in small quantities to sweet-scented spirits and wines, to improve their flavour and aroma. A very small quan-

tity of any one of them added to lavender water, eau de Cologne, tooth-powder, hair-powder, wash-balls, or a hog'shead of claret, communicates a delicious fragrance. See AMBERGRIS and ESSENCE ROYALE (*below*).

Essence d'Ambrette. [Fr.] *Syn.* ESSENCE OF MUSK SEED, SPIRIT OF M. S.; ESPRIT D'AMBRETTE, Fr. *Prep.* 1. Musk seed (ground in a clean pepper-mill), 1½ lb.; rectified spirit, 3 pints; digest for 3 or 4 weeks in a warm place, and filter.

2. Musk seed, 4 lbs.; rectified spirit, 1 gal.; digest 10 days, add water, 2 quarts, and distil over 1 gal. Very fine.

Essence of Ammoniacum. *Syn.* CONCENTRATED TINCTURE OF AMMONIACUM; ESSENTIA AMMONIACI, TINCTURA A. CONCENTRATA, L. *Prep.* 1. Ammoniacum (in tears), 1 lb., is bruised in a very cold marble mortar with half its weight of coarse and well-washed siliceous sand or powdered glass, and rectified spirit, ½ pint, gradually added; the trituration is continued until the whole is reduced to a smooth paste, and is then placed in a wide-mouthed bottle, and spirit of wine, 1½ pint, further added; the whole is then digested together for a week with constant agitation, and after sufficient repose to settle, the supernatant transparent liquid is decanted into another bottle for use.

2. Gum ammoniacum, 1 lb., is reduced to a cream with boiling water, ½ pint; as soon as the mixture has cooled a little, it is placed in a strong bottle, and rectified spirit of wine, 1½ pint, is cautiously added; the mixture is then corked down close, and the whole macerated for a few days; the bottle is next placed in a moderately warm situation, that the sediment may subside, after which the clearer portion is poured off through flannel into another bottle.

Obs. This preparation is used as a substitute for the gum in substance, for extemporaneously preparing emulsion of ammoniacum, mixture of a., &c. It is represented to possess fully the same amount of medicinal virtue as an equal weight of the solid gum, on which account it has a considerable sale. The product of the first formula, when well managed, is a beautiful pale brownish-coloured, transparent tincture; that of the second is milky and less slightly. The preparation generally sold under the name of 'CONCENTRATED ESSENCE OF AMMONIACUM' (ESSENTIA AMMONIACI CONCENTRATA, L.), and represented as twice as strong as the gum in substance, is generally prepared by the first formula given above for ESSENCE OF AMMONIACUM. A stronger article may be prepared by a similar process, by using 1 lb. of ammoniacum to a pint of the strongest rectified spirit. As, however, a clear liquid at this strength is somewhat difficult to produce, it is very seldom attempted by the druggists; they therefore generally content themselves with sending out the liquid at half the professed strength, leaving the label to confer the additional concentration. See AMMONIACUM.

Essence of Ancho'vies. *Syn.* **ESSENTIA CLUPEÆ, L.** *Prep.* 1. Anchovies, 1 lb., are 'boned,' reduced to a pulp in a wedgwood-ware or marble mortar, and passed through a clean hair or brass-wire sieve; meanwhile the bones and other portion that will not pass through the sieve are boiled with water, 1 pint, for 15 minutes, and strained; to the strained liquor, salt and flour each, 2½ oz., together with the pulped anchovies, are added, and the whole simmered for 4 minutes, when the vessel is removed from the fire, and as soon as the mixture is cooled a little, strong pickling vinegar, ½ pint, is mixed in; it is then bottled, and the corks tied over with bladder, and either 'waxed' or 'capsuled.' *Product*, 3 lbs. (nearly).

2. Anchovies, 7 lbs.; water, 9 pints; salt and flour, of each, 1 lb. *Product*, 20 lbs.

3. To the last, add of Cayenne pepper, ¼ oz.; the peel of a lemon (grated), and mushroom catsup, 4 oz. Very savoury.

4. From British anchovies (pickled sprats) or young pilchards, along with herring liquor, or the drainings of anchovy barrels.

Use, &c. As a sauce and condiment; when well prepared, it has a fine flavour. That of the shops is usually coloured with Venetian red or Armenian bole. An infusion of cochineal, or a little annotta, would form a more appropriate colouring, and would be perfectly harmless. See ANCHOVE and SAUCE.

Essence of Angelica. *Syn.* **ESSENTIA ANGELICÆ, L.** *Prep.* (Van Mons.) Angelica root (bruised), 1 part; rectified spirit, 8 parts; water, 16 parts; digest, and distil over 6 parts; Stomachic, carminative, and alexipharmic.—*Dose.* 1 to 2 teaspoonfuls.

Essence of Aniseed. *Syn.* **ESSENTIA ANISI (B. P.), L.; ESPRIT D'ANISE, Fr.** Oil of anise, 1 part; rectified spirit, 4 parts; mix (B. P.). Stimulant, aromatic, and carminative.—*Dose.* 10 to 20 minims. *Used* also to flavour liqueurs, and to make aniseed water. See SPIRIT.

Essence, An'odyne. *Syn.* **ESSENTIA ANODYNA, L.** *Prep.* 1. Hard aqueous extract of opium (in powder), 1 dr.; powdered cinnamon, ½ dr.; rectified spirit, 1 fl. oz.; digest a week.—*Dose.* 5 to 20 drops.

2. Extract of henbane (recent), 5 drs.; rectified spirit, 2 fl. oz.; as last.—*Dose.* 10 to 30 drops. Narcotic, sedative, and antispasmodic. Both are excellent preparations.

Essence, Antihysteria. *Syn.* **ESSENTIA ANTI-HYSTERICA, L.** *Prep.* 1. Cyanuret of potassium, 3 grs.; powdered sugar, 1 dr.; rectified spirit and eau d'orange, of each 4 fl. drs.; agitate together until dissolved.—*Dose.* 10 to 20 drops, in pure water; in hysteria, gastrodynia, &c. See DRAUGHT (Antihysteria).

2. (P. Cod.) Resembles FETID SPIRIT OF AMMONIA (which see).

Essence of Ap'ple. *Syn.* **SOLUTION OF VALERIANATE OF AMYL; ESSENTIA POMI ODO-RATA, L.** *Prep.* From apple oil (valerianate of oxide of amyl), as ESSENCE OF AL-

MONDS. *Used* to flavour liqueurs and confectionery.

Essence of Ar'nica. *Syn.* **ESSENTIA ARNICÆ, E. A. FLORUM, TINCTURA A. E. CONCENTRATA, L.** *Prep.* (Ph. Baden, 1841.) From arnica flowers, as ESSENCE OF ACONITE. It represents half its weight of herb.

Essence, Aromatic. *Syn.* **ESSENTIA AROMATICA, L.** *Prep.* From hay saffron, 1 dr.; and rectified spirit, 6 fl. drs.; digested together; to the filtered tincture is added oil of cinnamon and powdered white sugar, of each, 1 dr.; ether (rect.), 2 fl. drs.; oil of nutmeg and essence of ginger, of each, ½ dr.; after agitation and a few days' repose, the clear portion is decanted into a stoppered phial.—*Dose.* 5 to 15 drops; on sugar or in a glass of wine or weak spirit; in cholera, diarrhoea, spasms, &c.

Essence of Bark. *Syn.* **ESSENTIA CINCHONÆ, E. CORTICIS C, L.** *Prep.* 1. Resinous extract of yellow bark, 4 drs.; rectified spirit, 1½ fl. oz.; tincture of orange peel, ½ fl. oz.; acetic acid (Ph. L.), 1 fl. dr.; digest a week.

2. Disulphate of quinine, ½ dr.; resinous extract of bark, 2 drs.; rectified spirit, 2 fl. oz.; as before.—*Dose.* 12 drops to a teaspoonful; as a febrifuge and tonic.

Essence of Beef. *Syn.* **ESSENCE OF RED MEATS, &c.** *Prep.* 1. From lean beef (chopped small), 1 lb.; water, ½ pint; place them in a bottle, which they will only half fill, and agitate them violently for half an hour; then throw the whole on a sieve, and receive the liquid in a jug; next boil the undissolved portion in water, 1 pint, for 20 minutes; strain, mix the decoction with the cold infusion, evaporate the liquid to the consistence of a thin syrup, adding spice, salt, &c., to taste, and pour the essence, whilst boiling hot, into bottles, jars, or (still better) tin cans, which must then be at once hermetically corked, sealed, or soldered up, and stowed away in a cold place. In this state it will keep a long time.

2. (Ellis.) Take of lean beef (sliced), a sufficient quantity to fill the body of a porter bottle; cork it up loosely, and place it in a pot of cold water, attaching the neck, by means of a string, to the handle of the pot; boil for 1½ to 2 hours, then decant the liquid and skim it. Spices, salt, wine, brandy, &c., may be added as before. Highly nutritious and sustaining.

• **Essence of Bergamot.** See OIL (Volatile).

Essence, Bit'ter. *Syn.* **ESSENTIA AMARA, L.** *Prep.* (Ph. Den.) Wormwood, 4 parts; gentian root, bitter orange peel, and blessed thistle, of each, 1 part; rectified spirit, 45 parts; digest a week. Tonic and stomachic.—*Dose.* ½ dr. to 2 drs.

Essence of Calum'ba. *Syn.* **ESSENTIA CALUMBE, L.** See INFUSION OF CALUMBA.

Essence of Cam'phor. *Syn.* **CAMPHOR DROPS, LIQUOR OF CAMPHOR, CONCENTRATED ESSENCE OF C, CONCENTRATED SOLUTION OF C, CONC. CAMPHOR JULAP; ESSENTIA CAMPHORÆ, LIQUOR C, L. C. CONCENTRATUS, L.** *Prep.* 1. Camphor (clean), 4½ oz.; rectified spirit, 1

gal.; dissolve. This forms the 'ESSENCE OF CAMPHOR' and 'LIQUOR CAMPHORÆ' of the wholesale houses. About $\frac{1}{2}$ fl. dr., added to $7\frac{1}{2}$ fl. drs. of cold distilled water, forms (by agitation) a transparent aqueous solution of camphor, fully equal in strength to the filtered 'MISTURA CAMPHORÆ' (camphor julep) of the Ph. L. The above made with weaker spirit forms the 'spirit of wine and camphor' of the shops.

2. Camphor, 1 oz.; rectified spirit, 10 oz. (by weight); dissolve. This forms the 'CONCENTRATED ESSENCE OF CAMPHOR' of the wholesale druggists. 10 or 12 drops, added to 1 fl. oz. of pure cold water, make a transparent camphor julep, as before. There is a large quantity of these solutions of camphor sold by the London houses, who charge a considerable price for them. They are very convenient for preparing extemporaneous camphor julep or camphor mixture in dispensing.

3. (Fordred.) Tincture of camphor, 13 fl. drs.; tincture of myrrh, $\frac{1}{2}$ fl. dr.; rectified spirit, $18\frac{1}{2}$ fl. drs.; mix. 1 fl. dr., added to 4 fl. oz. of water, forms camphor julep. It has been proposed to bleach the tincture of myrrh with animal charcoal, but this interferes with its proper action.

4. (Homœopathic.) See CHOLERA REMEDIES, Nos. 6 & 7, page 335.

5. (Houlton.) Spirit of camphor (Ph. L.), 1 fl. oz.; proof spirit, 7 fl. oz. 1 fl. dr., to 3 fl. oz. of water, forms 'CAMPHOR JULEP.'

6. (Redwood.) Camphor, 1 dr.; rectified spirit, $2\frac{1}{2}$ oz.; dissolve, and add of water, $\frac{1}{2}$ oz.

7. (Swediaur.) Powdered camphor, 1 dr.; water saturated with carbonic acid gas, 12 fl. oz.; dissolve. 1 part of this solution, added to 4 parts of water, forms 'CAMPHOR MIXTURE.' See CAMPHOR.

Essence of Capsicum. See ESSENCE OF CAYENNE.

Essence of Car'away. Syn. ESSENTIA CARUI, L. Prep. From oil of caraway, as ESSENCE OF ALMONDS. Its applications and uses are similar. An inferior kind is prepared by macerating the seeds in proof spirit.

Essence of Car'damoms. Syn. ESSENTIA CARDAMOMI, E. C. CONCENTRATA, L. Prep. From lesser cardamom seeds (ground in a pepper mill), $5\frac{1}{2}$ lbs.; rectified spirit of wine, 1 gal.; digest for a fortnight, press, and filter.

Obs. This preparation is very convenient for flavouring cordials, pastry, &c., and is very powerful. In the laboratory, it is frequently substituted for powdered cardamoms in making compound extract of cologynth, and has the advantage of adding no inert matter to the preparation, whilst it imparts the characteristic odour of the seeds in a remarkable degree. When used in this way, it is not added to the extract until it is nearly cold and about to be taken from the pan. The testæ or shells of the seed should be separated from the kernels, as the former are quite inert, and if used occasion a loss of spirit for no purpose.

Essence of Cascari'la. Syn. ESSENTIA CASCARILLÆ, L. Prep. 1. Cascari'la (bruised), 12 oz.; proof spirit, 1 pint; proceed either by digestion or percolation. The product is 8 times the strength of the infusion of cascari'la (Ph. L.).

2. See INFUSION (Concentrated).

Essence of Cas'sia. Syn. ESSENTIA CASSIÆ, L. Prep. From oil of cassia, as essence of allspice or almonds.

Essence of Cayenne'. Syn. ESSENCE OF CAYENNE PEPPER, E. OF CAPSICUM, CONCENTRATED E. OF C.; ESSENTIA CAPSICI, TINCTURA CAPSICI CONCENTRATA, L. Prep. 1. Capsicum (recent dried pods, bruised), 3 lbs.; rectified spirit, 1 gal.; digest 14 days, press, and filter. Some persons prepare it by the method of displacement.

2. Capsicum, $\frac{1}{4}$ lb.; proof spirit, 1 pint; digest, as before. Weaker than No. 1.

3. (Kitchener's.) Cayenne pepper, 1 oz.; brandy, 1 pint; digest, &c., as before.

Obs. The product of the first formula is a transparent, dark-coloured liquid, having an intensely burning taste. One drop is sufficient to deprive a person of the power of speech for several seconds; and a few drops will impart the rich pungency of cayenne to a large quantity of soup, sauce, or any other article. It forms the 'ESSENCE OF CAYENNE' and the 'CONC. ESS. OF CAYENNE PEPPER' of the London houses. It is principally used as a 'flavouring,' and to make SOLUBLE CAYENNE PEPPER; also in dispensing. It is fully 8 times as strong as the 'TINCTURA CAPSICI' (Ph. L.). The product of the third formula is used exclusively for culinary purposes. The pods or fruit of *Capsicum annuum* (capsicum, chilly), *C. baccatum* (bird pepper), and *C. frutescens* (Guinea pods, red pepper), are indiscriminately used for this preparation, but the first are those preferred for medicinal purposes; the others have similar properties, but are more pungent and acrimonious; hence the preference given to them in the preparation of cayenne pepper. See PEPPER.

Essence of Ce'drat. See OIL (Volatile).

Essence of Cel'ery. Syn. ESSENCE OF CELERY SEED; ESSENTIA APII, ESS. A. SEMINIS, L. Prep. 1. From celery seed (bruised or ground), $4\frac{1}{2}$ oz.; proof spirit, 1 pint; digest a fortnight, and strain.

2. (Concentrated.) Celery seed, 7 oz.; rectified spirit, 1 pint; digest as before. Very fine. Both are used for flavouring.

Essence, Cephal'ic. See HEADACHE ESSENCE.

Essence of Cham'omile. Syn. CHAMOMILE DROPS; ESSENTIA ANTHEMIDIS, E. CHAMÆMELI, E. C. ALBA, L. Prep. 1. From essential oil of chamomile, as essence of allspice. Stomachic and stimulant.—Dose. 5 to 30 drops; $\frac{1}{2}$ fl. oz., shaken with about 1 pint of pure water, forms an excellent extemporaneous chamomile water.

2. Gentian root (sliced or bruised), 1 lb.;

dried orange peel, $\frac{1}{2}$ lb.; proof spirit, 1 gal.; essential oil of chamomile, $3\frac{1}{2}$ fl. oz.; macerate a week. Slightly coloured. Some persons use $\frac{1}{2}$ lb. of quassia wood, instead of the gentian and orange peel. Both the above are stomachic and tonic, and are favourite remedies in loss of appetite, dyspepsia, &c.—*Dose.* As the last, on sugar, or in a wine-glassful of wine or beer.

Essence of Chiretta. See INFUSION (Concentrated).

Essence of Cin'namon. *Syn.* ESSENTIA CINNAMOMI, SPIRITUS C. CONCENTRATUS, L. *Prep.* 1. From oil of cinnamon, as ESSENCE OF ALLSPICE OF ALMONDS.

2. Cinnamon, 5 oz.; rectified spirit, $\frac{3}{4}$ pint; water, $\frac{1}{4}$ pint; digest a week, and strain. Inferior to the last. Essence of cassia is commonly sold for it.

Essence of Civet. *Syn.* ESSENTIA ZIBETHI, L. *Prep.* 1. Civet (cut small), 1 oz.; rectified spirit, 1 pint; as ESSENCE OF MUSK.

2. Instead of rectified spirit use spirit of ambrette. Both are used in perfumery; chiefly in combination with other substances.

Essence of Cloves. *Syn.* ESSENTIA CARYOPHYLLI, L. *Prep.* 1. (White.) From oil of cloves, as ESSENCE OF ALLSPICE. *Used* as a 'flavouring.'

2. (Coloured.) Cloves (bruised), $3\frac{1}{2}$ oz.; proof spirit, $\frac{3}{4}$ pint; water, $\frac{1}{4}$ pint; digest a week, and strain. Inferior to the last. It is 8 times as strong as INFUSION OF CLOVES (Ph. L.). Chiefly used in dispensing.

Essence of Coffee. See COFFEE.

Essence of Co'gnac. (kōné-yák). *Syn.* BRANDY ESSENCE. *Prep.* From brandy oil, 2 fl. oz.; rectified spirit, 18 fl. oz. For flavouring malt spirit to imitate brandy. See OIL.

Essence of Cologne. *Syn.* CONCENTRATED EAU DE COLOGNE; ESSENTIA COLONIENSIS, AQUA C. CONCENTRATA, L. *Prep.* 1. By taking 8 times the quantity of the ingredients ordered for COLOGNE WATER, and using the strongest rectified spirit.

2. Oils of lemon and cedrat, of each, 2 drs.; oil of rosemary, 1 dr.; oil of bergamotte, 1 oz.; spirit of neroli, 2 fl. oz.; purest rectified spirit, 5 fl. oz.—*Used* as a condensed perfume.

Essence of Colts'foot. *Prep.* 1. (Ryan.) Balsam of tolu, 1 oz.; rectified spirit and compound tincture of benzoin, of each, 3 oz.; dissolve, and in a few days decant the clear portion.

2. (Paris.) Equal parts of balsam of tolu and compound tincture of benzoin, with double the quantity of rectified spirit.

3. Tincture of tolu, 5 fl. oz.; compound tincture of benzoin, 3 fl. oz.; powdered sugar (quite dry), 1 oz.; hay saffron, 1 dr.; digest a week, with frequent agitation.

Obs. Pectoral and stimulant. A quack remedy for consumption and most other diseases of the lungs, but unless assisted by occasional aperients, and in the absence of

fever, it is more likely to kill than cure in these complaints. The last is the best formula.

Essence of Cu'bebs. *Syn.* CONCENTRATED ESSENCE OF CUBEBS; ESSENTIA CUBEBAE, E. C. CONCENTRATA, L. *Prep.* 1. Cubebs (bruised, or preferably ground in a pepper mill), $\frac{1}{2}$ lb.; rectified spirit, 1 pint; digest 14 days, press, and filter.

2. (Wholesale.) Cubebs, $4\frac{1}{2}$ lbs.; rectified spirit, 1 gal. This essence has a very large sale, and if carefully prepared from a good sample of the drug, is a most excellent preparation. Every fl. oz. represents $2\frac{1}{2}$ drs. of cubebs.—*Dose.* 1 to 3 drs.

Essence of Cubebs (Oleo-resinous). *Prep.* (Dublanc.) Oleo-resinous extract of cubebs, 1 oz.; rectified spirit, 3 oz.; dissolve. A very active and concentrated form of administering cubebs, which must not be confounded with the preceding preparation, which is the one always meant when 'Essence of Cubebs' is ordered.—*Dose.* $\frac{1}{2}$ dr. to 1 dr.

Essence of Dill. *Syn.* DILL DROPS; ESSENTIA ANETHI, L. *Prep.* 1. From oil of dill, as ESSENCE OF ALLSPICE.

2. Oil of dill, extract of dill, and salt of tartar, of each, $\frac{1}{2}$ oz.; rectified spirit, 1 pint; digest, and strain. Both the above are aromatic and anti-flatulent. The first is commonly used as an adjunct to other medicines, especially to purgatives for children. The second is a popular tonic and stomachic in the flatulent colic, dyspepsia, &c., of women and children.—*Dose.* A few drops, on sugar.

Essence of Er'got. See LIQUOR OF ERGOT OF RYE.

Essence of Ergot (Ethereal). *Syn.* ESSENTIA ERGOTÆ ETHEREA, E. SECALIS CORNUTI E., L. *Prep.* 1. (Mr. Lever.) Ergot (powdered), 2 oz.; rectified sulphuric ether, 2 fl. oz.; digest a week, express the tincture, filter, and abandon the liquid to spontaneous evaporation; lastly, dissolve the residuum in ether, 1 fl. oz. This is an expensive and troublesome formula. The following modification of it is both simpler and less expensive.

2. Ergot (ground), 8 oz.; ether, 16 fl. oz.; prepare a tincture as before, and by a gentle heat distil off the ether in a retort connected with a well-cooled refrigerator, until 15 fl. oz. shall have passed over; continue the evaporation at a reduced heat until the remainder of the ether has passed off; lastly, dissolve the residuum, as soon as cold, in ether, 4 fl. oz.

Obs. Each fl. oz. represents 2 oz. of ergot.—*Dose.* 10 to 30 drops as a parturifacient, taken on sugar; 3 to 5 drops as a hæmostatic and emmenagogue, in hæmorrhages, floodings, &c. It possesses all the acrid, narcotic principle of the ergot, but less of the hæmostatic principle than the ordinary essence, whilst it is much more costly.

Essence of Fen'nel. *Syn.* ESSENCE OF SWEET FENNEL; ESSENTIA FENICULI, L. *Prep.* From

oil of fennel (*Feniculum dulce*), as ESSENCE OF ALLSPICE.

Essence of Gen'tian. See INFUSION OF GENTIAN (Concentrated).

Essence of Gin'ger. *Syn.* CONCENTRATED TINCTURE OF GINGER, *ESSENTIA ZINGIBERIS, TINCTURA Z. CONCENTRATA, L. Prep.* 1. Unbleached Jamaica ginger (bruised), 5 oz.; rectified spirit, 1 pint; digest a fortnight, press, and filter.

2. (Oxley's 'CONCENTRATED ESSENCE OF JAMAICA GINGER.') The same as the preceding, with the addition of a very small quantity of essence of cayenne. The above possess only about 4 times the strength of tincture of ginger (Ph. L.); and though vended in the shops as essence of ginger, scarcely deserve the name.

3. As No. 1 (next article, *below*), but using double the quantity of spirit. Very fine.

4. (Kitchener's.) Ginger (grated), 3 oz.; yellow peel of lemon (fresh), 2 oz.; brandy, 1½ pint; digest 10 days. For culinary purposes, &c. See *below*.

Essence of Ginger (Concentrated). *Syn.* *ESSENTIA ZINGIBERIS CONCENTRATA. Prep.* 1. Jamaica ginger (best unbleached, in coarse powder) and siliceous sand, equal parts, are sprinkled with rectified spirit of wine, q. s. to perfectly moisten them, and after 24 hours the mass is placed in a 'percolator,' and after returning the first runnings 2 or 3 times, the receiver is changed, and more rectified spirit poured on gradually, and at intervals, as required, until as much essence is obtained as there has been ginger employed.

Obs. The quality of the product of the above formula is excellent, but the process is somewhat difficult to manage. The mass remaining in the percolator is treated with fresh spirit until exhausted, and the tincture so obtained is employed, instead of spirit, for making more essence with fresh ginger. The last portion of spirit in the waste mass may be obtained by adding a little water. Coarsely powdered charcoal is frequently used instead of sand, in which case the product has less colour; at the same time, however, a little of the flavour is lost.

2. (Wholesale).—*a.* Best unbleached Jamaica ginger (as last), 12 lbs.; rectified spirit, 2½ galls., are digested together for 14 days, and the expressed and strained tincture reduced by distillation, in a steam or water bath, to exactly 1 gal.; it is next cooled, and transferred as quickly as possible into stoppered bottles, and the next day filtered.

Obs. The product of the last formula is a most beautiful article, of immense strength, and the richest flavour. The assertion made by a recent writer on pharmacy, that 'the product is very strong, but has lost some of the flavour of the ginger,' is evidently made in ignorance of the preparation. "We were the first to introduce and publish this formula, and have employed it for years on the most

extensive scale, and can conscientiously assert that, for inexpensiveness, and the quality of the essence produced by it, it is unequalled by any other. The process, though apparently complicated is, in reality, easily performed. The spirit distilled over contains none of the fragrant or aromatic principles of the ginger; on the contrary, the little flavour it has received (apparently from a species of etheral oil) is rather disagreeable than otherwise, and is better got rid of than retained in the essence. The spirit is used with advantage for preparing the common tincture of ginger, and several other articles. The cause of failure when this process is adopted is careless or awkward manipulation. When possible, hydraulic pressure should be employed to express the tincture. 2 oz. of this essence are regarded as equivalent to 3 oz. of the finest ginger, being fully twenty times as strong as the 'TINCTURE OF GINGER' (Ph. L.). A single drop, swallowed, will almost produce suffocation." Cooley.

6. From ginger (as last), 24 lbs.; rectified spirit, 6 galls.; make a tincture, as before, and reduce it by distillation to 1 gal.; then cool as quickly as possible out of contact with the air and add, of the strongest rectified spirit of wine, 1 gal.; lastly, filter, if required. Quality resembles No. 2, *a* (nearly). "We are in the habit of applying the method developed in the last two formulae to the preparation of the essences of several other substances, the active principles of which are not volatile at a low temperature." Cooley.

Essence of Grape. *Prep.* From grape oil, as ESSENCE OF ALMONDS. It is used for flavour brandy and wines. See OIL (Volatile).

Essence of Guaiacum. *Syn.* FLUID EXTRACT OF GUAIACUM; *ESSENTIA GUAIACI, EXTRACTUM GUAIACI FLUIDUM, L. Prep.* Recent guaiacum shavings, from which the dust has been sifted, 3 cwt., are exhausted by coction in water, as in the preparation of an extract, using as little of that fluid as is absolutely necessary; the decoction is evaporated to exactly 1½ gal.; it is next stirred until cold, to prevent the deposit of resinous matter, when it is put into a bottle, and spirit of wine, 5 pints, is added; the whole is then repeatedly agitated for a week, after which it is allowed to settle for 7 or 8 days, and the clear portion is decanted into another bottle.

Obs. This preparation is frequently substituted for guaiacum shavings in the preparation of compound decoction of sarsaparilla. 1 pint of this essence is considered equivalent to 19 lbs. of guaiacum in substance. See DECOCTION OF SARSAPARILLA (Comp.).

Essence for the Handkerchief. See ESSENTIA ODORATA, &c.

Essence for the Headache. *Syn.* CEPHALIC ESSENCE, EMBROCATION OF AMMONIA, DR. HAWKINS' EMBROCATION, WARD'S E., WARD'S ESSENCE FOR THE HEADACHE; EMBROCATIO AMMONIAE. *Prep.* 1. Take of the best

PHALICA, L. *Prep.* 1. Oil of lavender (Mitcham), 1 dr.; camphor, 1 oz.; liquor of ammonia, 4 oz.; rectified spirit, 1 pint; dissolve. Very fragrant and powerful.

2. (Beasley.) Spirit of camphor, 2 lbs.; strong water of ammonia, 4 oz.; essence of lemon, $\frac{1}{2}$ oz.

3. (Redwood.) Camphor and liquor of ammonia, of each, 2 oz.; oil of lavender, 4 drs.; rectified spirit, 14 oz. Very fragrant. Stimulant and rubefacient. *Used* as a counter-irritant lotion in local pains, as headache, earache, colic, &c. Compound camphor liniment is usually sold for it. See **LINIMENT**.

Essence of Henbane. *Syn.* **ESSENTIA HYOSCYAMI**, L. See **ESSENCE (Anodyne)**, No. 2.

Essence of Hop. *Syn.* **ESSENTIA LUPULI**, E. HUMULI, **TINCTURA LUPULI CONCENTRATA**, L. *Prep.* 1. New hops (rubbed small), 26 $\frac{1}{2}$ oz.; proof spirit, 1 quart; digest 24 hours, then distil over (quickly) 1 pint, and set the distillate (*spiritus lupuli*) aside in a corked bottle; to the residuum add water, 1 pint; boil 15 minutes, cool, express the liquor, strain, and evaporate it as quickly as possible to dryness by the heat of a water bath, powder the residuum, and add it to the distilled spirit; digest a week, and filter.

2. Lupulinic grains (yellow powder or lupulin of the strobiles), 5 oz.; rectified spirit, 1 pint; digest 10 days; express, and filter. Both the above are powerfully bitter, and loaded with the aroma of the hop. They are fully 8 times as strong as the 'TINCTURA LUPULI' of the Ph. L. A few drops added to a glassful of ale or beer render it agreeably bitter and stomachic.

3. (**BREWER'S E. OF HOPS.**) Several noxious preparations under the name of extract of hops are sold by the brewer's druggist. They are mostly semi-fluid extracts of quassia, gentian, and like powerful bitters. Of three of these articles which we have examined, one (for **PALE ALE**) consisted of the mixed extracts of quassia and chamomile; another was a preparation of picric acid; whilst a third ('strongly recommended for **PORTER**') consisted of about equal parts of the extracts of bitter aloes, cocculus indicus, and wormwood. A few years ago one of these vile compounds was publicly advertised, and 'warranted' as being equal to 100 times its weight in hops ($\frac{1}{2}$ oz. to 5 $\frac{1}{2}$ lbs.).

Essence of Jargonelle Pear. *Syn.* **PEAR ESSENCE**, **ESPRIT DE JARGONELLE**, &c. *Prep.* From pear oil (acetate of oxide of amy), as **ESSENCE OF ALMONDS**. This is now largely employed to flavour confectionery and liqueurs, See **AMYL** and **OIL (Volatile)**.

Essence of Jasmine. See **SPIRIT** and **OIL (Volatile)**.

Essence of Jes'samine. See **SPIRIT** and **OIL**.

Essence of Jon'quil. See **SPIRIT** and **OIL**.

Essence of Lav'ender. *Syn.* **ESSENTIA LAVANDULÆ (ODORATA)**, L. *Prep.* 1. Oil of lavender (Mitcham), 2 oz.; rectified spirit (strongest), 1 pint.

2. As the strongest *Eau de lavende*. See **SPIRIT**.

Essence of Lavender (Red). See **SPIRIT** and **TINCTURE**.

Essence of Lem'on. *Syn.* **ESSENTIA LIMONIS**, L. *Prep.* 1. See **OIL (Volatile)**.

2. (W. Procter.) Fresh oil of lemons, 1 fl. oz.; deodorised alcohol (strongest flavourless rectified), 8 fl. oz.; exterior yellow rind of lemons (fresh, $\frac{1}{2}$ oz.; digest 48 hours, and filter. *Used* for flavouring mixtures, pastry, &c.

3. From oil of lemons, as **ESSENCE OF ALLSPICE**. *Used* as the last.

Essence of Lemon Peel. *Syn.* **ESSENCE OF LEMON RIND**, **QUINTESSENCE OF L. P.**; **ESSENTIA CORTICIS LIMONIS**, L. *Prep.* 1. Yellow peel of fresh lemons, $\frac{1}{2}$ lb.; spirit of wine, 1 pint; digest for a week, press, and filter. Very fragrant.

2. Yellow peel of fresh lemons, 1 lb.; boiling water, $\frac{1}{2}$ gal.; infuse 1 hour, express the liquor, boil down to $\frac{1}{2}$ pint, cool, and add oil of lemon $\frac{1}{2}$ oz., dissolved in spirit of wine, 1 $\frac{1}{2}$ pint; mix, and filter. *Used* as the preceding.

Essence of Lov'age. *Syn.* **ESSENTIA LEVISTICI**, L. *Prep.* (Ph. Wurt.) Lovage root (*levisticum officinale*), 2 oz.; lovage seeds, 1 oz.; rectified spirit, 10 oz.; digest a week, and filter. Aromatic, stomachic, and diaphoretic. — *Dose.* $\frac{1}{2}$ dr. to 1 dr.; in dyspepsia, dropsies, &c.

Essence, Madden's. Concentrated infusion of roses.

Essence of Malt. See **COLOURING**.

Essence of Mint. *Syn.* **ESSENCE OF SPEARMINT**; **ESSENTIA MENTHÆ**, E. M. SPICATÆ, E. M. VIRIDIS, L. *Prep.* As **ESSENCE OF PEPPERMINT**.

Essence of Musk. *Syn.* **ESSENTIA MOSCHI**, **TINCTURA M. CONCENTRATA**, L. *Prep.* 1. Grain musk, 2 oz., and boiling water, 1 pint, are digested together in a close vessel until cold, when rectified spirit of wine, 7 pints, is added; the vessel (preferably a tin bottle) being corked close, and tied over with bladder, the whole is digested, with frequent agitation, for 2 months, in the sunshine (in summer), or in an equally warm situation in winter. At the end of the time the essence is decanted and filtered.

2. Grain musk, $\frac{1}{2}$ oz.; rectified spirit of wine, 2 pints; essence of ambergris, 1 fl. oz.; digest as before.

3. Musk (from the bladder, rubbed very small), 5 oz.; civet, 1 oz.; essence of ambergris, 1 pint; spirit of ambrette, 1 gal.; as before.

Obs. All the preceding formulæ yield superior essences, but the product of the last is of the very finest quality, and such as is seldom sold, except by the most celebrated houses, when it fetches a very high price. It is powerfully and deliciously odorous, and has received the approval of royalty itself, both in

these kingdoms and on the continent. The second formula also produces a very fine article, but less choice than that just referred to. The digestion should be long continued, and on no account less than 3 weeks, as otherwise much fragrant matter is left undissolved. The addition of 1 fl. dr. of either liquor of ammonia or liquor of potassa (the first is best) to each pint of the essence, vastly increases its fragrance. The essence of musk of the wholesale London druggists is generally made by merely digesting the freshly emptied musk pods in rectified spirit. Sometimes a little (a very little) grain musk is added. See ESSENCE ROYALE and ESSENCE OF AMBERGRIS.

4. (Guibourt.) Musk, 1 part; proof spirit, 12 parts; digest a fortnight, or longer. *Used* in dispensing, &c.

Essence of Musk Seed. See ESSENCE D'AMBRETTE.

Essence of Mustard. *Syn.* ESSENTIA SINAPIS, L. *Prep.* (Whitehead's.) Black mustard seed (bruised), and camphor, of each, 2 oz.; oil of rosemary, 3 drs.; balsam of tolu, 1 dr.; annatto, $\frac{1}{2}$ dr.; digest a week, and filter.

Essence of Myrtle. *Syn.* ESSENCE OF MYRTLE BLOSSOMS; ESSENCE DE MYRTE, ESPRIT DE M., Fr. *Prep.* Myrtle tops (in blossom), 2½ lbs.; proof spirit, 9 pints; digest 3 days, then distil 1 gal. A pleasant perfume. See OIL (Volatile).

Essence of Neroli. *Syn.* ESSENCE DE FLEURS D'ORANGES, ESPRIT DE F. D'O., Fr. *Prep.* 1. Neroli, 3 drs.; rectified spirit of wine, 1 pint; mix. A delicious perfume.

2. Oil of orange, 2 drs.; orris root (bruised), $\frac{1}{2}$ oz.; ambergris, 10 grs.; neroli, 35 drops; spirits of wine, 1 pint; digest 14 days, and filter. Very fragrant, but less 'chaste' than the last.

Essence of Nutmeg. *Syn.* ESSENTIA MYRISTICÆ, E. M. MOSCHATÆ, E. NUCIS M., L. *Prep.* From essential oil of nutmeg, as ESSENCE OF ALLSPICE. *Used* as a flavouring or zest by cooks, liqueurists, and confectioners.

Essence, Odontalgic. See TOOTHACHE ESSENCE.

Essence d'Ceillets. [Fr.] *Prep.* From cinnamon, 3 oz.; cloves, 1½ oz.; (both well bruised;) rectified spirit, 1 quart; digest for a week. Oil of cloves and spirit of cloves also bear this name in some places.

Essence of Opium. See ANODYNE ESSENCE, No. 1. BLACK DROP and ROUSSEAU'S LAUDANUM have also been sometimes so called.

Essence of Orange. *Syn.* ESSENTIA AURANTII, L. *Prep.* AS ESSENCE OF LEMON.

Essence of Orange Peel. *Syn.* ESSENTIA CORTICIS AURANTII, L. *Prep.* 1. (Golden.) Fresh yellow rind of orange, 4 oz.; rectified spirit and water, of each, $\frac{1}{2}$ pint; digest for a week, press, filter, and add of sherry wine, 1 quart. A pleasant liqueur.

2. (Saccharated.) See OLEO-SACCHARUM.

Essence d'Orient. [Fr.] A pearly looking substance, found at the base of the scales of

the blay or bleak, a small fish of the genus *cyprinus*.

Prep. The scales are scraped from the fish into a tub containing water, and after agitation and repose the fluid is poured off, and its place supplied with fresh water, and this in its turn, after agitation and repose, is also poured off. This part of the operation is repeated till the 'essence' and scales are perfectly freed from impurities, when the whole is thrown on a sieve, which retains the latter, but allows the former to flow through. After repose for a short time, the essence is obtained as a deposit at the bottom of the vessel.

Obs. Essence d'Orient has a bluish-white and pearly aspect, and is employed to cover the interior of glass bubbles and beads, in imitation of pearls and mother-of-pearl. Its tendency to putrefaction, while in the moist state, may be obviated by the addition of a little liquor of ammonia.

Essence of Patch'ouli. *Syn.* ESSENCE D'PATCHOULIE, ESPRIT DE POUCHÂ PÂT, Fr. *Prep.* 1. Indian patchouli (leaves or foliaceous tops), 2½ lbs.; rectified spirit, 9 pints; digest for a week; add, of water, 1 gal.; oil of lavender (Mitcham), 3 drs.; common salt, 2 lbs.; agitate well together, distil over (rapidly) 1 gallon, and add of essence of musk, 3½ fl. drs. A very fashionable perfume. Essence of patchouli, thus prepared, has been largely used, both at court and by the nobility generally.

2. Patchouli, 3 oz.; rectified spirit, 1 pint; digest a week, press, and filter. A still commoner kind is made with proof spirit.

Essence of Pear. *Syn.* ESSENCE OF JARGONELLE.

Essence of Pennyroyal. See ESSENTIA PULEGII, E. MENTHÆ P., L. *Prep.* From pennyroyal (*Mentha pulegium*), as ESSENCE OF PEPPERMINT. Stimulant, carminative, and emmenagogue. *Used* in dispensing, especially to make extemporaneous pennyroyal water.

Essence of Peppermint. *Syn.* ESSENTIA MENTHÆ PIPERITÆ (B.P.) L. *Prep.* 1. (B.P.) Oil of peppermint, 1 part; rectified spirit, 4 parts. Mix.—*Dose.* 10 to 20 minims.

2. To the last add of herb peppermint, parsley leaves, or spinach leaves (preferably one of the first two), $\frac{1}{2}$ oz., and digest for a week, or until sufficiently coloured. Sap green (10 or 12 grs., rubbed up with a teaspoonful of hot water) is also used for the same purpose. A delicate light green.

3. (Ph. U. S.) Oil of peppermint, 2 fl. oz.; rectified spirit, 16 fl. oz.

Obs. Essence of peppermint is not conceived to be good by the ignorant, unless it has a pale-greenish tint, which they take as a proof of its being genuine. The most harmless way of tinging it is that indicated above. A little green mint or parsley will, indeed, be found to improve the flavour. These additions are quite harmless. The practice of using cupreous salts, adopted by some lazy and unprincipled makers, is unpardonable, and admits

of no excuse, even a lame one, as not the least advantage, either of convenience, cost, or appearance, results from such a practice, while the colouring matter, though small in quantity, is nevertheless sufficient to impart a noxious quality to the liquid. This fraud may be detected by the addition of liquor of ammonia in excess, which will strike a bluish or greenish-blue colour when copper is present.

Essence of peppermint (like that of most of the other aromatic oils) is cordial, stimulant, and stomachic. A few drops (10 to 30) on sugar, or mixed with a little water or wine, is an excellent remedy in flatulence, colic, nausea, sickness, &c. It is also extensively used as a flavouring ingredient by cooks, confectioners, and druggists. A few drops, well agitated with half a pint of cold water, form an excellent extemporaneous peppermint water.

The formulæ 1 and 2, generally the latter, are those employed by the respectable portion of the London trade. The various published receipts for this and similar essences, ordering the essential oil in a larger proportion than that directed above, are never adopted in practice, and their products (often impossible combinations) exist only in the imaginations of the writers.

Essence of Pimen'to. See ESSENCE OF ALLSPICE.

Essence of Pine-apple. From pine-apple oil (butyric ether, butyrate of ethyl), as ESSENCE OF ALMONDS. It forms a delicious flavouring for liqueurs, confectionery, rum, &c. See ETHER and OIL (Volatile).

Essence of Quassia. *Syn.* ESSENTIA QUASSIAE, L. *Prep.* 1. From quassia (sliced), 1½ oz.; proof spirit, 1 pint; digest 10 days, and filter. ½ fl. dr. added to 7½ fl. drs. of water, forms the infusion of quassia of the Ph. L.—*Dose.* ½ dr., in water or wine, an hour before a meal, as a stomachic tonic, in dyspepsia, loss of appetite, &c., particularly when complicated with gout; 1 to 2 drs., three or four times daily, as a febrifuge and antiseptic, in intermittents, putrid fevers, &c.

2. (BREWER'S).—*a.* From powdered quassia (sprinkled with a little rum) and "foots" (coarse moist sugar or sugar bottoms), equal parts, reduced to the consistence of a semi-fluid extract by the addition of a few spoonfuls of water. For ale.

b. From powdered quassia, 1 part; burnt sugar colouring, 2 parts; well stirred together. For porter and stout. Both are used by fraudulent brewers as substitutes for hops.

Essence of Quinine. *Syn.* ESSENTIA QUINÆ, L. *Prep.* From disulphate of quinine, 1½ oz.; rectified spirit, ½ pint; digest with warmth, gradually dropping in a little dilute sulphuric acid (avoiding excess), and employing constant agitation, until the whole is dissolved. 1 fl. dr., added to 7 fl. drs. of proof spirit, forms the 'TINCTURE OF QUININE' (Ph. L.). Every fl. dr. contains 8 grs. of disulphate of quinine, or

about 10 grs. of the neutral sulphate. If more sulphuric acid is added than is sufficient to dissolve the salt (*i. e.* convert it into a neutral sulphate), the solution is apt to deposit part of it on keeping, owing to the gradual formation of ether, by the action of the excess of acid on the alcohol.

Essence of Rat'afia. The same as Essence of Almonds. So called from being used to flavour ratifias, noyeau, and other liqueurs.

Essence of Rhu'barb. *Syn.* ESSENTIA RHEI, L. *Prep.* From rhubarb (in powder) and siliceous sand, of each, 5 oz.; proof spirit, 1 pint; by the method of displacement. Every fl. oz. represents the active virtues of 2 drs. of rhubarb.

Essence of Rondeletia. *Prep.* 1. Essence (oil) of bergamotte, essence (oil) of lemon, and oil of cloves, of each, 1 dr.; otto of roses, 10 drops; rectified spirit, 1 pint.

2. To the last add, of oil of lavender, 1 dr.; neroli, 15 drops. A very fashionable and agreeable perfume.

Essence of Ro'ses. *Syn.* ESSENTIA ROSÆ (ODORATA), L. *Prep.* 1. Attar of roses (genuine), 2 drs.; alcohol, 1 pint; agitate frequently until they unite.

2. Attar of roses, 1 oz.; rectified spirit, 1 gal.; mix in a close vessel, and assist the solution by placing it in a bath of hot water. (See ESSENCE OF MUSK.) As soon as the spirit gets warm, take it from the water and shake it till quite cold; the next day filter.—*Obs.* Unless the spirit of wine is of more than the common strength, it will not retain the whole of the otto in solution in very cold weather.

3. To each pint of either of the preceding, add, of oil of bergamotte, 30 drops; neroli and essence of musk, of each, 20 drops.

4. Petals of roses, 3 lbs., digest in spirit of wine, 5 quartis, for 24 hours; distil to dryness in a water bath; digest the distilled spirit on 2 lbs. of fresh rose petals, as before, and repeat the whole process of maceration and distillation a third, fourth, fifth, and sixth time, or oftener, the last time only drawing over 1 gal., which is the essence. Each of the above is very superior. The last has a peculiar delicacy of flavour, when the spirit used to make it is pure.

Essence of Roses (Red). *Syn.* ESSENTIA ROSÆ (RUBRÆ), TINCTURA R. CONCENTRATA, L. *Prep.* From rose leaves, 1 lb.; proof spirit, 1 gal.; digest for 14 days, press, strain, add concentrated acetic acid, 2½ fl. drs.; mix well, and the next day filter. Used to make extemporaneous SYRUP and HONEY OF ROSES, &c. Smells, colours, and tastes, strongly of the flower. CONCENTRATED INFUSION OF ROSES is sold under the same name.

Essence of Rose'mary. *Syn.* ESSENTIA ROSEMARINI, L. *Prep.* From oil of rosemary, as ESSENCE OF ALLSPICE. Used as a perfume; also to make extemporaneous rosemary water.

Essence Royale. [Fr.] *Prep.* 1. (Soubeyran.) Ambergris, 40 grs.; musk, 20 grs.; civet and carbonate of potassa, of each 10 grs.; oil of cinnamon, 6 drops; oil of rhodium and otto of roses, of each, 4 drops; rectified spirit of wine, 4 fl. oz. (say $\frac{1}{4}$ pint); macerate for 10 days or longer. Antispasmodic and aphrodisiac. A few drops on sugar, or in syrup of capillaire.

2. See **ESSENCE OF AMBERGRIS.**

Essence of Sarsaparilla. *Syn.* CONCENTRATED ESSENCE OF SARSAPARILLA; *ESSENTIA SARSÆ*; *E. SARSAPARILLÆ*, L. *Prep.* 1. Sarsaparilla root (best red Jamaica), 2 $\frac{1}{2}$ lbs., is carefully decorticated, the bark reduced to coarse powder, and digested for a week or 10 days in sherry, $\frac{3}{4}$ pint, and rectified spirit, $\frac{1}{4}$ pint, with frequent agitation; after which the essence is expressed, and in a week the clear portion is decanted from the sediment. A very elegant preparation. $\frac{1}{2}$ fl. dr., added to 7 fl. drs. of water, forms 1 fl. oz. of a solution of equal strength to decoction of sarsaparilla of the Ph. L. Every fl. oz. represents the active principles of 2 oz. (= 2 oz. 85 grs., avoird.) of sarsaparilla root. In other words, it is twice as strong as the root, and 16 times as strong as the decoction.

2. Alcoholic extract of sarsaparilla, 7 oz.; sherry, $\frac{3}{4}$ pint; rectified spirit, $\frac{1}{4}$ pint; dissolve, and filter. Strength as the last.

3. (Beral.) Alcoholic extract, 4 oz.; sherry wine, 1 pint; dissolve and filter. About 3 fl. drs., added to water, 1 pint, form an extemporaneous decoction.

4. (Guibourt.) Alcoholic extract, 4 oz.; white wine, 1 lb. Strength the same as Nos. 1 and 2 (nearly).

5. (Hening.) Sarsaparilla (bruised, 10 oz.; distilled water, 6 pints; macerate at a temperature of 120° Fahr. for six hours, and strain; repeat with the same quantity of fresh water; mix the liquors, and evaporate in china vessels at 160° Fahr. If reduced to 10 fl. oz. (or to 9 fl. oz., with 1 fl. oz. of rectified spirit added), 1 fl. dr., mixed with 7 fl. drs. of water, will be equal to the decoction of the usual strength. If reduced to 5 fl. oz., 1 fl. dr. will be equal to 2 fl. oz. of the decoction.

6. The bark separated from sarsaparilla root, 2 $\frac{1}{2}$ lbs., is exhausted with water as last; the liquid is evaporated, as quickly as possible, in a water bath, to 16 fl. oz., and when cold, mixed with rectified spirit, 4 fl. oz. Strength same as No. 1.

7. The infusion in No. 6 is evaporated to 10 $\frac{1}{2}$ fl. oz., and when cold mixed with sherry, $\frac{1}{4}$ pint; in a week the clear portion is decanted from the sediment. Strength same as No. 1.

Obs. The formulæ No. 1, 2, 6, and 7, have each in turns been extensively employed by us in the laboratory, with the most satisfactory results. See **LIQUOR OF SARSAPARILLA.**

Essence of Sarsaparilla (Compound). *Syn.* *ESSENTIA SARSAPARILLÆ COMPOSITA*, *E. SARSÆ C.*, L. *Prep.* 1. One pint of No. 1, 2,

6, or 7 (*above*), is triturated with the extract prepared from mezereon bark, 3 $\frac{1}{4}$ oz., and extract of liquorice, 4 oz.; when mixed, it is returned to the bottle, and essence of guaiacum, 1 $\frac{1}{2}$ fl. dr., and oil of sassafras, 20 drops, are added; the whole is then well agitated for at least 15 minutes, and after a week's repose the clear portion is decanted, as before. $\frac{1}{2}$ fl. dr., with 7 $\frac{1}{2}$ fl. drs. of water, forms extemporaneous compound decoction of sarsaparilla.

2. (Cadet.) Sarsaparilla (bruised), 8 oz.; hot water, q. s.; exhaust the root by successive macerations; unite the liquors, and evaporate to 10 fl. oz.; strain, and add, when cold, of alcohol (842) and tinctures of guaiacum and mezereon, of each, 4 fl. drs.; white wine, 1 fl. oz.; oil of sassafras, 12 drops; extract of liquorice, 2 drs.; agitate, and after repose decant as before. This is nearly 8 times as strong as 'DEC. SARSÆ CO.'—Ph. L. The first is the best formula. See **LIQUOR OF SARSAPARILLA (Compound).**

Essence of Savory Spices. *Prep.* 1. Black pepper, 4 oz.; powdered turmeric, 3 drs.; coriander seeds, 1 $\frac{1}{2}$ dr. (all ground and genuine); oil of pimento, 1 $\frac{1}{2}$ fl. dr.; oils of nutmeg, cloves, cassia and caraway, of each, $\frac{1}{4}$ dr.; rectified spirit, 1 pint; digest, with agitation, for a fortnight. Very fine.

2. Black pepper, 3 oz.; allspice, 1 $\frac{1}{2}$ oz.; nutmegs and burnt sugar, of each, $\frac{1}{2}$ oz.; cloves, cassia, coriander, and caraway seeds, of each 1 dr. (all bruised or ground); rectified spirit, 1 pint; digest, with agitation, as before, for 14 days, press, and filter. Used as a flavouring. When made with proof spirit or brandy, and only $\frac{1}{2}$ the above weight of spice, it is called 'TINCTURE OF SAVORY SPICES.'

Essence of Sen'na. See **LIQUOR AND INFUSION (Concentrated).**

Essence of Smoke. See **WESTPHALIAN ESSENCE.**

Essence of Soap. *Syn.* SPIRIT OF SOAP, SHAVING FLUID; *ESPRIT DE SAVON*, *ESSENCE DE SAVON*, *ESSENCE ROYALE POUR FAIRE LA BARBE*, Fr.; *ESSENTIA SAPONIS*, *TINCTURA SAPONIS CONCENTRATA*, L. *Prep.* 1. Castile soap (in shavings), 4 oz.; proof spirit, 1 pint; dissolve, and add a little perfume.

2. Venetian soap, $\frac{3}{4}$ lb.; salt of tartar, 1 oz.; benzoin, $\frac{1}{2}$ oz.; spirit of wine, 1 gal.

3. Best soft soap, $\frac{1}{2}$ lb.; boiling water, 1 pint; dissolve, cool, and add, oils of cinnamon (cassia), verbena, and neroli, of each, 6 drops; dissolved in rectified spirit, 1 pint; mix well, and if not perfectly transparent, add a little more strong spirit, or filter through blotting paper.

Obs. This alcoholic solution of soap is chiefly used for shaving, and is very convenient in travelling, as a good lather may be instantly produced without the trouble of employing a soap-box. Instead of the above perfumes, 15 drops of essence of musk or ambergris, or 30 drops of any of the perfumed spirits, or 3 drops of attar of roses, or 6 drops of any of the aromatic essential oils, may be added, when a cor-

responding name is given to the preparation, as esprit de savon, de la rose, &c.

4. (P. Cod.) White soap, 3 oz.; carbonate of potassa, 1 dr.; proof spirit, 12 oz.; dissolve. *Used* medicinally. They are all used as frictions, &c.

5. (CAMPHORATED,—Guibourt.) White soap, 3 parts; camphor, 1 part; spirit of rosemary, 16 parts; dissolve. A variety of opodeldoc. *Used* as an embrocation in rheumatic pains, sore throat, &c.

Essence of Soup Herbs. *Syn.* SPIRIT OF SOUP HERBS, CONC. TINCTURE OF S. H., &c. *Prep.* (Kitchener's.) Lemon thyme, winter savory, sweet marjoram, and sweet basil, of each 1 oz.; lemon peel (grated), and eschalots, of each, $\frac{1}{2}$ oz.; bruised celery seed, $\frac{1}{2}$ oz.; proof spirit or brandy, 1 pint; digest for 10 days or a fortnight. A superior flavouring essence for soups, gravies, &c. See ESSENCE OF SAVOURY SPICES.

Essence of Spear'mint. See ESSENCE OF MINT.

Essence of Sprats. *Syn.* ESSENCE OF BRITISH ANCHOVIES. From pickled sprats (British anchovies), as ESSENCE OF ANCHOVIES, for which it is commonly sold.

Essence of Spruce. *Syn.* FLUID EXTRACT OF SPRUCE; *ESSENTIA ABIETIS*, *EXTRACTUM A. FLUIDUM*, L. *Prep.* A decoction of the young tops of the black spruce-fir (*Abies nigra*), evaporated to the consistence of a thick syrup. *Used* to make spruce beer, &c.

Essence, Toothache. *Syn.* *ESSENTIA ODONTALGIA*, L. *Prep.* 1. Acetate of morphia, $\frac{1}{2}$ dr.; tincture of pellitory of Spain (made with rectified spirit), 2 fl. oz.; acetic acid (glacial), 4 fl. drs.; dissolve, and add of oil of cloves, 6 fl. dr.

2. (Redwood.) Pellitory, $\frac{1}{2}$ lb.; extract of belladonna, 2 drs.; rectified spirit, 1 pint; digest 14 days, strain, and add, of hyponitrous ether, 1 oz.; oil of wine, $\frac{1}{2}$ oz.; oil of cloves, 2 drs. See DROPS (Odontalgic).

Essence of Tuberose. *Prep.* The flowers are stratified with sheep's or cotton wool, impregnated with the purest oil of ben or of olives, in an earthen vessel, closely covered, and kept for 12 hours in a water bath; the flowers are then removed, and fresh ones substituted, and this is repeated until the oil (*HUILE AU TUBEROSE*) is sufficiently scented. The wool or cotton is then mixed with the purest spirit of wine, and distilled in a water bath; or it is first digested in a warm situation, and in a well-closed vessel, for several days, during the whole of which time frequent agitation is had recourse to. A similar plan is followed for the preparation of essences of jasmine, violets, and other like flowers. See SPIRIT.

Essence of Turtle. *Syn.* ESSENCE OF GREEN TURTLE. *Prep.* From essence of anchovies and shallot wine, of each, 3 oz.; basil wine, $\frac{1}{2}$ pint; mushroom ketchup, $\frac{1}{2}$ pint; the juice of 2 lemons; the yellow peel of 1 lemon;

curry powder, $\frac{1}{2}$ oz.; digest for a week. *Used* to impart the flavour of turtle to soups and gravies.

Essence of Tyre. See HAIR DYE.

Essence of Vanilla. *Syn.* *ESSENTIA VANILLÆ*, *TINCTURE V. CONCENTRATA*, L. *Prep.* 1. Vanilla (cut small), 2 oz.; rectified spirit, 1 pint, digest a fortnight.

2. (Wholesale.) Vanilla, 2 lbs.; rectified spirit, 1 gal.; proceed as for ESSENCE OF MUSK. Very superior.

3. Vanilla (best), $\frac{1}{2}$ lb.; spirit of ambrette, 1 quart; cloves, 30 grs.; grain musk, 7 grs.; as last. Much esteemed. It is chiefly used as a perfume and for flavouring.

Essence of Verbe'na. *Syn.* ESSENCE OF LEMON-GRASS, E. OF CITRONELLE; *ESSENTIA VERBENÆ*, L. *Prep.* 1. From oil of lemon grass or verbenæ (*Andropogon citratus*), as ESSENCE OF ALLSPICE.

2. To the last add, of essences of ambergris and bergamotte (oil), of each, 1 fl. dr.; neroli, $\frac{1}{2}$ fl. dr.

3. To No. 1 add, of oils of lavender and bergamotte, of each, $\frac{1}{2}$ dr.; essence of vanilla, 2 fl. drs. A powerful and refreshing perfume.

Essence of Violet. *Syn.* *ESSENTIA VIOLE*, L.; *ESSENCES DES VIOLETTES*, Fr. See ESSENCE OF TUBEROSE and SPIRIT.

Essence of Vittie Vayr. *Syn.* ESSENCE OF VETIVER; *ESSENCE DE VITTIE VAYR DOUBLE*, Fr. *Prep.* 1. Vittie vayr or cuscus (the root of *Andropogon muricatus*, cut small and bruised), 3 lbs.; proof spirit, 9 pints; digest a week, add of water, 5 pints, and the next day distil over 1 gal. of essence.

2. To the last, before distillation, add, of otto of roses, $\frac{1}{2}$ dr.; eau de melisse (spirit of balm), $\frac{1}{2}$ pint; and proceed as before. *Used* as a perfume. In 1831 it was much employed in Paris as a prophylactic of cholera.

Essence, Volatile (Acetic). *Syn.* PUNGENT ACETIC ESSENCE; *ESSENTIA VOLATILIS ACETICA*, L. Aromatic vinegar.

Essence, Volatile (Ammoniacal). *Syn.* PUNGENT AMMONIACAL ESSENCE, AROMATIC AMMONIACAL E.; *ESSENTIA VOLATILIS, E. V. AMMONIACALIS, E. V. AROMATICA*, &c., L. *Prep.* 1. Oil of cinnamon, 6 drops; otto of roses, 12 drops; oil of cloves, 1 fl. dr.; essence of bergamotte, 2 fl. drs.; oil of lavender (Mitcham), 4 fl. drs.; essence of musk, 5 fl. drs.; liquor of ammonia (strongest), 1 pint; mix in a cold place, and shake the bottle until the whole is combined.

2. Essence of violets and oil of cinnamon, of each, 12 drops; neroli essence of jasmine, and otto of roses, of each $\frac{1}{2}$ dr.; oil of lavender, 1 dr.; essence royale and essence (oil) of bergamotte, of each, 2 $\frac{1}{2}$ drs.; liquor of ammonia (strongest), 1 pint; as the last.

3. Oils of lemon and bergamotte, of each, 5 fl. drs.; oil of lavender, $\frac{1}{2}$ fl. dr.; otto of roses, 1 fl. dr.; oils of cassia, neroli, cloves, and cedrat, of each, $\frac{1}{2}$ fl. dr.; oil of sandal wood, 15 drops; liquor of ammonia (strongest), 1 pint.

4. Essence of bergamotte, 6 fl. drs.; oil of lavender, 4 fl. drs.; oil of cloves, 3 fl. drs.; oil of cassia, $1\frac{1}{2}$ fl. dr.; oil of verbena (lemon grass), 1 fl. dr.; otto of roses, 30 drops; liquor of ammonia, 18 fl. oz.

5. (Redwood.) Oil of bergamotte, 3 oz.; essence of lemons, 2 oz.; oil of lavender, 6 drs.; essence of jasmine, 4 drs.; oil of sassafras, 3 drs.; oil of neroli, 2 drs.; otto of roses, $1\frac{1}{2}$ dr.; oil of origanum and essence of ambergris, of each, 1 dr.; musk, 20 grs.; macerate for a week, and decant the clear portion. It is added to the strongest liquor of ammonia in proportion of $1\frac{1}{2}$ oz. to the pint.

Obs. The above are used to fill smelling-bottles. They are all very fragrant and refreshing.

Essence, Ward's. See HEADACHE ESSENCE.

Essence of Water-fennel. *Syn.* ESSENTIA FENELLANDRI AQUATICI, E. FENICULIS A., L. *Prep.* (Cottereau.) Water-fennel seeds (fine-leaved water-hemlock, bruised), 1 oz.; proof spirit, 4 fl. oz.; digest. Narcotic and pectoral. —*Dose.* 5 to 25 drops, combined with bark; in phthisis, &c.

Essence, Westphalian. ESSENCE OF SMOKE, E. OF WOOD-SMOKE, CAMBRIAN ESSENCE, SMOKING FLUID; ESSENTIA FULIGINIS, &c., L. *Prep.* 1. Crude or empyreumatic pyroligneous acid, 1 pint; sugar colouring, 2 oz.; dissolve, and in a week decant the clear portion.

2. Tar, 3 drs.; sugar colouring, 2 oz.; hot crude pyroligneous acid, 1 pint; agitate constantly for 1 hour, and after repose decant the clear portion.

3. Acetic acid (Ph. L.), 1 pint; creasote, 5 drs.; mix. White.

4. Barbadoes tar, $\frac{1}{2}$ oz.; burnt sugar and common salt, of each, 1 oz.; strong pickling vinegar, $\frac{1}{2}$ pint; port or elder wine, $\frac{1}{2}$ pint; digest as before. Inferior to the preceding. Used to impart a smoky flavour to meat, fish, &c., by brushing it over them, or adding a little to the brine in which they are pickled.

Essence of Worm'wood. *Syn.* ESSENTIA AMARA, E. ABSINTHI, L. *Prep.* 1. Extract of wormwood, 4 oz.; oil of wormwood, 1 oz.; rectified spirit, 1 pint; digest a week, and filter. Tonic, stomachic, and vermifuge. —*Dose.* 10 drops to a teaspoonful.

2. (Van Mons.) Tincture of wormwood, 1 pint; salt of wormwood, 5 drs.; extract of wormwood, 1 dr.; digest as before. —*Dose.* $\frac{1}{2}$ to $1\frac{1}{2}$ fl. dr.

Flavouring Essences. *Syn.* CULINARY ESSENCES, SPICE E., ESSENCES FOR THE TABLE, &c. Those used by cooks, confectioners, liqueurists, &c., are all made by either dissolving 1 fl. oz. of the essential oil of the particular substance in 1 pint of rectified spirit, or by digesting 4 to 6 oz. of the bruised spice, or 5 to 10 oz. of the dried herb, in a like quantity (1 pint) of spirit. The first method is preferable, from being the least troublesome, and yielding the finest product. They are commonly la-

belled 'CONCENTRATED ESSENCE OF —.' An inferior article, vended under the names of 'ESSENCES OF CULINARY HERBS,' 'CULINARY TINCTURES,' 'TINCTURES FOR KITCHEN USE,' &c., are prepared from half the above quantity of oil or spice, infused in a pint of proof spirit or British brandy. The principal compounds of this class are the essences of allspice, caraway, cardamoms, cassia, cayenne, celery seed, cinnamon, cloves, coriander seed, fennel, garlic, ginger, lemon peel, mace, marjoram, nutmegs, orange peel, peppermint, spearmint, sweet basil, and the like. The whole of these are employed to flavour soups, gravies, sweetmeats, pastry, wines, mulled wines, liqueurs, &c.

Essences, Flower. Those for which separate formulæ are not given in this work, may most of them be made from the essential oil of the flowers and rectified spirit, as the last; or by digesting the flowers (crushed or bruised), 3 to 5 lbs., in proof spirit, 2 galls., for a few days, and then drawing over, by distillation, 1 gal. For the essences of those flowers which are not strongly odorous, the spirit thus obtained is distilled from a like quantity of flowers, a second, and a third time, or even oftener. The essences of other organic substances, whose fragrant principles are volatile, may be prepared in the same manner. A small quantity of some other odorous essence is frequently added to the product, to enrich or modify the fragrance. See FLOWERS AND ESSENCES BY INFUSION.

Essences, Fra'grant. See FLOWER ESSENCES (above), ESSENTIA ODORATA, PERFUMERY, &c.

Essences, Fruit. See ESSENCES OF APPLE, PINE-APPLE, JARGONELLE, &c.

Essences by Infu'sion. This term, among perfumers, is commonly applied to those essences, eaux, and esprits, which are prepared by digesting the ingredients in the spirit used as the vehicle for the aroma, in opposition to those obtained by 'distillation,' or by 'contact,' or 'pressure.' Thus, the ESSENCES OF AMBERGRIS, MUSK, and VANILLA, are of this class.

Essences, Vinous. *Syn.* ESSENTIA VINOSA, L. These are prepared in a similar way to the wines (VINA) of the pharmacopœia, by using 8 times the usual quantity of ingredients, and the very strongest sherry wine. 1 fl. dr., added to 7 fl. drs. of wine or water (properly the first only), forms an extemporaneous imitation of the official VINA MEDICATA. Some of the above are largely used in dispensing, and by travellers. See LIQUEUR AND WINE.

Essentia Bi'na. See COLOURING.

Essentia Odora'ta. *Prep.* 1. Oil of lavender, 1 dr.; oils of cloves, cassia, and bergamot, of each, $\frac{1}{2}$ dr.; neroli, 20 drops; essence royale, 2 fl. drs.; rectified spirit, $\frac{1}{2}$ pint; mix.

2. (Redwood.) English oil of lavender, 48 drops; oil of cloves, 32 drops; oil of orange peel, 16 drops; oil of bergamotte and sweet spirit of nitre, of each, 8 drops; oil of yellow sandal-wood, neroli, and otto of roses, of each, 2 drops; oil of cinnamon, 1 drop; rectified

spirit, and essence of ambergris and musk, of each, 1 oz.; honey water, 8 oz.; mix. *Used* as a perfume for the handkerchief, &c. The last form seems unnecessarily complicated and minute.

Essentia Odorifera. *Prep.* 1. Grain musk and balsam of Peru, of each, 10 grs.; civet, 4 grs.; oil of cloves, 5 drops; oil of rhodium, 3 drops; salt of tartar (dried by a dull-red heat and cooled), $\frac{1}{2}$ dr.; rectified spirit (strongest), $2\frac{1}{2}$ fl. oz.; macerate for 14 days, and pour off the clear.

2. Oil of rhodium and balsam of Peru, of each, $\frac{1}{2}$ dr.; oil of cloves, 1 dr.; spirit of ammonia, 2 fl. drs.; essence of civet and vanilla, of each, 2 fl. oz.; essence of musk, 5 fl. oz.; neroli, oils of lavender, verbena, and cassia, of each, 6 drops. As last. Both are very pleasant, durable, and powerful perfumes for personal use.

ESSENTIAL OIL. See OIL (Volatile).

ESSENTIAL SALT OF BARK. See BARK and EXTRACT.

ESSENTIAL SALT OF LEMONS. *Syn.* SALT OF LEMONS; SAL LIMONUM, L. The preparation sold under this name is made by mixing cream of tartar (bitartrate of potassa) with twice its weight of salt of sorrel (quarxalate of potassa), both in fine powder. It is used to remove fruit stains, &c., from linen, by rubbing a little of it on the part moistened with warm water. It is poisonous, if swallowed in quantity.

ETCHING. A species of engraving, in which the design is formed on the plate by the action of an acid, or some other fluid, instead of being cut out by the graver.

Proc. In the ORDINARY PROCESS OF ETCHING the plate is covered with 'etching ground' (an acid-resisting varnish), and the design is scratched on the metal through the ground, by means of a pointed tool of steel called the 'etching needle' or 'point.' A border of wax is then placed round the plate, and the 'biting' fluid poured on, and allowed to remain till the 'lights' or finest portions of the design are sufficiently 'bitten in.' The etching fluid is then poured off, the plate washed, and the light parts 'stopped out' with Brunswick black or other varnish; the solvent is again poured on, and allowed to remain until the finest portion of the exposed lines are sufficiently deep, when the acid is again poured off, and the whole process is repeated till the very darkest lines or shadows are sufficiently 'bitten in.' The plate is then cleaned, and is ready to be printed from. Occasionally the etched design receives a few finishing touches with the 'graver.'

There are several varieties of etching, of which the following are the principal:—**ETCHING WITH A SOFT GROUND**, when a coating of lard or tallow is employed, and the design is drawn on a piece of paper, laid evenly on the ground, by which means the fatty matter adheres to the paper, on the parts

pressed on by the point or pencil, and the copper beneath becomes exposed, and is then acted on by the acid. The effect resembles that of chalk or pencil drawings.—**STEEPLING**, or executing the design in dots instead of lines.—**AQUATINTA** or **AQUATINT**, a mode of etching on copper for producing an effect resembling a drawing in Indian ink. It is performed by sifting powdered asphaltum or lac resin on the plate, previously slightly greased, and, after shaking off the loose powder, gently heating it over a chaffing dish; on cooling, the lights are covered with turpentine varnish coloured with lampblack, by means of a hair pencil, and a rim of wax being placed round the plate, a mixture of 'aqua-fortis' and water is poured on it, and allowed to remain for 5 or 6 minutes, when it is poured off, the plate dried, and recourse had to the pencil as before. The process of 'stopping' and 'etching' is repeated again and again, until the darkest shades are produced. Sometimes, instead of using asphaltum, an alcoholic solution of shell-lac or gum mastic is poured over the plate, placed in a slanting direction; this varnish forms a film, which, on drying, leaves innumerable cracks or minute fissures through which the acid acts, on the plate. The fineness or coarseness of the grain depends entirely upon the condition of the powdered asphaltum, or on the quantity of matter dissolved in the spirit employed to form the ground.

The fluids employed for 'biting in' the designs vary considerably, almost every artist having his own receipt. Aqua-fortis, more or less diluted, is, however, generally employed for COPPER, and this, with the addition of pyroligneous acid, for etching on STEEL; but any fluid that rapidly dissolves the metal may be used for the purpose. The 'etching ground' may be formed of any substance capable of resisting the action of the etching fluid, and which is, at the same time, sufficiently soft to allow of the free use of the needle or point, and sufficiently solid to prevent an injury to the design during the 'scratching in.'

In **ETCHING ON GLASS**, the ground is laid on, and the design 'scratched in' in the usual way, when liquid hydrofluoric acid is applied, or the glass is exposed to the action of hydrofluoric acid gas. The former renders the surface of the etching transparent, the latter opaque. A simple modification of the process is to wet the design with sulphuric acid, and then to sprinkle on some finely pulverised fluor spar (fluoride of calcium), by which means hydrofluoric acid is set free and attacks the glass. This method may be very easily applied to the graduation of glass vessels, thermometer tubes, &c.

A **RAPID METHOD OF ETCHING ON IRON OR STEEL**, capable of very general application, is as follows:—"The metal is warmed until it is capable of melting a piece of bees' wax, or 'etching ground,' which is then carefully

rubbed over it, so as to form a thin and even coating; when cold, the design is 'scratched in' in the common way; a little powdered iodine is then 'sprinkled on the exposed parts, and at the same time a few drops of water are added, and the two worked into a liquid paste with a camel-hair pencil. The paste is then moved about over the intended etching, for a period varying from one to five minutes, according to the depth of the lines required to be produced. Afterwards the whole is removed, and reapplied, &c., as with the usual etching fluids. The same etching-paste, by being kept for a few days, again acquires the property of dissolving iron, and may be used again and again; but independently of this, the iodide of iron formed during the process, if rapidly evaporated to dryness in a clean iron vessel by a moderate heat, and placed in stoppered bottles, will sell for more than the original cost of the iodine. To travellers and amateurs who amuse themselves with the delightful art of etching, iodine, from its portability and convenience, will, doubtless, prove invaluable. We have adopted it with considerable success, and have found it especially useful in marking surgical instruments, razors, and other edge tools. We published this method many years ago. Several parties have since availed themselves of our suggestions and formulae, but without the slightest acknowledgment of the source from which they obtained them." (A. J. Cooley.)

• **Etching, Electro.** This mode of etching, which is in many respects superior to the ordinary mode, is based upon the destructive action of certain 'anions' during 'electrolysis.' If two plates of copper be connected with the opposite ends of a voltaic battery, and placed in a vessel containing very dilute sulphuric acid, the plate connected with the copper of the battery will be attacked by the anion oxygen which is released during the decomposition of the acid. This destructive action can be localised at pleasure by covering certain parts of the plate with a protecting stratum of varnish, ordinary 'etching ground' for instance. In the practice of electro-etching, the drawing is 'scratched in' in the usual way through an ordinary ground; a stout wire is then soldered to the plate, and this, as well as the back of the plate, is coated with sealing-wax varnish. Thus prepared, the plate is placed in a suitable 'decomposition cell' opposite a plate of somewhat similar size, and the two are connected respectively with the copper and zinc of a 'Daniell's cell,' or the silver and zinc of a 'Smee's cell.' After about ten minutes the plate is removed, washed, and dried; and when the 'fine work' has been stopped out with Brunswick black, it is returned for another space of ten minutes. By alternately exposing the plate to the action of the decomposing

fluid, and 'stopping out' parts of the work, the required gradation in tints is obtained. The exact duration of the various exposures, as well as their number, must, of course, be regulated by circumstances. See ETCHING FLUIDS (*below*).

Etching Fluids. 1. (For COPPER.)—*a.* From 'aqua fortis,' 2½ fl. oz.; water, 5 fl. oz.; mix.

b. To the last add of verdigris, 1 oz.; water, 2½ fl. oz.; dissolve. For light touches.

c. (EAU FORTE.—Callot and Piranesi.) Alum, sal-ammoniac, sea salt, and verdigris, of each, 4 oz.; vinegar (pyroligneous acid), 8 fl. oz.; water, 16 fl. oz.; mix, dissolve, boil for 1 or 2 minutes in a glazed or stoneware vessel, cool, and decant the clear portion. Used as the last.

d. Water acidulated with sulphuric acid. Used in the process of electro-etching.

2. (For STEEL.)—*a.* From iodine, 1 oz.; iron filings or wire, ½ dr.; water, 4 fl. oz. It must be kept in a stoppered bottle, until required for use.

b. From iodine, 3 drs.; iodide of potassium, 1 dr.; proof spirit, 1 fl. oz.; water, 2 fl. oz. As the last.

c. (Mr. Turrel.) Pyroligneous acid, 4 fl. oz.; alcohol (rectified spirit), 1 fl. oz.; mix; and add of nitric acid or double aqua fortis (sp. gr. 1.28), 1 fl. oz.

d. From hydrochloric acid, 5 parts; water, 95 parts; mix, and add the liquid to a solution of chlorate of potassa, 1 part, in water, 50 parts.

e. A solution of common salt. Used in the process of electro-etching.

Etching Ground. *Syn.* ETCHING VARNISH.

Prep. 1. Bees' wax, 5 parts; linseed oil, 1 part; melted together.

2. (Callot's HARD VARNISH, FLORENTINE V., FLORENCE V.) From linseed oil and mastic, equal parts, melted together.

3. (Callot's SOFT VARNISH.) From linseed oil, 4 oz.; gum benzoin and white wax, of each, ½ oz.; boil to two thirds.

4. (Lawrence.) White wax, 2 oz.; black pitch and Burgundy pitch, of each, ½ oz.; melt, add by degrees, of powdered asphaltum, 2 oz.; and boil together, until a piece, when thoroughly cold, will break by being bent double 2 or 3 times between the fingers; next pour it into warm water, make it into small balls, and place each of them in a piece of taffety for use.

Obs. The preceding compositions are applied to the surface of the plates, previously made sufficiently warm to melt them easily, their even diffusion being promoted by dabbing them with a wad of cotton. Those that are white are then generally blackened on the surface by skilfully passing them over the smoky flame of one or more candles, by which the marks of the etching point on the bright metal are rendered the more visible.

ETHER. *Syn.* OXIDE OF ETHYL. Described under ETHYL, OXIDE OF. Several

¹ See ELECTROLYSIS and ELECTROTYPY, pages 428 and 429.

² See VOLTAIC ELECTRICITY.

substances are known under the name of ethers besides the true ethers, or salts of ethyl, and are given below.

Ether of Cantharides. *Syn.* **ÆTHER CANTHARIDALIS**, L. *Prep.* (Ettinger.) From powdered cantharides, 1 part; ether, 2 parts; digested together for 3 or 4 days, and the tincture expressed. *Used* as a vesicant, &c.

Ether, Chloric. This name was applied by Dr. T. Thomson to the CHLORIDE OF OLEFIANT GAS, or 'DUTCH LIQUID,' and afterwards, by Guthrie and Silliman, to CHLOROFORM, which they took for an alcoholic solution of chloride of olefant gas. It now forms one of the synonyms of chloroform. The medicinal 'CHLORIC ETHER' of the shops is a solution of chloroform, 1 part, in rectified spirit, 8 parts; of which the *dose* is 20 or 30 drops, in water, as an antispasmodic and anodyne. See CHLOROFORM.

Ether, Chlorineted. Formed by the action of dry chlorine on pure ether. When the action is long continued, a heavy, oily product (BICHLORINETTED ETHER), smelling like fennel, is formed. By the still further action of chlorine, aided by sunlight, a white, crystalline substance (PENTACHLORINETTED ETHER), a compound resembling sesquichloride of carbon, is obtained.

Ether, Cu'preous. *Syn.* **TINCTURA CUPRI CHLORIDI ETHEREA**, L. *Prep.* (Van Mons.) Sulphate of copper, 6 parts, and chloride of barium, 5 parts, are triturated together, and the mixture digested in ether, 3 or 4 parts, until all the chloride of copper is dissolved.—*Dose.* 2 to 5 drops; in epilepsy, &c.

Ether, Methylic. *Syn.* **OXIDE OF METHYL, WOOD-ETHER, METHYL-ETHER; ÆTHER METHYLICUS**, L. *Prep.* From wood-spirit, 1 part; concentrated sulphuric acid, 4 parts; mix in a retort, apply heat, pass the evolved gas (methylic ether) through a little strong solution of potassa, and then collect it over mercury. See METHYL.

Ether, Spirits of Nitrous. See SPIRITS.

Ether, Washed. *Syn.* **ÆTHER LOTUS**, L. Ordinary ether, agitated first with 2 or 3 times its volume of distilled water, and a few grains of carbonate of potassa, or a few drops of milk of lime; and after decantation, again agitated with a like quantity of water only. *Used* for inhalations. For other purposes the washed ether is afterwards digested on chloride of calcium, to deprive it of retained water.

ETHERIN. *Syn.* **CAMPOR OF OIL OF WINE**. A volatile, white, crystalline substance, deposited by light oil of wine when left in a cold situation for some time. It is isomeric with etherole, and received its name from the assumption of its being the base of the ethereal compounds. According to this hypothesis, ether is a hydrate of etherin. Etherin forms brilliant prisms and plates; is tasteless; soluble in alcohol and ether; fuses at 230° Fahr., and boils at 500° Fahr.; and is a little lighter than water. The crystals are

purified by pressure between the folds of bibulous paper, solution in ether, and evaporation.

ETHEROLE. The yellowish, oily liquid, forming the residual portion of light oil of wine, after it has deposited its etherin. It is lighter than water; is freely soluble in both alcohol and ether; and has a rather high boiling-point. See ETHERIN and OIL OF WINE.

ETHION'IC ACID. *Prep.* An alcoholic solution of the crystals of sulphate of carbyle is diluted with water, the whole neutralised with carbonate of baryta, the filtered liquid evaporated by a very gentle heat to a small bulk, and a large quantity of alcohol added; the precipitate (ethionate of baryta) is treated (cautiously) with dilute sulphuric acid (avoiding excess), by which the baryta is withdrawn, and ethionic acid left in solution.

Prop., &c. Ethionic acid closely resembles sulphovinic acid. It is decomposed by heat. Its salts (ethionates), however, differ completely from the sulphovinates. They are all soluble in water, and are said to be anhydrous. The ethionates of ammonia, potassa, and soda, crystallise readily; those of lead, baryta, lime, and the other earths, are uncrystallisable. See ISETHIONIC ACID, and below.

ETHION'IC ANHYDRIDE. *Prep.* Pure and dry olefant gas is passed over anhydrous sulphuric acid ('sulphuric anhydride') contained in a U-shaped tube.

Prop., &c. When thus produced, it is in white, milky crystals, which speedily deliquesce in the air, giving rise to ethionic acid. It is similar in appearance, and probably identical with, 'sulphate of carbyle,' which results from the absorption of the vapour of anhydrous sulphuric acid by absolute alcohol.

ETHIOPS. *Syn.* **ÆTHIOPS**, L. A name given by the older chemists to several black powders, on account of their colour, and still occasionally employed in medical works.

Ethiops, Graph'ic. *Syn.* **ETHIOPS OF PLUMBAGO; ÆTHIOPS GRAPHITICUS**, L. From plumbago, 2 parts; quicksilver, 1 part; triturated together until the globules disappear.—*Dose.* 5 to 10 grs.; in herpes, and some other obstinate skin diseases.

Ethiops, Martial. Black oxide of iron, prepared by keeping iron filings under water, and occasionally shaking them. It is washed with water, dried as quickly as possible, and preserved from the air, to prevent further oxidation. Formerly much esteemed as a tonic.

Ethiops, Min'eral. *Syn.* **ETHIOPS MINERAL; ÆTHIOPS MINERALIS, HYDRARGYRI SULPHURETUM CUM SULPHURE**, L. Black sulphuret of mercury, with excess of sulphur.

(Tyson's.) Oxide of mercury (prepared by decomposing calomel with an equivalent proportion of liquor of potassa to which a little liquor of ammonia has been added) and flowers of sulphur, equal parts, triturated together. This is recommended as an efficient

substitute for the old and uncertain preparation commonly sold under the name of *Ethiops mineral*. It is, however, of more than double the usual strength, and should therefore be taken in proportionate doses. See MERCURY (Sulphuret).

Ethiops, Vegetable. Syn. ETHIOPS VEGETABILIS, PULVIS QUERCUS MARINÆ, L. Bladder wrack (*Fucus vesiculosus*), burned in a close vessel till it becomes black and friable. Used in bronchocoele, scrofula, &c. Like burnt sponge, it owes its virtues to the presence of a very minute quantity of iodine.—*Dose.* 20 grs. to 1 dr., or more, made into an electuary with honey or sugar.

ETHYL. C_2H_5 . *Syn. ETHYLE.* The hydrocarbon assumed to be the radical of the ether-compounds (ethyl-series). A body containing carbon and hydrogen in the proportions indicated by the formula of ethyl, $2(C_2H_5)$, has been obtained by exposing dry iodide of ethyl in sealed tubes for several hours to the action of finely divided zinc, at a temperature of from 320° to 338° Fahr. In this reaction the iodine of the iodide of ethyl combines with the zinc, and the hydrocarbon supposed to be ethyl is set free. On opening the sealed tubes and allowing the gas (which is a mixture of the 'ethyl' and certain secondary products) to pass into a freezing mixture, the temperature of which is kept below -9° Fahr., the 'ethyl' condenses to a colourless, mobile liquid. Hitherto no compound ether has been produced from the 'ethyl' thus prepared.

According to the beautiful theory of Liebig, ethyl is a 'salt-basyle,' forming 'haloid salts' with chlorine, iodine, and bromine; its oxide is ether, and the hydrate of this oxide alcohol. The compound ethers may be compared with ordinary salts in which the metal is replaced by the radical ethyl.

Ethyl, Oxide of. $(C_2H_5)_2O$. *Syn. ETHER, SULPHURIC ETHER, ÆTHER (B. P.), ÆTHER SULPHURICUS (Ph. E. D. & U.S.), Æ. RECTIFICATUS, Æ. VITRIOLICUS, Æ. SPIRITUS VITRIOLI DULCIS, L.* A colourless, highly volatile, fragrant, inflammable liquid, obtained by distilling a mixture of sulphuric acid and alcohol. It was not known before the 13th century.

Prep. There are two methods employed for the preparation of ether. The one is by mixing the whole of the ingredients at once, and immediately subjecting them to distillation at a proper temperature; the other is by adding the alcohol in a slender streamlet to the acid, previously heated to the etherifying point. The former, though less economical, is the one more generally employed.

1. Rectified spirit, 3 lbs.; sulphuric acid, 2 lbs.; carbonate of potassa (previously ignited), 1 oz.; pour 2 lbs. of the spirit into a glass retort, add the acid, and place the vessel on a sand bath, so that the liquor may boil as quickly as possible, and the ether, as it forms, pass over into a well-cooled receiver; continue the distillation until a heavier fluid begins to pass over, then

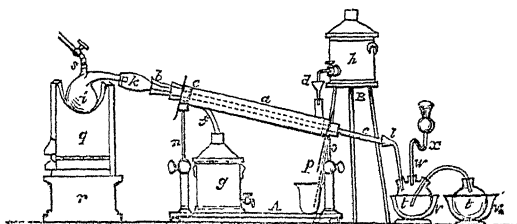

lower the heat, add the remainder of the spirit, and distil as before; mix the distilled liquors together, pour off the supernatant portion, add the carbonate of potassa, and agitate occasionally for one hour; finally, distil the ether from a large retort, and keep it in a well-stoppered bottle. Sp. gr. .750.

2. The strongest oil of vitriol, 3 parts, are mixed with alcohol, q. s. (about 2 parts at 830°) to reduce its sp. gr. to 1.780; an object which may be easily obtained by distilling off some of the ether, if required. The still or retort is then connected with a vessel full of alcohol, of at least 90° , by means of a small syphon tube, furnished with a stop-cock; the longer limb of which should be of glass, and so arranged that it just dips into the mixture of acid and alcohol. Heat is next applied, and the contents of the still raised to the boiling-point as rapidly as possible, and as soon as full ebullition commences the stop-cock of the syphon is cautiously turned, so as to allow the alcohol to flow down in such a manner as to keep the boiling liquid exactly at the same level; or, in other words to supply a quantity of alcohol exactly equal to that of the liquid which distils over. By careful manipulation the whole of the alcohol which enters the retort passes over as ether and water, and this decomposition proceeds for some time, and would continue for an unlimited period, did not the sulphuric acid ultimately become too weak to form ether, from the gradual absorption of the superfluous water contained in the alcohol. Were it convenient or practicable to use absolute alcohol, a given weight of sulphuric acid, of the proper strength would maintain the power of producing ether for an indefinite period. In practice, the quantity of alcohol that may thus be etherified is twice or thrice as much as by the common process, while neither sulphurous acid, sulpho-vinic acid, nor sweet oil of wine, is generated and the residual liquid of the distillation continues limpid, and has only a pale-brown colour. This is termed the 'continuous,' or 'Boullay's' method. (This process is similar to that given in the B. P.)

3. Alcohol of 90° , five parts, are mixed with oil of vitriol, 9 parts, in a vessel of copper or iron immersed in cold water; the mixture is next introduced into a still or retort, and raised to a state of ebullition as rapidly as possible, as before. A fresh quantity of alcohol, equal in bulk to the liquid distilled over, is then added to the liquid in the still, and distillation again had recourse to. As much concentrated alcoholic solution of potassa as will give it a perceptible alkaline reaction is next added to distilled liquor, which is then rectified by the heat of a water bath, as long as the ether which distils over has the sp. gr. .720 to .725 at 80° Fahr. Instead of the potassa, a little milk of lime may be used, along with its own bulk of water. By allowing the product to stand for some days over chloride of calcium or quicklime, and again rectifying it along with one

of these substances, perfectly pure ether may be obtained.

Obs. The mixture of alcohol with sulphuric acid requires some caution. It is best done by

- a.* Condenser tube.
b. Glass tube.
d. Funnel by which cold water runs in from the water bottle *h*.
e. Pipe by which water escapes through *f* into the bottle *g*.
i. Retort.
k. Adapter, connecting the retort with the condenser.
l. Adapter, connecting the condenser with the bottles *t*, *t*.
A. Wooden tressel, with movable arms *n*, *o*, for supporting and adjusting the heights of the condenser.

- B.* Wooden stool for supporting the water bottle.
g. Furnace.
r. Support for the furnace.
p. Gutter for carrying off water that overflows the funnel *d*, and preventing its escape along the pipe *c*.
s. Leg of syphon connected with bottle containing alcohol.
t, t. Glass globes, placed in the basins *r*, *v*, and surrounded with pounded ice or ice-cold water.
w. Safety tube, containing a little mercury at *x*.

introducing the alcohol into a suitable vessel, and imparting to it a rapid whirling motion, by which a considerable conical cavity is formed in the centre, and into which the acid may be gradually poured with perfect safety. The mixed fluids should be brought to a state of rapid ebullition, as quickly as possible, as without this precaution much of the alcohol distils over before the liquor acquires the proper temperature for etherification. On the small scale, a tubulated retort, connected with a Liebig's condensing tube, and two globular receivers surrounded with a freezing mixture, or ice-cold water, may be employed as the distillatory apparatus. The second receiver should be connected with the first one by means of a bent glass tube, reaching nearly to the bottom of the former; and the whole of the joints should be securely luted, as soon as the expanded air has been allowed to escape. We have employed the following convenient little apparatus for the preparation of small quantities of ether, and it will be found very suitable for the distillation of most other highly volatile liquids, and particularly for boiling mixtures of alcohol and organic acids. By connecting the neck of a flask or digester containing volatile fluids with the lower instead of the upper end of the refrigerator, ebullition may be carried on without loss, as the vapour will be condensed, and run back into the vessel from which it has distilled.

For the rectification of ether, a water bath is employed along with the above simple refrigerator, and the receivers surrounded by ice or a freezing mixture.

Chem. comp., &c. Ether is generally regarded as the oxide of ethyl, and alcohol as the hydrate of this base. This view is borne out by analysis, which proves that ether differs from alcohol

by the elements of water. Recent experiments have also shown that the relation existing between the two compounds is—if alcohol be expressed by the formula C_2H_5O , the true formula of ether will be $(C_2H_5)_2O$. We cannot describe these experiments here, but we may remark that ether cannot be made to combine with water directly, nor can alcohol be converted into ether by the abstraction of water, pure and simple, without the aid of other substances.

The compound ethers may be compared to ordinary salts in which the metal is replaced by a radical termed ethyl, having the formula C_2H_5 . This view is, of course, in accordance with the theory which regards ether as the oxide of ethyl.

According to theory, 1 equivalent, or 46 parts of absolute alcohol, should produce 1 eq., or 37 parts, of pure ether; but in practice, the greatest product obtained by operating according to Boullay's method, which produces more ether than any other, does not exceed $33\frac{1}{2}$ parts for the preceding quantity of alcohol, or 71.5%. A mixture of 9 parts of oil of vitriol, and 5 parts of alcohol of 90%, ceases to produce ether after 31 parts of such alcohol have been added.

The most economical method of etherification is that known as the continuous ether process, or the process of Boullay. When this is adopted, the retort or flask should be fitted with a sound cork, perforated by an aperture to receive a thermometer, and the application of the heat, and the flow of alcohol, should be so managed, that a temperature of 300° Fahr. and a state of rapid and violent ebullition (points of essential importance) are maintained.

Prop., Uses, &c. Pure ether is a colourless,

transparent, and very limpid fluid, having a penetrating and agreeable smell, and a burning, sweetish taste; its evaporation produces the sensation of extreme cold; when prevented, a sensation of heat is experienced. Its specific gravity varies between .712 and .724. If it contains water it begins to crystallise in brilliant white plates when cooled to -24° Fahr., and become a white crystalline mass at -46° or -47° Fahr.; but if absolutely pure, ether cannot be solidified by any degree of cold that can be produced, it remaining fluid when placed in contact with solid carbonic acid, at a temperature of about -148° Fahr. Boils at 96° or 97° Fahr.; is very combustible; is soluble in about 10 parts of distilled water, and mixes with alcohol in all proportions. It abstracts corrosive sublimate, perchloride of gold, sesquichloride of iron, and many of the alkaloids, from their watery solutions, and is hence invaluable in analysis and pharmacy. It readily dissolves the volatile and fixed oils, and most fatty matters, as well as sulphur and phosphorus in small quantities. By exposure to light and air it absorbs oxygen, and water and acetic acid are gradually formed. It is decomposed by exposure to a high temperature. Its evaporation occasions intense cold. The greatest degree of cold yet produced (-166° Fahr.) has resulted from the admixture of ether with solid carbonic acid. Ether is powerfully stimulant, narcotic, and antispasmodic, and externally refrigerant, if allowed to evaporate, or stimulant and counter-irritant if its evaporation is prevented, and is used in various diseases. Applied to the forehead by means of the fingers or a strip of linen, it generally relieves simple cases of nervous headache. In *pharmacy*, it is largely employed in the preparation of tinctures, alkaloids, spirits, &c.; and in *chemistry* is invaluable in organic analyses. Its principal commercial application is as a solvent for pyroxyline, in the manufacture of collodion. It is also employed as a solvent of resins, India rubber, &c., in the preparation of varnishes, and for several other useful purposes.—*Dose*. 20 drops to 2 fl. drs.; in water or wine. Excessive doses of ether produce intoxication resembling that from alcohol, and require similar antidotes. Shortly before the discovery of chloroform, it was found that when the vapour of ether was inhaled it gradually produced insensibility to pain. It was therefore employed as an anæsthetic in surgical operations. Having been found less efficient than chloroform, and more troublesome to administer, its use for this purpose has been abandoned.

Tests. Ether may be recognised by its volatility, odour, taste, sparing solubility in water, admixture with alcohol in all proportions, great inflammability (burning with a yellowish-white flame), and its power of dissolving fats and resins. Its further identification can only be effected by ultimate analysis.

Prep. The ether of the shops, generally, con-

tains alcohol, water, or acetic acid, and sometimes all of them. Its usual specific gravity fluctuates between .733 and .765. Exposed to the air, it volatilises entirely. It turns litmus paper red; sometimes very slightly, and occasionally even not at all. $\frac{1}{2}$ fl. oz. mixes completely with $\frac{1}{2}$ pint of water. Pure ether should, however, be neutral to test-paper, although seldom so. When shaken in a minim measure with half its volume of concentrated solution of chloride of calcium, its volume should not lessen. 10 fluid ounces of water should only dissolve 1 fluid ounce of ether, and remain transparent.

Preserv. Ether rapidly evaporates at common temperatures when kept in corked bottles, and even in bottles secured with ground-glass stoppers and tightly tied over with bladder and leather; it also becomes sour by age. To prevent this waste, the stoppers should fit accurately, and the bottles should be placed in as cool a situation as possible. Bottles furnished with ground-glass caps, as well as stoppers, are frequently employed. (See *engr.*) Dewar's 'ether phial' is formed on a similar principle. We have seen bottles of ether accurately stoppered, tied over with bladder, and thickly coated with wax, which have yet become quite empty by a voyage to the tropics, though they still appeared to be as closely secured as when they were first filled.

Caution. The vapour of ether is very inflammable, and when mixed with atmospheric air, it forms a violently explosive mixture. The density of this vapour is 2.586, that of air being 1; hence it rapidly sinks, and frequently accumulates in the lower parts of buildings, especially cellars which are badly ventilated, in the same way as water does. The only remedy is thorough ventilation. Many serious accidents have arisen from this cause, for no sooner is a light carried into an apartment where such vapour is present, than an explosion takes place.

Ethyl, Acetate of. $C_2H_5C_2H_3O_2$. *Syn*. ACETATE OF OXIDE OF ETHYL, ACETIC ETHER, PYROLIGNEOUS ETHER; *Æther aceticus*, L. A compound discovered by the Count de Lauraguais in 1759.

Prep. 1. Acetate of potassa, 3 parts (or an equiv. quant. of acetate of soda), alcohol (85 $\frac{1}{2}$), 3 parts, oil of vitriol (strongest), 2 parts, are mixed together and distilled, by the heat of a sand bath, from a glass or earthenware retort into a well-cooled receiver; the distillate is agitated with a little water to remove undecomposed alcohol, and then digested first with a little chalk, to remove acidity, and afterwards with fused chloride of calcium, to absorb water; it is, lastly, rectified by a gentle heat. 2. Rectified spirit (sp. gr. .84), 50 parts, acetic acid (sp. gr. 1.075), 33 parts, are mixed together, and oil of vitriol (strongest), 10 parts,

added; the distillation is continued until 65 parts have passed over, and the distillate, after digestion for some hours on a little dry carbonate of potassium, is rectified as before, the first 50 parts only being kept for use.

Prop., &c. Acetic ether is colourless, and bears a considerable resemblance to ordinary ether, but it has a much more agreeable and refreshing odour. It boils at 165° Fahr.; has a sp. gr. of .89 at 60° Fahr.; dissolves in about 7 parts of water; and mixes in all proportions with alcohol and ether. It is decomposed by alkalies and the strong acids.

Acetic ether is diaphoretic, stimulant, antispasmodic, and narcotic.—*Dose.* $\frac{1}{2}$ to 2 fl. drs.; in similar cases to those in which sulphuric ether is employed, and especially in nervous and putrid fevers, spasmodic vomitings, and diseases of the bowels and stomach, arising from debility, and not of an inflammatory character. Its principal consumption is in the manufacture of British brandy.

Ethyl, Benzoate of. $C_2H_5C_6H_5O_2$. *Syn.* BENZOIC ETHER, BENZOATE OF ETHER, B. OF OXIDE OF ETHYL; ÆTHER BENZOICUS, L. *Prep.* Alcohol (sp. gr. .830), 4 parts, benzoic acid (cryst.), 2 parts, concentrated hydrochloric acid, 1 part, are distilled together; as soon as the product turns milky when mixed with water, the receiver is changed, and the liquid that distils over collected; to this liquid water is added, and the supernatant ether is decanted, and boiled with water and a little oxide of lead (to separate benzoic acid); it is, lastly, freed from water by allowing it to stand over chloride of calcium.

Prop., &c. A colourless, oily liquid, slightly heavier than water, and possessing an aromatic odour and taste. It boils at 410° Fahr., and is miscible with alcohol and ether.

Ethyl, Bromide of. C_2H_5Br . *Syn.* ÆTHER HYDROBROMICUS, L. A volatile, ethereal liquid, discovered by Serullas.

Prep. Bromine, 8 parts; alcohol, 32 parts; dissolve, place the mixture in a retort, add of phosphorus, 1 part, and distil by a gentle heat as soon as the liquid becomes cold. The ether is separated from the distillate by the addition of water.

Prop., &c. A very volatile liquid, with a penetrating taste and smell; boiling at 105° Fahr., and heavier than water.

Ethyl, Butyrate of. $C_2H_5C_4H_7O_2$. *Syn.* BUTYRIC ETHER, PINE-APPLE OIL; ÆTHER BUTYRICUS, L. *Prep.* By passing hydrochloric acid gas into an alcoholic solution of butyric acid, and purifying the product from free acid. Commercially, from crude butyric acid saponified with caustic potassa or baryta, and the resulting soap distilled along with alcohol and 1 of vitriol.

Uses. Crude butyric ether forms the 'pine-apple oil' of commerce, and when largely diluted with rectified spirit, the 'pine-apple essence' so much employed as a flavouring substance by confectioners, liqueuristes, &c.

It imparts a delicious flavour to sweetmeats, rum, arrack, punch, &c. The Germans add it to common rum, to form the flavouring for their 'pine-apple ale.'

Ethyl, Carbonate of. $(C_2H_5)_2CO_3$. *Syn.* CARBONIC ETHER, CARBONATE OF OXIDE OF ETHYL; ÆTHER CARBONICUS, L. *Prep.* Fragments of potassium are added to oxalic ether, gently warmed, as long as bubbles of gas are formed; the excess of metal is removed from the semi-solid mass, some water added, and the whole distilled. The carbonic ether floats on the surface of the liquid in the receiver, and is collected, dried by contact with chloride of calcium, and rectified along with some potassium or sodium, till it ceases to yield acetate of potassa when acted on by caustic potassa.

Prop., &c. Colourless, limpid, and aromatic; tastes pungent and burning; boils at 259° to 260° Fahr. It greatly resembles oxalic ether. It is decomposed by alkalies.

Ethyl, Chloride of. C_2H_5Cl . *Syn.* LIGHT HYDROCHLORIC E., CHLORIDE OF ETHYL; ÆTHER HYDROCHLORICUS, L. A highly volatile compound, formed of ethyl and chlorine.

Prep. Rectified spirit of wine is saturated with dry hydrochloric acid gas, in the cold, and the product is distilled in a retort connected with a Woolfe's apparatus, the first bottle of which should be two thirds filled with tepid water (70° to 75° Fahr.), and the remainder surrounded with a mixture of ice and salt. To render it perfectly anhydrous, it must be digested on a few fragments of fused chloride of calcium.

A mixture of oil of vitriol, 3 parts, and alcohol, 2 parts, is poured upon common salt (dried), 4 parts; and the whole distilled as before.

Prop., &c. This ether has a sweetish taste; is soluble in about 15 parts of water, and miscible in all proportions with alcohol; boils at 54° Fahr.; burns with a flame edged with green; is neutral to test-paper; and does not affect a solution of nitrate of silver. Sp. gr. .921, at 32° Fahr.—*Dose.* 10 to 30 drops, as an antispasmodic and a powerful diffusible stimulant. Owing to its extreme volatility, it can only be taken dissolved in spirit.

Ethyl, Cyanide of. C_2H_5CN . *Syn.* ÆTHER HYDROCYANICUS, L. *Prep.* Cyanide of potassium and sulphovinate of baryta, equal parts, are mixed and distilled in a glass retort by a moderate heat. The product separates into two strata; the lighter one is impure hydrocyanic ether; this is decanted and agitated with 4 or 5 times its bulk of water at 120° to 140° Fahr., and the operation is repeated with about 2 parts of water; the ether is again decanted, and placed in contact with chloride of calcium for 24 hours, and then rectified.

Prop., &c. It boils at 190° Fahr. Sp. gr. .788. In its therapeutical effects it resembles hydrocyanic acid, but is less active. Its odour is, however, more penetrating and offensive.—*Dose.* 2 to 6 drops, in mucilage or emulsion;

ercise favours the preservation of the general health, by calling into direct action the majority of the organs of the body; and it also acts powerfully on the skin, by stimulating its functions, increasing its temperature, awakening its tone, and subjecting it to a current of atmosphere favorable to its respiratory offices. But to be beneficial in the highest degree, exercise must be accompanied by feelings of present interest and enjoyment. The mind must direct and go with it; to ensure its full benefits, the "soul must be present."

"During convalescence, properly regulated exertion is highly serviceable; but it should never be carried so far as to produce exhaustion, and should be pursued for some time in doors, before it be attempted in the open air; the latter, at first, should always take place in a carriage, that can be opened or closed at will; the patient may then attempt short walks in the open air; but, in all cases, it is of importance that he is not unduly fatigued, as, otherwise, injury instead of benefit will be the result. One of the most serious errors, committed with regard to exertion, is that of permitting a convalescent to sit up too frequently, or for too long a time, under the mistaken notion of giving him strength. A patient should never be allowed to sit up longer than is agreeable to his feelings, and never so long as to produce a sense of fatigue." (Dr. R. E. Griffith.)

EXPANSION. All substances, solid, liquid, and gaseous, when chemical change does not take place, expand by heat, and contract by cold. In some of them this property occurs in a greater degree than in others, but is constant for the same substance under the same circumstances. The chemist avails himself of this property in the construction of his thermometer; the wheelwright, in fixing on the tire of his wheels; the engineer, in restoring to the perpendicular the leaning walls of buildings; &c.

This expansion by heat is of great importance in the manufactures, as allowance has to be made of it in every purpose where metals are employed.

The following is a list of the expansion of the chief metals, &c., when heated from 32° to 212 Fahr., or from 0° to 100° Cent. :—

Substance.	Expansion.	
	In bulk.	In length.
Glass . . .	1 in 384	1 in 1150
Platinum . .	1 " 377	1 " 1311
Steel . . .	1 " 309	1 " 926
Iron . . .	1 " 282	1 " 846
Gold . . .	1 " 227	1 " 682
Copper . . .	1 " 194	1 " 582
Brass . . .	1 " 179	1 " 536
Silver . . .	1 " 175	1 " 524
Tin . . .	1 " 172	1 " 516
Lead . . .	1 " 117	1 " 351
Zinc . . .	1 " 113	1 " 340

Of the liquids, they expand as follows, when

heated from 0° to 100° Cent., or from 32° to 212° Fahr. :—

Mercury . . .	1 in 55 in bulk
Water . . .	1 " 21 " "

Gases practically all expand alike; that is to say, for every degree Fahrenheit a gas expands $\frac{1}{273}$ of its bulk at 32°, and for every degree Centigrade $\frac{1}{273}$ of their volume at 0° C.

An example will show the importance of this. Suppose an iron bar, connecting two sides of a building, and of a length of about 85 feet. The increase in length by heat of this bar would make it 1 inch longer in summer than in winter; and it would, if no allowance be made, pull or thrust the walls to this extent each year.

EXPECTORANTS. *Syn.* EXPECTORANTIA, *L.* Medicines that promote the secretion of the tracheal and bronchial mucus. According to Dr. Good, true expectorants are "those medicines which rather promote the separation of the viscid phlegm with which the bronchia are loaded, than simply inviscate and dilute it; though these are also treated as expectorants by many writers." Ammoniacum, antimoni-als, assafetida, the balsams of Peru and tolu, benzoic acid, benzoin; the fumes of vinegar, tar, and several of the volatile oils; garlic, ipecacuanha, the oleo-resins, squills, tartarised antimony, and the smoke of tobacco and stramonium, are among the principal substances commonly called expectorants. Tartarised antimony, squills, chlorine, and ammoniacal gases, have also been used (diluted) to provoke the coughing and favour the expulsion of foreign bodies from the air-passages; and also to favour the expectoration of mucus, pus, and membranous concretions, when the local irritation is not sufficiently great. (Schwilgue.) Expectorants are commonly employed in pulmonary complaints and affections of the air-tubes, attended by a vitiated state of the mucus, or an imperfect performance of the natural functions of the secretory vessels. "Of all classes of the materia medica, none are more uncertain in their action than expectorants." (Pereira.) The act of ejecting matter from the chest is called EXPECTORATION.

EXPERIMENTS are acts or operations intended to develop some unknown fact, principle, or effect; or to establish or demonstrate it, when discovered. Similar operations, performed merely for amusement, are also often, though incorrectly, called by this name. In rational experiments these two objects are combined. To experimental research is due the present high state of advancement and usefulness of the various sciences most intimately connected with our happiness and well-being. The danger of taking things for granted has been thus pleasantly and instructively pointed out by Archbishop Whateley :—
"It was objected to the system of

nicus, when first brought forward, that if the earth turned on its axis, as he represented, a stone dropped from the summit of a tower would not fall at the foot of it, but at a great distance to the west; in the same manner as a stone dropped from the masthead of a ship in full sail does not fall at the foot of the mast, but towards the stern. To this it was answered, that a stone, being a part of the earth, obeys the same laws, and moves with it; whereas it is no part of the ship, of which, consequently, its motion is independent. The solution was admitted by some, but opposed by others; and the controversy went on with spirit; nor was it till one hundred years after the death of Copernicus that, the experiment being tried, it was ascertained that the stone, thus dropped from the head of the mast, *does* fall at the foot of it."

EXPORTATION. (EXPORTATION ON DRAWBACK.) By law, a certain allowance, or drawback of duty, is payable on certain articles, when exported from any part of the United Kingdom, either as merchandise or ship stores. Thus:—

SUGAR, refined in the United Kingdom, from 4s. to 6s. per cwt., according to quality.

TOBACCO, manufactured in the United Kingdom, 3s. 3d. per lb. The full drawback is only allowed on normal tobacco, which contains 13 per cent. of moisture. If the moisture exceeds 13 per cent., a proportionate reduction is made in the drawback; if it is found less than 13 per cent., a proportionate increase is granted.

SNUFF is entitled to drawback at 3s. 3d. per lb., subject, however, to an increase, if the moisture is less than 13 per cent., and the inorganic matter not over 18 per cent., and to a decrease, if the moisture in organic matter exceeds these per-centages.

BEER. The amount of this drawback is proportional to the quantity of malt or sugar used in the brewing of the beer, and is nearly equivalent to the duty originally paid on such malt or sugar. It is computed according to the following scale:—For every barrel, or 36 gallons of beer, the original gravity of which was not less than 1040°; a drawback of 4s. 3d., and for every additional 5 degrees, from 1040° to 1125° inclusive, a further sum of 6d. per barrel.

SOLIDIFIED WORTS, made by a licensed brewer, from malt or sugar, or malt and sugar, a drawback of 2s. 10 $\frac{5}{8}$ d. per 28 lbs.

MALT. Under certain restrictions, a drawback of the duty charged, after deducting 7 $\frac{1}{2}$ per cent. of the measured quantity.

SPIRITS, from 10s. to 10s. 3d. per proof gallon.

In all cases samples are taken by the Custom House officer, and forwarded to the Inland Revenue laboratory, where they are examined previous to the payment of the drawback.

EXPRESSION. In the *useful arts*, the mechanical operation by which a fluid contained

in the pores or cells of a solid is pressed out or expelled. Many of the fluid substances employed in pharmacy and chemistry are obtained by expression. Thus, the unctuous vegetable oils, as those of almonds, linseed, &c., are procured by submitting these substances to powerful pressure between iron plates, which are either made warm, or the bruised seeds are previously exposed in bags to the steam of boiling water. The juices of fresh vegetables are also obtained by expression. The substances are first bruised in a marble mortar, or, on the large scale, in a mill, and immediately submitted to the press, to prevent them passing into a state of fermentation, which would injure the quality of the product. Fruits which contain highly flavoured or fragrant seeds, or which have rinds containing essential oil, are generally deprived of them before being sent to the press. The subacid fruits are also allowed to lay together for some days before pressing them, as the quantity and quality of the product is thereby increased. The fluid matter absorbed by the ingredients employed in the preparation of tinctures, infusions, decoctions, extracts, &c., is generally obtained by powerful pressure. Expression is also frequently had recourse to for the purpose of obtaining solids in a state of purity, as in the expulsion of oleine from stearine, water from bicarbonate of soda, &c. On the small scale, the common screw-press, or one of like construction, is usually employed; but the power thus obtained is insufficient to expel the whole of a fluid diffused through the pores of a solid. Hence has arisen the use of the hydraulic press, which is now almost alone employed on the large scale. In all these cases the substances are placed in bags made of haircloth, or coarse canvas, previously to their being submitted to pressure. For tinctures and like pharmaceuticals, a small screw-press (TINCTURE PRESS) made of 'galvanised' or tinned iron, and varying in capacity from 1 quart to several gallons, is employed.

EXSICCATION. See DESICCATION.

EXTRACT. *Syn.* *EXTRACTUM*, L. Among *chemists*, this term is understood to apply to the residuum of the evaporation of aqueous decoctions or infusions of vegetable matter. In *medicine* and *pharmacy*, it has a less definite signification, being applied to various preparations obtained by evaporating the expressed juices, or the decoctions, infusions, or tinctures of vegetable substances, until a mass, of a solid or semi-solid consistence, is formed. Extracts vary in their nature and composition with the substances from which they are prepared, and the fluids employed as solvents. When water is employed as the menstruum, the products (AQUEOUS EXTRACTS, WATERY E.; *EXTRACTA AQUOSA*, E. *SIMPLICIORA*, L.) usually consist of gum, starch, sugar, albumen, extractive, and saline and other matter, along with the peculiar principles on which the medicinal virtue of the vegetable depends. When spirit

is employed as the solvent, the products (ALCOHOLIC EXTRACTS; *EXTRACTA ALCOHOLICA*, L.) contain most of the substances above enumerated, except the gum and starch, together with several other substances which are soluble in spirit, but which are either wholly or nearly insoluble in water; as resins, essential oils, and the proximate principles of vegetables. These preparations, with scarcely an exception, are considerably more powerful than the aqueous extracts of the same vegetables. In some cases proof spirit or under-proof spirit is employed, when the extracts (SPIRITUOUS EXTRACTS; *EXTRACTA SPIRITUOSA*, L.) generally possess properties between those of the above. In other cases, dilute acetic acid or acidulated water is employed as the menstruum, when the products (ACETIC EXTRACTS; *EXTRACTA ACETICA*, L.) possess much greater activity than when prepared with water; and would in many cases prove fatal, if exhibited in doses as large as those of the aqueous extracts. Still more active extracts are obtained by a combination of the last two menstrua. According to Ferrari, plants treated with rectified spirit of wine, mixed with $\frac{1}{10}$ th part of acetic acid, yield extracts of remarkable activity. On the Continent, ether is sometimes used as the menstruum for the active principles of certain substances, as cantharides, cubeb, worm-seed, &c. (ETHERAL EXTRACTS; *EXTRACTA ETHEREA*, L.). The term 'simple extract' is applied to an extract prepared from a single plant or vegetable substance, and the term 'compound extract' to one prepared from two or more of such substances. The FLUID EXTRACTS (*EXTRACTA FLUIDA*, L.) of modern pharmacy are those which are only evaporated to the consistence of a thin syrup, and then mixed with 1-10th to 1-8th of their volume of rectified spirit.

Prep. The preparation of medicinal extracts may be conveniently considered under two divisions, viz.—1. The production of a solution of the soluble portion of the substances operated on; and, 2. The reduction of this solution by evaporation to the consistence of an extract.

I. PREPARATION OF SOLUTIONS:—The preliminary operations in the manufacture of extracts are similar to those employed in the preparation of DECOCTIONS, INFUSIONS, and TINCTURES. The proper quantity of the ingredients being taken, the whole is well bruised or reduced to coarse powder, or otherwise divided by slicing with a knife, that every portion may be fully exposed to the solvent action of the fluid. In some few cases (as with gentian, &c.) the 'slicing,' or reduction to fragments, is often conveniently deferred until the action of the menstruum shall have so far softened the ingredients as to render them of easy division by the knife. Those substances (as sarsaparilla, chamomiles, &c.) whose medicinal principles reside in the cortical portion, or which are of easy solubility, are commonly

subjected to the action of the menstruum without being subjected to any particular preparation.

In the preparation of AQUEOUS EXTRACTS, the ingredients are treated with water until all the soluble matter that it is desirable to obtain is dissolved out. There are several methods of effecting this object, depending upon the nature of the substances acted on. In some cases, maceration in cold water is resorted to; in others, percolation with that fluid in a 'displacement apparatus.' More generally, however, boiling water is poured on the substance, and is digested on it for some time, as in the preparation of infusions; or the substance is exhausted by boiling it in water, as in the preparation of decoctions. After the ebullition or infusion has continued a sufficient time, the heat is removed, and the liquid portion drawn off. The ingredients are then pressed to extract the remaining liquid; or they are washed or 'sparged' with hot water, which expels it by displacement. According to the usual practice in the majority of cases, a second quantity of water is poured on after the first has been thoroughly drained off, and the infusion or decoction is repeated a second and even a third time, or until the ingredients are perfectly exhausted of their soluble portion. The liquor or liquors thus obtained being allowed to repose for 15 or 20 minutes, for the purpose of depositing the sand or other gritty and heavy matter that is mechanically mixed with them, are carefully decanted from the sediment, and, after being run through a fine hair-sieve, or flannel bag, are ready for concentration. In some instances, however, this method proves insufficient to render the liquid clear. In such cases, the solution may generally be rendered transparent by clarification with a little white of egg, removing the scum as it rises, straining the liquid through flannel, as before; or the liquid may be filtered through a bag made of fine 'Welsh flannel,' or of 'tweeled cotton cloth' (Canton flannel), both of which should be soaked in clean water for at least an hour before use. In the small way, filters of linen or paper are sometimes employed; but as all media sufficiently fine to render vegetable solutions transparent soon choke up, this filtration is objectionable, from the length of time it occupies. In some houses, the aqueous infusion or decoction is allowed to repose for 24 hours, and then decanted and evaporated; but such a plan is objectionable, as, however smooth and glossy extracts so prepared may appear, their medicinal virtues are lessened by the lengthened exposure to the atmosphere.

When about one half of an aqueous solution has evaporated, it is often advantageous to repass it through a flannel or horsehair strainer, to remove the flocculi that generally form by the action of the heat and air. This is especially necessary with vegetable solutions prepared without boiling, and should

adopted whenever a smooth and slightly extract is desired.

II. REDUCTION OF SOLUTIONS:—The reduction of the solution to the proper consistence is effected by evaporation. The mode in which this is performed varies for different extracts. The London College directs that, "unless otherwise ordered, the evaporation should be conducted as quickly as possible, in a broad, shallow pan, placed in a water bath, until a proper consistence is acquired for forming pills; stirring assiduously with a spatula towards the end of the operation." The Dublin College orders that "all simple (aqueous) extracts (*EXTRACTA SIMPLICIORA*), unless otherwise ordered, are to be prepared by boiling the vegetable matter in 8 times its weight of water, till the liquid is reduced to one half; the liquor is then to be expressed, and, after a short time allowed for defecation, to be decanted, filtered, and evaporated in a steam or water bath, until it begins to thicken, and then finally inspissated by a reduced heat, with continual stirring, until a consistence for forming pills be attained." The instructions of the Edinburgh College are similar, with the one important exception, however, of ordering the evaporation to be conducted in a water bath saturated with chloride of sodium.

Though the water bath has the sanction of the London College, it is ill adapted for the purpose to which it is here ordered to be applied, as, from its low evaporative power, the advantages which are derived from its equable temperature are vastly overbalanced by the lengthened exposure of the solution in a heated state to the action of the atmosphere. It has been shown that a vegetable extract so prepared is inferior in quality to a similar one formed by rapid evaporation in a shallow pan over a naked fire, or placed in a sand bath, provided proper care is taken, and assiduous stirring is adopted during the whole time of the exposure to heat. In practice, however, the use of a naked fire is perfectly inadmissible, as the least neglect on the part of the operator would probably lead to the incineration of the whole. These objections are obviated by the addition of the $\frac{1}{4}$ th part of salt to the water of the bath, which raises its boiling-point to $218\frac{1}{2}^{\circ}$ Fahr., when the temperature of the contained extract is fully 212° ; the remaining 6° being lost by the interposition of the substance of the evaporating vessel.

ON THE LARGE SCALE, the evaporation of infusions or decoctions for extracts is usually conducted in very wide, shallow, copper or tinned-copper pans, having steam-tight jackets of cast iron, and heated by steam 'playing' between the two.

The rapid deterioration which vegetable juices and solutions undergo by exposure to the air, especially at high temperatures, has led to the introduction of apparatus, by which they may be concentrated without contact with the atmosphere, and at a less degree of heat than

is required for that purpose in open vessels. Such is the method, commonly called 'Barry's process,' in which the air is removed from certain air-tight refrigerators by the introduction of steam, which is then condensed by the application of cold, by which means a partial vacuum is obtained. Another process for attenuating the atmosphere over the surface of fluids during evaporation is by the action of an air-pump. This plan was introduced by Howard, and is commonly applied to the concentration of syrups in the sugar refineries. Extracts obtained by either of these methods are said to be prepared 'in vacuo,' and are found in practice to be immensely superior to the common extracts of the shops, and consequently require to be exhibited in proportionably small doses.

Obs. When water, acidulated with acetic acid, is employed in the preparation of extracts, the vegetable substances are usually macerated in it, in the cold, or the dilute acid is sprinkled over the bruised plant in the fresh or recent state, and the whole is then submitted to strong pressure, to expel the juice, which is strained and evaporated in the usual way, but preferably in a well-tinned or plated-copper pan.

ALCOHOLIC AND SPIRITUOUS EXTRACTS are prepared by evaporating a filtered concentrated tincture of the ingredients in any suitable vessel, by which the volatilized spirit may be saved. In general, rectified spirit is used as the menstruum; but in some cases proof spirit is employed; and, in others, the substances are first digested in proof spirit, and afterwards in water, and the mixed tincture and infusion evaporated in the usual manner.

ETHEREAL EXTRACTS are obtained in a similar manner to alcoholic ones; but being merely prepared in small quantities at a time, the process may be conveniently performed in glass vessels. When it is required to boil either of the above fluids (alcoholic or ethereal), or any other volatile liquid on the ingredients, a vessel fitted with a long tube, or a Liebig's condenser reversed, as noticed under ether, may be used to prevent any loss of the menstruum.

The **INSPISSATED VEGETABLE JUICES** (*JUICES*, E.; *SUCCI*, L.) of the British Pharmacopœia are obtained by expressing the juices from the fresh plants, and preserving them by the addition of spirit. "By thus preserving the juice of the plant its properties are not impaired by the action of the air during the time necessary to dry the leaf for tincture, nor by the action of both air and heat during the time necessary to evaporate the juice to the consistence of an extract."—Squire. The directions of the Edinburgh College for preparing their inspissated juices (*SUCCI SPIS-SATI*, L.) are—"Beat the fresh substance, and press it strongly through a canvas bag, in order to obtain the juice; which, being put into a wide, shallow vessel, and

heated by means of boiling water saturated with sea-salt, is to be reduced to the consistence of honey. The mass, when cold, is to be put into glazed earthen vessels, and moistened with strong alcohol." By operating in this way a considerable portion of the activity of narcotic vegetables is lost. Some of the juices, as that of aconite, are impaired in so short a time as scarcely to compensate for the trouble of preparing them. This deterioration does not, however, take place in any remarkable degree, if the expressed juice from the recent vegetable be evaporated by exposing it in a thin stratum to a current of very dry air, as adopted by Mr. Squire. This may be managed by putting the juice into small, flat trays or dishes, placed on shelves in a suitably arranged apparatus, alternated with similar vessels of concentrated sulphuric acid; or by causing a current of very dry air, at the common temperature of the atmosphere, to pass over them. It has been shown that 10 grs. of extract, thus prepared, were more than equal to 20 grs. prepared *in vacuo*; and to more than 60 grs., and, in some cases, 90 grs., of those prepared by the common process of boiling down the juice to an extract.

The concluding portion of the process of extract-making, technically termed 'finishing-off,' requires the most scrupulous attention. As the evaporation advances, the heat should be lessened, and as soon as the extract acquires the consistence of thick treacle it should be removed altogether, and the remainder of fluid matter evaporated by the heat retained by the copper pan, the escape of vapour being promoted by assiduous and laborious stirring with a suitably shaped wooden spatula. This part of the process should be continued until a proper consistence is attained and the extract is nearly cold. When high-pressure steam or a chloride of calcium bath is employed, care must be taken to withdraw the heat before stirring the semi-liquid mass; as, if an extract having a temperature of about the boiling-point of water, or even a few degrees below it, is agitated, it becomes full of bubbles, and appears rough and puffy, and this appearance cannot be removed by subsequent stirring, or by any method but redissolving it in water and re-evaporation. This is especially the case with the extracts of sarsaparilla (simple and compound), gentian, liquorice, and most others of a similar class. A good laboratory man knows from experience the proper time for the removal of the heat, but unpractised persons often fail in this particular. In such cases, should the heat retained by the evaporating pan, and by the extract, prove insufficient to complete the process, a little more may be cautiously applied. Without assiduous and laborious stirring in the way described, a very smooth and glossy extract cannot be produced. To promote this artificial appearance, some persons add $3\frac{1}{2}\%$ or 4% each of

olive oil and gum arabic, dissolved in water, with about $1\frac{1}{2}\%$ or 2% of spirit of wine.

The consistence of the ordinary extracts of the shops is the same as that of electuaries and confections, and is described in the Ph. E. as equal to that "of thick honey." The instructions of the Ph. L. and D., to evaporate the mass "until it acquires a consistence proper for making pills," except in 2 or 3 cases (as *Ext. Colocynth. Comp.*, &c.), is not adopted, and, indeed, would be found inconvenient in practice. Extracts evaporated to such a consistence are commonly termed 'pilular extracts;' and when evaporated so that they are quite dry, and brittle when cold, they are called 'hard extracts' (*EXTRACTA DURA*, L.).

Pres. Extracts should be put into pots as soon as taken from the pan, and, after being carefully and securely tied over with bladder, should be 'stored' in a dry situation. The London College orders "a small quantity of rectified spirit to be sprinkled upon all the softer extracts, to prevent them becoming mouldy." A better way is to employ a little spirit, noising in solution a few drops of oil of cloves, or a still less quantity of creasote. This should be added to them the last thing before removing them from the evaporating pan, and when they are nearly cold. The same object is effected by moistening the inside of the bladder (used to tie them over) with a few drops of oil of cloves or creasote. Hard extracts should be kept in bladders or gut skins, placed in stone pots, and well covered over. With care, extracts prepared from recent vegetable substances may be preserved twelve months, or from season to season; and those from dry ingredients, or such as are less inclined to spoil, for perhaps double that time; but beyond these periods their virtues cannot be relied on, and they should consequently be discarded, if remaining unused or unsold.

Pur., &c. The quality of an extract cannot be ascertained by mere inspection, nor is it readily discovered by chemical tests. A knowledge of these facts has induced the mercenary and fraudulent manufacturer to employ damaged and inferior drugs in their preparation, alike regardless of the welfare of the patient and the credit of the practitioner. A common practice with some manufacturers is, not only to pick out the least expensive variety of every drug for the preparation of their extracts, but the most inferior and often damaged and worthless portion of this already inferior article. The production of a smooth, bright, and glossy extract is all that is usually attempted by these individuals, and all that is sought after by the mass of purchasers, who mistake the simulation of the mere external signs of good quality for its actual existence. It is a fact, which we can verify from extensive experience in the laboratory, and from years of practical observation on this point, that extracts faithfully prepared from good materials do not possess the slightly and ple-

appearance or those commonly vended by the wholesale druggists. On comparing the extracts prepared by different metropolitan houses, we have found that those which have exhibited a remarkably bright and glossy appearance have been uniformly inferior, and sometimes nearly inert; whilst others, with a less prepossessing appearance, have been generally of good quality. These facts are well established by reference to the extracts of those houses and institutions that are remarkable for the superior quality of their preparations, and by comparing them with the common extracts of the shops supplied by the wholesale trade.

A good extract should be—1. Free from grit, and wholly soluble in 20 parts of the menstruum employed in its preparation, forming a nearly clear solution.—2. It should have a uniform texture and colour, and be of a proper consistence.—3. If a narcotic or active extract, it may be exhibited in proper doses, and its effects watched. Its activity may also be tested on any small animal.—4. An assay for the proximate vegetable principle (alkaloid, &c.) contained in the plant from which it has been prepared may be made. The extracts prepared from the expressed juices of plants, without straining off the coagulated albumen, are, of course, exceptions to the first test. Unfortunately, these tests are not always easily performed, and the last two are inapplicable to those extracts that exercise no very marked physiological action, unless when taken in repeated doses, long continued. This want of a ready means of accurately testing the qualities of extracts has enabled the fraudulent manufacturer to sell inferior articles with impunity, and often without the least fear or danger of detection.

In general, an extract more than six months old contains only half the activity of a similar one newly made. When more than twelve months old they should be rejected as worthless, and the stock renewed.

Uses, &c. The extracts of the shops are generally acknowledged to be the most varying, imperfect, and uncertain class of medicines belonging to modern pharmacy. They are mostly used in the same cases as the plants from which they are prepared, but in smaller doses.

Concluding remarks. In the preparation of extracts the great desiderata to be aimed at are—to suit the menstrua and the methods of manipulating to the peculiar characteristics of the active constituents of the vegetable substances operated on. The pharmacist should always bear in mind that a perfect extract should be a concentrated, solid mass, representing, as near as possible, in medicinal efficacy, the materials from which it has been prepared, and capable of being redissolved, so as to form a solution closely resembling that from which it has been derived. An extract possesses an equal strength to the whole mass of the

ingredients from which it has been prepared is almost next to an impossibility, however desirable such a degree of perfection may be. The medicinal properties of all solutions of vegetable matter are injured by being reduced to the solid state; and this deterioration, more or less, takes place, whether the solvent be water, acetic acid, proof spirit, or alcohol. The volatile portions (the essential oils, the aroma, &c.) are nearly or wholly dissipated; and though these do not always form the principal or active ingredients of the vegetables from which extracts are prepared, yet they generally exercise a modifying and controlling influence over the other ingredients, which considerably alters their therapeutical action. The loss of aroma may often be a trifling deficiency, but in the extracts of aconite, henbane, hemlock, belladonna, and other narcotic plants, this is not the case. In these cases it is well known that the inert preparations are wholly deficient of the odour of the recent plant, and that in proportion as the odour is developed, so is their activity preserved. The powerful smell of the recently expressed juice of hemlock, with the scarcely perceptible odour of the extract (EXTRACTUM CONII, Ph. L.), offers an excellent example of this fact. The dose of the one often reaches 20 or 30 gr., whilst that of the other seldom exceeds 5 or 10 drops, or a portion equivalent in dry ingredients to considerably less than $\frac{1}{2}$ gr.

When extracts are ordered in prescriptions, those of the 'Pharmacopœia' should be alone employed by the dispenser, as the substitution of others for them would not only be violating faith with the prescriber, but might also produce consequences alike injurious to the dispenser and the patient. Many medical gentlemen prefer extracts prepared by particular processes or persons, but such intention is always indicated in their prescriptions.

Extract of Aconite. *Syn.* EXTRACT OF WOLFEBANE, E. OF MONKSHOOD, INSPISSATED JUICE OF ACONITE; EXTRACTUM ACONITI (B. P., Ph. L. E. & U. S.), STICTUS SPISSATUS ACONITI (Ph. D. 1826), *L. Prep.* 1. (B. P.) Take 112 lbs. of the fresh leaves and flowering tops, bruise them, press out the juice, heat it gradually to 130° F., and separate the green matter by a calico filter. Heat the strained liquor to 200° F. to coagulate albumen, and again filter. Evaporate the filtrate by a water bath to the consistence of a thin syrup; then add to it the green colouring matter previously separated, and stirring the whole together assiduously, evaporate at a temperature not exceeding 140° F. to a pill consistence.—*Dose.* 1 to 2 grs.

2. (Ph. L.) Take of fresh leaves of aconite, 1 lb.; bruise them in a stone mortar, express the juice, and evaporate it, unstrained, to a proper consistence. The formulæ of the Ph. D. & U. S. are similar.

3. (Ph. E.) Beat the fresh leaves of aconite to a pulp, and express the juice, then subject

the residuum to percolation with rectified spirit until the latter passes through without being materially coloured; unite the expressed juice and the percolated tincture, filter, distil off the spirit, and evaporate in a vapour or a water bath to a proper consistence. Stronger than the preceding.

Obs. A variable and uncertain preparation. Numbness and tingling follow its application to the limbs or tongue when it is of good quality.—*Product.* 1 cwt. of fresh leaves yield between 5 lbs. and 6 lbs. of extract.—*Prop.* Anodyne, sudorific, and narcotic; very poisonous.—*Dose.* $\frac{1}{2}$ gr. to 2 grs., made into a pill with liquorice powder; once or twice a day, in neuralgic pains, chronic rheumatism, glandular swellings, &c., gradually and cautiously increased to 5 or 6 grs.

4. (Alcoholic; E. A. ALCOHOLICUM, L.)—a. (P. Cod.) Aconite (in coarse powder), 1 lb.; proof spirit, $3\frac{1}{2}$ lbs. (say $2\frac{1}{2}$ pints); proceed by the method of displacement, and when all the spirit has penetrated the powdered mass, keep this covered with distilled water, until the liquid begins to cause a precipitate in falling into that which has previously passed through; next distil the spirit from the tincture, and evaporate the residuum to the proper consistence.

b. (Ph. U. S.) Aconite 1 lb.; spirit sp. gr. .935 (=13 u. p.), 1 quart, or q. s.; as last.

c. (Ph. Baden.) From the tincture prepared with rectified spirit, and by either maceration or displacement. Stronger than the last two.

d. (Ph. Bor.) The juice is expressed from the fresh herb, which is then sprinkled with about $\frac{1}{3}$ of its weight of water, and again pressed; the mixed and strained liquid is evaporated in a vapour bath at 122° to 140° Fahr., to about one half; to this, as soon as cold, an equal weight of spirit (sp. gr. .900) is added, and after frequent agitation for 24 hours, the whole is filtered, with pressure; the marc is treated with fresh spirit (equal to about 1-4th that first used) and again pressed; the mixed liquors are next filtered, and are, lastly, evaporated, as before, to the proper consistence.

Obs. Resembles the simple extract, but is much more powerful. It has been exhibited internally in the form of pills, and used externally, combined with ointment or spread on simple plaster.—*Dose.* $\frac{1}{12}$ to $\frac{1}{4}$ gr. every three hours.

5. (Ammoniated; E. A. AMMONIATUM, L.—Dr. Turnbull.) Extract of aconite, 1 dr.; liquor of ammonia (strongest), 10 or 12 drops; mix.

6. (Dried; E. A. SICCUM, L.—P. Cod.) The expressed juice, strained through a sieve or coarse linen, is at once, without depuration, exposed in earthen dishes, in layers of about 2 lines deep, in a stove or current of dry air, to a temperature ranging between 95° and 104°

Fahr., until reduced to dryness. The dried extract is to be packed in bottles.

7. (Saccharated; E. A. SACCHARATUM, L.) From extract of aconite (Ph. Bor.), 4 oz.; sugar of milk (in powder), 1 oz.; mix, and dry the mass in a warm place, adding sugar of milk, q. s. to make the whole equal in weight that of the extract used (4 oz.). An excellent preparation, which keeps well. The other NARCOTIC EXTRACTS, as those of BELLADONNA, HEMLOCK, HENBANE, &c., are to be treated in a similar manner. See ACONITE, and *below*.

Extract of Aconite Root. *Syn.* EXTRACTUM ACONITI RADICIS ALCOHOLICUM, L. *Prep.* (Dr. Fleming; Dr. Turnbull.) From a tincture of the root made with rectified spirit. It is said to be 12 times as strong as the extract of the leaves.

Extract of Ag'aric. *Syn.* EXTRACTUM AGARICI, L. *Prep.* (P. Cod.) From the infusion of white agaric (*Polyporus officinalis*) prepared with cold water. Purgative.—*Dose.* 1 to 4 grs.

Extract of Alcorn'co. *Syn.* EXTRACTUM ALCORNOCE, L. *Prep.* From a decoction of alcornoco bark (South American). Astringent and tonic.—*Dose.* 5 to 20 grs.; in phthisis &c.

Extract of Aloes. *Syn.* PURIFIED ALOES WASHED A.; EXTRACTUM ALOES BARBADENSIS (B. P.), EXTRACTUM ALOES (Ph. L.), E. A. AQUOSUM (Ph. D.), L. *Prep.* 1. (B. P.) Barbadoes aloes, in small pieces, 1 lb.; treated with 1 gal. of boiling water for 12 hours, and the clear liquid evaporated.—*Dose.* 1 to 3 grs. B. P. 2 to 6 grs.

2. (B. P.) Socotrine aloes, 1 lb., treated with 1 gal. of boiling water for 12 hours, and the clear liquid evaporated to dryness.

3. (Ph. D.) Aloes (hepatic), 4 oz.; water, 1 quart; boil till dissolved; when cold, decant the clear liquid, and evaporate as before.

4. (Ph. Bor. 1847.) By macerating powdered aloes in cold water for 48 hours, with frequent agitation, and then evaporating in a water bath at a temperature not exceeding 150° to 165° Fahr., until a pilular consistence is attained.

Obs. The second is the form commonly adopted in the laboratory. When made with the juice of borage, burgloss, &c., it forms the old 'ALOES INSUCCATA'.—*Dose.* 5 to 15 gr. See ALOES and EXTRACT OF BARBADOS ALOES.

Extract of Anem'one. See EXTRACT OF PASQUE FLOWER.

Extract of Angel'ica. *Syn.* EXTRACTUM ANGELICÆ, L. *Prep.* 1. (Ph. Baden.) From a tincture of the root, prepared with spirit sp. gr. .944 (=21 $\frac{1}{2}$ u. p.).

2. (Ph. Bor.) Angelica root and rectified spirit, of each, 2 parts; water, 9 parts; digest, strain, and evaporate. Inferior to the preceding.

3. (Dr. Moir.) Angelica root, 2 lbs.; rectified spirit, 1 gal.; make a tincture; treat

'marc' add proof spirit, 1 gal., and repeat the digestion; filter the two tinctures separately, mix, distil off the spirit, and evaporate. Balsamic, stomachic, and tonic.—*Dose.* 10 to 20 grs. The last is the most balsamic and agreeable.

Extract of Apples. *Syn.* CHALYBEATED E. OF A.; EXTRACTUM FERRI POMATUM, L. *Prep.* (Ph. Bor.) Crab-apples (unripe), 6 lbs.; peel them and reduce them to a pulp; add iron wire (in small coils), 1 lb.; digest in a vapour bath for about a week, express, strain, decant, and evaporate in a porcelain vessel, with constant stirring, to the consistence of a soft extract; dissolve the residuum in water, 4 parts, strain and evaporate as before.—*Dose.* 5 to 10 grs.; as a chalybeate tonic. The formula of the Ph. Baden is nearly similar.

Extract of Arnica. *Syn.* EXTRACT OF ARNICA FLOWERS; EXTRACTUM ARNICÆ FLO- RUM, L. *Prep.* 1. (P. Cod.) From the dried flowers, as ALCOHOLIC EXTRACT OF ACONITE—P. Cod.

2. (Ph. Græca, 1837.) From a tincture of the flowers, prepared with rectified spirit, 3 parts, and water, 5 parts.—*Dose.* 2 to 6 grs.; as a stimulant in various diseases accompanied with debility, deficient nervous sensibility, paralysis, dropsies, diarrhœa, amenorrhœa, dysentery, &c.

Extract of Arnica-Root. *Syn.* EXTRACT OF ARNICA; EXTRACTUM ARNICÆ RADICIS, L. *Prep.* 1. (Ph. Baden.) As EXTRACT OF ANGE- LICA—Ph. Baden.

2. (Ph. Græca.) From tincture of the root, prepared as No. 2 (*above*). The form of the Hamburg Codex is nearly similar.—*Dose*, &c. As the last.

Extract of Artichoke. *Syn.* EXTRACTUM JYNARE, L. *Prep.* From the fresh leaves of the artichoke, as EXTRACT OF ACONITE—Ph. L.—*Dose.* 3 to 6 grs., twice or thrice daily; in rheumatism, &c.

Extract of Asparagus. *Syn.* EXTRACTUM ASPARAGI, L. *Prep.* 1. (Soubeiran.) From the expressed juice of the shoots, clarified and evaporated by a gentle heat.

2. From the juice of the roots, as No. 1. Both are diuretic.—*Dose.* 15 grs. to $\frac{1}{2}$ dr., or more.

Extract of Bael. *Syn.* EXTRACTUM BELLE LIQUIDUM, L. B. P. Bael, 1; distilled water, 15; rectified spirit, $\frac{1}{2}$; macerate for 12 hours in 5 of the water, pour off the liquid, repeat the operation twice for 1 hour; press, filter, and evaporate to 1, including the spirit. A fluid ounce is equal to a solid ounce.—*Dose*, 1 to 2 drs.

Extract of Bark. See EXTRACT OF CIN- CHONA.

Extract of Belladonna. *Syn.* EXTRACT OF DEADLY NIGHTSHADE, INSPISSATED JUICE OF BELLADONNA; EXTRACTUM BELLADONNÆ (B. P., Ph. L. E. & D.), SUCCUS SPISSATUS BELLA- DONNÆ, L. *Prep.* 1. (B. P.) Take 112 lbs. of fresh leaves and tender branches, bruise in

a stone mortar or other suitable apparatus, and press out the juice, heat it gradually to 130° F., separate the green colouring matter by a calico filter, heat the strained liquor to 200° F. to coagulate the albumen, and again filter; evaporate the filtrate by a water bath to the consistence of a thin syrup, then add to it the green colouring matter previously separated, and, stirring the whole together assiduously, continue the evaporation at a temperature not exceeding 140°, until the extract is of a suit- able consistence for forming pills.—*Dose.* $\frac{1}{4}$ to $\frac{1}{2}$ gr., gradually increased to 1 or 2 grs.

2. (Ph. E.) Express the juice from the bruised fresh plant, sprinkle the 'marc' with water, and again apply pressure; mix the ex- pressed liquids, filter them, and evaporate the filtered liquor in a vapour bath to the consist- ence of an extract.

3. (Ph. D.) From the leaves, collected when the plant begins to flower. The expressed juice is allowed to stand for 24 hours, and the clear portion is decanted; the sediment is placed on a calico filter, washed with an equal bulk of cold water, and the filtrate mixed with the expressed juice. The mixed liquid is next heated in a water bath, to coagulate its albu- men, and after being skimmed, and filtered through flannel whilst hot, the washed sedi- ment is added, and the whole evaporated, as before.

4. (Ph. U. S.) The expressed juice is heated to the boiling-point, filtered and evaporated (see *below*).

Obs. The P. Cod. directs this extract to be made by two different formulæ. The product of the one resembles that of the Ph. L.; that of the other, that of the Ph. E. That of the Ph. L., from retaining the fecula, is the weak- est preparation. *Dose.*— $\frac{1}{2}$ gr. to 1 gr., gradu- ally increased to 3 or 4 grs.; as an anodyne in neuralgia, tic-douloureux, &c.; as an antispas- modic to relieve rigidity and spasms, in various affections of the pterus, rectum, urethra, blad- der, &c., and in whooping-cough; in various maladies of the eyes; and as a resolvent and discutient in several glandular diseases. It has been highly recommended as a preserva- tive against scarlet fever. It is most frequently employed externally, under the form of a plas- ter, ointment, or lotion. It is poisonous.

5. (Alcoholic; E. B. ALCOHOLICUM, L.)—*a.* (P. Cod.) As ALCOHOLIC EXTRACT OF ACONITE—P. Cod.

b. (Ph. U. S.) As the last (nearly), using spirit of '95 (= about 13 u. p.).

c. (Moir.) The expressed juice is coagulated by heat, cautiously applied, and filtered; the filtrate is reduced to the consistence of a syrup, and mixed with an equal volume of nearly an- hydrous alcohol (say of 90%); the clear portion is lastly evaporated, as before.

Obs. The above is much more powerful than the common extract, and is chiefly used in ex- ternal applications. See BELLADONNA, and *below*.

2. (Mr. Houlton.) From the expressed juice by spontaneous evaporation. A better plan is to expose it to heated air. Antihysteria, emmenagogue, and vermifuge.—*Dose*. 5 to 20 grs.

Extract of Cincho'na. *Syn.* EXTRACT OF BARK. Three simple extracts, prepared respectively from YELLOW, PALE, and RED CINCHONA, are given in Ph. L.—*Prep.* 1. (From CALISAYA or YELLOW BARK:—EXTRACT OF CINCHONA, E. OF YELLOW C., E. OF HEART-LEAVED C.; EXTRACTUM CINCHONÆ, L.)—*a.* EXTRACTUM CINCHONÆ FLAVÆ LIQUIDUM (B. P.). Yellow cinchona bark in coarse powder, 16; distilled water, a sufficiency; rectified spirit, 1; macerate the bark in 40 of water for twenty-four hours, then pack in a percolator, and add water until 240 have passed through, or until the bark is exhausted; evaporate the liquor to 20, at a temperature not exceeding 160°; then filter, and continue the evaporation to 3, or until the sp. gr. of the liquid is 1.200; when cold, add the spirit gradually, constantly stirring. Sp. gr. 1.100.—*Dose*. 10 to 30 minims.

b. (Ph. L.) Yellow cinchona (coarsely bruised), 8 lbs.; distilled water (temperate), 4 pints; macerate for 24 hours (constantly stirring), and strain through linen; what remains, again macerate in water 1 quart, for 24 hours, and strain; evaporate the mixed liquids to a proper consistence.

Obs. The aqueous extracts of cinchona bark possess little medicinal virtue, owing to the insolubility of the alkaloids (quinine, cinchonine, &c.) in water, and also from the rapid oxidation of their extractive matter, when exposed in solution to the joint action of heat and atmospheric oxygen.—*Dose*. 5 grs. to $\frac{1}{2}$ dr., in mixtures, faintly acidulated with sulphuric acid. Cinchona bark yields from 24 $\frac{1}{2}$ to 30 $\frac{1}{2}$ of aqueous extract.

2. (From PALE BARK:—EXTRACT OF PALE CINCHONA, E. OF PALE BARK, E. OF LANCE-LEAVED B.; EXTRACTUM CINCHONÆ PALLIDÆ, L.)—*a.* (Ph. L.) From pale bark, as EXTRACT OF CINCHONA—Ph. L. (*above*).

b. (Ph. L. 1836.) From the decoction.

Obs. This forms the EXTRACT OF BARK of the shops. The red and yellow cinchona barks are scarcely ever used for making extracts. Their richness in quinine leads to their almost exclusive employment for the manufacture of that alkaloid, by which their value is greatly enhanced. As far as our knowledge extends, no other extract of bark than this is either employed or asked for.

3. (From RED BARK:—EXTRACT OF RED CINCHONA, E. OF RED BARK, E. OF OBLONG-LEAVED B.; EXTRACTUM CINCHONÆ RUBRÆ, L.)—*a.* (Ph. L.) From red bark, as EXTRACT OF CINCHONA—Ph. L. (*above*).

b. (Ph. L. 1836.) From the decoction.

Obs. These extracts are ordered to be kept in two states, the one (SOFT EXTRACT OF CINCHONA; EXTRACTUM CINCHONÆ MOLLE) for making pills, &c.; the other (HARD EXTRACT

OF CINCHONA; EXTRACTUM CINCHONÆ DURUM) for powdering.—The *dose*, &c., of all the above are the same.

4. (Dry:—ESSENTIAL SALT OF BARK; EXTRACTUM CINCHONÆ SICCUM, L.)—*a.* (P. Cod.) From an aqueous infusion of pale bark (prepared by displacement with water at a temperature not above 77° Fahr.), evaporated to the consistence of a thick syrup, and then spread thinly and uniformly on earthenware dishes, or sheets of glass, and dried in a stove, by a very gentle heat. It is separated from the plates with a knife, and preserved in well-closed phials. Prior to spreading it out on the plates, about 4 $\frac{1}{2}$ or 5 $\frac{1}{2}$ of thick mucilage is commonly added.

b. (Ph. Bor.) As the above (nearly).

c. (Ph. Hann. 1831.) Similar to the above; but the liquid, when it acquires the consistence of treacle, is diluted with water, and again evaporated to a like consistence; and this dilution and evaporation is repeated until, on the addition of water, it forms a clear solution.—*Dose*. 5 to 25 grs. The product of the last formula is nearly inert, and that of the others possesses little activity.

5. (Fluid:—EXTRACTUM CINCHONÆ FLUIDUM, L.)—*a.* See LIQUOR OF CINCHONA.

b. (Dr. Neligan.) From yellow bark, as FLUID EXTRACT OF BUCHU.

6. (Resinous:—ALCOHOLIC EXTRACT OF BARK; EXTRACTUM CINCHONÆ ALCOHOLICUM, E. CINCHONÆ, L.)—*a.* (Ph. E.) From any variety of cinchona bark (in powder), 4 oz.; proof spirit, 24 fl. oz.; prepare a tincture by displacement, distil off most of the spirit, and evaporate the residuum to the consistence of an extract. This is the only EXTRACTUM CINCHONÆ of the Edinburgh College.

b. (Ph. U. S.) Peruvian bark, 1 lb.; rectified spirit, 4 pints; make 4 pints of tincture by displacement; add water to the mass in the percolator, digest, and obtain 6 pints of infusion; distil off the spirit from the tincture, and evaporate the infusion to the consistence of syrup, then mix the two, and complete the evaporation. More active than the aqueous extract.—*Dose*. 5 to 20 grs.

c. (Ellis.) Yellow bark, 2 lbs.; hydrochloric acid, 4 fl. drs.; water, 1 gal.; boil, strain, and repeat the decoction with fresh water and acid; mix the decoctions, filter, and agitate it with fresh-slaked lime, 2 $\frac{1}{2}$ oz.; filter or decant; dry the residuum, and exhaust it with hot alcohol, q. s.; lastly, evaporate the alcoholic tincture to a pilular consistence.—*Dose*. 1 to 5 grs. Some persons have proposed to call this 'ESSENTIAL SALT OF BARK.'

7. (Vinous:—EXTRACTUM CINCHONÆ VINOSUM, L.—Ph. Hesse.) Peruvian bark (in powder), 1 part; white wine (sherry), 8 parts; digest 3 days, express, filter, and evaporate.

Extract of Cocculus. *Syn.* EXTRACT OF COCCULUS INDICUS, BLACK EXTRACT, EXTRACT (Brewer's), BEEF STRENGTHENER, HARD MUL-

TUM; *EXTRACTUM COCCULI*, E. C. INDICI, L. *Prep.* From *cocculus indicus*, by decoction. It is kept in two states—one having the consistence of thick treacle; the other, that of a pilular extract. The first is 'put up' in bladders; the last is made into $\frac{1}{2}$ -lb. rolls, like lead plaster or roll-chocolate. It is narcotic and poisonous, and is employed by fraudulent brewers and publicans to give a false strength to their liquors. See *COCCULUS INDICUS*, BEER, &c.

Extract of Col'chicum. *Syn.* *EXTRACT OF MEADOW SAFFRON*, E. OF THE CORMS OF COLCHICUM; *EXTRACTUM COLCHICI* (B. P.). *Prep.* 1. (B. P.) The expressed juice of fresh colchicum corms, cleared of deposit, boiled, strained, and evaporated to a proper consistency at a temperature of 160° Fahr.—*Dose.* 1 to 2 grs.

2. (Wholesale.) From the decoction of the dried corms. *Prod.* 50% to 55%.

Obs. This extract is given in the usual cases in which colchicum is employed.—*Dose.* 1 to 4 grs., every third or fourth hour. (Thomson.) "A favorite remedy of Dr. Hue, of St. Bartholomew's Hospital, in the early stages of acute rheumatism. The dose is 1 gr. every four hours." (Pereira.)

3. (Acetic; *ACETIC EXTRACT OF MEADOW SAFFRON*; *EXTRACTUM COLCHICI ACETICUM* (B. P).—*a.* (B. P.) Crushed fresh corms, previously peeled, 19; acetic acid, 1; stir together, press, boil, and strain through flannel, and evaporate to a soft extract.—*Dose.* 1 to 2 grs. with an equal weight of liquorice powder.

b. (Wholesale.) Dried corms, 14 lbs.; acetic acid (pyroligneous), 6 pints; distilled water, 5½ galls.; digest for 14 days, express, filter, and evaporate. Product, 2½ to 3 lbs.

Obs. The above extracts are generally prepared from the dried corms, and hence the very uncertain and inferior quality of those commonly met with. They also possess less activity than the pharmacopoeial preparations. They rapidly get dry and crumbly, and, unless a little spirit and oil of cloves are added, will scarcely keep a week in warm weather without becoming mouldy.—*Dose.* 1 to 3 grs., two or three times a day. It is much stronger than the common extract, and contains the acetate of colchicine. Sir C. Scudamore prefers the acetic extract prepared by the formula *b* (above).

4. (Alcoholic; *EXTRACTUM COLCHICI ALCOHOLICUM*, L.—P. Cod.). As *EXTRACT OF BOX*. More active than even the acetic extract. All the preparations of colchicum are poisonous in large doses.

Extract of Colocynth. *Syn.* *EXTRACT OF BITTER APPLE*; *EXTRACTUM COLOCYNTHIDIS* (Ph. L. & E.), E. C. SIMPLEX, E. C. MOLLE, L. *Prep.* 1. (Ph. L.) From colocynth pulp (out in pieces and the seeds removed), by simple maceration in cold water, for 36 hours, frequently pressing it with the hands, and afterwards strongly pressing out the liquor, which must be strained before evaporating it.

2. (Ph. E.) From the decoction. This is the plan adopted at Apothecaries' Hall, and in the laboratory generally. Many houses do not even remove the seeds.

Obs. This extract rapidly gets hard, crumbly, and mouldy, by keeping. For the remedy, see observations on *EXTRACT OF COLCHICUM*, above.—*Dose.* 5 grs. to 20 grs.; as a cathartic. Colocynth pulp yields about 65% of extract.

3. (Alcoholic; *EXTRACTUM COLOCYNTHIDIS ALCOHOLICUM*, L.)—*a.* (Ph. Baden.) As *EXTRACT OF ANGELICA*—Ph. Bad.

b. (P. Cod.) From a tincture prepared with proof spirit. Much more active than the simple extract.—*Dose.* 2 to 7 grs.

4. (Dry; *EXTRACTUM COLOCYNTHIDIS SICCUM*, L.—Ph. Bor.) As the last, but using spirit of the sp. gr. .900 (about 16 o. p.), digesting at a tepid heat, evaporating to dryness, and powdering.—*Dose.* 1 to 6 grs.

Extract of Colocynth (Compound). *Syn.* *COMPOUND EXTRACT OF BITTER APPLE*, *CATHARTIC EXTRACT*; *EXTRACTUM CATHARTICUM*, E. *COLOCYNTHIDIS COMPOSITUM*, B. P. *Prep.* 1. (B. P.) Colocynth free from seeds, 6; extract of Socotrine aloes, 12; scammony, or resin of scammony in powder, 4; hard soap in powder, 3; cardamoms freed from capsules in fine powder, 1; proof spirit, 160. Macerate the colocynth in the spirit for four days, press out the tincture, distil off the spirit, and add to it the extract of aloes, the soap, and the scammony; then evaporate the residue by a water bath to a pilular consistence, adding the cardamoms towards the end of the process.—*Dose.* 2 to 5 grs., with 2 or 3 grs. of extract of hyoscyamus to prevent griping.

2. (Ph. L. 1836.) Colocynth pulp (sliced, without the seeds), 6 oz., proof spirit, 1 gal.; digest with a gentle heat for 4 days, express, strain, and add, of extract of aloes (Ph. L. 1836), 12 oz., powdered scammony, 4 oz., Castile soap (cut small), 3 oz., and evaporate (distil) to a proper consistence; adding, towards the last, powdered cardamoms, 1 oz.

3. (Wholesale.) The formulæ adopted by the wholesale druggists are mere modifications of that of the Ph. L. 1809; water being used instead of spirit as the menstruum, with actual benefit, as we honestly believe, to the quality of the preparation. The following are extensively employed by those who do most in this article, and we can speak highly of the quality of the products obtained by their use.

a. Turkey colocynth, 18 lbs., is boiled in about 20 times its weight of water for five or six hours; to the strained decoction is added hepatic aloes, 40 lbs., which are boiled until dissolved, when the solution is decanted. In the mean time the colocynth is exhausted with a second quantity of water (less than the first), and the strained liquor is added to the undissolved residuum of the aloes, and boiled for a few minutes; after which it is drawn off and mixed with the first decoction of aloes; the

mixed liquors are then allowed to stand until quite cold (commonly until the next day), to deposit the resinous portion. The liquor is next decanted or drawn off, and set evaporating as quickly as possible; as soon as the consistence of treacle is arrived at, the whole is allowed to cool considerably, and moist sugar (clean), 4 lbs., and Castile soap, 10 lbs. (previously melted with a little water), are added; powdered scammony, 6 lbs., is next gradually sifted in, the extract all the time being assiduously stirred by a second person. Lastly, the heat is further moderated, and the stirring continued until a rather harder consistence is acquired than is proper for the extract, when the steam is wholly 'shut off,' or the vessel removed from the heat, and as soon as the whole has become sufficiently cool to prevent any considerable evaporation of the spirit, essence of cardamoms, 2 lbs. (say, 1 quart), is expertly stirred in; and the extract at once (whilst still warm) put into stone jars or pots, and tied or covered over, for store or use. The product is usually labelled 'EXT. COLOCYNTH. COMP. OPT.' It looks well, and smells very aromatic, and is really an excellent preparation.

6. Turkey colocynth, 2½ lbs.; hepatic aloes, 5½ lbs.; powdered scammony, 1½ lb.; powdered cardamoms, 6 oz. (or essence, ½ pint); Castile soap (genuine), 1 lb. 2 oz.; pale moist sugar, ½ lb.; proceed as last. This produces a beautiful article, and of unquestionable quality, equally effective, and milder in its action than the College preparation. It is labelled and sent out as EXT. COLOCYNTH. COMP. PH. L. (1836).

4. (Ph. L. 1809.) Colocynth, 6 drs. (6 parts); aloes, 1½ oz. (12 parts); scammony, ½ oz. (4 parts); hard soap, 3 drs. (3 parts); cardamoms, 1 dr. (1 part); as No. 3, *a* (nearly).

Qual., &c. Compound extract of colocynth is often adulterated with acrid cathartics to make up for the deficiency or inferiority of its proper ingredients, and foreign matter often becomes mixed with it by the use of impure scammony. The presence of cape aloes may usually be detected by the nauseous odour; chalk (an article frequently present in bad scammony), by placing a little ball of the extract in a glass tube, and pouring over it some dilute hydrochloric or acetic acid, when an effervescence will ensue, if that substance be present; jalap, scammony adulterated with fecula, and other starchy substances, by the filtered decoction of the extract turning blue on the addition of tincture of iodine; gamboge, by the decoction becoming deep red on the addition of liquor of potassa, and by a filtered alcoholic solution of the extract forming a yellow emulsion with water, which becomes transparent and assumes a deep-red colour on the addition of caustic potassa; and further, by this solution (if the alkali is not in excess) giving a yellow precipitate with acids and with acetate of lead, a brown precipitate with sulphate of copper, and

a very dark brown one with the salts of iron; also by the ethereal solution of the extract dropped on water yielding an opaque yellow film, soluble in caustic potassa, if it contains gamboge.

Dose. 3 grs. to 15 grs. It is a safe and mild, yet certain, purgative. It may be mixed with calomel without the latter being decomposed. 2½ or 3 grs., mixed with an equal weight of blue pill and taken overnight, forms an excellent aperient in dyspepsia, liver complaints, &c. See ABERNETHY MEDICINES.

Obs. There are few formulæ which have undergone so many alterations in the hands of the College as that for compound extract of colocynth. Before 1809, proof spirit was ordered to be employed as the menstruum, and, omitting the soap, the preparation resembled that of the Ph. L. 1836. In 1809, the College directed water to be used instead of spirit, and added a certain quantity of soap. In the next edition of the Pharmacopœia (1815), the soap was again omitted; but in the edition of 1824, the formula of 1809 was again adopted, substituting, however, proof spirit for the water. These directions were also continued in the edition of 1836. In the last London Pharmacopœia (1851) the formula for this extract is omitted altogether, and in its place a pill (PILULA COLOCYNTHIDIS COMPOSITA) is inserted.

The compound extract of colocynth and the simple and compound extracts of sarsaparilla are in greater demand in the wholesale trade, and are sold in larger quantities at a time, than all the other medicinal extracts put together. As a proof, if it were necessary, that honesty is the best policy, it may be mentioned, that a certain metropolitan druggist, remarkable for the superiority of this preparation, has obtained no inconsiderable fortune by its sale alone; while the host of miserable vendors of the evaporated decoction of musty colocynth seed, Cape aloes, worthless scammony, and scentless cardamoms, sold under the name, attempt to ruin each other, by offering their rubbish at a price that precludes the possibility of a large profit, or even of the establishment of a respectable connection.

Extract of Conia. See EXTRACT OF HEMLOCK.

Extract of Contrayer'va. *Syn.* EXTRACTUM CONTRAYERVÆ, L. *Prep.* (Palat. Cod.) From contrayer'va root, as EXTRACT OF GINCHONA—Ph. L.—*Dose.* 10 grs. to ½ dr.; as a diaphoretic tonic, in low conditions of the system.

Extract of Copai'ba. *Syn.* RESINOSUM EXTRACTUM COPAIBA; EXTRACTUM COPAIBÆ, E. C. RESINOSUM, L. *Prep.* (Mr. Thorn.) From balsam of copai'ba, by distilling off the oil, until the residuum assumes the consistence of an extract.—*Dose.* 10 to 20 grs., or more. One of the many useless preparations which encumber modern pharmacy. It may be taken in 3-dr. doses without any perceptible effect beyond a fit of indigestion.

Extract of Copal'che. *Syn.* EXTRACTUM COPALCHI, E. CORTICIS C, L. *Prep.* From copalchi bark (*Croton pseudo-China*), as EXTRACT OF CASCARILLA, which it for the most part resembles.—*Dose.* 1 to 3 grs.

Extract of Couch Grass. *Syn.* EXTRACT OF DOG'S GRASS; EXTRACTUM GRAMINIS, L. *Prep.* 1. (P. Cod.) From the root of couch grass, or dog's grass (*Triticum repens*), as EXTRACT OF BISTORT—P. Cod.

2. From the fresh root, as EXTRACT OF ACONITE—Ph. L.

3. (Fluid; MELLAGO GRAMINIS, EXTRACTUM GRAMINIS FLUIDUM, L.—Ph. Hann. 1831.) From the decoction of the fresh root of couch grass, evaporated to the consistence of new honey. Pectoral.—*Dose.* 15 grs. to $\frac{1}{2}$ dr., or more.

Extract of Cu'bebs. *Syn.* EXTRACTUM CUBEBE, L. *Prep.* 1. From the alcoholic tincture evaporated by a very gentle heat.—*Dose.* 5 grs. to 30 grs.

2. (Mr. Toller.) To the last add a little powdered Castile soap, when it begins to thicken, and evaporate to a pulular consistence.—*Dose.* 10 grs. to 30 grs.

3. (Fluid; LIQUOR CUBEBE, EXTRACTUM C. FLUIDUM, L.)—*a.* Cubebs (ground in a coffee-mill), $1\frac{1}{2}$ lb.; rectified spirit, 1 quart; prepare a tincture, either by displacement or by digestion for a week, and reduce it, by distillation at a very gentle heat, until the whole measures exactly 1 pint. Every fl. oz. represents 2 oz. of cubebs.—*Dose.* 20 to 40 drops.

b. (M. Puche.) From cubebs and proof spirit, equal parts, by percolation; without subsequent evaporation. Represents its own weight in cubebs.—*Dose.* $\frac{1}{2}$ to 1 fl. dr.

c. (Ph. U.S. 1851.) Cubebs, 1 lb. (nearly); ether, q. s.; make 1 quart of tincture; then distill off $1\frac{1}{2}$ pint of the ether by the heat of a water bath, and expose the residuum in a shallow vessel until the remainder of the ether has evaporated.

4. (Oleo-resinous; EXTRACTUM CUBEBE, E. CUBEBARUM, E. C. OLEO-RESINOSUM, L.)—*a.* (M. Dublanc.) The essential oil resulting from the careful distillation of any given quantity of cubebs, is mixed with the resinous extract obtained by evaporating a tincture of the dried residuum made with rectified spirit; the whole being reduced to the consistence of a thick syrup. 1 lb. of cubebs yields about 6 oz. of this extract.

b. (Labelonge.) Cubebs are first exhausted with ether, and then with proof spirit, in a displacement apparatus; the alcoholic tincture is evaporated to an extract over a water bath, and when cold, the ethereal tincture is mixed with it, and the mixture abandoned to spontaneous evaporation until the ether is volatilised.

c. (W. Procter.) An ethereal tincture (by displacement) is poured into a large retort, and 5-6ths is drawn over by the heat of a water bath; the evaporation of the residuum,

to the proper consistence, is carried on at a heat not exceeding 120° Fahr. The formula of the Ph. Baden. is nearly similar. Said to represent 6 to 8 times its weight in cubebs. 1 lb. yields 2 oz. of this extract.

d. (Hamb. Cod. 1845.) This resembles *a* (*above*).

Obs. This extract has a darkish brown colour, and tastes and smells strongly of cubebs. It is only slightly soluble in water.—*Dose.* 5 grs. to 20 grs.; made into an emulsion or pills, or enclosed in a capsule. See CUBEBS.

Extract of Cu'cumber. See ELATERIUM.

Extract of Cuspa'ria. EXTRACT OF ANGOSTURA BARK; EXTRACTUM CUSPARIE, E. CORTICIS C, E. ANGOSTURE, L. *Prep.* 1. From angostura bark, as EXTRACT OF CINCHONA—Ph. L.

2. (Alcoholic.) As EXTRACT OF CINCHONA—Ph. E. Stronger than the last. Both are aromatic, bitter, tonic, and stimulant.—*Dose.* 10 grs. to $\frac{1}{2}$ dr.; in dyspepsia, chronic diarrhoea, dysentery, &c.

Extract of Daff'odil. *Syn.* EXTRACTUM NARCISSI, L. *Prep.* 1. From the fresh flowers of daffodil or yellow narcissus (*Narcissus pseudonarcissus*), as EXTRACT OF ACONITE—Ph. L.

2. (Alcoholic.) From the dried flowers, as EXTRACT OF BOX. Both are pectoral and expectorant; and in large doses nauseant and emetic.—*Dose.* $\frac{1}{2}$ gr. to 2 grs.; in hooping-cough, &c.

Extract of Dandel'ion. See EXTRACT OF TARAXACUM.

Extract of Digita'lis. See EXTRACT OF FOX-GLOVE.

Extract of Dog's Grass. See EXTRACT OF COUCH GRASS.

Extract of Dog'wood. *Syn.* EXTRACTUM CORNUS, R. CORNI, L. *Prep.* From American or tree dogwood (*Cornus Florida*), as EXTRACT OF CINCHONA BARK.

Obs. In its general effects, American dogwood approaches the cinchonas, and is said to be not inferior to them in the cure of intermittents. (Bigelow.) It contains a peculiar bitter principle, called cornine. Several other varieties of the genus *Cornus*, as round-leaved dogwood (*Cornus circinata*), swamp dogwood (*Cornus sericea*), &c., are used in America, but are less valuable.

Extract of Dulcama'ra. See EXTRACT OF BITTER SWEET.

Extract of Elate'rium. *Syn.* INFISSATED JUICE OF THE SQUIRTING CUCUMBER; SUCCUS SPISSATUS MOMORDICE ELATERII. For preparation and recent synonyms, see ELATERIUM.

Extract of El'der Berries. *Syn.* ELDER ROB; ROOB SAMBUOI, EXTRACTUM SAMBUOI, E. s. NIGRE, E. BAOCABUM s., SUCCUS SAMBUOI INFISSATUS, L. *Prep.* 1. (Ph. L. 1788.) The expressed and depurated juice of elder berries, evaporated to the consistence of honey.

2. (Ph. E. 1744.) To the above, when it begins to thicken, add 1-5th part of sugar.

3. (Ph. Bor.) As the last (nearly), but adding only 1 oz. of white sugar to each pound of the extract whilst still warm.—*Dose.* 1 to 4 drs.; in rheumatism, gout, and various skin affections.

Extract of El'ecampane. *Syn.* EXTRACTUM INULÆ, E. RADICUM I. CAMPANÆ, E. HELENTI, L. *Prep.* 1. (Ph. L. 1746.) From a decoction of the dried root.

2. (P. Cod.) As EXTRACT OF BISTORT—P. Cod.

3. (Ph. Suec. 1845.) From a tincture prepared with proof spirit and water, equal parts.—*Dose.* 10 grs. to $\frac{1}{2}$ dr.; as a diaphoretic, expectorant, and tonic; in asthma, hooping-cough, various skin diseases, &c.

Extract of Elm. *Syn.* EXTRACTUM ULMI, E. CORTICIS U., L. *Prep.* 1. From the decoction of the bark of the common elm (*Ulmus campestris*).

2. (Soubiran.) As EXTRACT OF BOX. Astringent and alterative.—*Dose.* 20 grs. to 1 dr.; in secondary syphilis, chronic skin affections, &c.

Extract of Er'got. *Syn.* AQUEOUS EXTRACT OF ERGOT, HÆMOSTATIC EXTRACT; EXTRACTUM ERGOTÆ, E. E. AQUOSUM, E. SECALIS CORNUTI, E. HÆMOSTATICUM, L. *Prep.* 1. (B. P.) *Extractum Ergotæ Liquidum.* Ergot in coarse powder, 16; ether, 20; distilled water, 70; rectified spirit, 8. Shake the ether in a bottle with half its bulk of the water, and, after separation, decant the ether. Place the ergot in a percolator, and free it from oil by passing the washed ether through it; remove the marc and digest it in the remainder of the water for twelve hours at 160° F. Press out the liquor, and evaporate it to 9, and when cold add the 8 of spirit; allow it to stand for an hour to coagulate, filter, and make up the quantity to 16.—*Dose.* 15 to 30 minims.

According to Squire, the amount of ether employed should be double the above, in two percolations, and the marc should be dried in the air before digesting with water. See ERGOTINE (Bonjeau's).

2. (Alcoholic; EXTRACTUM ERGOTÆ ALCOHOLICUM, L.) See ERGOTINE (Wigger's).

Extract of Fern. *Syn.* EXTRACTUM FILICIS LIQUIDUM—B. P. See EXTRACT OF MALE FERN.

Extract of Flesh. See EXTRACT OF MEAT, ESSENCE OF BEEF, TRA (Beef), &c.

Extract of Foxglove. *Syn.* EXTRACTUM DIGITALIS (Ph. E.), L. *Prep.* 1. (Ph. L. 1836.) From the leaves of *Digitalis purpurea*, as EXTRACT OF ACONITE—Ph. L.

2. (Ph. E.) From the filtered expressed juice, either evaporated *in vacuo*, with the aid of heat, or by exposure to a current of dry air.

3. (P. Cod.)—a. As EXTRACT OF BISTORT—P. Cod.

6. As EXTRACT OF BOX—P. Cod.

4. (Ph. Baden.) As ALCOHOLIC EXTRACT OF ACONITE—Ph. Rad.

Obs. The juice of foxglove is very readily injured by exposure to air and heat. The evaporation should therefore be conducted as rapidly as possible, but at a low temperature. It is narcotic, sedative, and is powerfully poisonous.—*Dose.* $\frac{1}{2}$ gr., cautiously increased to 2 or 3 grs. It is principally given in fevers, dropsy, diseases of the heart, pulmonary consumption, epilepsy, scrofula, and asthma. This extract spoils by long keeping. The last two are stronger than the rest, and keep better. It is omitted in the present Ph. L.

Extract of Fu'mitory. *Syn.* EXTRACTUM FUMARIÆ, L. *Prep.* 1. From either the infusion or decoction of the dried leaves of common fumitory (*Fumaria officinalis*).

2. (P. Cod.) From the clarified juice of the fresh herb. Slightly aperient, diaphoretic, and alterative. It has been given in obstructions of the liver and cutaneous affections of the leprous kind.

Extract of Galls. *Syn.* EXTRACTUM GALLÆ, E. GALLARUM, L. *Prep.* 1. From the infusion by maceration or displacement with cold water.

2. From the hot infusion or decoction. The first is to be preferred. Astringent. *Used* chiefly in ointments and injections for piles, foul ulcers, &c., and, internally, in hæmorrhages, spitting of blood, &c.

Extract of Gentian. *Syn.* EXTRACTUM GENTIANÆ (B. P.), L. *Prep.* 1. (Ph. L.) Gentian root (sliced), 3 lbs.; distilled water (temperate), 4 pints; macerate for 12 hours, and gently express the liquor; repeat the maceration with water, 1 quart, for 6 hours; and evaporate the mixed liquors.

2. (Ph. L. 1836.) From the ordinary infusion of the root made with 10 or 12 times its weight of boiling water, the maceration being continued for 24 hours.

3. (Ph. E.) From an infusion prepared by percolation with cold water. The formula of the Ph. Baden, Paris, and U. S. are similar.

4. (B. P.) Gentian 1 lb.; water (boiling), 10; macerate for 2 hours, boil 15 minutes, strain, and evaporate to a soft pilular consistence.—*Dose.* 10 to 15 grs.

5. (Ph. D. 1826.) From the decoction.

Obs. On the large scale, this extract is almost universally prepared by exhausting the root by coction with water, as in the last formula. When well prepared, it is one of the smoothest and brightest extracts of the Pharmacopœia. Good gentian root yields by infusion in hot water fully 50%, and by decoction about 60% of extract.—*Dose.* 10 grs. to 30 grs., two or three times daily, as a stomachic bitter and tonic; either alone or combined with rhubarb, ginger, or aloes. It is, however, more especially used as a vehicle for chalybeates and other metallic preparations. The principal consumption of extract of gentian is by the brewers, in lieu of hops.

6. (HARD E. OF G.; E. G. DURUM, L.) The

last dried by a gentle heat until brittle enough to powder.

Extract, Goulard's. See SOLUTION OF SUB-ACETATE OF LEAD.

Extract of Guaiacum. *Syn.* EXTRACTUM GUAIACI, L. *Prep.* 1. (Ph. L. 1746.) From lignum vitæ shavings or sawdust, exhausted by coction with water; as soon as the mass becomes thick, 1-8th of rectified spirit is to be added.

2. As the last, omitting the spirit. Diaphoretic, diuretic, and alterative; in dropsy, gout, rheumatism, skin diseases, &c.

Extract of Guarana. *Syn.* EXTRACTUM GUARANÆ, E. PAULLINIÆ, L. *Prep.* (Dr. Gavrelle.) From tincture of guarana (seeds of *Paullinia sorbilis*), prepared by coction with proof spirit. Tonic and alterative.—*Dose.* 2 to 5 grs., twice or thrice daily.

Extract, Hæmostatîc. See EXTRACT OF ERGOT.

Extract of Hedge Hyssop. *Syn.* EXTRACTUM GRATIOLÆ, L. *Prep.* 1. (Ph. Bor.) From the herb (*Gratiola officinalis*), as ALCOHOLIC EXTRACT OF ACONITE—Ph. Bor.

2. (Ph. Baden.) AS EXTRACT OF ACONITE—Ph. Baden.

3. (Vinous.) AS VINOUS EXTRACT OF CINCHONA. Purgative, diuretic, and vermifuge.—*Dose.* 2 to 5 grs., gradually increased, watching its effects; in dropsy, jaundice, gout, &c. It has been said to be the basis of the celebrated 'EAU MÉDICINALE D'HUSSON.'

Extract of Hellebore. The extracts prepared from three different plants may be included under this head:—

1. (EXTRACT OF BLACK HELLEBORE; EXTRACTUM HELLEBORI, E. H. NIGRI, L.)—*a.* (Ph. L. 1788.) From the infusion or decoction of black hellebore (*Helleborus officinalis*).—*Dose.* 5 to 12 grs.

b. (Alcoholic—P. Cod. & Ph. U. S.) AS EXTRACT OF BOX (nearly). That of the Ph. Bad. is similar.—*Dose.* 3 to 8 grs.

c. (Vino-alcoholic—Cottureau.) Powdered black hellebore, 2 lbs.; salt of tartar, $\frac{1}{2}$ lb.; dilute alcohol (sp. gr. .935), 7 pints; digest 12 hours, and express the tincture; add to the marc, white wine, 7 pints; digest for 24 hours, express, mix the tinctures, filter, and evaporate.—*Dose.* 2 to 6 grs.

Obs. When prepared by coction with water till exhausted of soluble matter, black hellebore root yields about 40% of extract. In small doses, it is alterative, purgative, and resolvent; in larger ones, it is a drastic, hydragogue cathartic, and emmenagogue, dangerous unless combined and its effects carefully watched.

2. (EXTRACT OF GREEN HELLEBORE, E. OF AMERICAN H., E. OF ITCH-WOOD; EXTRACTUM VERATRI VIRIDIS, L.) From the fresh root (rhizome) of the green hellebore (*Veratrum viride*), as EXTRACT OF ACONITE—Ph. L.—*Dose.* $\frac{1}{2}$ gr. to $\frac{1}{2}$ gr. Used in America in the same cases as white hellebore.

3. (EXTRACT OF WHITE HELLEBORE; EX-

TRACTUM VERATRI, E. HELLEBORI ALBI, L.) From the root (rhizome) of the white hellebore (*Veratrum album*), as EXTRACT OF BLACK HELLEBORE.—*Dose.* $\frac{1}{2}$ gr. to $\frac{1}{2}$ gr. Emetic, purgative, stimulant, and highly acrid. In gout, rheumatism, and nervous affections, mania, &c. See VERATRINE.

Extract of Hemlock. *Syn.* INSPISSATED JUICE OF HEMLOCK; EXTRACTUM CONII (B. P.), SUCOS SPISSATUS CONII, L. *Prep.* 1. (B. P.) The inspissated juice of the fresh plant, prepared as directed for EXTRACTUM BELLADONNÆ.—*Dose.* 4 to 6 grs.

2. (Ph. L.) From the fresh plant (*Conium maculatum*), as EXTRACT OF ACONITE—Ph. L.

3. (Ph. E.) AS EXTRACT OF FOXGLOVE—Ph. E.

4. (Ph. D.) AS EXTRACT OF BELLADONNA—Ph. D.

Obs. Of all the inspissated juices (not even excepting that of aconite), this is the one most readily injured by exposure to the air and heat, and which soonest loses its qualities by age. Its active principle is CONINE. Extract of hemlock has a greenish colour, and a strong odour of the fresh-bruised plant. It is "of good quality only when a very strong odour of conia (a 'mouse-odour') is disengaged by degrees, on its being carefully triturated with liquor of potassa." (Ph. E.) "The extracts of hemlock may become feeble, if not inert, in one of two ways,—either by the heat being continued after the concentration has been carried to a certain extent, or by long keeping. On the one hand, I have always observed that from the point at which the extract attains the consistence of thin syrup, ammonia begins to be given off in abundance, together with a modified odour of couine; and, on the other hand, I have found extracts, which were unquestionably well prepared at first, entirely destitute of couine in a few years." (Christison.) "The most active extract is that which is procured by moderate pressure from the leaves only." (Brande.) "The extract of the Ph. D., being freed from the inert albumen and chlorophyll, contains most of the active principle, and is nearly soluble in water." (Royle.) On the large scale, the whole of the green portion of the plant is pressed for juice. 1 cwt. of hemlock yields from 3 to 5 lbs. of extract.—*Dose.* 2 grs., gradually increased to 5 grs., or more, until some obvious effect is produced; as an anodyne, alterative, and resolvent in various obstinate disorders, as glandular and visceral enlargements, foul and painful ulcers, scrofula, cancer, neuralgia, rheumatism, troublesome coughs, &c.

5. (Alcoholic; EXTRACTUM CONII ALCOHOLICUM, L.)—*a.* (Ph. Baden.) AS ALCOHOLIC EXTRACT OF ACONITE—Ph. Baden.

b. (P. Cod.) As the last, but using proof spirit.—*Dose.* $\frac{1}{2}$ to 2 grs.

6. (Dried; EXTRACTUM CONII SICCUM, L.)—*a.* As the DRIED EXTRACT OF ACONITE—P. Cod.

b. (Archer.) By drying the extract of the Dublin College with a continuous current of warm air.

Extract of Hemp. *Syn.* EXTRACT OF AMERICAN HEMP; EXTRACTUM APOCYNI, E. A. CANABINI, L. *Prep.* From the root of the *Apo-cynum cannabinum*, as EXTRACT OF GENTIAN. A hydragogue cathartic.—*Dose.* 2 to 6 grs.; in dropsy, &c. The plant from which this extract is prepared is called 'INDIAN HEMP' in the United States of America, a practice which should be avoided, as this name is now almost exclusively appropriated to *Cannabis Indica*, a variety of the common hemp (*Cannabis sativa*, var. *Indica*) growing in India. See EXTRACT OF INDIAN HEMP.

Extract of Henbane. *Syn.* EXTRACT OF HYOSCYAMUS; EXTRACTUM HYOSCYAMI (B. P.), SUCCUS SPISSATUS HYOSCYAMI, L. *Prep.* 1. (Ph. L.) From the fresh leaves and leaf-stems of common henbane (*Hyoscyamus niger*), as EXTRACT OF ACONITE.—Ph. L.

2. (Ph. E.) As EXTRACT OF FOXGLOVE—Ph. E.

3. (B. P.) From the fresh leaves and young branches, as EXTRACT OF BELLADONNA.—*Dose.* 3 to 6 grs.

4. (Ph. U. S.) From the expressed juice coagulated by heat and strained.

Obs. In the Paris Codex extracts are ordered to be prepared from henbane both by the processes Nos. 1 and 4 above.—*Product* (by the ordinary method).—1 lb. of the fresh leaves yielded fully 8 drs. of extract (Geiger); 1 cwt. yielded 4 ½ lbs. (Brande); 1 cwt. of the recent plant yielded, by an ordinary screw press, 59½ lbs. of juice, and this, evaporated in a water bath, gave 5 lbs. 9 oz. of extract (Squire); 1½ cwt. of the green herb yielded 11 lbs. of extract (Gray).—*Dose.* 2 to 10 grs.; as an anodyne, hypnotic, antispasmodic, sedative, and narcotic; more especially in those cases in which the use of opium is objectionable. *Externally*, as a topical application to sore or inflamed parts, either made into an ointment or spread on plaster.

5. (Alcoholic; EXTRACTUM HYOSCYAMI ALCOHOLICUM, L.) The formulae of the Ph. Bad., Par. & U. S. are similar to those for ALCOHOLIC EXTRACT OF ACONITE.

6. (E. OF HENBANE SEEDS; EXTRACTUM SEMINUM HYOSCYAMI, L.—P. Cod.) An extract of the seeds made with spirit sp. gr. .900 (= about 16 o. p.) is dissolved in 4 parts of cold water, and the solution filtered and evaporated. Stronger than the simple extract.—*Dose.* ¼ gr. to 3 grs.

Extract of Holy Thistle. *Syn.* EXTRACTUM CARDUI BENEDICTI, L. *Prep.* 1. (Ph. Baden.) From holy or blessed thistle (*Carduus Benedictus*) by displacement with cold water.

2. (Ph. Bor.) As EXTRACT OF GENTIAN—Ph. L. (nearly). Tonic, diaphoretic, febrifuge, often diuretic, and occasionally emetic.—*Dose.* 5 to 15 grs., as a tonic or stomachic, chiefly.

Extract of Hops. *Syn.* EXTRACTUM LUPULI, (B. P., Ph. L. & E.); E. HUMULI (Ph. D.), L. *Prep.* 1. (B. P.) Hop, 8; rectified spirit, 15; distilled water, 80. Macerate the hop in the spirit for 7 days, press out the tincture, filter, and distil off the spirit, leaving a soft extract; boil the residual hop with the water for one hour, then express the liquor, strain, and evaporate on a water bath to the consistence of a soft extract. Mix the two extracts, and evaporate at a temperature not exceeding 160° to a pilular consistence.—*Dose.* 5 to 10 grs.

2. (Ph. L.) From commercial hops (the strobiles or catkins of *Humulus Lupulus*), 2½ lbs.; boiling distilled water, 2 galls.; macerate for 24 hours, boil to a gallon, strain whilst hot, and evaporate to a proper consistence. The form of the Ph. E. is nearly similar.

3. (Ph. D.) As EXTRACT OF ALOES—Ph. D. Tonic and stomachic, and slightly anodyne and hypnotic.—*Dose.* 5 grs. to 30 grs.; in dyspepsia, and cases that do not permit of the use of opium. 1 cwt. of ordinary hops yield about 40 lbs. of extract. (Brande.) The druggists usually employ hops 2 or more years old, called by the dealers 'yearlings,' 'olds,' or 'old olds,' because these may be purchased at ⅔ to ¾ the price of those of the last season's growth. The first of the above are estimated to have only ⅔ the strength of new hops; the second about ½; and the last little or none, at least in a medical point of view.

4. (Alcoholic; EXTRACTUM LUPULI ALCOHOLICUM, L.—Cotteneau.) By displacement with proof spirit. Stronger than the aqueous extract.

Extract of Horsehound. *Syn.* EXTRACTUM MARRUBII, L. *Prep.* 1. From the fresh herb, as EXTRACT OF ACONITE.

2. From the infusion or decoction. Antispasmodic, pectoral, tonic, and emmenagogue.—*Dose.* 10 grs. to 1 dr.

3. (Ph. Baden.) By displacement with cold water.

4. (Alcoholic; EXTRACTUM MARRUBII ALCOHOLICUM, L.)—a. From a tincture made with proof spirit. Said by M. Thoriel to possess considerable power as a febrifuge.—*Dose.* 5 grs. to 20 grs.

b. (Ph. Lusit.) From a tincture made with a mixture of rectified spirit, 1 part, and water, 7 parts. Inferior to the last.

Extract of Indian Hemp. *Syn.* CANNABINE, HEMP RESIN, ALCOHOLIC EXTRACT OF INDIAN HEMP; EXTRACTUM CANNABIS INDICÆ, E. O. I. ALCOHOLICUM, RESINA CANNABIS, L. *Prep.* 1. (B. P.) Indian hemp in coarse powder, 1; rectified spirit, 5; macerate seven days, press out the tincture, distil off the spirit, and evaporate.—*Dose.* ¼ to 1 grain in pill.

2. (O'Shaughnessy.) The dried resinous tops of Indian hemp ('GUNJAH') are boiled in rectified spirit until all the resin is taken up, when most of the spirit is distilled off, and the

evaporation completed by the heat of a water bath. 1 cwt. yields about 7 lbs.

3. (Robertson.) By slowly acting on the 'gunjah' with the vapour of alcohol, by a species of percolation; the spirit of the resulting tincture is partly removed by distillation, and the rest by slow evaporation at a temperature not above 150° Fahr. 1 cwt. yields about 8 lbs.—*Dose* of the last two, 1 to 3 grs., gradually increased.

4. (Messrs. Smith.) The bruised 'gunjah' is exhausted with tepid water, then with a solution of carbonate of soda (1 of carbonate to 2 of gunjah), and next with pure water; it is then pressed, dried, and exhausted by displacement with rectified spirit; the tincture is agitated with a milk of lime (containing 1 oz. of lime for every lb. of gunjah), and, after filtration or decantation, any retained lime is precipitated by a little sulphuric acid in slight excess; the tincture is next agitated with animal charcoal, and again filtered; most of the spirit is now removed by distillation, and 3 or 4 times its bulk of water being added, the remaining spirit is removed by a gentle heat; lastly, the remaining water is poured off, and the resin washed with fresh water, and dried. *Product*, 6½.—*Commencing dose*, ¼ gr.

3. (Purified; EXTRACTUM CANNABIS INDICÆ PURIFICATUM, L.—Ph. D.) From the crude extract of Indian hemp, as imported ('CHURRUS'), 1 oz.; rectified spirit, 4 fl. oz.; dissolve, and after defecation, decant, and evaporate.

Obs. The preparations of Indian hemp are said to be anæsthetic, anodyne, hypnotic, stimulant, phrenic, and aphrodisiac, and, in over-doses, to produce catalepsy. They have been recommended in hysteria, hydrophobia, cholera, rheumatism, chorea, convulsions, and various other painful spasmodic and nervous affections of a serious character. According to the observations of Dr. O'Shaughnessy, 1 gr. of the extract produced catalepsy in a rheumatic patient. The extract prepared with the plant grown in our botanic gardens has quite a different effect to that of the Indian plant; and it also appears that the inhabitants of this country are less susceptible to its action than those of India, and consequently bear the drug in larger doses. This hemp is known in India as the 'increaser of pleasure,' the 'exciter of desire,' the 'cement of friendship,' the 'causer of a reeling gait,' the 'laughter-mover,' &c. See EXTRACT OF HEMP (*above*), HEMP, &c.

Extract of Ipecacuanha. *Syn.* EXTRACTUM IPECACUANHÆ, L. *Prep.* 1. (P. Cod.) From ipecacuanha, as EXTRACT OF BOX—P. Cod.

2. (Ph. Bor.) As EXTRACT OF HENBANE SEEDS. Expectorant and emetic.—*Dose*. 1½ to 8 grs.

Extract of Iron. *Syn.* EXTRACTUM FERRI, E. MARTIS, L. *Prep.* 1. From tincture of tartarised iron.—*Dose*. 2 to 10 grs.; as a chalybeate tonic.

2. (Compound.) See EXTRACT OF APPLE.

Extract. *Prep.* 1. (Alcoholic; E. M. ALCO (B. P.), M. L.)—a. Ph. Hamb.) By distilling *Prep.* 1; of the tincture made with rectified rectified and filtering the residue, retaining what rate then the filter.

press out the simple distillation of the tincture off the s_1 Green or brownish green; insoluble macerate 4 hours, e_1 ½ oz. mezereon root-bark yielded evaporate by ab . Disp.) It is chiefly used mix the two e_1 blistering ointments and pl temperature note; sistence for 10 1. GREEN OIL OF MEZEREON ZEREI ETHEREUM, B. P.)—a grs.

2. (Ph. L.) Ja bark cut small, 1 lb.; rectified spirit, 1 gal.; s_1 ether, 1 pint. Macerate s_1 of the spirit for 3 days, press the tincture; boil the s_1 and press. To 2 galls.; until reduced to ½ s_1 the remainder tincture and decoction separate. te for 3 days, one distil and the other evaporate and press. thickens; lastly, mix the two and co over the evaporation.—*Product*. About 66% = 10_0 of alcoholic and 50% of aqueous extract. (Brande.) 18 lbs. yield 12 lbs. of extract. (Lab. Journ.)—*Dose*. 6 to 15 grs.

3. (Ph. E.) From tincture of jalap prepared by displacement with rectified spirit. It consists of impure resin of jalap. It is more active than the last.—*Prod.* 16½.—*Dose*. 2 to 6 grs.

Obs. Extract of jalap is an active purgative. It should be well beaten up with a little sulphate of potassa, sugar, or some aromatic powder, to prevent it griping. The substance commonly sold as extract of jalap in the shops is prepared by boiling jalap root for 3 or 4 hours in water, when it is taken out, and well bruised or sliced, and again boiled with water until exhausted of soluble matter. The mixed decoctions are then allowed 12 or 14 hours for defecation, after which the supernatant portion is decanted and evaporated.

Extract of jalap "should be kept in the soft state (EXTRACTUM JALAPÆ, E. J. MOLLE), so as to form pills; and in the hard state (HARD EXTRACT OF JALAP; EXTRACTUM JALAPÆ DURUM), that it may be rubbed to powder." (Ph. L.)

Extract of Juniper. *Syn.* EXTRACTUM JUNIPERÆ, E. BACCARUM J., L. *Prep.* (P. Cod.) Macerate juniper berries in water at 77° to 86° Fahr., for 24 hours, strain, repeat the process with a fresh quantity of water, mix the liquors, filter, and evaporate.—*Dose*. 29 grs. to 1 dr.; as a stimulant diuretic, in dropsy, &c.; and also as a pill-basis.

Extract of Kalada'na. *Syn.* EXTRACTUM KALADANÆ, L. *Prep.* (Bengal Disp.) From the tincture of the seeds of kaladana (*Pharbitis Nil*). Purgative. Said to be equal to EXTRACT OF JALAP, and of double the strength.

Extract of Lettuce. *Syn.* INSPISSATED JUICE OF LETTUCE; EXTRACTUM LACTUCÆ (B. P.), L. *Prep.* 1. (B. P.) The inspissated juice evaporated to a pillular consistence, according

PYRETHRI, E. P. ÆTHERO-ALCOHOLICUM, L. Prep. (W. Procter.) Alcohol (rectified spirit), 1 pint; ether, $\frac{1}{2}$ pint; mix, and pour it gradually on root of pellitory (*Anacyclus Pyrethrum*), 1 lb., placed in a percolator; afterwards pour on alcohol, 1 pint; and subsequently, sufficient dilute alcohol (proof spirit) to displace $2\frac{1}{2}$ pints of tincture (ESSENCE OF PELLITORY, TOOTHACHE ESSENCE); the latter is either suffered to evaporate spontaneously, or by a very gentle heat, until a soft extract is attained. *Used* to destroy the sensibility of the nerves of teeth, previous to plugging, and for toothache.

Extract of Pepper. *Syn.* **EXTRACTUM PIPERIS, E. P. NIGRI, L. Prep.** 1. From decoction of black pepper (bruised). Stimulant; stronger tasted than the berries, but less aromatic.—*Dose.* 10 grs. to 1 dr.; in agues.

2. (Fluid; **EXTRACTUM PIPERIS FLUIDUM, L.—Ph. U. S.**) From black pepper, as **FLUID EXTRACT OF CUBEBS—Ph. U. S.**, separating the PIPERINE by expression through a cloth, and keeping the fluid portion for use.

Extract of Pimpinella. *Syn.* **EXTRACTUM PIMPINELLE, L. Prep.** From the root of burnet saxifrage (*Pimpinella saxifraga*), as **EXTRACT OF HOPS**. Astringent.—*Dose.* 10 to 20 grs.

Extract of Pinkroot. *Syn.* **EXTRACT OF WORM GRASS, E. OF WORMSEED ROOT; EXTRACTUM SPIGELLE, L. Prep.** 1. From Carolina pinkroot (*Spigelia Marylandica*), as **EXTRACT OF BOX—P. Cod.**—*Dose.* 5 to 20 grs.

2. (Fluid; **ESSENCE OF PINKROOT, LIQUOR OF P.; EXTRACTUM SPIGELLE FLUIDUM, L.**) Pinkroot, 1 lb.; proof spirit, 3 pints; make a tincture, evaporate to 10 fl. oz., add sugar, $\frac{3}{4}$ lb., and rectified spirit, q. s. to make the whole measure exactly a pint.—*Dose.* For a child, beginning with $\frac{1}{2}$ a teaspoonful.

3. (Compound; **COMPOUND LIQUOR OF PINKROOT; EXTRACTUM SPIGELLE FLUIDUM COMP., L.—a.** (Estlack.) Carolina pinkroot or spigelia (bruised), 4 oz.; senna, 3 oz.; savine, 1 dr.; pour on boiling water, 1 quart; when cold, add rectified spirit, $\frac{1}{2}$ pint; digest 24 hours, express (or percolate), filter, evaporate to 12 fl. oz., in which dissolve, manpa, 1 oz.; sugar, 8 oz. Every fl. oz. is equal to 2 drs. of pinkroot, and $1\frac{1}{2}$ dr. of senna.—*Dose.* For a child, $\frac{1}{2}$ to 1 teaspoonful; for an adult, a table-spoonful.

b. (W. Procter.) Pinkroot, 16 oz.; sepna, 8 oz. (both in coarse powder); diluted alcohol (sp. gr. .935), 2 pints; macerate for 2 days, then proceed by displacement, adding fresh spirit, until 4 pints have passed through; filter, evaporate to 20 fl. oz., and add carbonate of potassa, 1 oz.; next add oils of caraway and aniseed, of each, $\frac{1}{2}$ dr.; (previously triturated with) powdered sugar, 24 oz.; lastly, apply a gentle heat to dissolve the sugar.

c. (**EXTRACTUM SPIGELLE ET SENNE FLUIDUM—Ph. U. S.**) As the last (nearly).—*Dose.* As above. All the above preparations of pink-

root are regarded as powerful and certain anthelmintics; particularly the last two.

Extract of Pipsis'sewa. See **EXTRACT OF WINTER-GREEN**.

Extract of Poi'son Oak. *Syn.* **EXTRACTUM RHOIS TOXICODENDRI, L. Prep.** (P. Cod.) From the expressed juice of the leaves of *Rhus toxicodendron*. Narcotic, stimulant, and alterative. *Dose.* $\frac{1}{2}$ gr. to 1 gr., gradually increased; in chronic rheumatism, obstinate skin diseases, &c.

Extract of Pomegranate. *Syn.* **EXTRACTUM GRANATI, L. Prep.** 1. (Soubeiran, & P. Cod.) From the root-bark of pomegranate, as **EXTRACT OF BOX**. In tape-worm.—*Dose.* 10 to 20 grs.; followed by a purgative.

2. (E. G. **CORTICIS FRUCTUS, L.**) From the decoction of the fruit-rind. As the last.

Extract of Poppies. *Syn.* **EXTRACTUM PAPAVERIS (B. P.), E. P. ALBI, L. Prep.** 1. (B. P.) Capsules coarsely powdered, 16; rectified spirit, 2; distilled water, a sufficiency; mix the poppy capsules with 40 of the water, stirring them frequently during 24 hours; then pack in a percolator, and pass water slowly through them until about 160 have passed though; evaporate the liquor by a water bath to 20; when cold, add the spirit. After 24 hours, filter the liquor, and evaporate to a pilular consistence.—*Dose.* 2 or 5 grains.

2. (Ph. L.) Bruised poppy-heads (without the seeds), 15 oz.; boiling distilled water, 1 gal.; macerate 24 hours, boil to one half, strain, and complete the evaporation.

3. (Ph. E.) As the last, with "capsules not quite ripe."

Obs. The medical action of extract of poppies, for the most part, resembles that of opium; but it is considerably weaker, and is generally regarded as less prone to produce headache and delirium.—*Dose.* 2 to 12 grs. It is usually prepared by the large manufacturers, by exhausting the capsules, by coction with water; hence the inferior quality of the extract of the shops, which contains a considerable quantity of inert matter.

The principal consumption of this extract is among the brewers, brewers' druggists, and wine merchants. For this purpose it is evaporated until it becomes hard on cooling, when it is formed into half-pound rolls, and covered with paper, like lead plaster. One of these rolls added to a hoghead of ale, stout, or sherry, materially increases the 'headiness' or apparent strength of these beverages.

Extract of Potat'o. *Syn.* **EXTRACTUM SOLANI TUBEROSI, L. Prep.** (Dr. J. Latham.) From the stem and leaves of the potato plant, as **EXTRACT OF ACONITE—Ph. L.** Narcotic.—*Dose.* 2 to 10 grs.

Extract of Pur'ging Flax. *Syn.* **EXTRACTUM LINI CARTHARTICI, L. Prep.** (Dr. B. Lane.) From the dried herb, as **EXTRACT OF HOPS—Ph. L.** Aperient and diuretic.—*Dose.* 5 to 10 grs.; 14 lbs. yielded $2\frac{1}{2}$ lbs. of extract.

Extract of Quas'sia. *Syn.* **EXTRACTUM**

QUASSIA (B. P.), Ex. q. LIGNI, L. *Prep.* 1. (B. P.) Quassia scraped, 1 lb.; distilled water, a sufficiency; macerate the quassia in 8 oz. of water for 12 hours; pack in a percolator; add water till the quassia is exhausted; evaporate, filter before it becomes thick, and again evaporate in a water bath to a proper consistence for pills.—*Dose.* 2 to 5 grs.

2. From the decoction of quassia chips. *Product.* 5½ to 6½.

3. (Ph. E.) From the rasped wood, as EXTRACT OF BISTORT—P. Cod. Bitter and stomachic. *Dose.* 5 to 10 grs., or more.

Obs. This extract is almost universally prepared by coction, and is principally consumed by the brewers, who employ it as a substitute for hops, in large quantities. The bark is frequently substituted for the wood, but is considerably less bitter. The Ph. Baden has an extract prepared with spirit of '944.

Extract of Quince Seeds. *Syn.* EXTRACTUM CYDONIÆ, E. C. SEMINUM. *Prep.* From the decoction. Sucked as a lozenge, in hoarseness, &c.

Extract of Rhatany. *Syn.* EXTRACTUM RHATANIÆ; E. KRAMERIÆ (B. P.), L. *Prep.* 1. (B. P.) Rhatany in coarse powder, 1; cold distilled water, 15; macerate 24 hours in 2 of the water, then percolate the whole; evaporate by water bath to dryness.—*Dose.* 5 to 20 grains.

2. (Ph. E. Baden and U. S.) From dried rhatany root (*Krameria triandria*), as EXTRACT OF BISTORT—P. Cod.

3. (Ph. Bor.) By two successive macerations in boiling water of 24 hours each, and evaporating at a temperature not exceeding 165° Fahr.

Obs. Extract of rhatany is astringent and tonic.—*Dose.* 10 to 20 grs. A large quantity of this extract, of very inferior quality, is imported from Brazil, and other parts of South America. It is kept in two states, hard and soft; the former resembles kino, and is often sold for it; the latter is chiefly consumed by the manufacturers and 'improvers' of port wine.

Extract of Rhubarb. *Syn.* EXTRACTUM RHEI (B. P.), L. *Prep.* 1. (B. P.) Rhubarb (sliced or bruised), 8 oz.; rectified spirit, 5 oz.; distilled water, 50 oz.; macerate 4 days, strain, and set it aside, that the fæces may subside; next decant the clear portion, strain, mix, and evaporate to a proper consistence over a water bath at 160 F.

2. (Ph. L.) As EXTRACT OF CINCHONA—Ph. L. (nearly). "The extract is obtained of finer quality by evaporation in a vacuum with a gentle heat." The Baden formula is similar.

Obs. This extract is usually prepared by decoction from inferior and damaged rhubarb, picked out from the chests on purpose; hence the inferior quality of the extract of the shops. When made of good Turkey, or even East India rhubarb, it is a very valuable prepara-

tion.—*Dose.* As a stomachic, 5 to 10 grs.; as a purgative, 10 grs. to ½ dr. It is seldom exhibited alone. *Product.* 50½.

3. (Fluid; LIQUOR OF RHUBARB, ESSENCE OF R.; LIQUOR RHEI, EXTRACTUM RHEI FLUIDUM, L.)—*a.* (W. Procter.) Rhubarb (in coarse powder), 8 oz.; mix it with an equal bulk of coarse sand, and moisten it with dilute alcohol (sp. gr. .935, = 13 u. p.) to form a pasty mass; in a short time introduce it into a percolator, shake it until uniformly settled, and cover it with cloth or paper; then pour on the rest of the spirit (the remainder of 2 pints) until the product has little odour or taste of the root; next gently evaporate the tincture to 5½ fl. oz., and add sugar, 5 oz., when the whole should measure 8 fl. oz.—*Dose.* 15 to 30 drops.

5. (Ph. U. S.) As the last, adding of oils of fennel and anise, of each, 4 drops; (dissolved in) tincture of ginger, 4 fl. drs.

4. (Compound; EXTRACTUM RHEI COMPOSITUM, E. PANCHYMAGOGUM, L.—Ph. Bor.) Extract of rhubarb, 3 drs.; extract of aloes, 1 dr., (softened with) water, 4 drs.; mix, and add of soap of jalap, 1 dr., (dissolved in) proof spirit, 4 drs.; lastly, evaporate to an extract, dry this in a warm place, and powder. Stomachic and purgative.—*Dose.* 4 to 20 grs.

Extract of Rue. *Syn.* EXTRACTUM RUTÆ, E. FOLIORUM RUTÆ, L. *Prep.* 1. From rue leaves (*Ruta graveolens*), as EXTRACT OF HOPS—Ph. L.

2. (Alcoholic—P. Cod.) As ALCOHOLIC EXTRACT OF ACONITE—P. Cod. (nearly.) The formula of the Ph. Wert. is similar.

Obs. This extract is stomachic, carminative, and emmenagogue.—*Dose.* 10 to 20 grs., twice a day. It is usual to add a little of the essential oil to the extract, just before taking it out of the evaporating-pan, and when nearly cold. The first is the form adopted in trade in this country.

Extract of Saffron. *Syn.* POLYCHROITE; EXTRACTUM CROCI, L. *Prep.* 1. From hay saffron, as EXTRACT OF COLOCYNTH—Ph. L.

2. (P. Cod.) From the tincture. Superior to the last.

Obs. The first is used chiefly as a colouring and flavouring substance by cooks, confectioners, wine and cordial brewers, &c.—*Dose.* 5 to 15 grs.; as an excitant, antispasmodic, and emmenagogue.

Extract of Sarsaparilla. *Syn.* EXTRACTUM SARZÆ, E. SARSAPARILLÆ, L.; EXTRACT DE SALSEPARILLE, Fr. *Prep.* 1. (Ph. L. 1836.) From sarsaparilla, as EXTRACT OF HOPS—Ph. L. The Ph. D. 1826 is similar.—*Dose.* 10 grs. to 1 dr. *Product.* (From Jamaica sarsaparilla) 32½ to 36½.

2. (Alcoholic; EXTRACTUM SARZÆ ALCOHOLICUM, L.)—*a.* From a tincture of the root-bark, prepared with proof spirit, either by digestion or percolation.

5. (P. Cod. and Ph. U. S.) From sarsaparilla root (powdered), as ALCOHOLIC EXTRACT

OF ACONITE.—P. Cod. Superior to the aqueous extract.—*Dose.* 10 to 20 grs.

3. (Fluid; LIQUOR OF SASSAPARILLA, ESSENCE OF S.; LIQUOR SARZÆ, ESSENTIA SASSAPARILLÆ, EXTRACTUM SARZÆ LIQUIDUM—Ph. L., E. S. FLUIDUM—Ph. E. & D., L.); EXTRACTUM SARZÆ LIQUIDUM—(B. P.) *a.* Jamaica sarsaparilla cut transversely, 16; distilled water (temp. 160° Fahr.), 280; rectified spirit, 1. Macerate in half the water for 6 hours, and decant the liquor; digest the residue in the remainder of the water for 6 hours more, mix the liquors, express and filter; evaporate by water bath to 7, or until it has a sp. gr. of 1.180; when cold add the spirit. Sp. gr. should be about 1.025.—*Dose.* 1 to 4 drs.

b. (Ph. L.) Sarsaparilla 3½ lbs.; distilled water, 3 galls.; boil to 12 pints, pour off the liquor, and strain whilst hot; again boil the sarsaparilla in water, 2 galls., to one half, and strain; evaporate the mixed liquors to 18 fl. oz.; and when cold, add of rectified spirit, 2 fl. oz. Each fl. oz. represents 2½ oz. of the root (nearly).

c. (Ph. E.) Sarsaparilla, 1 lb.; boiling water, 4 pints; digest 2 hours, then bruise the root, boil it for 2 hours, filter, and express the liquid; repeat the cotion with water, 2 pints, as before; evaporate the mixed liquors to the consistence of a thin syrup, and, when cold enough, add of rectified spirit q. s. to make up 16 fl. oz. Each fl. oz. represents 6 drs. of the root, and 6 fl. oz. of the decoction.

d. (Ph. D.) Sarsaparilla, 1 lb. (avoir.); proceed as before, and add of rectified spirit, q. s. to make the product up to 20 fl. oz. Strength, as the last (nearly). In the Ph. D. 1826 the decoction of sarsaparilla, 1 lb. (troy), was ordered to be evaporated to 30 oz., which with the spirit (2 oz.) made the preparation only half the strength of the present one.

4. (Compound; EXTRACTUM SARZÆ COMPOSITUM, E. SASSAPARILLÆ COMP. L.) There is no form for this preparation in the Pharmacopœias, but it is nevertheless in immense demand, from its great convenience in dispensing. The following formulæ are employed by one of the wholesale houses that does largest in this preparation:—

a. Guaiacum shavings (from which the small has been sifted), 30 lbs., Italian juice, 24 lbs., mezereum root, 6 lbs., are boiled with water, q. s., for 1 hour; the decoction is then drawn off, and the boiling repeated with fresh water a second and a third time; the mixed decoctions are allowed to deposit for 6 or 8 hours, or longer, and the clear portion decanted and strained through flannel; the liquid is now reduced to the consistence of treacle, when extract of sarsaparilla, 9 lbs., is added, and the evaporation conducted at a considerably lower temperature until near its completion, when the source of heat is removed, and the remaining evaporation conducted at the expense of

that retained by the metal of the "pan;" when nearly cold, and just before removing the extract to the 'pots' or 'jars,' essential oil of sassafras, 2 drs., dissolved in rectified spirit, 1 quart, is added, and quickly but completely stirred in. The product is a very showy article, if well managed, and weighs about 45 lbs., the precise quantity depending on the quality of the juice employed. It is labelled 'EXT. SARZÆ COMP.'

b. As the last, but only using 15 lbs. of juice, and that Solazzi. *Prod.* About 35 lbs. It is labelled and sent out as 'EXT. SARZÆ CO. OPT.'

c. By any of the forms given under COMPOUND DECOCTION OF SASSAPARILLA, either common or concentrated, by continuing the evaporation.—*Dose.* Same as that of the simple extract.

5. (Fluid Compound; COMPOUND LIQUOR OF SASSAPARILLA.)—*a.* From any of the preceding formulæ by arresting the evaporation when the fluid has acquired the consistence of a thin syrup, and adding to each pint, when cold, rectified spirit, 4 fl. oz.

b. (Alcoholic—W. Hodgson.) Sarsaparilla (bruised), 16 oz.; liquorice root (bruised), guaiacum wood (rasped), and sassafras bark (sliced), of each, 2 oz.; mezereum (sliced), 6 drs.; spirit, sp. gr. .935 (=13 u. p.), 7 pints; digest 14 days, express, filter, evaporate to 12 fl. oz., add of sugar, 8 oz., and as soon as this is dissolved, withdraw the heat. Stronger than the last.—*Dose.* 1 fl. dr.

c. (E. SASSAPARILLÆ FLUIDUM—Ph. U. S.) As the last (nearly).

6. (From the root-bark; EXTRACTUM CORTICIS SARZÆ, L.) From the decoction or tincture of the root-bark. The cortical portion of sarsaparilla yields fully 50% of aqueous extract. "Five times as much as the medullum." (Pope.)

Obs. Each of the above extracts of sarsaparilla (simple, fluid, and compound), when of good quality, dissolves in water, forming a deep reddish-brown solution, perfectly transparent, and depositing little sediment, even by standing some days. See SASSAPARILLA.

Extract of Scammony. *Syn.* RESIN OF SCAMMONY; RESINA SCAMMONII, E. S. ALCOHOLICUM, E. SIVE RESINA SCAMMONII (Ph. E.), L. *Prep.* 1. From powdered scammony, exhausted with proof spirit, and the resulting tincture distilled until little but water passes over; the remaining water is then poured from the resin, which is next well washed in boiling water and dried at a temperature below 240° Fahr. Brown; impure.

2. As the last, but using either alcohol of 90% or ether, and animal charcoal. White; pure.

Obs. Scammony resin is translucent, fusible, and combustible; and freely soluble in alcohol, ether, and oil of turpentine. It is frequently adulterated with jalap resin, a fraud readily detected by its insolubility in

the last two menstrua.—*Dose.* 5 to 10 grs. "When pure or virgin scammony can be procured, it is an unnecessary preparation." (Pereira.)

Extract of Scurvy-grass. *Syn.* EXTRACTUM COCHLEARIE, L. *Prep.* (P. Cod.) From the clarified juice of fresh scurvy-grass, by exposure to warm air. Anti-scorbutic, stimulant, anti-rheumatic, and diaphoretic.—*Dose.* 1 to 2 drs. The valuable principles of the juice are dissipated by much heat.

Extract of Sen'ega. *Syn.* EXTRACTUM SENEGÆ, L. *Prep.* 1. (P. Cod.) From senna or snake-root (*Polygala Senega*), as EXTRACT OF BOX.—P. Cod.

2. (Compound; EXTRACTUM SENEGÆ COMPOSITUM, E. S. ET SCILLÆ, L.—Ecky.) From equal parts of squills and senna, as the last, but by displacement. Both the above are stimulant, expectorant, sudorific, and diuretic.—*Dose.* 1 to 12 grs.

Extract of Sen'na. *Syn.* EXTRACTUM SENNÆ, L. *Prep.* 1. (EXTRACTUM SENNÆ AQUOSUM, L.)—*a.* As EXTRACT OF COLOCYNTH.—Ph. L.

2. (P. Cod.) As EXTRACT OF BISTORT.—P. Cod.

c. (Ph. Bor.) From senna leaves, by maceration in tepid water (104° Fahr.) for 24 hours, and expression and filtration; the operation is repeated with fresh water, and the strained liquors evaporated to a thick extract (at 149° to 157° Fahr.), which is dissolved in water, 4 parts, the solution filtered, and again evaporated.—*Dose.* 10 to 20 grs. It is principally used as a basis for purgative pills. When prepared by decoction it is nearly inert. A better extract is prepared from the common tincture made with proof spirit.

2. (Alcoholic; EXTRACTUM SENNÆ ALCOHOLICUM, L.—Guibourt.) Senna (in powder). 1 part; rectified spirit, 5 parts; heat gradually to boiling, let it cool; in 24 hours express, strain, and repeat the process with fresh spirit; lastly, distil and evaporate. Proof spirit answers for this purpose.

3. (Fluid; EXTRACTUM SENNÆ FLUIDUM, L.—Ph. (U. S.)) Senna (in coarse powder), 2½ lbs.; spirit (at or near proof), 64 fl. oz.; macerate 24 hours, then act by displacement, subsequently adding weak spirit (1 of rectified spirit to 3 of water) until 10 pints of tincture are obtained; evaporate to 1 pint, filter, add sugar, 20 oz., and oil of fennel, 1 fl. dr. (dissolved in) compound spirit of ether, 2 fl. drs. Every fl. oz. represents 1 oz. of senna.

Extract of Smoke. *Syn.* EXTRACTUM FULIGINIS, L. *Prep.* 1. (Aqueous.) Wood-soot, 2 oz.; water, 1 pint; boil to 16 fl. oz., filter, and evaporate.

2. (Acetic.) Wood-soot, 2 oz.; distilled vinegar and water, of each, ½ pint; as the last. Formerly reputed antispasmodic, alterative, &c.—*Dose.* 3 to 6 grs., 2 three times a day; in dyspepsia, hysteria, cancer, scrofula, and various syphilitical affections.

Extract of Snake-root. See EXTRACT OF SENEGA.

Extract of Soap'wort. *Syn.* EXTRACTUM SAPONARIE, L. *Prep.* (P. Cod. & Ph. Bad.) From the dried roots of soapwort (*Saponaria officinalis*), as EXTRACT OF BISTORT.—P. Cod. Aperient and alterative.—*Dose.* 15 grs. to ½ dr.

Extract of Spruce. See ESSENCE OF SPRUCE.
Extract of Squills. *Syn.* EXTRACTUM SCILLÆ, L. *Prep.* 1. (Aqueous; E. S. AQUOSUM.—*a.* (Ph. Baden.) From squills, as EXTRACT OF COLOCYNTH.—Ph. L. (nearly).

2. (Ph. Bor.) From squills, as EXTRACT OF SENNA.—Ph. Bor. (nearly), but using boiling water, avoiding ebullition during the evaporation, and powdering the residuum.—*Dose.* 1 to 5 grs.

2. (Alcoholic; EXTRACTUM SCILLÆ ALCOHOLICUM, L.—P. Cod.) From the tincture prepared with proof spirit, by distillation and evaporation.—*Dose.* ½ to 3 grs., as an expectorant and diuretic, twice or thrice a day. In larger doses it is nauseant and emetic.

Extract of Stor'ax. See STYRAX.

Extract of Stramo'nium. *Syn.* EXTRACT OF THORN-APPLE; EXTRACTUM STRAMONII, (Ph. L. & D.), L. *Prep.* 1. (B. P.) Pack stramonium seeds, coarsely powdered, in a percolator, and pass about their own weight of washed ether slowly through them, remove the ether, and set aside. Now pour over them proof spirit until the seeds are exhausted; distil off the spirit, and evaporate the residue by a water bath to a proper pill consistence.—*Dose.* ½ gr., gradually increasing.

2. (Ph. L.) Seeds of thorn-apple (*Datura stramonium*), 15 oz.; boiling distilled water, 1 gal.; macerate for 4 hours in a vessel lightly covered, near the fire; afterwards take out the seeds, bruise them in a stone mortar, and return them to the liquor; then boil down to 4 pints, strain whilst hot, and evaporate. The Ph. D. is similar. *Product.* (About) 12½. Anodyne and narcotic.—*Dose.* ¼ gr. to ½ gr., gradually increased, twice or thrice a day; in neuralgia, rheumatism, tic douloureux, spasmodic asthma, epilepsy, worms, &c.

3. (P. Cod. & Ph. U. S.) From the expressed juice of the fresh leaves, heated to boiling, and filtered. The P. Cod. also orders it to be prepared as EXTRACT OF ACONITE.—Ph. L. Anodyne and narcotic.—*Dose.* ½ gr. to 1 gr.

Obs. On the large scale, this extract is prepared by expressing the juice of the fresh herb, and boiling the remainder in water; the juice and decoction are then mixed, filtered, and evaporated. 1½ cwt. of stramonium yielded 37 lbs. of juice, and this, with the decoction, gave 31 lbs. of extract. (Gray.)

4. (Alcoholic; EXTRACTUM STRAMONII.—Ph. E., E. S. ALCOHOLICUM, L.)—*a.* (Ph. E. & Ph. U. S.) From the seeds (ground in a coffee-mill), by percolation with proof spirit. *Product.* (About) 14½; 1 lb. yielded 2½ oz. (Recluz.)

b. (P. Cod.) From the leaves, as EXTRACT OF ACONITE—P. Cod.—*Dose.* $\frac{1}{2}$ gr., gradually increased. (See *above*.)

Extract of *Succory*. *Syn.* EXTRACTUM CHICORII, L. *Prep.* (Guibourt.) From the fresh root, as EXTRACT OF ACONITE—Ph. L. Aperient, deobstruent, and tonic.—*Dose.* 10 gr. to $\frac{1}{2}$ dr.

Extract of Sweet Flag. *Syn.* EXTRACTUM ACIDI, E. CALAMI AROMATICI, L. *Prep.* From the rhizomes, as EXTRACT OF RHUBARB—Ph. L. See SWEET FLAG.

Extract of Tan'sy. *Syn.* EXTRACTUM TANACETI, L. *Prep.* 1. From the herb (*Tanacetum vulgare*), as EXTRACT OF HOP—Ph. L.

2. (Giordano). AS EXTRACT OF HOREHOUND—Ph. Lusitan.

Obs. This extract is said to be tonic, stomachic, anthelmintic, emmenagogue, and febrifuge. Dr. Clark says that in Scotland it was found to be serviceable in various cases of gout. The infusion is, however, preferable.—*Dose.* 5 grs. to 20 grs.

Extract of Taraxacum. *Syn.* EXTRACT OF DANDELION; EXTRACTUM TARAXACI (Ph. L. & E.), E. T. HERBÆ ET RADICIS (Ph. D. 1826), L. *Prep.* 1. (B. P.), Crush fresh dandelion root, press out the juice, and allow it to deposit; heat the clear liquor to 212° F., and maintain the temperature for 10 minutes; then strain and evaporate by a water bath, at a temperature not exceeding 160° F. to a proper consistence.—*Dose.* 5 to 15 grains.

2. (Ph. L.) From the recent root of dandelion (*Leontodon Taraxacum*), as EXTRACT OF HOP—Ph. L. The formulæ of the Ph. E. & U. S. are nearly similar.

3. (Ph. D.) From the herb and root, as the other simple extracts (EXTRACTA SIMPLICIORA).

4. (P. Cod.) From the expressed juice, as EXTRACT OF STRAMONIUM—P. Cod.

5. (Ph. Bor.) AS EXTRACT OF SENNA—Ph. Bor. (nearly).

6. (Ph. Baden.) By displacement with cold water.

7. (Wholesale.) From the decoction.

8. (Fluid.) See LIQUOR OF TARAXACUM.

Obs. The extract of the shops is usually prepared by exhausting the root by coction with water. The products of the first two of the above formulæ, when recent, have a faint and agreeable odour, and a sweet bitter taste; those of Nos. 4, 5, and 6, smell strongly of the recent root, have a pale and lively brownish yellow colour, and a bitter acidulous taste, without any trace of sweetness; that of the last one is devoid of odour, and possesses a coffee-brown colour, and a sweetish, burnt taste, not much unlike a solution of burnt sugar. The medicinal virtue of this extract is greatest when the aroma and bitter taste of the recent root is well developed; and when sweet, its efficacy as a remedy is impaired. (Squire.)

Taraxacum root should be gathered during

the winter months, when the quantity of the product is looked at; as then a given weight of the juice yields more extract; but in summer and autumn it possesses more bitterness and aroma. 4 lbs. of juice from roots gathered in November and December yielded 1 lb. of extract, while it took from 6 to 9 lbs. of juice from the root, gathered in spring or summer, to yield a like quantity. (Squire.) The herb yields by the evaporation of its expressed juice, about 5% of extract. According to Mr. Jacob Bell, the average yield of 1 cwt. of root is about 7½ lbs. ('Pharm. Journ.,' x, 446.)

Good extract of taraxacum should be wholly soluble in water.—*Dose.* 10 grs. to $\frac{1}{2}$ dr.; as a resolvent, aperient, and tonic, in liver and stomach complaints, &c.

Extract of Tea. *Syn.* EXTRACTUM THEÆ, L. *Prep.* 1. From an infusion of any of the rougher kinds of black tea. Astringent. Has been recommended in diarrhoea; formed into pills.—*Dose.* 10 grs. to $\frac{1}{2}$ dr. A hard, black-looking substance, smelling and tasting faintly of tea, is imported under the same name from China.

2. (Pidding's.) The joint products of distillation and infusion combined. Proposed to be made in China, and exported as a condensed preparation of tea. (ESSENCE OF TEA; ESSENTIA THEÆ); to be used as a substitute for the leaves, in order to save the expense of freight, &c.

Extract of Thorn-Apple. See EXTRACT OF STRAMONIUM.

Extract of Tobac'co. *Syn.* EXTRACTUM TABACI, E. NICOTIANÆ, L. *Prep.* 1. (Chipendale.) From decoction of tobacco. Proposed as an external application in neuralgia, &c.

2. (Alcoholic; EXTRACTUM TABACI ALCOHOLICUM, L.—Ph. Bor.) Tobacco leaves, 1 lb.; spirit (sp. gr. .900), 2 lb.; digest in a warm place for some days, express strongly, and again digest in a mixture of water and spirit (.900), of each, 1 lb., for 24 hours; again press out the liquor, and evaporate the strained and mixed liquors in a vapour bath, at a temperature not exceeding 167° Fahr.

Extract of Tormentil. *Syn.* EXTRACTUM TORMENTILLÆ, L. *Prep.* (Ph. Amst.) From the root of *Potentilla Tormentilla*, as EXTRACT OF HOPS—Ph. L. The Ph. Baden. directs its preparation by displacement with cold water. Astringent and febrifuge.—*Dose.* 15 to 30 grs.; in diarrhoea. It was formerly regarded as a specific in syphilis. (Lindley.)

Extract of U'va Ur'si. See EXTRACT OF WHORTLEBERRY.

Extract of Valerian. *Syn.* EXTRACTUM VALERIANÆ, L. *Prep.* 1. From valerian root, as EXTRACT OF HOP—Ph. L.; but using a covered vessel.

2. (Ph. Bor. and Baden.) AS EXTRACT OF CINCHONA—Ph. L. (nearly), employing strong

force in the expression of the liquor, and only evaporating to the consistence of syrup.

Obs. It is usual to add to this extract a little of the ESSENTIAL OIL OF VALERIAN, dissolved in a small quantity of rectified spirit, just before removing it from the evaporating-pan, and when nearly cold. Anti-spasmodic and nervine.—*Dose.* 10 grs. to $\frac{1}{2}$ dr. In hysteric and spasmodic diseases. Valerian yields about 40% of soft extract.

3. (Alcoholic; *EXTRACTUM VALERIANÆ ALCOHOLICUM*, L.—P. Cod.) As EXTRACT OF BOX.—P. Cod.

4. (Fluid; *EXTRACTUM VALERIANÆ FLUIDUM*, L.—Ph. U. S.) Rectified spirit, 12 fl. oz.; mix, add of valerian (in coarse powder), 8 oz.; digest and percolate, adding, subsequently, spirit (at or near proof) until 16 fl. oz. of tincture have passed through; let this evaporate spontaneously, in a shallow vessel, until reduced to 5 fl. oz.; in the mean time add fresh spirit to the mass in the percolator, until 10 fl. oz. more of tincture are obtained, which add to the above residuum of the evaporation, observing to dissolve any oleo-resinous deposit in a little rectified spirit, and to add it to the rest; lastly, filter, and add of rectified spirit, q. s. to make the whole measure 16 fl. oz.

Extract of Vanilla. See LIQUOR OF VANILLA.

Extract of Wall Pel'litory. *Syn.* *EXTRACTUM PARIETARIÆ*, L. *Prep.* From fresh wall pel'litory (*Parietaria officinalis*), as EXTRACT OF ACONITE—Ph. L. Aperient, diuretic, and pectoral.—*Dose.* 10 grs. to $\frac{1}{2}$ dr.

Extract of Walnut. *Syn.* *EXTRACTUM JUGLANDIS IMMATURE*, L. *Prep.* 1. From unripe walnuts (*Juglans regia*), as EXTRACT OF ACONITE—Ph. L.

2. From the decoction of the green shells. Vermifuge.—*Dose.* 20 to 30 grs. in cinnamon water.

Extract of Walnut Leaves. *Syn.* *EXTRACTUM JUGLANDIS FOLIORUM*, L. *Prep.* 1. From the decoction of dried walnut leaves.

2. (Soubeiran.) By displacement with tepid water. Diaphoretic and alterative.—*Dose.* 2 to 4 grs. twice or thrice a day; in scrofula, scirrhus, &c.

3. (Alcoholic; *EXTRACTUM JUGLANDIS FOLIORUM ALCOHOLICUM*, L.—Ph. Bor.) From walnut leaves (cut), as ALCOHOLIC EXTRACT OF TOBACCO—Ph. Bor. (nearly).

Extract of Water-dock. *Syn.* *EXTRACTUM RUMICIS AQUATICI*, L. *Prep.* From the root, as EXTRACT OF HOPS, Ph. L. Astringent and antiscorbutic.—*Dose.* 15 grs. to 1 dr.; in skin diseases, &c.

Extract of Whortleberry. *Syn.* *EXTRACT OF BEARBERRY*; *EXTRACTUM UVAE URSI*. (Ph. L.), L. *Prep.* From the dried leaves of the bearberry (*Arctostaphylos Uva-Ursi*), as EXTRACT OF HOPS—Ph. L.—*Dose.* 5 to 15 grs. twice or thrice a day; in chronic diseases of the bladder and kidneys, attended with in-

creased secretion of mucus, without inflammation.

Extract of Win'ter Cher'ry. *Syn.* *EXTRACTUM ALKEKENGII*, L. *Prep.* From the berries of *Physalis alkekengi*, as EXTRACT OF ELDER. Aperient, detergent, and diuretic.—*Dose.* 2 to 4 drs.

Extract of Win'ter-green. *Syn.* *EXTRACT OF PIPSISSEWA*; *EXTRACTUM CHIMAPHILÆ*, L. *Prep.* From the herb winter-green or pipsissewa (*Chimaphila umbellata*), as EXTRACT OF HOPS—Ph. L.—*Dose.* 10 grs. to $\frac{1}{2}$ dr.; in dropsy, scrofula, and chronic affections of the urinary organs.

Extract of Wood Sor'el. *Syn.* *EXTRACTUM ACETOSÆLLÆ*, L. *Prep.* (Fideret.) From the expressed juice of the fresh herb (*Oxalis acetosella*). Acid, bitter, and antiscorbutic.—*Dose.* 15 grs. to $\frac{1}{2}$ dr.

Extract of Worm Grass. See EXTRACT OF PINKROOT.

Extract of Worm'seed. *Syn.* *EXTRACTUM CINÆ ÆTHERETUM*, E. *SEMINUM C. Æ.*, L. *Prep.* (Hamb. Cod. 1845.) Wormseed, 1 oz.; ether, 4 oz.; digest 3 or 4 days, press, filter, distil off 4-5ths, and evaporate the residuum to a proper consistence. *Prod.* 25% to 30%. Vermifuge.—*Dose.* 3 to 10 grs., night and morning, for 2 or 3 successive days, followed by a brisk purge.

Extract of Worm'wood. *Syn.* *EXTRACTUM ABSINTHII*; *EXTRACTUM ARTEMESIÆ ABSINTHII*, L. *Prep.* 1. (Ph. D. 1826.) From the dried flowering tops of wormwood, as the other simple extracts (*EXTRACTA SIMPLICIORA*—Ph. D.)

2. (Ph. Bor.) As EXTRACT OF RHATANY—Ph. Bor.

3. (P. Cod. & Ph. Baden.) By displacement by cold water.

Obs. Bitter stomachic, tonic, and vermifuge.—*Dose.* 10 grs. to 20 grs., 2 or 3 times daily; in dyspepsia, loss of appetite, gout, &c. It is usual to add a few drops of the oil of wormwood to the extract before taking it from the pan.

4. (Alcoholic; *EXTRACTUM ABSINTHII ALCOHOLICUM*, L.—Guibourt.) From a tincture prepared from the dried tops of wormwood boiled in proof spirit. More active than the last.

Extract of Yew. *Syn.* *EXTRACTUM TAXI*, L. *Prep.* 1. (Loder.) From the inspissated juice of the fresh leaves of the yew (*Taxus baccata*). Its action on the circulation greatly resembles that of digitalis, but is more manageable.—*Dose.* 1 to 7 grs.; in epilepsy, &c.

2. (Alcoholic,—Ph. Baden.) From the dried leaves, as ALCOHOLIC EXTRACT OF ACONITE—Ph. Baden.

Obs. In addition to the preparations given above, there are many others which are often called 'EXTRACTS.' These may be grouped under the following heads:—

Concentrated Extracts. *Syn.* *RESINOIDS*. Pharmaceutical preparations of more or less value, largely employed by the American phy-

sicians who style themselves 'ECLECTICS.' They are supposed to present in the most concentrated form the medicinal virtues of the plants from which they are derived. See RESINOIDS.

Fluid Extracts. *Syn.* **EXTRACTA FLUIDA, EXTRACTA LIQUIDA, L.** This name has been applied in modern pharmacy to various preparations differing materially from each other in their degree of fluidity and concentration. Some of these have been already noticed, and others will be found under one or other of their synonyms. Much confusion would be avoided by confining the name 'FLUID EXTRACT' to those preparations only which differ from the ordinary official extracts in being in the liquid form; whilst others of a like character, but of less consistence or concentration, might be conveniently classed under the general denomination of 'LIQUORS' (**LIQUORES, L.**). The various condensed preparations of vegetable substances, now common in trade, 'professedly several times stronger than the common DECOCTIONS, INFUSIONS, and TINCTURES, might be simply and advantageously distinguished by the addition of 'CONCENTRATED' to their names. Tinctures made with rectified spirit, and of (say) at least 8 times the usual strength, might be appropriately termed 'ESSENCES.' See DECOCTION, ESSENCE, EXTRACT, INFUSION, OLEO-RESIN, SYRUP, TINCTURE, &c.

Extracts, Perfumatory. See EXTRACT.

Extracts, Pulverulent. *Syn.* **DRIED EXTRACTS, DESICCATED E.; SACCHARATED E.; EXTRACTA PULVERATA, E. SICCATA, E. CUM SACCHARO, L.** *Prep.* 1. Ordinary soft extract of the drug, 4 parts; white sugar (in powder), 1 part; mix, and dry by exposure in a warm situation; lastly, reduce the mass to powder, and if it weighs less than 4 parts, triturate it with more powdered sugar until its weight is equal to the original weight of the extract used in its preparation. The strength of the extract thus continues unchanged.

2. (Ph. Bor.) As the last, but using powdered sugar of milk, in lieu of cane sugar.

3. (Gauger.) Alcoholic extract, 3 parts, rectified spirit, 1 part, are triturated together in a porcelain mortar until thoroughly incorporated, when white sugar (in powder), 15 oz., is gradually added, and the two carefully and completely blended together; the mixture is dried as before, and more sugar added until the whole weighs exactly 18 oz. Six grains represent one grain of the unprepared extract.

Obs. The above are admirable preparations, intended chiefly to render the perishable extracts of the narcotic plants (**EXTRACTA NARCOTICA**) less liable to suffer by age. See EXTRACT OF ACONITE (Saccharated), &c.

EXTRACTIVE. *Syn.* **EXTRACTIVE PRINCIPLE.** This substance was discovered by Fourcroy, and presumed by him to be the common basis of all extracts. It has since

been proved by Chevreul and other chemists to be a heterogeneous compound, varying in composition with the plant from which it is extracted. Extractive has a brown colour, or one becoming so in the air; it speedily putrefies, and becomes oxidized, and is rendered insoluble by long exposure to air, and by repeated solutions and evaporations. In its unaltered state it is soluble in water and in alcohol, is nearly insoluble in ether, and is precipitated from its solutions by the acids and metallic oxides. With alumina it forms the basis of several brown dyes.

EXTRAIT. [Fr.] Literally an extract. Among perfumers, extraits are mostly spirituous solutions of the essential oils or odorous principles of plants and other fragrant substances. The French commonly apply the term to any concentrated spirit, either simple or compound. In the shops of the Parisian perfumers upwards of 60 preparations of the kind are distinguished by this name. The extracts of JASMINE, JONQUIL, MAY-LILY, ORANGE BLOSSOMS, VIOLETS, and other like flowers of delicate perfume, are obtained by agitating and digesting the 'huiles' and 'pom-mades' of the flowers with the purest rectified spirit, in the manner described under SCENTED SPIRITS ('esprits'). This process is repeated with fresh oil or pom-made until the spirit is rendered sufficiently fragrant. The other extracts (both simple and compound) are made by the common methods of infusion and distillation. See ESSENCE, EXTRACT, SPIRIT, &c.

EYE. In anatomy and physiology, the organ of vision. In order that vision may be distinct, it is necessary that the pencil of rays diverging from each point of the object and entering the pupil should converge to a focus on the retina. Near-sightedness ('MYOPIA,' L.) is due to the too great convexity of either the 'lens' or 'cornea,' causing the rays to converge to a focus before reaching the retina. The spectacles worn by myopic persons have concave glasses, which, by increasing the divergence of the rays falling upon the eye, have the effect of carrying back each focal point towards the retina. In the long-sight of old people ('PRESBYOPIA,' L.) the foci of the refracted pencils are situated behind the retina, the 'lens' or the 'cornea' being not sufficiently convex. This defect is corrected by convex glasses, which increase the convergence of the incident rays. See BLINDNESS, COLOUR BLINDNESS, VISION, &c.

Eye Drops. See WATER (Eye).

Eye Pow'ders. See COLLYRIA.

Eye Salve. See OINTMENT (Eye).

Eye Snuff. See SNUFF.

Eye Waters. See WATER.

FACE A'GUE. The common name for the intermittent form of facial NEURALGIA or TIG DOULOUREUX. See NEURALGIA.

FACE PAINTS. *Syn.* **FARDS, Fr.** See

* BLOOM, CARMINE, PEARL WHITE, ROUGE, &c.

FAC-SIM'ILE. An exact imitation of an original in all its traits and peculiarities. The term is chiefly used in relation to copies of old manuscripts, or of the handwriting of famous men, or of interesting documents, produced by engraving or lithography. See SIGNATURES.

FACTI'TIOUS. *Syn.* FACTITIUS, L. Artificial; made by art, in distinction from that produced by nature. Numerous illustrations of the application of this word occur in the pages of the present work.

FÆCES. Excrement. In the *laboratory*, the 'settling' or sediment deposited by a liquor. See DEFECATION.

FAINT'ING. *Syn.* SWOONING; SYNCOPE, DELIQUIM ANIMI, L. In *pathology*, a state in which the respiration and circulation are apparently suspended for a time, or are extremely feeble. The symptoms are too well known to require description. The causes are supposed to be—diminished energy of the brain, and organic affections of the heart or neighbouring vessels. This has led nosologists to divide syncope into two varieties:—

1. *Occasional* (SYNCOPE OCCASIONALIS, s. ACCIDENTALIS, L.), primitively induced by sudden and violent emotions of the mind, powerful odours, derangement of the stomach or bowels, constrained position of the body, tight-lacing, pressure, loss of blood, debility from disease, &c. This variety is frequently followed by vomiting, and, occasionally, by convulsions or epileptic fits. The recovery is accelerated by the horizontal position, without the head being the least elevated, by which the arterial blood is more vigorously thrown upon the brain, and thereby stimulates it to resume its usual functions. Pungent substances (smelling-bottle, vinaigrette, &c.) may be applied to the nostrils, and cold water sprinkled on the face and chest. In all cases the dress (corset, waist-band, neck-cloth, &c.) should be instantly loosened, and indeed this is the first assistance which should be given, either in syncope or apoplexy. As soon as the patient can swallow, a little brandy-and-water, or wine, or a few drops of ether or spirit of sal volatile, may be given.

2. *Cardiac* (SYNCOPE CARDIACA, L.), arising without any apparent cause, with violent palpitation during the intervals, and altogether of a more formidable character than the preceding. The subsequent treatment must here be directed to the cure or alleviation of the original disease.

FAINTS. The first and last runnings of the whiskey-still. The one is technically termed the 'strong faints,' the other, the 'weak faints.' They are both purified by rectification, &c. See DISTILLATION.

FAITH. Dr. Pereira remarks, that "faith

in the beneficial agency of remedies, and confidence in the skill of the medical attendant, are important adjuvants in the treatment of disease. To them both the physician and empiric owe part of their success."

FAL'LING SICK'NESS. See EPILEPSY.

FAR'CY. See GLANDERS.

FAR'INA. The flour of any species of corn, pulse, tuber, or starchy root. The most important kinds of farina are noticed under their respective heads. The following dietetic articles of a farinaceous character are extensively advertised:—

BAKER'S ALIMENTARY COMPOUND. Fine flour (pastrycook's), 2 parts; finely ground rice, 1 part.

BASTER'S COMPOUND FARINA. Wheat flour, 14 oz.; white sugar, 2 oz.

BRADEN'S FARINACEOUS FOOD. Similar to Hard's (*below*).

BRIGHT'S NUTRITIOUS FARINA. Rice flour and potato starch, equal parts.

BRIGHT'S BREAKFAST POWDER. Chocolate, 1 part; nutritious farina (Bright's) 2 parts.

BULLOCK'S SEMOLA. Wheat flour, from which a portion of the starch has been removed, so as to leave an excess of gluten.

DENHAM'S FARINACEOUS FOOD. Wheat flour, 3 parts; barley meal, 1 part; the mixture is slightly baked, and again ground and sifted. Said to be slightly laxative.

DURYEA'S MAIZENA. Indian corn starch prepared for food.

GARDINER'S ALIMENTARY PREPARATION. Pure rice flour, very finely ground.

HARD'S FARINACEOUS FOOD. Wheat flour, slightly baked, and resifted.

KINGSFORD'S OSWEGO PREPARED CORN. An excellent preparation of Indian corn.

LEATH'S ALIMENTARY FARINA. Wheat flour (baked), with some sugar, Indian corn meal, and tapioca. According to some, it also contains potato starch.

MAIDMAN'S NUTRITIOUS FARINA. Potato starch tinged with beet-root or other pink colouring matter.

PLUMBE'S FARINACEOUS FOOD. South-sea arrow-root, with about 1-3rd its weight of pea flour.

POLSON'S CORN FLOUR. The starch of Indian corn or maize prepared with great care. It is much used as a substitute for arrow-root, and for custards, puddings, &c.

SMITH'S NURSING FARINA. Equal parts of baked wheat flour and rice flour.

Obs. Many of the above compounds are deficient in the nitrogenous elements of nutrition, and all of them nearly destitute of the mineral and saline matters which are absolutely necessary to the formation of the bones and tissues, and the support of the body in health, and are consequently utterly unsuitable as an exclusive article of diet, especially for

young children. Unfortunately, it has been too much the fashion of medical men of late years to recommend these compounds, and even to furnish testimonials as to their excellence, apparently relying solely on the representation of their proprietors or vendors. We deem it, however, to be a public duty to caution parents and nurses against their injudicious use. As mere adjuvants or auxiliaries, when the natural food supplied by the mother may be insufficient for the nutrition of the infant, some of them may doubtless be of value; but in all other cases they should be largely combined with pure cow's milk, beef tea, meat broths or gravies, eggs, or other substances rich in the nitrogenous and saline elements of nutrition.

FARMING. The business or management of a FARM. Formerly farming was looked upon as a profession easily understood, and successfully pursued only by an empiric. It is now, however, regarded in a different light, and the farmer, to succeed, not only requires perseverance and observation, but also a sound knowledge of natural sciences. See AGRICULTURE, BUTTER, CHEESE, IMPLEMENTS, MANURES, SOILS, &c.

FASTING. See ABSTINENCE.

FAT. *Syn.* ADEPS, *L.* The fat of animals is a concrete oil contained in the cellular membrane of their bodies, more especially round the kidneys, in the folds of the omentum, at the base of the heart, upon the surface of the intestines, and among many of the muscles. Fat varies in consistence, colour, and odour, with the animal from which it is obtained. That of the carnivora is usually soft and rank-flavoured; that of the ruminantia solid and nearly scentless. It is generally whitest and most copious in the well-fed young animal, and yellowish and more scanty in the old. That under the skin and surrounding the kidneys (suet) is also more solid than that in the neighbourhood of the movable viscera. In the cetacea, or whale tribe, the fatty secretion assumes the form of oil. These variations in consistency depend upon the relative proportions of solid stearin and liquid olein present in the fat.

The vegetable fats are found in various parts of certain plants, but are generally most abundant in the seeds. They are extracted by simple pressure or else by boiling. Two kinds of vegetable fat, namely, palm-oil and coconut oil, are extensively employed in the useful arts.

All fats are lighter than water. They are all soluble in ether, benzole, and turpentine, and may be mixed with each other in any proportion.

In former times the fats of many animals were employed in pharmacy, but at present those principally used are lard and suet. In perfumery, in addition to these, beef marrow and bear's grease are employed. For both these purposes the crude material is cut into

small pieces, and freed as much as possible from all extraneous membranes; after which it is placed in a boiler with water, and heated until it is completely fused, when the whole is strained, and allowed to cool very slowly. By this means a cake of cleansed fat is obtained, which may be readily separated from any adhering water.

Fats and the fat oils are best preserved by being run into glazed jars, and secluded from the action of the air. A little benzoic acid or gum-benzoin, dissolved in them by heat, will generally prevent, and in all cases greatly defer, the accession of rancidity. We introduced this method into the laboratory in our early days of manipulation, and ourselves, and others to whom we have made it known, have since employed it with undeviating advantage in the manufacture of cerates, ointments, and other preparations containing fatty matter or the fixed oils. It has been shown by Dr. Griesler that nitric ether, and its alcoholic solution, act in the same manner. A few drops are not only sufficient to prevent rancidity, but, it is said, will even destroy the disagreeable odour of rancid fat. When heated to remove the alcohol, they immediately become bright, clear, and scentless. See OIL, GLYCERIN, OLEIN, PALMITIN, STEARIN, TALLOW, &c., also *below*.

FAT'TY ACIDS. In chemistry, compounds having acid properties derived from the various fats and oils. The radicals of these acids exist in the natural fats combined with a base called glyceryl. When fats are saponified by an alkali, stearate, palmitate, and oleate of potassa or soda, as the case may be, are produced and glycerin is set free. On decomposing either of these compounds with sulphuric acid a sulphate of the alkali is formed, and the fatty acid is precipitated. Some of the fatty acids, as stearic, cerotic, palmitic, and lauric, are solid at ordinary temperatures; others, as oleic, are liquid. The hard fatty acids are extensively used as candle materials, being superior in every respect to the natural fats from which they are derived.

FAT'TENING. Until comparatively a recent date, the plan used to fatten domestic animals was to prevent their taking exercise, and to gorge them with food. The excessive fat produced by these means was, however, found to be far from wholesome, and was less delicate than that arising in the natural way. This system was therefore gradually abandoned in favour of the present one, which consists in supplying the animal with abundance of wholesome food, and with the means of taking exercise, as far as the disposition or feelings dictate. Hence the farmers "in the most enlightened districts, such as Berwickshire, East Lothian, &c., instead of tying up their fattening cattle in stables like horses, and placing their food before them, put two or three together in small yards with sheds attached, in

which they can run about, eat when they choose, and take shelter from the rain, or cold, or the sun, at pleasure, under the open shed. Swine are treated in the same manner, and also spring lambs that are fattened for the market. Poultry are no longer kept in coops and crammed, or rabbits in hutches; but the former are allowed to take exercise in fields sown with various herbs, and the latter are kept in a species of artificial warren, where they can take exercise by burrowing." (London.)

FEAR. Although fear is a depressing and debilitating emotion, and sometimes acts prejudicially on the health, it frequently acts as a curative or preventive of disease. It is a well-known fact that females who are the most faint-hearted and desponding during the period of their sex's trial, generally experience a more rapid convalescence than those who are more confident and resolute. During the raging of an epidemic fear generally induces temperance, cleanliness, and the adoption of other precautions which tend powerfully to prevent disease. Boerhaave, according to Pereira, is said to have prevented the occurrence of epileptic attacks (brought on by the sight of a person falling down in a fit in the sight of the hospital patients), by directing a red-hot iron to be applied to the person who should next be affected.

FEATHERS. Ostrich feathers are those most esteemed as articles of personal decoration, and goose feathers for beds; but the feathers of other birds are commonly used for both purposes.

Feathers are prepared for ornamental purposes by scouring them with white soap-and-water (1 oz. to the pint), used hot; they are next well rinsed in several successive portions of pure water, and after being drained and shaken, are, lastly, passed through water slightly blued with pure indigo, and dried out of the dust. When dry, the ribs are generally rubbed with a piece of glass, having a curved notch in it, for the purpose of increasing their pliancy, and the filaments are curled by drawing them between the edge of a blunt knife and the ball of the thumb of the hand which holds it.

Feathers, Bleaching of:—

A new trade has sprung up within the past ten years, by which black, brown, or grey feathers are bleached sufficiently to enable them to be dyed any required colour.

The process is as follows:—The feathers are first thoroughly washed with soap-and-water, to free them from any oil they may contain. They are next transferred to a bath composed of bichromate of potash dissolved in water, to which has been added a few drops of nitric or sulphuric acid. In this bath they rapidly lose their black, brown, or grey colour, and become almost white. On being removed from this bath they are well rinsed in water, and are then fit to be dyed, even the most delicate

colour. Great care is required in the process, as the flue of the feather is apt to be destroyed, if kept too long in the bath. A bleached feather may be readily known by the yellow colour of its stem.

Other methods have been adopted, such as a bath of chloride of lime or sulphurous acid, &c., but the bichromate bath gives the best results.

BLACK. By immersion for 2 or 3 days in a bath (at first hot) of logwood, 8 parts, and copperas or acetate of iron, (about) 1 part.

BLUE. With the indigo vat.

BROWN. By any of the brown dyes for silk or woollen.

CRIMSON. A mordant of alum, followed by a hot bath of brazil wood, and afterwards by a weak one of cudbear.

PINK or ROSE. With safflower and lemon juice.

PLUM. The red dye, followed by an alkaline bath.

RED. A mordant of alum, followed by a hot brazil-wood bath.

YELLOW. From an alum mordant, followed by a bath of tumeric or weld. Other shades may be obtained by a mixture of the above dyes.

Feathers may also be dyed by simple immersion, for two or three minutes, in a bath of any of the aniline colours.

Goose feathers for BEDS are generally PURIFIED by simply exposing them to the sun or in a stove until perfectly dry, and then beating them to remove loose dirt. When carelessly collected and dirty, they are sometimes first cleansed with lime water, or, better still, with a weak solution of carbonate of soda, or water to which a little solution of chloride of lime has been added; after which they are rinsed in clean water, and dried or stove-d as before. Old feathers are cleansed or purified in the same way.

FEBRIFUGES. *Syn.* FEBRIFUGA, L. In pharmacy, substances or agents which cure or alleviate fever. The term is more particularly applied to medicines used against the ague, as CINCHONA BARK and ARSENIOUS ACID, and their preparations. The extreme value of cold water, as a drink in ardent fever, has been known in all ages. In 1723 Dr. Hancock published a work entitled—'Febrifugum Magnum, or Common Water the best Cure for Fevers, and probably for the Plague,' which in a short time ran through several large editions, but appears to have been overlooked by the hydropaths of the present day.

FECULA. *Syn.* FECULA, L. The matter which subsides from cold water in which bruised or rasped vegetable substances have been washed. The fecula obtained from the seeds of the cereals and leguminosae, and from tuberous or bulbous roots, consists of nearly pure STARCH. In some cases the starch is

associated with the green colouring matter (CHLOROPHYLL) and the narcotic principles of the vegetables which yield it. The green fecula obtained by straining the expressed juices of the leaves and herbaceous parts of plants is of this character.

The fecula of all the amylaceous roots, rhizomes, and tubers, may be easily obtained, on the small scale, by rasping them, pressing, and working the pulp in cold water, and after straining the resulting milky liquid through a hair sieve, allowing it to settle. The sediment may be again washed by diffusion through clean cold water, and must be, lastly, collected, and dried out of the dust, and, without artificial heat.

The fecula of narcotic plants for medicinal purposes is obtained by allowing the expressed juice to repose for 24 hours, and then decanting the clear portion, and drying the residue. Sometimes heat is employed. See ARROW-ROOT, STARCH, &c.

FEET (The). To preserve the feet in a proper condition, they should be frequently soaked, and well washed in warm or tepid water. The nails of the toes should be pared, soaked, and well washed in warm or tepid water. The nails of the toes should be pared, to prevent their becoming inconveniently long, and from growing into the flesh. Many persons suffer severely from **TENDER FEET**. This generally arises from the use of thin cotton or silk stockings, and boots or shoes that are either too tight or stiff, or not sufficiently porous to permit of the escape of the perspiration. Waterproof boots and shoes which are also air-tight (as those of gutta percha and India rubber), are common causes of tender feet, and even of headaches, dyspepsia, and apoplexy. The best treatment of tender feet is the immediate adoption of worsted stockings or socks, and light, easy shoes of buckskin, goatskin, or some other equally soft kind of leather. It is highly necessary for the preservation of health to preserve the feet **DEX**; persons who are, therefore, exposed to the wet, or who are frequently passengers through the public streets in bad weather, should regard sound and good boots and shoes as of the first importance. In fact, in a hygienic point of view, a wet back should be less shunned than wet feet. Many persons frequently experience **EXTREME COLDNESS** and **NUMBNESS** OF THE **FEET**. The best and most natural remedy for this is active exercise or friction, the former being always adopted when possible. In such cases the use of warm woollen stockings is absolutely necessary, and the debilitated and aged may advantageously keep them on throughout the night, or at all events until the feet acquire a comfortable degree of warmth. The **DISAGREEABLE ODOR** which is evolved by the feet of some individuals in hot weather may be removed by the observance of extreme cleanliness, and by occasionally soaking the feet in warm water, to which a small quantity of

chloride of lime or sal ammoniac has been added.

DISTORTION OF THE FEET is not uncommon in childhood, being sometimes congenital, but as frequently the result of weakness or bad nursing. "A child with its feet turned inwards is called **VARUS**; when they are turned outwards it is styled **VALGUS**. The proper use of bandages, early applied, will generally correct these deformities; but if they be neglected in infancy they become incurable." (Med. Lex.) **CLUB FOOT**, of which there are several varieties, may also be frequently relieved by a simple surgical operation.

FELTING. This is a process by which various species of fur, hair, and wool, are blended into a compact texture, in many respects resembling cloth. It depends on the peculiar anatomical construction of these substances enabling them to interlace and intertwine with each other, by which they become permanently matted together. Felt was formerly chiefly employed for hats. It is now commonly used for mill-bands, filters, &c.; and when varnished or japanned, or saturated with asphalt or bitumen, as a durable substitute for japanned leather, and for roofing.

FENNEL. *Syn.* **FENICULUM** (Ph. L.), *L.* The fruit (seed) of *Feniculum dulce*, or sweet fennel; the oil distilled from the fruit (**OIL OF FENNEL**; **OLEUM FENICULI**, *L.*) as well as a distilled water (**FENNEL WATER**; **AQUA FENICULI**, *L.*), are official in the Pharmacopoeias. They are stimulant and carminative; but are now seldom employed.

FENUGREEK. The seeds of *Trigonella Fenum Græcum*. Resolvent and stomachic. The seeds dye yellow; formerly roasted for coffee; now chiefly employed in veterinary medicine.

FERMENT. *Syn.* **FERMENTUM**, *L.* A substance which induces fermentation. According to one view ferments are compounds whose decomposition proceeds simultaneously with that of the body undergoing metamorphosis. They all contain albuminous or azotised principles, which in a moist state putrefy and suffer decomposition. According to Pasteur, however, fermentation is excited by living organisms—fungi and infusoria. See **FERMENTATION** and **YEAST**.

FERMENTATION. *Syn.* **FERMENTATIO**, *L.* In chemistry, a peculiar metamorphosis of a complex organic substance, by a transposition of its elements under the agency of an external disturbing force. Fermentation, according to the theory proposed by Liebig, is a metamorphosis, by which the elements of a complex molecule group themselves so as to form more intimate and stable compounds. It is excited by the contact of all bodies the elements of which are in a state of active decomposition or fermentation. "In nitrogenised substances of a very complex constitution, putrefaction or fermentation is spontaneously established when

water is present, and the temperature sufficiently high, and it continues till the original compounds are wholly destroyed. Substances destitute of nitrogen, on the contrary, require, in order to their undergoing this metamorphosis, the presence of a nitrogenised substance, already in a state of putrefaction (fermentation)." (Wiebig.) The substances which promote this change are termed FERMENTS, and among these the principal are gliadin, gluten, vegetable albumen, and all nitrogenous substances in a state of spontaneous decomposition or fermentation. "It is imagined that when these substances, in the act of undergoing change, are brought into contact with neutral ternary compounds of small stability, as sugar, the molecular disturbance of the body, already in a state of decomposition, may be, as it were, propagated to the other, and bring about the destruction of the equilibrium of forces to which it owes its being. The complex body, under these circumstances, breaks up into simpler products, which possess greater permanence." (Fownes.) YEAST, the ferment most commonly employed for inducing the vinous fermentation, is such a substance in an active state of putrefaction, and whose changes are in continual motion. Putrefying animal substances are equally capable of exciting the same action. "If we add to a solution of pure sugar an albuminous substance, caseous or fleshy matter, the development of yeast becomes manifest, and an additional quantity of it is found at the end of the operation. Thus, with nourishment, ferment engenders ferment. It is for this reason that a little fermenting must, added to a body of fresh grape juice, excites fermentation in the whole mass. These effects are not confined to alcoholic (vinous) fermentation. The smallest portion of sour milk, of sour dough, or sour slice of beet-root, of putrefied flesh and blood, occasions like alterations in fresh milk, dough, slice of beet-root, flesh, and blood. But finally, and which is a very curious circumstance, lose are put into a liquid containing any fermenting substance another in a sound state, the latter would suffer decomposition under the influence of the former. If we place urea in the presence of beer-yeast, it experiences no change; while if we add it to sugar-water in both fermenting state, the urea is converted into bicarbonate of ammonia. We thus possess two modes of decomposition; the one direct, the other indirect." (Ure.)

A very remarkable circumstance connected with fermentation is that it is always accompanied by the development of microscopic living organisms—fungi and infusoria. "So constantly, indeed, is this the case, that many chemists and physiologists regard these organisms as the existing cause of fermentation and putrefaction; and this view appears to be corroborated by the fact that each particular kind of fermentation takes place most readily in contact with a certain living organisms."

(Fownes.) Thus the vinous or alcohol-producing fermentation is accompanied, or caused, by two fungi, called *Torula cerevisia* and *Penicillium glaucum*; the acetous or vinegar-producing fermentation by *Torula aceti*; the lactic fermentation (souring of milk) by *Penicillium glaucum*; &c. But whether fermentation is caused by a vital act of the fungi themselves, or by a peculiar state of the albuminous matter in which it occurs, is still an open question, owing to the many difficulties which surround investigations of this nature.

Fermentation or putrefaction differs from EREMACAUSIS or decay, in being limited to changes occurring in and beneath the surface of water, the effect being a mere transposition of elements, or a metamorphosis of the organic body. EREMACAUSIS, on the other hand, refers to the decomposition of moist organic matter, when freely exposed to the air, by the oxygen of which it is gradually burned and destroyed, without any sensible elevation of temperature. Although the presence of oxygen is essential to the commencement of this change, whenever fermentation is freely established it is no longer necessary, as it proceeds without the aid of any other substance external to the decomposing body, unless it be water or its elements. The entire absence of the exciting causes—warmth, air, and moisture—leaves even those substances which under ordinary circumstances are most liable to change, in a state in which they may remain for an almost indefinite period without perceptible alteration. Thus, animal substances in a frozen or dry state do not undergo decomposition, nor does a solution of sugar or the juice of grapes (must) when perfectly excluded from the air; but on the mere exposure of these substances to warmth, moisture, or atmospheric air, putrefaction or fermentation immediately commences. Remove the cork from the bottle of 'capillaire' on the parlour sideboard, or pierce the skin of one of the grapes on the dessert table with a needle, and these bodies, which would have otherwise suffered no change for weeks, or even months, will soon exhibit symptoms of spontaneous decomposition. The knowledge of this fact has been practically applied to the preservation of animal and vegetable substances for food. Even the most putrescible of these may be preserved for an unlimited period by enclosure in metallic cases, or glass bottles, from which the air has been completely removed and excluded.

The important duties which fermentation or putrefaction performs in the economy of our globe, and in several of the arts of life and civilisation, have long rendered the development of its principles an object of the highest interest and importance, both in a scientific and practical point of view. In its most extended sense, this subtle process of nature, though occasionally productive of injurious

effects, may be regarded as one of the most necessary and beneficial with which we are acquainted. Like the labours of a scavenger, it speedily removes from the surface of our globe those matters which would otherwise remain for some time without undergoing decomposition. It either dissipates in air, or reduces to more fixed and useful forms of matter, those organic substances which, by their presence, would prove noxious, or, at all events, useless to the animal and vegetable kingdoms. It is the giant power that cleans the Augean stable of nature, at the same time that it provides some of the most esteemed articles of utility and luxury for the well-being and enjoyment of man.

Chemists have distinguished fermentation into different varieties, which, in general, are named after the more important products of its action. Of late years, the number of these varieties has been greatly increased by the extension of the term to several operations besides those formerly included under it. See ACETIFICATION, BREAD, PUTREFACTION, BREWING, &c.

FERN (Male). *Syn.* MALE SHIELD FERN; **FILIX MAS**, **RADIX FILICIS**, L. The root (rhizome) of the *Lasireæ Filix-mas*, or male fern. It is bitter, astringent, or vermifuge. —*Dose.* 1 to 3 drs., in powder, or made into a decoction, repeated for 3 or 4 days, and followed by a purge. It is chiefly given in tape-worm. In Switzerland it is deemed almost infallible, but has proved less successful in these countries. See OILS.

FERRICYANIDE. *Syn.* **FERRIDCYANIDE**, **FERRIDCYANURET**. A compound of ferricyanogen with a metal or other basic radical. The **FERRICYANIDE OF POTASSIUM**, or 'RED PRUSSIAN OF POTASH,' as it is often improperly called, is a well-known example. The ferricyanides of AMMONIUM and the ALKALIES and ALKALINE EARTHS are soluble; those of most of the METALS, insoluble. See *below*.

FERRICYAN'OGEN. *Syn.* **FERRIDCYANOGEN**, **FERRIC-CYANOGEN**. The peculiar salt-radical which exists in the so-called red prussiate of potash. It is isomeric with ferrocyanogen, from which it differs in capacity of saturation (being tribasic), and in the behaviour of its compounds with solutions of the metals. It has not been isolated. See **POTASSIUM (Ferricyanide)**.

FERROCYANIDE. *Syn.* **FERROCYANURET**, **PRUSSIANE**; **FERROCYANIDUM**, **FERROCYANURETUM**, L. A compound of ferrocyanogen with a metal or other basic radical. The principal substance of this kind is the **FERROCYANIDE OF POTASSIUM** or 'YELLOW PRUSSIAN OF POTASH,' as it is often called. See the respective bases—AMMONIUM, POTASSIUM, SODIUM, &c., and *below*.

FERROCYAN'OGEN. *Syn.* **FERROCYANOGENIUM**, L. A bibasic salt-radical, composed

of the elements of 3 equivalent GEN and 1 equivalent of the me^s been has never been isolated. It un- various bases to form FERROCYANAMMON, CYANOGEN, HYDROFERROCYANICAL, but &c. or bad

FERRUGO. [L.] Rust of ironed in (Sesquioxide). turned

FEVER. *Syn.* **FEBRIS**, proper use pathology, a condition characteristically cor- appetite, thirst, languor, debility, lected ness to move, accelerated pulse, ind. (Lex.) of surface, and general disturbance of a. functions. A large number of diseases which all or some of these symptoms appe are called FEVERS. They have been divid by nosologists into intermittent (**INTERMITTENTES**), remittent (**REMITTENTES**), and continued fevers (**CONTINUES**). The first of the are generally known as AGUES; the seco differ from agues in there being one or mo marked exacerbations and remissions of t symptoms, every 24 hours, but without a entire intermission. The terms 'hectic,' 'n- vus,' 'bilious,' 'inflammatory,' &c., have al been applied to particular varieties of fever and names indicative of certain cutaneous : pearances connected with them have been giv to others; as 'scarlet' fever, 'yellow' fev &c.

The usual symptoms of incipient fever (brile symptoms) are—chilliness (varying fr a simple shiver to a sensation of cold wat running down the back), a quick pulse, h and dry skin or flushing, languor, often evince by yawning, depression of spirits, alternate fit of shivering and heat, hurried and uneasy re spiration, flying pains in various parts of th body, as the head, back, and loins; loss o appetite, nausea or vomiting, dry mouth, furre tongue, costiveness, urine small in quantity and usually of a deep colour, &c. When an of these symptoms appear, their progress ma often be arrested by the timely exhibition o an emetic, followed by a saline purgative, an diaphoretics; at the same time promoting th action of these remedies by a low diet an drinking copiously of diluents, and careful avoiding animal food, spirits, fermented liquors or anything at all stimulant. Whenever symp toms of fever become established, medical ad vice should be sought and implicitly followed In parts where it cannot be obtained the treat ment recommended under AGUE, INFLAMMA TION, REMITTENT FEVER, and TYPHUS, may be followed with advantage.

In visiting or attending persons labouring under fevers, it is advisable to avoid immediate contact with them or their clothing, or standing near them in such a position as to inhale their breath, or the effluvia evolved (in some cases) by their bodies; and when remaining for some time in the apartment, it is preferable to sit or stand near the fireplace, or between the window and door, as such parts of the room are generally better ventilated than the

other portions. The greatest purifier of the atmosphere of a sick chamber is a good fire, because it occasions a continual current of the impure air up the chimney, and a corresponding influx of fresh air from without. Chloride of lime, or chloride of zinc, or their solutions, are also good purifiers. The first, however, should not be used in quantity, as the evolved chlorine might in that case impede the respiration of the patient. It is also advisable to avoid entering the room of a patient labouring under contagious diseases of any class when the stomach is empty, or the spirits depressed; and it has been recommended to clear the mouth of the saliva immediately after quitting the chamber. See **ABLUTION**, &c.

FIBRIN. *Syn.* **FIBRINE.** An azotized substance, forming the coagulable portion of fresh-drawn blood, and the principal constituent of the muscular or fleshy parts of animals. It is eminently nutritious, and capable of yielding in the animal body albumen, caseine, and the tissues derived from them. (Liebig.)

Prep. Fibrin is easily obtained in a nearly pure state, by agitating or beating newly drawn blood with a small bundle of twigs, when it attaches itself to the latter under the form of long reddish filaments, which become white when worked with the hands in a stream of cold water. It may also be procured by washing the coagulum of blood, tied up in a cloth, in cold water, until all the soluble portions are removed. A small quantity of fat, which it still contains, may be removed by digesting it in ether.

Prop., &c. Pure fibrin occurs as long, white, elastic filaments, which are tasteless, odorless, and insoluble in both hot and cold water. Wetted with acetic acid, it forms, for a time, a transparent jelly, which is only soluble in pure water. Very dilute solutions of the caustic alkalies dissolve it completely, and the new solution greatly resembles liquid albumen. Dried by a gentle heat, it is about 80% of water.

U. *Syn.* **FICUS** (B. P., Ph. L. E. & D.), **FIGA**, **CARICE FRUCTUS**, L. The figs of commerce are the dried fruit of *Ficus Carica*, the common fig-tree. They are demulcent, emollient, laxative, and pectoral. Roasted and boiled figs are occasionally employed as poultices for gumboils and other affections of the mouth.

FILBERT. *Syn.* **FILBERD.** The fruit of the cultivated hazel or nut-tree (*Corylus Avellana*). Filberts are distinguished from common nuts by their lengthened figure and larger size. The best are imported from Spain.

FILES. The manufacture of these articles do not come within the limits of this work. It may, however, be useful to mention that **FILES**, **FLOATS**, and **RASPS**, which 'cut dull' from age, dirt, or being much worn, are greatly improved by being kept wet, immersed

in water for some hours, or even for a day or two.

FILTER. *Syn.* **FILTRUM**, L. An instrument or apparatus for straining or filtering liquids.

FILTERING POWDERS. *Prep.* 1. Fuller's earth washed, dried without heat, and reduced to coarse powder.

2. From pipe clay or potter's clay, as the last. Both the above are used to filter and bleach oils.

3. From clay or fuller's earth, 1 part; fine siliceous sand, 2 parts; the two are separately washed, after which they are drained, and mixed together, and dried, as before. *Used* for **GLUTINOUS OILS**.

4. Granulated animal charcoal, sifted and fanned from the dust. *Used* to filter and bleach **SIRUPS** and **VEGETABLE SOLUTIONS**.

Obs. Filtering powders are prepared of several degrees of coarseness, and should be chosen with reference to the degree of fluidity of the liquid to be filtered through them. In no case should they be reduced to fine powder, as not only is the process of filtration thereby rendered unnecessarily tedious, but in some cases (as when charcoal dust is mixed with glutinous vegetable solutions and syrups) the filtrate carries off a portion of the powder, which can afterwards be separated from it only with considerable difficulty. See **CHARCOAL**, **FILTRATION**, **OIL**, &c.

FILTRATION. *Syn.* **FILTRATIO**, L. The separation of liquids from substances mechanically suspended in them, by passing them through media having pores sufficiently fine to retain or keep back the solid matter. Filtration is one of the most common and useful of the chemo-mechanical operations of the arts, and its successful performance in an economical and expeditious manner is therefore a matter of the highest importance in the laboratory, and, indeed, in almost every branch of human skill and industry, in which liquids are employed. Simple in principle, and apparently easily performed, it is, nevertheless, one of those operations which require no less of care than of tact and experience to conduct it with certainty and success. The losses sustained in the laboratory, by defective manipulation in this particular, often exceed those arising from ignorance and accidents in every other department conducted in it.

Filtration is usually resorted to for the purpose of freeing liquids from feculence, dirt, and other foreign matter, and for obtaining them in a clear or transparent state; but, in some cases, it has for its object the collection of the suspended substances, as precipitates, &c., and in others both these intentions are combined. The word 'filtration' is absolutely synonymous with 'straining,' but in the language of the laboratory it is usually applied to the operation of rendering liquids transparent, or nearly so, by passing them through fine media, as filtering paper, sand, and the like; whilst the

term 'straining' is employed to designate the mere separation of the grosser portion, by means of coarse media, flannel, horsehair cloth, &c., through which they flow with considerable rapidity. Filtration is distinguished from 'clarification' by its mere mechanical action, whereas the latter operates by depuration, or the subsidence of the suspended substances or fæces, arising from their gravity being naturally greater than the fluid with which they are mixed, or being rendered so by the application of heat, or by the addition of some foreign substance.

The apparatus, vessels, or media, employed for filtration, are called 'FILTERS,' and are technically distinguished from 'STRAINERS' by the superior fineness of their pores.

Both strainers and filters act on the same principles as the common sieve on powders; they all, in like manner, retain or hold back the coarser matter, and permit the liquid or smaller and more attenuated particles to pass through. The term 'medium' (plural 'media') is applied to the substance or substances through the pores of which the liquid percolates.

The forms of filters, and the substances of which they are composed, are various, and depend upon the nature of the liquids for which they are intended. On the small scale, funnels of tin, zinc, copper, wedgwood-ware, earthenware, glass, or porcelain, are commonly employed as the containing vessels. (See *engr.*)

The filtering medium may be any substance of a sufficiently spongy or porous nature to allow of the free percolation of the liquid, and whose pores are, at the same time, sufficiently small to render it limpid or transparent. Unsized paper, flannel, linen, calico, cotton wool, felt, sand, coarsely powdered charcoal, porous stone, or earthenware,

and numerous other substances of a similar kind, are employed for this purpose.

For many liquids that filter easily, and in which the suspended matter is of a coarse and porous nature, it is often sufficient merely to place a little cotton wool or tow, or a small piece of sponge, in neck of the funnel, as at (a) in the above engr.; but such an apparatus, from the small extent of the filtering surface, acts either slowly or imperfectly, and soon gets choked up. Filters of unsized paper are well suited for all liquids that are not of a corrosive or viscid nature, and are universally employed for filtering small quantities of liquids in the laboratory. A piece of the paper

is taken of a size proportionate to the quantity

of the liquid to be filtered, and is first doubled from corner to corner into a triangle (see *engr.*), which is again doubled into a smaller triangle, and the angular portion of the margin being rounded off with a pair of scissors, it constitutes a paper cone, which is placed on a funnel of proportionate capacity, and is then nearly filled with the liquid. A piece of paper so cut, when laid flat upon the table, should be nearly circular. Filtering paper is now sold ready cut in circles of various sizes, which simply require doubling for use. Another method of forming a paper filter, preferred by some persons, is to double the paper once, as above (see fig. 2), and then to fold it in a similar way to a fan, observing so to open it and lay it on the funnel that a sufficient interval be left between the two to permit of the free passage of the filtered liquid on its descent towards the receiver. The 'plaited filter,' as thus formed, is exceedingly useful for general purposes; it exposes the entire surface of the paper to the liquid, and allows filtration to proceed more rapidly than a 'plain filter' does. (See *engr.*)

In reference to funnels, it may be remarked, that those employed for filtering rapidly should be deeply ribbed on the inside, or small rods of wood or glass, or pieces of straw, or quills, should be placed between them and the paper. The neck or tubular part of the funnel should, in like manner, be deeply ribbed or fluted on the outside, to permit of the free passage of the air, when it is placed in a narrow-mouthed bottle or receiver. When this is not the case, filtration proceeds but slowly, and the filtered liquid is apt to be driven up the outside of the neck of the funnel by the confined air, and to be continually hissing and flowing over the mouth of the vessel. The breadth of a funnel, to filter well, should be about three fourths its height, reckoning from the throat (a). When deeper, the paper is liable to be continually ruptured, from the pressure of the superincumbent fluid; and when shallower, filtration proceeds slowly, and an unnecessarily large surface of the liquid is exposed to the atmosphere, and is lost by evaporation. To lessen this as much as possible, the upper edge of the glass is frequently ground perfectly smooth, and a piece of smooth plate-glass is laid thereon. When paper filters are of large dimensions, or employed for aqueous fluids that rapidly soften the texture of the paper, or for collecting heavy powders, or metallic precipitates, it is usual to support them on linen or calico, to prevent their breaking. This is best done by folding the cloth up with the paper, and cutting the filter out of the two, in the same way as would be done with doubled paper, observing so to place it in the funnel that the paper and calico may remain close together, especially towards the bottom.

The filtration of small quantities of liquid, as in chemical experiments, may often be conveniently performed by merely placing the paper on the circular top of a recipient (see *engr.*), or on a ring of glass or earthenware laid on the top of any suitable vessel. A filter of this kind that will hold one fluid ounce will filter many

ounces of some liquids in an hour.

Good filtering paper should contain no soluble matter, and should not give more than $\frac{1}{100}$ to $\frac{1}{200}$ of its weight of ashes. The soluble matter may be removed by washing it, first, with very dilute hydrochloric acid, and secondly, with distilled water.

For filtering a larger quantity of a liquid than can be conveniently managed with a funnel, and also for substances that are either too viscid or too much loaded with feculence to allow them to pass freely through paper, conical bags made of flannel, felt, tweeled cotton cloth or Canton flannel, linen or calico, and suspended to iron-hooks by rings or tapes, are commonly employed. The first two of the above substances are preferable for saccharine, mucilaginous, and acidulous liquors; the third for oily ones; and the remainder for tinctures, weak alkaline lyes, and similar solutions. These bags have the disadvantage of sucking up a considerable quantity of the fluid poured into them, and are therefore objectionable, except for large quantities, or when they are to be continued in actual use as filters for some time. On the large scale, a number of them are

usually worked together, and are generally enclosed in cases to prevent evaporation, and to exclude dirt from the filtered liquor that trickles down their sides. These arrangements will be noticed further on.

A simple mode of filtering aqueous fluids, which are not injured by exposure to the air, is to draw them off from one vessel to another, by means of a number of threads of loosely twisted cotton or worsted, arranged in the form of a syphon. (See *engr.*) The little cotton

rope at once performs the operations of decantation and filtration. This method is often convenient for sucking off the water from a small quantity of a precipitate.

When solid substances, as porous stone or earthenware, are used as the media for filtration, vessels of metal, wood, or stone-ware, are employed to contain them and the supernatant liquid. In these cases the filtering medium is usually arranged as a shelf or diaphragm, and divides the vessel into two com-

partments; the upper one being intended to contain the dirty liquid, and the under one to receive the same when filtered. Such an apparatus is set in operation by merely filling the upper chamber, and may at any time be readily cleared out by reversing it, and passing clean water through it in an opposite direction. Small arrangements of this kind, intended to be screwed on to the water supply-pipe by either end, and which answer the purpose intended in the most satisfactory manner, have been manufactured and vended under the name of 'REVERSIBLE' or 'SELF-CLEANING FILTERS.' When pulverulent substances, as sand, coarsely powdered charcoal, &c., are employed, a similar arrangement is followed; but in this case the shelf or diaphragm must consist of any convenient substance pierced with numerous holes, over which must be placed, first a stratum of coarse pebbles, next some of a finer description, and on this a proper quantity of the sand, charcoal, or other medium. Over the whole should be placed another layer of pebbles, or a board or plate of metal or earthenware, pierced with a number of holes, to allow the liquid to be poured into the filter without disturbing its arrangement. Apparatus of this kind, of a permanent description, and arranged for filtering large quantities of liquids, are properly denominated 'FILTERING MACHINES.'

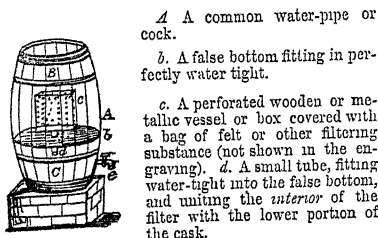

Among the liquids usually submitted to filtration, the following may be mentioned as the principal—water, oils, syrups, tinctures, vegetable juices, infusions, and decoctions.

The filtration of water may now be considered. The water of our wells is presented by nature ready filtered to the hand of man, and often exhibits an admirable degree of transparency and purity. It acquires this state by percolating through the mineral strata of the earth, which deprive it of the organic matter it derives from the soil and subsoil, but, at the same time, it dissolves a portion of the saline and earthy media through which it passes, and hence acquires that peculiar 'hardness' which is constantly found in spring water. On the large scale, this natural system of filtration has been imitated by some of the commercial companies that supply our cities and towns with water. Extensive beds of sand and gravel have been employed, with variable success, as the filtering media; and were it not that filters gradually lose their porosity by the accumulation of the retained matter in their pores, such a method would be excellent. But the great expense of such filters precludes the possibility of frequently cleaning or renewing them, by which means they can alone be kept in an efficient state.

A filter which possesses the advantages of being easily and cheaply cleaned when dirty, and which frees water from mechanical impurities with immense rapidity, may be formed by placing a stratum of sponge between two

perforated metallic plates, united by a central screw, and arranged in such a manner as to permit of the sponge being compressed to any required degree. Water, under gentle pressure, flows with such rapidity through the pores of compressed sponge, that it is said that a few square feet of this substance will perfectly filter several millions of gallons of water daily. This method of filtration has been made the subject of a patent, and has been favorably noticed by the legislature.

A few barrels or hogsheads of water may be easily filtered daily, by the arrangement represented in the engraving.

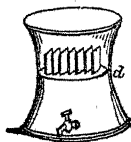

A A common water-pipe or cock.

b. A false bottom fitting in perfectly water-tight.

c. A perforated wooden or metallic vessel or box covered with a bag of felt or other filtering substance (not shown in the engraving). *d.* A small tube, fitting water-tight into the false bottom, and uniting the interior of the filter with the lower portion of the cask.

It is evident that when water is poured into the upper portion, *B*, of a vessel so arranged, it will sink through the filter *c*, and pipe *d*, into the lower chamber *C*, and this filtration will go on as long as the supply continues, and water is drawn from the cock *e*. By uniting the cock *e* with a tank or casks, and by keeping the upper portion *B* always full by means of a ball-cock, a considerable quantity of water may be thus filtered. The advantage of this plan is, that the filter *c* can be always readily got at, and easily cleaned or renewed.

For filtering water on the small scale, and for domestic use, 'alcarazzas,' diaphragms of porous earthenware and filtering-stone, and layers of sand and charcoal, &c., already referred to, are commonly employed as filtering

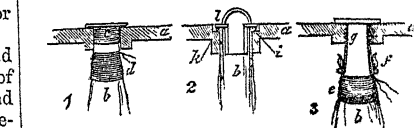

media. The filtering power of porous stone or earthenware may be greatly increased by adopting the arrangement represented in the margin, which consists in making the diaphragm of the shape of a disc (*d*), supporting plates of the same material, the whole forming but one piece. The 'PLATYLITHIC WATER-FILTERS,' which are formed of porous stone cut on this plan, present 200 to 300 square inches of filtering surface. The 'PORTABLE FILTERS,' set up in stone-ware, that are commonly sold in the shops, contain a stratum of sand, or coarsely-powdered charcoal; before, however, having access to this, the water has to pass through a sponge, to remove the coarser portion of the impurities. Among the many new kinds of portable filters now offered for sale are two which claim special notice, viz.,

the 'MOULDED CARBON FILTER,' consisting of: spherical or cylindrical vessel formed of compressed carbon; and the 'SILICATED CARBON FILTER,' in which the medium is a compact substance, formed of animal charcoal and the ashes of Boghead coal.

Oils are filtered, on the small scale, through cotton-wool, or unsized paper, arranged in a funnel; and on the large scale, through long bags, made of tweeled cotton-cloth (Canton flannel). These bags

are usually made about 12 or 15 inches in diameter, and from 4 to 8 feet long (see engr.), and are inclosed in bottomless casings, or bags of coarse canvas about 5 to 6 or inches in diameter for the purpose of condensing a great extent of filtering surface into the smallest possible space.

number of these double bags (from 1 to 50 or 60) are connected with corresponding holes in the bottom of a block-tin or tinned-copper cistern, into which the oil to be filtered is poured. The mode in which these bags are fastened to the cistern is of the utmost importance, as on the joint being close and secure depends the integrity of the apparatus. The methods of doing this are figured in the engraving, which, with the references, will explain themselves, the same letters referring to the same parts of each.

- a.* Bottom of cistern.
- b.* Filtering-bag.
- c.* Screw of the conical nozzle fitting into the cistern.
- d.* Binding cord connecting bag and nozzle.
- e.* Binding cord connecting bag and lower nozzle.
- f.* Bayonet-catch, connecting the lower portion of nozzle fastened to the bag with the upper and fixed part, *g*.
- g.* The thick hem at the top of the bag (purposely enlarged by enclosing a piece of thick cord therein), rests on the shoulders, *k*.
- h.* A metallic cylinder, loosely fitting the hole in the cistern, and over which the top of the bag is drawn before being put into its place; when fitted, as in engraving, it retains the hem *i* securely in its place at the shoulder *k*.

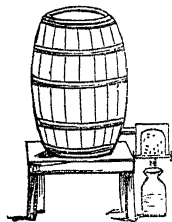

The second of the above arrangement is the least expensive, and certainly the most convenient in practice; and when the cylinder *h* fits the hole closely (allowing for bag), is as safe, or safer, than an ordinary screw.

The bags are surrounded by a wooden screw fitted up with doors for the purpose of keeping

ing off the dust; and the bottom of the apartment is furnished with large steam-pipes, by which a proper temperature may be kept up in cold weather. The use of heat should, however, never be had recourse to when it can be avoided, as although it vastly increases the rate of filtration, the oil so filtered is more apt to become opaque in cold weather than when the process is conducted at the natural temperature of the atmosphere. This is particularly the case with castor oil and sperm oil. In the United States of America, where the latter is consumed in enormous quantities for illumination, the best is always 'winter strained,' as it is popularly called. In practice, it is more convenient to have a number of small cisterns at work (say 50 or 100 galls. each), than one or two larger ones; as any accident that may occur is more easily remedied, and that without stopping the whole operation.

When cotton-cloth bags are employed without being 'creased,' or enclosed in others of canvas, they should not be longer than about 3 or 4 feet, and not wider than about 5 or 6 inches when filled. When larger they are dangerous.

A convenient method of filtering a single cask of oil is, to insert the pipe of a two-way patent filter into the cork-hole, by which means the whole will be filtered as drawn off, without any trouble on the part of the operator. This filter consists of a porous bag stretched over a perforated metallic vessel, nearly the shape and size of the exterior casing, and its edge is tightly screwed between the sides and bottom of

the latter, so as to be quite water-tight. The cock communicates with the interior of the perforated plate and filter, and the supply-pipe with the exterior. By this means the interior chamber, which occupies $\frac{2}{3}$ ths of the vessel, rapidly fills with filtered oil, and continues full as long as any liquor remains in the cask. This arrangement is also well adapted to the filtration of wines, beer, cordials, porter, and various other liquors. It is unequalled in simplicity and usefulness. The same filter may be removed from cask to cask, with the facility of a common cock.

The filtration of SYRUPS is now generally effected on the large scale by passing them through the 'GREASED BAG FILTER' just described. On the small scale, as employed by confectioners and druggists, they are usually passed through CONICAL FLANNEL BAGS. (See page 739.) The filtration of thick syrups is, however, attended with some difficulty, and it is therefore a good plan to filter them in a somewhat dilute state, and afterwards to

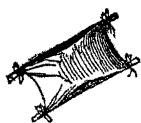

reduce them to a proper consistence by evaporation in clean vessels of tinned copper, by steam heat. Syrups, when filtered in a heated state, run well for a time, but the pores of the fabric rapidly get choked, from the thickening of the syrup and partial crystallization of the sugar, occasioned by the evaporation of the aqueous portion from the surface of the bag. This may be partially prevented by enclosing the bag in a metallic casing. On the whole, clarification is preferable for syrups to filtration, on the small scale. They need only be well beaten up while cold with a little white of egg, and then heated; a scum rises, which must be removed as soon as it becomes consistent, and the skimming continued until the liquid becomes clear. Any floating portions of scum that may have escaped notice are easily removed by running the syrup through a coarse flannel strainer, whilst hot. The most extensive application of the process of filtration in the arts is in the refining of sugars.

TINCTURES and DILUTE SPIRITS are usually filtered, on the small scale, through BIBULOUS or UNSIZED PAPER placed on a funnel; and on the large scale, through thin and fine COTTON BAGS. In general, however, tinctures clarify themselves by the subsidence of the suspended matter, when allowed to repose for a few days. Hence it is the bottoms alone that require filtering; the supernatant clear portion need only be run through a small hair sieve, a piece of tow or cotton placed in the throat of a funnel, or some other coarse medium, to remove any floating substances, as pieces of straw, &c. Spirits which are largely loaded with essential oil, as those of ANISEED, &c., run rapidly through paper or calico, but usually require the addition of a spoonful or two of magnesia before they will flow quite clear. When possible, tinctures, spirits, and all similar volatile fluids, are better and more economically cleared by subsidence or clarification than by filtration, as, in the latter way, a portion is lost by evaporation, and the strength of the liquid is thereby altered.

Vegetable juices should be allowed to deposit their feculous portion before filtration. The supernatant liquid will then be often found quite clear. It is only when this is not the case that filtration should be had recourse to. A small quantity may be filtered through coarse or woollen filtering paper, supported on a piece of coarse calico placed on a funnel; when the quantity is large, one of the CONICAL BAGS before described should be employed. The bottoms from which the clear portion has been decanted should be placed on a separate filter, or else not added until the whole of the other portion has drained through. Vegetable juices are often rendered clear, by simply heating them to about 180° or 200° Fahr., by which their albumen is coagulated; they are also frequently clarified by the addition of a little white of

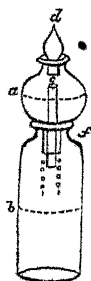

egg and heat, in the same way as syrups. Many of them (as those of hemlock, henbane, aconite, &c.) are greatly injured by heat, and must consequently be filtered, or only simply decanted after repose. In all cases they should be exposed to the air as little as possible, as they rapidly suffer decomposition.

Vegetable infusions and decoctions may be cleared by defecation followed by filtration. The conical bags of flannel before described are usually employed for this purpose. When the liquid is to be evaporated to an extract, they are commonly suspended by a hook over the evaporating pan. A convenient method of straining these fluids, practised in the laboratory, is to stretch a square of flannel on a frame or 'horse,' securing it at

the corners by pieces of string. (See *engr.*) Such a frame, laid across the mouth of a pan, is more easily fed with fresh liquid than a bag, whose mouth is 40 or 50 inches higher. The same purpose, for small quantities of liquid, is effected by laying the flannel across the mouth of a coarse hair sieve. The concentrated infusions and decoctions, being usually weak tinctures, may be filtered in the same way as the latter. (See *above*.) Many vegetable solutions, that from the viscosity of the suspended matter can scarcely be filtered, may be readily clarified with white of egg in the cold, or pass the filter rapidly if a very small quantity of acetic, tartaric, sulphuric, or other strong acid, is previously added.

Corrosive liquids, as the STRONG ACIDS, are filtered through powdered glass, or SILICEOUS SAND, supported on pebbles in the throat of a glass funnel, or through asbestos or gun-cotton placed in the same manner. Charcoal has also been employed for the same purpose, but is not fit for some acids. Strong caustic alkaline lyes are also filtered through powdered glass or sand. Weak alkaline lyes may be filtered through fine calico, stretched across the mouth of a funnel. Many corrosive liquids, as solution of potassa, &c., require to be excluded from the air during filtration. The simplest apparatus that can be employed for this purpose is that figured in the margin:—(a) is a globular bottle fitted with the ground stopper (d), and having a perforated neck (f) ground to the bottle (b); (c) is a small tube, wrapped round with as much asbestos, linen, or calico, as is required to make it fit the under neck of the bottle through which it passes. The tube (c) may also be fixed by placing pebbles and powdered glass or sand round

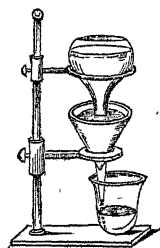

it, as before mentioned. For use, the solution to be filtered is poured into the bottle (a) nearly as high as the top of the tube (c), and the stopper is replaced. The liquid then descends into (b), and a similar quantity of air passes up the tube into (a). LIQUOR POTASSÆ may be always obtained fine by depuration in close vessels, when the sediment of lime only need be filtered, which may be effected with calico fixed across the mouth of a funnel.

When a precipitate, or the suspended matter in a liquid, is the object of the filtration, the filter should be of such a nature that the powder may be easily separated from it, when dry, and that with the least loss possible. Linen filters are for this reason preferable for large quantities, and those of smooth bibulous paper for small ones. The powder should be washed down the sides of the filter, and collected, by means of a small stream of water, in one spot at the bottom, assisting the operation with a camel-hair pencil; and, when the whole is dry, it should be swept off the paper or cloth with a similar pencil or brush, and not removed by a knife, as is commonly done, when it can be possibly avoided.

The 'first runnings' of liquid from a filter are commonly foul, and are pumped back or returned until the fluid runs perfectly limpid and transparent, when it is 'turned into' the 'filtered liquor cistern,' or proper receiver. In many cases the liquid does not readily become transparent by simply passing through the filter; hence has arisen the use of FILTERING POWDERS, or substances which rapidly choke up the pores of the media in a sufficient degree to make the fluid pass clear. In the employment of these powders, care should be taken that they are not in too fine a state of division, nor used in larger quantities than are absolutely necessary, as they are apt to choke up the filter, and to absorb a large quantity of the liquid. The less filtering powder used, the more rapid will be the progress of the filtration, and the longer will be the period during which the apparatus will continue in effective action. For some liquids these substances are employed for the double purpose of decolouring or whitening, as well as rendering them transparent. In such cases, it is preferable first to pass the fluid through a layer of the substance in coarse powder, from which it will 'run' but slightly contaminated into the filter; or, if the powder is mixed with the whole body of the liquid, as in bleaching almond oil, &c., to pass the mixture through some coarser medium to remove the cruder portion before allowing it to run into the filter. Another plan is, after long agitation and subsequent repose, to decant the clearer portion from the grosser sediment, and to employ separate filters for the two. Granulated animal charcoal is used, according to the first method, to decolour

syrops, oils, &c.; and filtering powder by the second and third, to remove a portion of the colour, and to clarify castor and other oils. The common plan of mixing large quantities of filtering powder with castor oil, and throwing the whole into the filter, as adopted by the druggists, is injudicious. When simple filtration is required, it is better to use little or no powder, and to continue returning the oil that 'runs' through, until, by the swelling of the fibres of the filter bags, it flows quite clear. By this plan the same filters may be used for a long period of time (for many years), and will continue to work well; whilst, by the usual method, they rapidly decline in power, and soon deliver their contents slowly, and after a short time scarcely at all.

It is often of great advantage to render a filter 'self-acting,' or to construct it in such a way that it may 'feed itself,' so that it may continue full and at work without the constant attention of the operator. On the small scale, this may be readily effected on the principle of the common fountain lamp (see *engr.*); and on the large scale, by placing the vessel containing the unfiltered liquid on a higher level than the filter, and by having the end of the supply-pipe fitted with a ball-cock, to keep the liquid in the filter constantly at the same height.

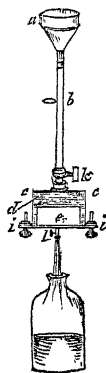

The rapidity of filtration depends upon the—porosity of the filtering medium—the extent of the filtering surface—the relative viscosity or mobility of the filtering liquid—the pressure or force by which the liquid is impelled through the pores of the filter, and—the porosity and fineness of

the substances it holds in suspension. The most efficient filter is produced when the first two or the first three are so graduated to the others that the liquid filters rapidly, and is at the same time rendered perfectly transparent.

In the common method of filtration no pressure is exerted beyond that of the weight of the column of the liquid resting on the filtering medium, but in some cases additional pressure is employed. This is had recourse to for the purpose of producing a more rapid filtration, and more especially for filtering liquids that, from their viscosity, will scarcely pass through the pores of substances sufficiently fine to remove their impurities in the ordinary way.

One of the easiest means of employing pressure in filtration is to increase the height of the column of the filtering liquid. From the peculiar properties of fluids, by which they transmit pressure in an equal degree in all

directions, this column need not be of equal diameter throughout, but may be conveniently contracted to the size of a small pipe, as in the accompanying engraving, which represents a small filter on this construction at work. (*a*) is the funnel or reservoir of foul liquid; (*b*) a small pipe conveying the liquid to the filter; (*c*) a chamber, of which the upper portion (*d*) is filled with the descending liquid, and the lower portion (*e*) with the filtering media; (*i*) are screws by which the bottom plate is fastened on, which plate is removed to clean out or renew the filter. For use, the cocks (*h*) and (*l*) are closed, and the liquid poured into the funnel (*a*); the cock (*h*) is next opened, and, in a few minutes after, the cock (*l*), when an uninterrupted flow of filtered liquor will be obtained as long as any fluid remains in the funnel (*a*) and the tube (*b*). The length of the tube determines the degree of pressure. Care must be taken first to pass the foul liquid through a hair sieve, or some other strainer, to remove any substance that might choke up the pipe (*b*).

Another method of employing pressure in filtration is the withdrawal of the air from the receiving vessel, as in the vacuum filter, by which a pressure of about $14\frac{1}{2}$ lbs. to the square inch becomes exerted on the surface of the liquid by the atmosphere. The vacuum in the receiving vessel may be produced by the air-pump or by steam.

A commoner method of applying pressure than either of those already mentioned is to condense the air over the surface of the liquid by means of a forcing-pump, or by steam.

On the small scale, pressure may be applied to filtration by means of a syphon, whose shorter leg has its mouth blown into the shape of a bell or funnel, over which filtering paper or fine calico may be stretched.

The application of pressure to filtration is not always advantageous, and beyond a certain limit is generally attended with inconvenience, if not with absolute disadvantage. It is found in practice that fluids under pressure take a longer period to run clear than without pressure, and that ruptures of the media more frequently take place in the former case, or with pressure, than in the latter. Great pressure is in no case advantageous.

The filters already noticed are those that act by the fluid descending through the media; but in some cases the reverse method is employed, and the liquid filters upwards, instead of downwards. These are called ascending filters, and are often preferable to those on the descending principle, because the suspended matters that require removal by filtration usually sink, and thus a portion escapes being

forced into the pores of the filter. They are also more convenient when pressure is employed. Their construction depends upon the same principles as the common filter, and merely requires that the feeding vessel should be higher than the upper surface of the filtering media. OILS are conveniently filtered in this way, because of their little specific gravity. By fixing a small filter on this principle into the head of a cask, and pouring in water through a funnel, whose neck reaches nearly to the bottom of the cask, the oil will float up and pass the filter, leaving the sediment behind. In cold weather hot water may be employed.

In some cases the upward and downward systems of filtration are united in the same apparatus, and this plan is advantageous where the space for operating is limited. For this purpose it is merely necessary to connect the bottom of an ascending filter with the top of a descending one, or the reverse; the proper pressure being in either case applied. See **CLARIFICATION, DEFECTION, FININGS, &c.**

FININGS. Substances used by publicans, brewers, wine merchants, &c., to clarify their liquors.

Prep. 1. (BREWER'S FININGS; COOPER'S F.) Isinglass (finely shredded), 1 lb., and sour beer or cider or vinegar, 3 or 4 pints, are macerated together, and more of the sour liquor added as the isinglass swells, until about a gallon has been used, agitation with a whisk or a small bundle of twigs being occasionally had recourse to, for the purpose of promoting the solution. As soon as the whole of the isinglass is dissolved, the mixture is reduced to the consistence of thin syrup, with weak mild beer, or cider, or any other liquid that the finings are intended for. The whole is next strained through a tannin cloth or a hair sieve, and at once reduced to a proper state of dilution, by the addition of more liquor. **Product.** 6½ to 7 galls. "A pound of good isinglass will make about 12 galls. of finings." (Ure.) **Used** to clarify fermented liquors, especially beer. 1 to 1½ pint is the usual dose for a barrel of ale or porter; and a quart for a hoghead of cider or wine.

2. (SPIRIT FININGS.)—a. Alum (ord. cryst.), 1 lb.; powder, and divide it into 12 equal portions, which are to be separately wrapped in blue paper, and marked No. 1. Next take of carbonate of soda (sesquicarbonate of the shops), 6 oz.; divide this as the last, wrap it in white paper, and mark each parcel No. 2. Keeps dry anywhere.

b. From alum, 1 lb.; salt of tartar (dry), ½ lb.; proceed as before. The white papers containing the salt of tartar must be kept in a dry, well-corked, wide-mouthed bottle or jar. Both of the last two are used to clarify gin

and cordials. The contents of one of the blue papers are dissolved in about a pint of hot water, and the resulting solution is well 'rummaged up' with the liquor. A solution of the contents of one of the white papers, in about ½ pint of hot water, is then added, and the agitation continued for some minutes longer; after which the cask is 'bunged' close and the whole allowed to repose until the next day. This is sufficient for a barrel (say 30 to 36 galls.), but many persons use double the quantity. The effect is not only to clarify but also to 'blanch' the liquor.

Obs. Good liquors, either fermented or spirituous, need no artificial 'fining,' as they always clarify themselves by repose. With those, however, which are 'out of condition,' or of inferior quality, it is often necessary, as without such a proceeding, they remain unsaleable. This is particularly the case with malt liquor. "Attempts to clarify it in the cask seldom fail to do harm. The only thing that can be used with advantage for fining foul or muddy beer is isinglass." (Ure.) The disadvantages resulting from the artificial clarification of fermented liquors are—that they do not afterwards 'stand well on draught,' that much of the conservative astringent matter which they contain is precipitated with the 'finings,' that their piquancy and flavour is more or less diminished, and that they are more than usually liable to become flat and vapid, whether in cask or bottle. The large proportion of 'finings' used, the more marked are their injurious effects, and the shorter the interval which elapses before the accession of the several symptoms referred to. We have seen the most disastrous consequences follow the injudicious use of 'finings,' more especially in respect to those liquors in which a certain amount of piquancy, astringency and briskness, is an essential condition. In one instance which came under our notice upwards of 30 barrels of 'underground' (very strong old ale) was thus reduced in value to less than 1-3rd its original cost; and in another, a large bottled stock of the 'fines old Burton' was found to be utterly unsaleable. In both cases the 'spoiled liquor' was got rid of by mixing it in and selling it with 3d. and 4d. beer.

Liquors which 'refuse to fine' or become clear, when treated with 'finings' in the usual manner, are called 'stubborn' by coopers and cellar-men. See **BREWING, GIN, MALT LIQUORS, WINES, &c.**

FIRE. The calamities resulting from this destructive agent are of such frequent occurrence, as to justly claim a notice of the subject here. The causes of fires are numerous, and of a varied character, and, in most instances difficult to determine, because it is the interest of those concerned to suppress all evidence connected with the matter. Accident, the convenient word given to the imaginary havoc to which so many fires are referred, if truth

a. Cask of oil.
b. Stand.
c. Funnel for water.
d. Filter.

fully interpreted, will, in general, be found to be equivalent to carelessness, recklessness, or guilt. We believe that there are few fires which have happened that might not have been prevented by the exercise of common prudence, and that a vast number have been caused by direct negligence, arising from sheer laziness and indifference, to use no harsher terms. As familiar instances, may be mentioned—allowing sparks to fall on the ground and remain there, without extinguishing them; carrying a naked candle into rooms containing inflammable substances; smoking carelessly and in dangerous places, as workshops, warehouses, on shipboard, &c.; keeping instantaneous light matches in improper places, and neglecting to pick up those that may happen to fall on the ground, &c. &c. The list might easily be extended, but we believe every reflecting reader can do so for himself. The great increase in the number of fires since the introduction of lucifer matches, and the almost general use of tobacco, cannot fail to have attracted the attention of every one. The danger of matches falling about might be avoided by the use of those which can only be ignited by rubbing them on the prepared surface of the box. These 'safety matches' are coming into general use, and must eventually supersede all the more dangerous kinds.

Prev. This consists of the exercise of those ordinary precautions which the good sense of every careful and trustworthy man, be he master or servant, cannot fail to suggest. It would be useless to enumerate them.

Fires might often be readily extinguished when first discovered by the timely application of a few buckets of water. When an apartment is found to be on fire, the door, chimney, and windows should be immediately closed, if possible, and only opened for the purpose of projecting water on the flames. By this means the supply of air will be cut off, and rapid combustion prevented. The same applies to the lower doors and windows of a house (especially the shop window), which are often injudiciously kept open or removed, under the pretence of rendering assistance. The neglect of this precaution has often caused a mere smouldering fire, that might have been easily put out, to burst into an unextinguishable mass of flame.

It has been proposed at various times to make certain additions to the water used for the purpose of extinguishing fires, in order to render its action more certain and effective. It is found that sal ammoniac (5 oz. to the gal.) exerts this property in a remarkable degree. Several other articles, as common salt, pearlsh, and kitchen soda, act in the same way, though less effectively. A few buckets of such water will speedily arrest the progress of a fire before it has much extended itself. Such a plan is easily applied, by adding the saline matter to the buckets of water, which are either used by hand, or to feed the engine

for the first few minutes of its working. When, however, a fire has made much progress, the action of such substances becomes scarcely perceptible.

Chimneys on fire are readily extinguished in several ways, without having recourse to throwing water down them from the top, by which much damage is frequently done to the furniture in the rooms. One of the simplest methods is, to cautiously scatter a handful of flowers of sulphur over the dustiest part of the burning coals; the sulphurous vapours, being incapable of supporting combustion, rapidly extinguish the flames. Another method is, to shut the doors and windows, and to stop up the bottom of the chimney with a piece of wet carpet or blanket, throwing a little water or flowers of sulphur, or even common salt, on the fire immediately before doing so. By this means the draught is stopped, and the burning soot extinguished for want of air. In many of the first-class houses recently erected, 'fire-place shutters' are provided, which, when partly drawn down, act as powerful bellows or 'blowers;' and which, when wholly drawn down, so as to touch the hearth-stone, entirely close up the fire-place, and instantly extinguish the combustion of the fuel in the grate, or that of the soot in the chimney. This simple arrangement, the advantages of which were pointed out in an early edition of this work, renders fires in chimneys of little moment, as it is only necessary to draw down the shutter to put them out. If a chimney is stopped at top, instead of at the bottom, the whole of the smoke must, of necessity, be driven into the apartment.

Escape from apartments on fire may be best effected by creeping on the hands and knees. In this way the window or door may be reached. It is found that the atmosphere of a room so full of smoke as to produce suffocation to a person standing upright, may generally be safely breathed on nearly a level with the floor. A damp cloth, or handkerchief, tied over the mouth and nostrils, or, still better, over the whole face and head, will enable a person to effect a passage through the densest smoke, and, in many cases, to escape from buildings on fire, when otherwise it would be impracticable. Should descent by the staircase be found impossible, then the window should be immediately sought, and a ladder or fire-escape waited for. In the absence of either, if the danger is imminent, a rope should be made by tying the sheets and blankets of the bed together, one end of which should be firmly secured to a chair or table, or preferably to one of the bed-posts, and with this apparatus descent should be cautiously attempted. Jumping out of the window should be avoided, as persons who have not been brought up as clowns, or harlequins, run just as much danger in performing such an exploit as they do by remaining in the burning building. When it is impossible to escape from a burning build-

ing by the stairs or windows, retreat may be sometimes secured by a trap-door opening on to the roof, or by a skylight, when, unless it be an isolated house, the roof of one of the adjoining buildings may probably be gained with safety.

Fire-escapes of various kinds have been employed of late years in the metropolis, and have proved of the greatest value in rescuing persons from burning buildings.

It is said that there is no instance on record of a person being burnt to death in a dwelling-house in Edinburgh, where the houses are usually high; yet in London, where fire-engines and fire-escapes are provided in greater numbers, deaths are very frequent from this cause. The reason of this difference is, that in the former city the stairs are all made of stone, by which means a road of escape is secured.

The clothes of females and children, when on fire, may be most readily extinguished by rolling the sufferer in the carpet, hearth-rug, table-cover, a great-coat, cloak, or any other woollen article at hand. If this be expertly done, the flames may be rapidly put out, unless the skirts of the dress be distended by hoops or crinoline, when there is great difficulty in staying the progress of the flames. Should assistance not be at hand, the person whose clothes are on fire should throw herself on the ground, and roll the carpet round her, as before described; or if such a thing is not in the room, she should endeavour to extinguish the flames with her hands, and by rapidly rolling over and over on the floor. In this way the fire will be stifled, or at least the combustion will proceed so slowly that less personal injury will be experienced before assistance arrives. The advantage of assuming the horizontal position is manifest from the fact, that nine times out of ten it is the lower parts of the dresses of females that first catch fire.¹

The extinction of fires on board ships by means of carbonic acid gas was some years since suggested to the Admiralty by Mr. J. R. Hancorn. He proposes that a simple and economical apparatus should be attached to every decked vessel, capable of supplying this gas, which is a well-known non-supporter of combustion, and will extinguish fire at the very instant of coming in contact with the burning matter. Chalk with sulphuric acid diluted with water (vinegar, or any other acid will do) yields 44% of the gas; hence, a ton of chalk, and a fourth part of that quantity of sulphuric acid, will be found sufficient to extinguish any fire on board a ship. Mr. Hancorn also proposed this as a method of destroying vermin in ships, such as rats and cockroaches, for which purpose it is more easily applied and more effectual than that usually adopted.

¹ For the mode of rendering muslin and other inflammable articles of ladies' apparel fire-proof, see INCOMBUSTIBLE FABRICS.

This plan was rejected by the Admiralty, from a fear that the destructive action of the gas might extend to the crew as well as the fire. But "it surely is possible by mechanical means to expel the gas before again entering the ship's hold. At any rate, the grand point would be obtained of extinguishing the fire—though the crew might have only the deck to stand on."

It is often difficult to get horses out of buildings on fire, but it is said that they will readily come out if, after being blindfolded, the saddle and bridle, or the harness, &c., to which they are accustomed, are thrown over them as usual.

Fire Annihilator (Phillips's). This is essentially a gaseous fire engine, which at any moment can be made to discharge a stream of mixed gases and vapours having the power of checking combustion. When first introduced it was generally regarded as a most important invention, but it has not proved an effective substitute for the common water engine. For extinguishing fires on board ship and in close apartments it is undoubtedly well adapted, but as a street engine it is comparatively useless, owing to the unmanageable nature of its fire-annihilating vapours.

The composition with which the 'Fire Annihilator' is charged is a mixture of dried ferrocyanide of potassium, sugar, and chlorate of potassa. It is set in action by a blow on a glass vessel containing oil of vitriol, which, being fractured, permits the acid to flow over the 'charge,' when the anti-combustion gas is liberated, and rushes forth with great impetuosity.

Fire-damp. See HYDROGEN (Carburetted.)

Fire-engine. The common fire-engine is a compound forcing-pump, consisting of two 'forcing-pumps' placed on opposite sides of an air-vessel, with which both communicate. The 'fulcrum' of the 'lever' by which both pumps are worked is placed midway between them; consequently they act alternately in charging the air-vessel. In order to obtain a very forcible jet, it is necessary to prevent the escape of any portion of the contents of the air-vessel until the confined air is considerably compressed. The lever is connected with hand-rails on each side of the engine, and these are alternately raised and depressed by the workers. Engines worked by steam power are now common in London and most of our large towns.

Fire-proofing. See INCOMBUSTIBILITY, &c.

Fire-works. See PYROTECHNY, and below.

FIRES. (In pyrotechny.) Coloured fires may be termed, not inaptly, the *chefs-d'œuvre* of the pyrotechnist's art, since on their excellence the attractions of most other varieties of fire-works depend. The following forms, under judicious management, yield fires of remarkable beauty.

Blue Fire. *Prep.* 1. From metallic an-

timony, 1 part; sulphur, 2 parts; nitre, 5 parts.

2. From realgar, 2 parts; charcoal, 3 parts; chlorate of potassa, 5 parts; sulphur, 13 parts; nitrate of baryta, 77 parts.

3. (Mr. A. Bird.) Charcoal and orpiment, of each, 1 part; black sulphuret of antimony, 16 parts; nitre, 48 parts; sulphur, 64 parts.

4. (Fownes.) Tersulphuret of antimony, 1 part; sulphur, 2 parts; dry nitre, 6 parts. This is the composition used for the Bengal or blue signal light, employed at sea.

5. (Prof. Marchand.) Sulphur, sulphate of potassa, and ammonio-sulphate of copper, of each, 15 parts; nitre, 27 parts; chlorate of potassa, 28 parts. For theatrical illuminations. This may be rendered either lighter or darker coloured, by lessening or increasing the quantities of the sulphate of potassa and ammonio-sulphate of copper.

6. (LIGHT BLUE—Marchand.) Sulphur, 16 parts; calcined alum, 23 parts; chlorate of potassa, 61 parts.

7. (DARK BLUE—Marchand.) Calcined alum and carbonate of copper, of each, 12 parts; sulphur, 16 parts; chlorate of potassa, 60 parts.

8. (Marsh.) Sulphate of copper, 7 parts; sulphur, 24 parts; chlorate of potassa, 69 parts.

9. (Ruggieri.) Nitre, 2 parts; sulphur and zinc, of each, 3 parts; gunpowder, 4 parts.

10. From sulphur, 1 part; dried verdigris, 2 parts; chlorate of potassa, 9 parts.

Crimson Fire. *Prep.* 1. (Marsh.) Chlorate of potassa, $4\frac{1}{2}$ parts; charcoal (alder or willow), $5\frac{1}{2}$ parts; sulphur, $22\frac{1}{2}$ parts; nitrate of strontia, $67\frac{1}{2}$ parts. For pots.

2. (Marsh.) Charcoal, $4\frac{1}{2}$ parts; sulphuret of antimony, $5\frac{1}{2}$ parts; chlorate of potassa, $17\frac{1}{2}$ parts; sulphur, 18 parts; nitrate of strontia, 55 parts. For boxes and stars.

3. (Marchand.) Sulphur, 16 parts; chalk (dry), 23 parts; chlorate of potassa, 61 parts. Turns on the purple. See RED FIRE (*below*).

Green Fire. *Prep.* 1. Nitrate of baryta, 77 parts; chlorate of potassa, 8 parts; fine charcoal, 3 parts; sulphur, 13 parts.

2. From metallic arsenic, 2 parts; charcoal, 3 parts; chlorate of potassa, 5 parts; sulphur, 13 parts; nitrate of baryta, 77 parts. Very beautiful, particularly when burnt before a reflector.

3. (Mr. A. Bird.) Charcoal and black sulphuret of antimony, of each, 2 parts; chlorate of potassa, 5 parts; sulphur, 6 parts; nitrate of baryta, 80 parts.

4. (Fownes.) Lamp black, 1 part; chlorate of potassa, 4 parts; sulphur, 6 parts; dry nitrate of baryta, 18 parts.

5. (Marchand.) Boracic acid, 10 parts; sulphur, 17 parts; chlorate of potassa, 73 parts. Very beautiful.

6. (Marchand.) Chlorate of potassa, 18 parts; sulphur, 22 parts; nitrate of baryta, 60 parts. For theatrical illuminations.

7. (LIGHT GREEN—Marchand.) Sulphur, 16 parts; carbonate of baryta, 24 parts; chlorate of potassa, 60 parts. Extremely delicate.

8. (Marsh.) Charcoal and sulphuret of arsenic, of each, $1\frac{1}{2}$ part; sulphur, $10\frac{1}{2}$ parts; chlorate of potassa, $23\frac{1}{2}$ parts; nitrate of baryta, $62\frac{1}{2}$ parts. For pots or stars.

Lilac Fire. *Prep.* 1. (Marsh.) Black oxide of copper, 6 parts; dry chalk, 20 parts; sulphur, 25 parts; chlorate of potassa, 49 parts. For pans.

2. (Marsh.) From black oxide of copper, 3 parts; dried chalk, 22 parts; sulphur, 25 parts; chlorate of potassa, 50 parts. For stars.

Orange Fire. See RED FIRE, No. 8 (*below*).

Pink Fire. *Prep.* (Marchand.) Charcoal, 1 part; chalk and sulphur, of each, 20 parts; chlorate of potassa, 27 parts; nitre, 32 parts. For theatrical illuminations. See RED FIRE, No. 10 (*below*).

Purple Fire. *Prep.* 1. From lamp black, realgar, and nitre, of each, 1 part; sulphur, 2 parts; chlorate of potassa, 5 parts; fused nitrate of strontia, 16 parts.

2. (Marsh.) Sulphuret of antimony, $2\frac{1}{2}$ parts; black oxide of copper, 10 parts; sulphur and nitrate of potassa, of each, $22\frac{1}{2}$ parts; chlorate of potassa, 42 parts. For pans.

3. (Marsh.) Sulphate of copper, $9\frac{1}{2}$ parts; sulphur, 13 parts; chlorate of potassa, $77\frac{1}{2}$ parts. For stars.

4. From sulphur, 12 parts; black oxide of copper, 12 parts; chlorate of potassa, 30 parts. See CRIMSON FIRE, No. 3 (*above*), and RED FIRE, No. 9 (*below*).

Red Fire. *Prep.* 1. From sulphur, sulphuret of antimony, and nitre, of each, 1 part; dried nitrate of strontia, 5 parts.

2. (Mr. A. Bird.) Charcoal, 1 part; black sulphuret of antimony, 4 parts; chlorate of potassa, 5 parts; sulphur, 13 parts; dried nitrate of strontia, 40 parts.

3. (Fownes.) Lamp black, 2 parts; chlorate of potassa, 8 parts; sulphur, 9 parts; dried nitrate of strontia, 32 parts.

4. (Marchand.) Sulphur, 16 parts; carbonate of strontia, 23 parts; chlorate of potassa, 61 parts.

5. (Marchand.) Chlorate of potassa, 20 parts; sulphur, 24 parts; nitrate of strontia, 56 parts. For theatrical illuminations.

6. (Marsh.) Coal dust, 2 parts; gunpowder, 6 parts; sulphur, 20 parts; dried nitrate of strontia, 72 parts.

7. (Ruggieri.) Sulphuret of antimony, 4 parts; chlorate of potassa, 5 parts; sulphur, 13 parts; fused nitrate of strontia, 40 parts. A little charcoal or lamp black makes it burn quicker.

8. (ORANGE RED—Marchand.) Sulphur, 14 parts; chalk, 34 parts; chlorate of potassa, 52 parts.

9. (PURPLE RED—Marchand.) Sulphur, 16 parts; chalk, 23 parts; chlorate of potassa, 61 parts.

10. (ROSE-RED—Marchand.) Sulphur, 16

parts; dried chloride of calcium, 23 parts; chlorate of potassa, 61 parts. See PINK FIRE.

11. From charcoal, 2 parts; chlorate of potassa, 6 parts; sulphur, 13 parts; dried nitrate of strontia, 40 parts.

Violet Fire. *Prep.* 1. From charcoal, 8 parts; sulphur, 10 parts; metallic copper, 15 parts; chlorate of potassa, 30 parts.

2. (DARK VIOLET—Marchand.) Alum and carbonate of potassa, of each, 12 parts; sulphur, 16 parts; chlorate of potassa, 60 parts.

3. (PALE VIOLET—Marchand.) Sulphur 14 parts; alum and carbonate of potassa, 16 parts; chlorate of potassa, 54 parts.

White Fire. *Prep.* 1. From nitre, 60 parts; sulphur, 20 parts; black antimony, 10 parts; meal powder, 6 parts; powdered camphor, 4 parts. For either pans or stars.

2. (Mr. A. Bird.) White arsenic, 1 part; charcoal, 2 parts; black antimony, 16 parts; nitre, 48 parts; sulphur, 64 parts.

3. (Marchand.) Charcoal, 2 parts; sulphur, 22 parts; nitre, 76 parts. For theatrical illuminations.

4. (Marchand.) Gunpowder, 15 parts; sulphur, 21 parts; nitre, 64 parts. As the last.

5. (Marsh.) Gunpowder, 12½ parts; zinc filings, 18 parts; sulphur, 23 parts; nitre, 46½ parts. For pans.

6. (Marsh.) Zinc dust or filings, 15 parts; sulphur, 28 parts; nitre, 57 parts. For stars.

7. (Ruggieri.) Sulphur, 13½ parts; sulphuret of antimony, 17½ parts; nitre, 48 parts.

8. (Ruggieri.) From realgar, 2 parts; sulphur, 7 parts; nitre, 24 parts.

9. (Ruggieri.) Charcoal, 1 part; sulphur, 24 parts; nitre, 75 parts.

10. (Ruggieri.) Iron or zinc borings, 25 parts; gunpowder, 100 parts.

Yellow Fire. *Prep.* 1. From sulphur, 16 parts; dried carbonate of soda, 23 parts; chlorate of potassa, 61 parts.

2. (Marchand.) Gunpowder, 14 parts; sulphur, 16 parts; dried soda, 20 parts; nitre, 50 parts.

3. (Marchand.) Charcoal, 1½ part; sulphur, 17½ parts; dried soda, 20 parts; nitre, 61 parts.

4. (Marsh.) Charcoal, 6 parts; sulphur, 19½ parts. For pans. Very beautiful.

Obs. The ingredients in the above compounds are to be separately reduced to powder, and sifted through lawn, after which they should be kept in well-corked wide-mouthed bottles until the time of mixing them for use. The chlorate of potassa, more especially, must be separately treated, and cautiously handled, in order to prevent the possibility of explosion, from friction, whilst it is in contact with combustible matter. The requisite quantity of each of the ingredients being weighed out and placed on a clean sheet of white paper, the whole is to be thoroughly but carefully mixed together with a light hand, by means of a bone or wooden knife. The compound is next lightly packed into small cups or pans for

illuminations, or into small pill-boxes for stars and trains, a little priming and quick-match being lastly attached to each. To ensure success, the several ingredients must be dry and commercially pure; and though reduced to the state of a uniform powder, care must be taken that they are not absolutely 'dusty,' or too finely pulverised. The nitrate of strontia, alum, saltpetre, carbonate of soda, &c., before being weighed, require to be gently heated in an iron pot or pan, until they fall to powder, and lose their hygrometric moisture, or water of crystallisation. To ensure the perfect admixture of the ingredients, the whole, after they have been stirred together on paper, as before directed, may be passed through a hair or perforated zinc or brass sieve. Further, as coloured fires rapidly deteriorate by keeping, and even sometimes inflame spontaneously, to prevent disappointment and accidents they should not be prepared long before they will be required for use, and should be stored in some situation in which their spontaneous combustion would be productive of no disastrous consequences.

Of the above formulæ, those bearing the name of the late Mr. Marsh, of Woolwich, more especially deserve the attention of the pyrotechnist. See FLAME, PYROTECHNY, &c.

FISH. *Syn.* PISCES, L. Fishes form the fourth class of vertebrate animals (VERTEBRATA) in the Cuvierian arrangement of the animal kingdom, and in the variety of their genera and species are second only to the INSECTA, whilst in prolificness and number they probably exceed all other animated beings that reach a size equal to that of even the smallest member of their prodigious race. Besides their value to man as food, they furnish him with oil, isinglass, and various other articles of utility and luxury, and provide, either directly or indirectly, an inexhaustible supply of manure for the fertilisation of his fields. As food, fish are undoubtedly wholesome and nutritious, although less so than the flesh of animals or the grains of the cereals. Of all the various substances used as aliments by man, fish are, however, the most liable to run into a state of putrefaction, and should therefore be only eaten when perfectly fresh, or, if not recently taken, then only when their perfect preservation has been ensured by any of the ordinary methods employed for the purpose. Those that are the whitest and most flaky when cooked, as cod, flounders, haddock, hake, soles, turbot, whiting, &c., are the most easily digested; and those abounding in oily matter, as eels, herrings, mackerel, salmon, &c., are most nutritious, though the most likely to offend the stomach. Salt-water fish have been said to be more wholesome than river fish, but without sufficient reason. Salted fish are hard of digestion, unless when carefully cooked and well masticated. Skin diseases are said to be more common among those who live continually on fish than among those who abstain from

it; but this probably arises from their use being unaccompanied by a proper quantity of fresh vegetables or fruit, both of which are scarcer on the sea-coast than further inland. As one of the components of a mixed diet, the value of fish is indisputable. Acid sauces and pickles are the proper additions to fish, from their power of retarding the progress of putrefaction, and of correcting the relaxing tendency of large quantities of oil and butter.

Artificial Propagation. The fecundity of fish is positively marvellous. According to the recent observations of Mr. Frank T. Buckland, salmon yield about 1000 ova or eggs to every lb. of their weight; a trout weighing 1 lb. produced upwards of 1000; a mackerel (1 lb.), 86,120; a herring ($\frac{1}{2}$ lb.), 19,840; a sole (1 lb.), 134,466; a turbot (8 lbs.), 385,200; and a cod (20 lbs.), 4,872,000. The ova here spoken of form what is commonly called the 'hard roe' of the female fish; the 'soft roe' is 'the milt' of the male fish. To protect the spawn, and the fry, when hatched, is the object of the art of fish-culture, which has made great progress during late years. When the spawn is not artificially protected, the greater portion is always wasted, being swept away by the stream, and devoured by fish, birds, and insects. The natural enemies of the newly hatched fish are, again, so numerous, that it is really surprising that any should escape destruction. According to given data and accurate calculations of the returns of fisheries made by Messrs. Ashworth and Buist, only one salmon egg out of every thousand deposited ever becomes a fish fit for human food. Other fish, both fresh and salt-water, suffer in proportion. The hatching of fish by artificial means has been carried out on a large scale in France, and has been commenced in Scotland and Ireland, and on a small scale in England. The spawning fish, having been caught by a net, is made to deposit her eggs by gently pressing on the abdomen; these are impregnated by 'milt' expressed from the male fish in a similar manner, and mixed with them in a shallow tub or other vessel prepared for the purpose. The impregnated eggs are placed in long shallow boxes, bottomed with gravel and pebbles, and so arranged that a small stream of water from a reservoir may flow from one to another. The time of hatching depends entirely upon the temperature of the water; from 40° to 45° Fahr. seems to be the healthiest temperature. After about 50 days (in the case of salmon), when all goes well, the young fish makes its appearance as a misshapen creature about an inch long, with a bag containing the yolk of the egg attached to its abdomen. At 3 days old the fry is about 2 grs. in weight; at 16 months it has increased to 2 oz. To preserve the young fish in health, the boxes must be covered with shades of slate or zinc. The French fish-breeders generally feed the young fry with boiled frogs powdered fine. The Scotch give

boiled liver. Mr. Buckland prescribes a diet of roe of sole, or plaice, or whiting. As to the age at which it is advisable to turn the young fish out of the nursery, there is much difference of opinion. Some breeders recommend turning them out as soon as the 'umbilical bag' is absorbed; others think they should be taken care of till they are older and stronger, and better able to defend themselves or escape from attack. For full details respecting the artificial propagation of fish, the reader is referred to Mr. Buckland's recent work, entitled 'Fish-Hatching.'

Choice, &c. "The flesh of any fish is always in the highest perfection, or in season, as it is called, during the period of the ripening of the milt and roe. After the fish has deposited the spawn, the flesh becomes soft, and loses a great deal of its peculiar flavour. This is owing to the disappearance of the oil or fat from the flesh, it having been expended in the function of reproduction." (Fleming's 'Phil. of Zoology.') Fish should be dressed as soon after being caught as possible, as much of their peculiar delicacy and flavour is lost by keeping, even for a few hours. Turbot and salmon are said by the fishmongers to be improved in flavour when 2 or 3 days old, but this is surely a mistake, as the former, when dressed immediately after being caught, possesses a fine creamy taste, which it afterwards loses; whilst the latter, by the loss of a single tide, loses a portion of the fine white curd which is previously found between the flakes, and by longer keeping, this curd, with the larger flakes, disappear altogether. In the eyes of some epicures the richness is, however, increased by this change. Mackerel, and some other fish, suffer so much from keeping only a few hours, that they become quite unwholesome. Herrings offer a remarkable example of the advantage of dressing fish as fresh as possible. When cooked soon after being caught, they possess considerable delicacy and flavour, but after being kept for only a few hours the oil separates from the flesh, and they become soft, greasy, and strong-flavoured.

In the choice of every kind of fish, stiffness, brightness of the eyes, and redness of the gills, may be regarded as invariable signs of freshness. A peculiar elasticity will also be perceived in fish recently caught, little or no permanent impression being made by the ordinary pressure of the fingers, from the flesh immediately rising when the pressure is withdrawn. Fresh fish also lie in a partly curled position, and never quite straight, as is the case when they have been kept for some time. Thickness and fleshiness are deemed marks of the good condition of all fish.

Cleaning, dressing, &c. On the proper cleaning of fish preparatory to dressing it, depends much of its delicacy and flavour. Ordinary cooks seldom do this well, from not slitting the fish sufficiently open to permit the

inside to be thoroughly washed, and seldom using sufficient water. The superior flavour of fish cleaned by the fishmongers arises from their performing the operation more completely, and from the large quantity of water they employ about them. The flavour of all fish is improved by adding a little salt or vinegar to the last water in which they are washed. The sound, milt, and roe, should be carefully cleaned and preserved.

Fish is preferably 'dressed' by simple boiling, broiling, or frying; in fact, the finer kinds of fish are often injured by the excessive interference of the cook. When boiled, "all large fish, with the skin whole, must be placed on the fire in cold water; if crimped, or cut into slices or pieces, in boiling water; if whole, it must not be covered with more than two or three inches of water, or the skin will crack, and not only spoil the appearance of the fish, but will diminish the gelatine and gluten it contains, and instead of eating firm and full of flavour, it will be soft and woolly, especially if over-boiled." (Soyer.) As soon as a scum rises from boiling, it should be removed by the skimmer. The addition of a little salt or vinegar to the water improves the flavour of most fish, and renders the flesh firmer. The proportions should be "two teaspoonfuls of salt to every quart of water." "If the fish be whole, as soon as it begins to boil remove the cover on one side, and let it simmer gently until done." (Soyer.) A fish is known to be sufficiently dressed by the flesh in the thicker parts separating easily from the bone. "If a large fish, I generally try it by gently pushing a wooden skewer through the thickest part; if it goes in easily, it is done." (Soyer.) When this is the case it should be removed from the kettle, as by soaking in the water fish loses its firmness, and becomes sodden. Sole, skate, and mackerel, are usually put into boiling water, whether whole or sliced. Fish for broiling should be well washed in strong vinegar, wiped dry with a towel, and flowered before placing them on the gridiron; and the bars of the latter should be hot, and well buttered. (Rundell.) Fish for frying should be prepared as for broiling, and the butter, oil, or lard, should be allowed to boil for a minute or two before putting them into the frying-pan. The latter should be perfectly smooth and bright, and the butter or oil in abundance, to prevent the fish sticking to it and burning. As the fish are cooked solely by the heat of the melted fat, to fry them in the highest perfection there should be enough of it to cover them. Butter or oil is the best for the purpose. To avoid loss, the contents of the frying-pan, after the fish is removed, should be poured into a clean jelly-jar or basin, and reserved for another occasion. The fish being removed from the pan, the superfluous fat should be drained from them preparatory to 'serving' them. When fish is divided into fillets or

cutlets before being cooked, it is usual to take out the bones, and to dress it with force-meat &c.

In serving fish of the finer kinds, no other additions are required than melted butter and the ordinary fish sauces and pickles. The dishes are commonly garnished with raw parsley, for the sake of appearance, but boiled parsley, chopped small, should accompany it. All kinds of fish should be served on a napkin.

Caution. It sometimes happens that a fish-bone accidentally swallowed remains in the oesophagus, and occasions serious inconvenience; in fact, instances have been known where so much irritation has arisen that death has followed. In such cases it is advisable, as soon as possible, to take of tartar emetic, 4 grs., dissolved in warm water, $\frac{1}{2}$ pint; and immediately afterwards the whites of six eggs. The coagulated mass will not remain in the stomach more than two or three minutes, and the remedy has been known to "remove no less than 24 pins at once."

FISH GLUE. See GLUE and ISINGLASS.

FISH SKIN. *Syn.* SHARK SKIN. The skin of the spotted dog-fish or rough hound (*chien de mer*, Fr.), stretched and dried. Used for polishing wood and ivory. Several other varieties of fish skin are employed in the arts. The dressed skin of the 'rousette' (*peau de rousette*, Fr.) is transparent, and very beautiful. Cemented on green paper, and rubbed down and polished, it is used as veneer for fancy boxes. The skins of several varieties of *Squalus* are also used for both the above purposes. See SHAGREEN.

FIVE HERBS. See SPECIES.

FIX'ATURE. *Syn.* BANDOLINE, CLYSEPTIQUE, EAU COLLANTE, FIXATEUR, Fr. This consists of any of the simple vegetable mucilages, combined with a little spirit, to preserve it, and with a little perfume, to render it more agreeable.

Prep. 1. From carrageen, Irish, or pearl moss, soaked in cold water for an hour or two, and after being drained, and pressed dry in a clean napkin, dissolved by boiling in soft water, q. s. The decoction is strained through cambric, and when nearly cold is mixed with about $\frac{1}{3}$ rd or $\frac{1}{4}$ th of its volume of eau de Cologne or other scented spirit, with the further addition of a few drops (5 or 6) of oil of cloves. Sometimes a little brandy is added to the mucilage, and when it is intended for present use, as is common with home manufacturers, the spirit is frequently omitted altogether. $\frac{1}{4}$ oz. of the prepared moss is fully enough for $\frac{1}{2}$ pint of strained decoction, if rightly managed.

2. From quince seed boiled in water, as the last. $\frac{1}{4}$ oz. yields nearly $\frac{1}{2}$ pint of strained decoction.

3. Pale gum arabic (picked), 1 $\frac{1}{2}$ oz.; rose water, 2 fl. oz.; pure water, 3 fl. oz.; dissolve.

4. Gum arabic, 3 $\frac{1}{2}$ oz.; water, $\frac{1}{2}$ pint; dissolve, and drop in eau de Cologne, gradually,

until the cloudiness at first occasioned ceases to be removed by agitation; the next day decant the clear portion. All of the above are very superior, and keep well.

5. (Redwood.) Gum tragacanth, $1\frac{1}{2}$ dr.; water, 7 oz.; proof spirit, 3 ozs.; otto of roses, 10 drops; macerate 24 hours, and strain.

6. Malt, 7 oz.; hot water (that will barely permit the finger to be held in it without pain), $\frac{1}{2}$ pint; infuse in a covered jug or basin, gently press out the liquid, and as soon as cold, add of proof spirit (or brandy or Cologne water), $2\frac{1}{2}$ fl. oz., and strain.

Obs. Bandoline is used by ladies and by hairdressers for stiffening the hair, and to make it curl firmly and remain in place. It is applied either by moistening the fingers and passing the hair through them, or by means of a small sponge. See POMMADE.

FIXED AIR. See CARBONIC ACID.

FIXED OILS. See FAT and OILS.

FLAKE WHITE. See WHITE PIGMENTS.

FLAME. Gas or vapour in an incandescent state. The light emitted from pure flame is exceedingly feeble; illuminating power being almost entirely dependent upon the presence of solid matter. See ILLUMINATION, and below.

Flame Colours. The vapours of metallic compounds communicate colours to flames. The characteristic colours of some metals are very beautiful, and their exhibition forms a favorite experiment of chemical lecturers. The coloured flames are generally produced by the combustion of alcohol or rectified spirit upon certain salts in fine powder. In this way a GREEN colour is communicated by boric acid, or chloride of copper; a RED one by the nitrates of iron, lime, or strontia; a VIOLET, by potassa and its salts; and a YELLOW, by nitrate of soda. Messrs. Church and Crookes have recently described a mode of exhibiting the characteristic flames of the metals which is admirably adapted for the lecture-table.¹ 'Gun-paper,' made in the same way as 'gun-cotton,' is to be soaked in solutions of the chlorates of the different metals, dried with care, and kept dry. A good 'gun-paper' for the purpose is prepared by soaking strips of Swedish filtering-paper for ten minutes in a mixture of 4 parts oil of vitriol with 5 parts strong nitric acid, both by measure. The strips, when taken out of the acid, should be washed first with cold, and then with hot rain or distilled water, till the washings are no longer sour to the taste. The solutions of the metallic salts need not be very strong; but if they are warm, the strips of 'gun-paper' will be more easily and completely saturated with them. Since some of the chlorates attract moisture from the air, it is better to dry the papers prepared with them before the fire previous to lighting them. They are shown to best advantage when a strip is loosely crumpled up into a pellet, lighted quickly at one corner, and thrown up into the air against a

dark back ground. They leave after burning, if properly prepared, no ash whatever. Paper prepared with the salt of potassa gives a flash of VIOLET flame, that prepared with the soda salt the characteristic YELLOW flame, and that with chlorate of baryta a very beautiful GREEN light. The chlorates of strontium, lithium, and calcium, when thus ignited, gives intense colours. The VIOLET-BLUE flame of copper is well seen, even with the chloride of that metal, while paper soaked in nitrate of potassa shows the potassium flame better than if the chlorate be used. 'Gun-paper' prepared with a very weak solution of chloride or chlorate of thallium shows the characteristic SPRIG-GREEN flame of that metal with great distinctness. Chlorate of barium, being an article of commerce, may be employed for the preparation of the other chlorates, it being merely necessary to add to this salt in solution an exactly equivalent quantity of the sulphate or carbonate of the metal whose chlorate is desired. For instance, in order to make 'chlorate of copper,' 15.1 gr. of chlorate of barium being dissolved in hot distilled water, a boiling solution containing 12.5 gr. of pure crystallised sulphate of copper is to be added to it. Insoluble white 'sulphate of baryta' falls, while the solution, filtered and evaporated, yields the new chlorate in crystals. See FIRES, PYROTECHNY, &c.

FLANNEL. It has been shown by the experiments of Count Rumford that the conducting power of the different materials employed for clothing varies considerably. A thermometer surrounded with cotton wool, and heated by immersion in boiling water, took 1046 seconds to lose 135° Fahr., when plunged into a bath of melting ice; but, under the same circumstances, when sheep's wool was employed, 1118 seconds elapsed before a like sinking of the thermometer took place ('Phil. Trans.,' 1792); thus showing the greater conducting power of the former, and consequently the superiority of the latter substance for the manufacture of warm clothing. But the chief advantage of wool, as an article of under-clothing, depends less upon its actual power of conducting heat than its peculiar texture. Flannel acts as a gentle stimulus on the skin, and exercises the most beneficial action, by keeping the pores clean, and in a state most favorable to perspiration. This action is a species of friction similar in character, although inferior in degree, to that of the common flesh-brush or horse-hair glove, so long employed as a skin stimulant. Flannel has also the advantage of absorbing the perspiration as soon as emitted, and allowing its watery portion to pass off into the atmosphere almost as soon as formed, but this is not the case with cotton and linen fabrics. The different effects of flannel and linen are particularly susceptible during brisk exercise. When the body is covered with the former, though perspiration be necessarily increased, the perspired matter

¹ See 'Intellectual Observer,' April, 1863.

freely passes off through the flannel, and the skin remains dry and warm. If the same exercise be taken in linen shirts, perspiration, as in the former case, is indeed also increased, but the perspired matter, instead of being dispersed into the atmosphere, remains upon the linen, and not only clogs the pores of the skin, but gives a disagreeable sensation. From this property of flannel, persons who wear it next the skin seldom catch cold from changes of temperature, even though perspiring profusely; but in similar cases, when linen or calico shirts are worn, chilliness immediately comes on, followed by sniffing, sneezing, and cough, and all the other symptoms of severe catarrh.

The common objections raised against the use of flannel are founded on vulgar prejudices, ignorance, obstinacy, or bravado, and are undeserving of the notice of sensible people. In a fickle and moist climate like that of England, every person should wear a robe of flannel next the skin, or at all events a waistcoat of flannel reaching below the loins; and this should not be discarded as soon as the cold weather has passed, but its use should be continued all the year round; for in reality, flannel is, if possible, even more required in summer than in winter, because persons perspire more freely in hot than in cold weather, and are consequently more susceptible of cold, while at that period of the year their clothing is less capable of protecting them from the effects of sudden changes of temperature and draughts of cold air, moisture, &c. Females, children, persons of delicate constitutions, and all others who from their habits of body or life perspire freely, or are much exposed, should wear flannel.

In washing flannels, it is recommended that they should only be put into warm water, by which method their colour will be preserved, and they will be prevented from shrinking.

FLASH. Prep. From burnt-sugar colouring, 1 gall.; fluid extract of capsicum or essence of Cayenne, $\frac{1}{2}$ pint, or enough to give a strong fiery taste. Used to colour spirits, and to give them a false strength. It is made by the brewers' druggists, and labelled 'ISINGLASS AND BURN'T SUGAR.'

FLASKS. The late lamented and ingenious Mr. Fownes suggested the employment of Florence oil-flasks as cheap substitutes for retorts, receivers, digesters, and some other vessels used for chemical purposes. His plan was to cut the neck smoothly round with a hot iron, and softening it in the flame of a good argand gas-lamp, to turn over the edge so as to form a lip, or border. The neck will then bear a tight-fitting cork without splitting.

FLATULENCE. Syn. FLATULENCY, WIND. In pathology, a morbid collection of gas in the stomach and bowels. Its most common cause is indigestion. When the natural fluids of the

stomach are secreted in a healthy state, they exercise an antiseptic and digestive action on the food, by which it is speedily reduced to a magma that is little liable to spontaneous change whilst in the body; but when the reverse is the case, fermentation soon commences, and the stomach and associated viscera become distended with gas, and all the well-known symptoms of flatulency are developed in rapid succession. The quantity of gas thus accumulated in the 'primæ viæ' is often enormous. An ordinary apple during fermentation yields about 600 times its bulk of gas, and many vegetables yield much more. (Dr. Hales.) It is, therefore, not at all surprising that so much inconvenience should be felt when the food, instead of being digested and assimilated, runs into the state of active fermentation.

The treatment of flatulency consists mainly in the selection of proper articles of food. Oleraceous vegetables, peas, beans, under-dressed potatoes, and indigestible fruits, should be especially avoided, as well as the use of large quantities of weak or warm liquids. The diet should consist principally of animal food, carefully but not over-cooked, with a sufficient quantity of good mealy potatoes (mashed, not whole), and good wheaten meal-bread, moderately seasoned with common salt and spices. The most suitable beverages are toast-and-water, and a little good brandy largely diluted with water. The healthy tone of the stomach may be re-established by the proper use of tonics, bitters, and mild aperients.

To relieve the fit of flatulency, carminatives and aromatics, as black pepper, mustard, peppermint, ginger, cinnamon, lavender, and most spices, may be had recourse to. A glass of peppermint cordial, or of brandy strongly flavoured with peppermint or ginger, is a popular and efficient remedy. A few drops (15 to 30) of ether, with a little tincture of capsicum or spirit of sal volatile, seldom fail to give relief. See DYSPEPSIA.

FLAVOURING SUBSTANCES. See ESSENCE, OIL (Volatile), SPICE, WINE, &c.

FLAX. See LINEN, LINSEED, and OIL.

FLEA. This troublesome little animal is the *Pulex irritans* of Linnæus, and belongs to the *Suctoria*, or fourth order of the *Insecta*. Its favorite haunts are our warm under-clothing, and its most productive breeding-places are in the 'flue' which careless servants allow to accumulate underneath our beds. Cold, light, perfumes, and ventilation, are inimical to its propagation.

FLESH. Syn. CARO, L. The muscular substances of animals; the softer, solid portions of the body, as distinguished from the bones and fluids. See FIBRIN, FOOD, &c.

Flesh-brush. This simple instrument is used for exciting the cutaneous circulation. Those which have the bristles set on a leather back are esteemed the best. The flesh-glove or hair flesh-rubber is a useful modification of the

common flesh-brush. Those manufactured by Messrs. Savory and Moore, in imitation of the Indian kheesah or mitten, are superior to all others. In the absence of both flesh-brush and glove, a rough towel wound round the hand is no bad substitute. See FRICTION.

FLIES. See FLY.

FLIP. See EGG FLIP.

FLOUNDER. A flat fish, very like the plaice, but smaller, and of more obscure colour. It is very common about the British coast, and is found in the Northern, Baltic, and Mediterranean seas. Its flesh is very wholesome.

FLOUR. *Syn.* FARINA, L. The finely ground and 'dressed' meal of bread corn, and of the seeds of some of the leguminosæ. That known specifically as 'flour' in this country is obtained from spring varieties of *Triticum vulgare* (the common wheat).

Var., &c. Of varieties of flour there are several, depending chiefly on the amount of bran which they contain, and the relative fineness of the sieves through which they are passed:—

FINE WHEAT FLOUR, PASTRY FLOUR; FARINA, F. TRITICI, F. SEMINIS TRITICI. The finest flour, obtained from the meal produced in the first grinding of wheat between sharp stones, by means of a sieve of 64 wires to the inch. *Used* for pastry.

MIDDINGS. The remainder of the flour of the first grinding, obtained by means of a slightly coarser sieve. *Used* for making household bread, but is mostly reground for the next variety.

SECONDS. The finest part of the flour, obtained by regrinding 'middings' between blunt stones. *Used* by the bakers for their finest wheaten bread.

POLLARD. The coarse flour, from which the seconds has been sifted. *Used* for making sea biscuits and gingerbread, and to fatten poultry and hogs.

COUNTRY HOUSEHOLD FLOUR. This is usually ground only once, and sifted to $\frac{2}{3}$ ths of the weight of the wheat.

AMMUNITION FLOUR is ground and sifted to nearly $\frac{2}{3}$ ths the weight of the wheat.

According to Mr. Accum, thirty-two pecks of wheat in the London mills yield, of flour $38\frac{1}{2}$ parts; pollard, 8 parts; and bran (*furfur tritici*), 12 parts; the bulk of the wheat being doubled by grinding.

According to Mr. Hard, miller, of Dartford, quoted by Dr. Pereira, the wheat having been ground in the usual way, is allowed to remain in the state of meal for some time before 'dressing,' which removes the heat caused by the process, and enables the miller to obtain more flour, and the baker a better quality, than if 'dressed' immediately it is ground.

"The process of dressing is by a wire cylinder containing a certain number of sheets of different texture or fineness, which cylinder contains eight hair brushes attached to a

spindle passing through the centre of the cylinder, and laid out so as to gently touch the wire. This cylinder is fed by a 'shoe' with the meal; then the 'flour' and 'offal,' after passing through the wire in this way, are divided by wooden partitions fixed close to the outside of the cylinder." "The produce of the wheat-meal dressed through the wire machine consists of—1, Flour;—2, White Stuff, or Boxings, or Sharps;—3, Fine Pollard;—4, Coarse Pollard, or Horse Pollard;—5, Bran. The 2nd product (*i. e.* the white stuff) is then submitted to another 'dressing' through a fine cloth machine, and produces—1, Fine Middlings, for biscuits;—2, Toppings, or Specks;—3, Dustings;—4, Best Pollard, Turkey Middlings, or Coarse Middlings."

TABLE of the Produce of One Quarter of Wheat (=504 lbs.) By Mr. HARD.

Flour	392 lbs.
Biscuit or fine middlings	10 "
Toppings or specks	8 "
Best pollard, Turkey p., or twenty-penny	15 "
Fine pollard	18 "
Bran and coarse pollard	50 "
Loss by evaporation and waste	11 "
	<hr/>
	504 "

Comp. According to Vauquelin, French wheat flour contains about 10% of water, 11% of gluten, 71% of starch, 5% of sugar, and 3% of gum; and the water of the dough amounts to about 50%. The quantity of the bran in wheat ranges under 2%.

Pur. This article of food is very frequently adulterated both by the miller and the baker, as has been before alluded to in the article on bread. The principal physical characteristics of wheat flour of good quality are the following:—it has a dull white colour, somewhat inclining to yellow;—it exhibits no trace of bran, even when pressed smooth with the hand, or with a polished surface;—its cohesiveness is so great, that on being squeezed in the hand, the lump is some time before it loses its shape;—it has a homogeneous appearance, and does not lose more than from 6% to 12% by being carefully dried in a stove. The smaller the loss in this way the finer is the quality, other matters being equal, and the more economical in use. (See *below*.)

Tests. 1. Solution of ammonia turns pure wheat flour yellow; but if any other corn has been ground with it, pale brown; or if peas or beans have been ground with it, a still darker brown.

2. Solution of potassa, containing about 12% of caustic alkali, dissolves pure wheat-flour almost completely; but when it is adulterated with the flour of the leguminous seeds (beans, peas, &c.), the cellulose of these substances

remains undissolved, and its hexagonal tissue is readily identified under the microscope. Mineral substances (chalk, plaster of Paris, bone dust, &c.) are also insoluble in this test, and appear as a heavy white sediment.

3. Boiling water poured on the sample causes the evolution of the peculiar odour of pea or bean flour when these substances are present. Bread made with such flour evolves a like odour on being toasted.

4. Pure hydrochloric acid poured on potato flour, or on wheat flour adulterated with it, develops a smell of rushes; it also dissolves starch, but changes the colour of pure wheat-flour to a deep violet.

5. Nitric acid turns wheat flour of an orange-yellow colour, but forms a stiff and tenacious jelly with potato fecula, the colour of which it does not alter.

6. A portion of the suspected sample submitted to dry distillation in a stoneware retort, and the distillate collected in a receiver containing a little water, the latter is found to remain perfectly neutral if the wheat flour is pure, but acquires a distinctly alkaline reaction when beans, pulse, or pea meal is present. (Rodrigues.)

7. Triturate 300 grs. of the sample with an equal weight of clean siliceous sand, and after five minutes form a homogeneous paste with water; afterwards further adding more water, until about 2 fl. oz. have been used. The filtered liquid, treated with an equal quantity of a strong and pure aqueous solution of iodine, develops a pink colour, which gradually disappears, when the specimen examined consists of pure wheat flour; but assumes a deep-purple colour, which disappears much more slowly, if the flour is adulterated with even 10% of fecula or potato flour. This test succeeds, not only with flour and meal, but also with macaroni, vermicelli, &c. (M. Chevallier.)

8. The milky liquid holding the starch in suspension (see Anal., next col.) is poured into a small conical glass, and left at rest for some time; the clear liquid is then decanted, and any remaining water carefully sucked up with a pipette, and the whole left for some time, in order that the deposit may harden. The upper gray layer is next removed with a teaspoon, and the harder and stiffer second layer left undisturbed until it becomes quite solid by drying. When in this state, it may be used in the form of a cone, upon a lump of dry plaster. The fecula or potato starch (if any is present), being heavier than that of wheat, forms the apex of the cone, and its quantity may be estimated in the following manner:—The operator cuts from the apex of the little cone above mentioned a slice, which he triturates only for a short time in an agate mortar (one of glass, or porcelain, or wedgwood-ware, will not do), and he tests that with aqueous solution of iodine. If it turns blue, it is fecula. Another slice is treated in the same manner, until the operator comes to

the wheat starch, which, in the present instance, is not affected by the aqueous solution of iodine. This difference of behaviour of the two species of starch with iodine is due to the friction of the pestle and mortar, which is sufficient to divide or tear the envelopes of the particles of the potato starch, which then become blue when treated by solution of iodine. The particles of wheat starch, on the contrary, are not disaggregated by that treatment, and being therefore protected by their envelope, are not acted upon by the solution of iodine, or, at most, assume only a brown tinge. (M. Robine.)

9. Wheat flour adulterated with plaster of Paris, ground bones, chalk, and potato flour, has a higher specific gravity than a sample of the pure flour. This may be readily ascertained by any person, by filling a small vessel with some pure flour, and then with the given sample. "A vessel which will contain 1 lb. of wheat flour will contain $1\frac{1}{2}$ lb. of fecula" (potato flour), and hence "the proportion of this adulteration may be easily estimated." (Ure.)

10. If to a sample of wheat flour is added a solution of potassa, containing about $1\frac{1}{2}\%$ of the pure alkali, the granules of potato farina, or of bean meal, or pea meal, present (if any), will acquire 4 or 5 times their original volume, whilst those of the pure wheat starch will be scarcely affected by it. This change is very perceptible under a microscope of small power. 2 parts of liquor of potassa (Ph. L.) and 5 parts of distilled water form a mixture that answers for the above purpose.

11. By means of the microscope the admixture of the cheaper feculas and meals with wheat flour is readily detected by the characteristic appearance of the starch grains; and when the adulteration exceeds 9% or 10%, its extent may be readily estimated with considerable accuracy. As the range of adulteration is generally from 12% to 27%, this method is applicable in the greater number of cases.¹

Analysis. The value of wheat flour as an aliment depends upon the quantity of gluten, sugar, starch, and phosphate of lime, which it contains; and its superiority over the flour of the grains of the other cereals is referred to its containing a larger proportion of the first and last of these substances than they do. The quantitative analysis of flour is very simple, and may be easily made by persons unacquainted with chemistry, by attending to the instructions below:—

a. Make 1000 grs. of the sample into a dough with a little water, let it rest an hour, and then gently knead it in successive waters, until the starchy particles are perfectly removed. Collect the portion (GLUTEN) left in the hand, drain off the water, place it on a piece of filtering or blotting paper, several times doubled, and set it aside.

¹ See also *BREAD Adulter. and Exam.*

b. Mix the several waters employed in the preceding process, and set them aside in a tall vessel, to deposit the suspended portion (STARCH). After a sufficient time pour off the clear liquid, and throw the whole of the sediment on a weighed paper filter, placed in a funnel, observing to remove the portion adhering to the bottom of the vessel by means of a little clean water, that none may be lost.

c. Evaporate the decanted liquid, as well as what runs from the filter, until it becomes curdy, then filter it through a piece of weighed blotting paper, and preserve the sediment (ALBUMEN); next evaporate the residuum to the consistence of a syrup, agitate it with 10 times its weight of alcohol, and filter, observing to wash the paper filter clean with a little alcohol after the solution has passed through it. The substance on the paper is PHOSPHATE OF LIME and GUM, and must be set aside. By subsequent digestion in water, filtration, and evaporation, the two may be obtained separately.

d. Evaporate or distil off the spirit from the solution and washings, as above; the residuum is SUGAR.

e. Dry the substances educed as above, by a gentle heat, and weigh them. The weight of the albumen may be taken with that of the gluten, as it possesses about the same nutritive value, and also because it has been asserted by some persons that the former substance is in reality gluten, and not albumen. By dividing the given weights by 10, the per-centage value of the sample is obtained. The pieces of filtering paper employed should be carefully dried and weighed before using them, and the same degree of heat should be employed for this purpose as that to which they will be afterwards exposed in the drying of the substances resulting from the operations.

Obs. The above method of ascertaining the actual value of any sample of flour as an article of food, though not strictly accurate, approximates sufficiently to the truth for all practical purposes, and is well adapted to the wants of the baker and large purchaser. In many cases it will only be necessary to perform the first part of the process (a), which will give the per-centage of the most important constituent of the flour; the rest being of minor consequence.

In addition to what has been already stated in the article on BREAD, it may be useful to mention, that a pound of the best flour, from thoroughly dried wheat, will take 10 fl. oz. of water to form it into ordinary dough, or 9 fl. oz. to form it into bread dough. Under the old parliamentary acts, a sack of flour (280 lbs.) was presumed to produce 80 loaves (quartern or quarter-peck), the weight of which, within 48 hours after being baked, was to be 4 lbs. 5½ oz. each. At the present time fully 92 loaves, weighing 4 lbs. each, are produced by the London bakers from one sack of flour, when

honest weight is given; but as the latter is rarely the case, and the bread is frequently 'slack' or 'under-baked,' and thus contains more water than good bread ought to do, a much larger product is commonly obtained. The dough loses about ¼th of its weight in baking, if in batches; but fully ½th, if baked in small loaves, and placed in the oven separately. The best bread contains about ¾ths of its weight of added water; and common bread, often much more than ½th. The proportion of water in the London bread has greatly increased during the last few years, owing to the introduction of the fraudulent plan of making the dough with rice jelly or moss jelly. This is the reason why the bread of some bakers suffers such a loss of weight in a few hours after being taken from the oven. A 4 lbs. loaf of bread purchased from a baker at Lambeth, after remaining on the sideboard of a sitting-room for 24 hours, was found to have lost no less than 6½ oz. by evaporation, and in two days longer its interior cells were covered with green mould, and the whole was unfit for food. The bakers, aware of these facts, are particularly careful not to bake more bread than they can dispose of whilst 'new,' and are in the habit of refusing to weigh their bread before selling it, when it is more than 10 or 12 hours old, although they are liable to be 'fined' for such a refusal. See BREAD, CAKES, FARINA, &c., also *below*.

Flour, Baked. *Syn.* FARINA TOSTA, F. TRITICI TOSTA, L. *Prep.* From wheat flour, carefully baked in a 'slack' oven, until it acquires a pale-buff hue. Astringent; used to make food for infants troubled with diarrhoea. See FARINA.

Flour, Barley (Prepared). *Syn.* FARINA HOEDRI PREPARATA, L. *Prep.* (Ph. Bor.) From barley flour, compressed into a tin cylinder until the vessel is 2-3rds full, which is then suspended at the upper part of a still 2-3rds filled with water, and after the 'head' is fitted on, the water is kept boiling for 30 hours (2 days of 15 hours each). Lastly, the upper layer being removed, the rest is reduced to powder, and kept in a dry place.

Flour, Boiled. *Syn.* TRITICINA, FARINA PREPARATA, L. *Prep.* From fine flour, tied up in a linen cloth as tight as possible, and after it has been frequently dipped into cold water, the outside of the cloth is tied over with flour, until a crust is formed, and it, to prevent the water soaking in, is whilst boiling; it is then boiled for a long time, and when cold, it is divided into small oblong pieces. For use, it is reduced to powder, either by grinding or grating it, and is then prepared like arrow-root. It forms a good diet for children, in diarrhoea, &c.; and as it may be easily prepared at home, it has the advantage of being free from adulteration.

Flour, Jones's Patent. *Prep.* From kiln-dried flour, 1 cwt.; tartaric acid, 10½ oz.; mix thoroughly; after 2 or 3 days, add, of bicar-

bonate of soda, 12 oz.; lump sugar, $\frac{1}{2}$ lb.; common salt, $1\frac{1}{2}$ lb.; mix, and pass the compound through the 'dressing-machine.' It is necessary that the whole of the ingredients should be perfectly dry, and separately reduced to fine powder before adding them to the flour. By simply mixing it with cold water, and at once baking it, it produces light, porous bread.

Obs. We have already had occasion to pay a passing tribute to the excellence and usefulness of Jones's Patent Flour.¹ It is, indeed, invaluable in every household, as furnishing the means of producing, with great economy, and extemporaneously, not merely cakes, puddings, pastry, and fancy bread, but the 'staff of life' itself, household bread, of a purity, flavour, and lightness, seldom, if ever, met with in that purchased of the bakers.

Flour, Sewell's Patent.—*a.* (No. 1.) Flour, 1 sack (280 lbs.); hydrochloric acid (sp. gr. 1.14), 45 oz.; mix, by adding the acid in a 'spray.'—*b.* (No. 2.) To the last, add (expertly) bicarbonate of soda, 39 oz.; mix thoroughly, and pass the whole through a sieve or 'dressing machine.'

Obs. This flour is used as the last, to which, however, it is inferior in quality. No. 1 will keep 5 weeks. No. 2 will keep a month. Jones's flour will keep good in a dry place for years. If No. 1 is alone employed for the dough, to each pound of the flour, 63 grs. of bicarbonate of soda, with salt, q. s., must be added. The patentee claims for his invention the merit of the soda and acid being converted into culinary salt in the process of mixing up the flour and baking the dough.¹

FLOWERS. *Syn.* FLORES, L. These beautiful and fragrant ornaments of our gardens and our dwellings are too highly esteemed by all classes of the community to require anything in favour of their cultivation to be said here. Our remarks will, therefore, chiefly refer to their collection, improvement, and preservation.

'Full' or 'double flowers,' or those in which the internal organs become petals, are so much more beautiful than the 'single flowers' of the corresponding species and varieties, that their production, with tolerable ease and certainty, has long been a desideratum with both the professional and amateur florist. Various plans have been proposed having this object in view, among which are the following:—1. The use of the best seed only, but not before it is at least 3 or 4 years old.—2. The selection of the outer row of seed only, and its careful preservation intact for at least 2 seasons before sowing it. We are assured that this method is particularly successful with dahlias.—3. The removal of the plants to a shady situation as soon as the flower-buds begin to develop themselves, and stinting them with water and nourishment for a few weeks. In this method a few only of the buds are permitted to mature; the rest

¹ See UNFERMENTED BREAD.

being snipped off with a pair of scissors as early as possible.—4. The use of small pots and a scanty supply of water until the flowers are partly developed, when water is supplied in abundance, with or without the addition of a little liquid manure.*

To hasten the 'blooming' of flowers, it is a common practice with the gardeners to grow them in as small pots as is consistent with their healthy existence, and carefully to avoid transplanting them to larger pots, for several weeks before their usual time of blossoming. A plant on the point of flowering, if transferred to a larger pot and a richer soil, immediately commences making roots and leaves, whilst the embryo flowers either wholly decay, or their development is checked until the usual season of their production has passed over.

The following liquid has been used with great advantage to promote the vigorous growth and the early flowering of plants:—Sulphate or nitrate of ammonia, 4 oz.; nitrate of potassa, 2 oz.; sugar, 1 oz.; hot water, 1 pint; dissolve and keep it in a well-corked bottle. For use, put 8 or 10 drops of this liquid into the water of a hyacinth glass or jar, for bulbous-rooted plants, changing the water every 10 or 12 days. For flowering plants in pots, a few drops must be added to the water employed for them. The preference should be given to rain water for this purpose. The fluid sold under the name of liquid guano may be used in the same manner.

Flowers may be preserved in a fresh state for a considerable time, by keeping them in a moist atmosphere. When growing on the parent stem, the large amount of evaporation from the surface of their leaves is compensated for by an equivalent proportion of moisture supplied by the roots; but when they are plucked, the evaporation from the surface continues, while the supply of moisture is cut off. To supply, in part, this loss of moisture by evaporation, has arisen the almost universal practice of placing flowers in water; but their mutilated stems possess a far inferior power of sucking up fluids to that of the roots, and thus their decay is only deferred for a time. To preserve them more effectually, or at least to render their existence less ephemeral, we may surround them with a moist atmosphere, by which the loss of water from the surface of their leaves will be reduced to the smallest possible amount. "It is now eighteen years ago since we first saw, in the drawing-room of a gentleman, in the hot dry weather of the dog-days, flowers preserved day after day in all their freshness by the following simple contrivance:—A flat dish of porcelain had water poured into it. In the water a vase of flowers was set; over the whole a bell-glass was placed, with its rim in the water. This was a 'Ward's case' in principle, although different in its construction. The air that surrounded the flowers being confined beneath the bell-glass, was kept constantly moist with the water that rose into

it in the form of vapour. As fast as the water was condensed it ran down the sides of the bell-glass back into the dish; and if means had been taken to inclose the water on the outside of the bell-glass, so as to prevent its evaporating into the air of the sitting-room, the atmosphere around the flowers would have remained continually damp. We recommend those who love to see plenty of fresh flowers in their sitting-rooms in dry weather to adopt this method. The experiment can be tried by inverting a tumbler over a rose-bud in a saucer of water." ("Gardener's Chron.")

Another method by which some flowers may be preserved for many months is to carefully dip them, as soon as gathered, in perfectly limpid gum water, and after allowing them to drain for 2 or 3 minutes, to set them upright, or arrange them in the usual manner in an empty vase. The gum gradually forms a transparent coating on the surface of the petals and stems, and preserves their figure and colour long after they have become dry and crisp.

Faded flowers may be generally more or less restored by immersing them half-way up their stems in very hot water, and allowing them to remain in it until it cools, or they have recovered. The coddled portion of the stems must then be cut off, and the flowers placed in clean cold water. In this way a great number of faded flowers may be restored, but there are some of the more fugacious kinds, on which it proves useless.

Flowers may be produced in winter by taking up the plants, trees, or shrubs, in the spring, at the time when they are about to bud, with some of their own soil carefully preserved around the roots, and placing them upright in a cellar till Michaelmas; when, with the addition of fresh earth, they are to be put into proper tubs or vessels, and placed in a stove or hot-house, when they must be treated in the usual manner. By this method, in the month of February, fruits or roses will appear. Flowers sown in pots about Michaelmas may thus be made to bloom at Christmas.

The apparently instantaneous flowering of plants, exhibited a few years ago by M. Herbert to an astonished audience, was, we believe, effected by the heat generated by fragments of quicklime concealed in the mould close to, but not in immediate contact with, the roots. The plants selected by M. Herbert—a group of geraniums and a rose tree—were planted in two rather deep boxes of garden mould, and were covered with glass shades. The operator commenced by pouring over the roots, from a small watering-pot, a liquid which, uniting to the ingredients already in the earth, caused a great heat, as was shown by an intense steam or vapour, which was evolved within the shades, and allowed, to some extent, to escape through a small hole in the top, which at first was kept closed. The effect upon the geraniums was certainly almost

instantaneous: the buds beginning to burst in about five or six minutes, and the plants being in full bloom within ten minutes, when the blossoms were gathered by M. Herbert, and distributed amongst the ladies present. With the rose tree the exhibitor was less fortunate. The invention may prove useful where ladies require to decorate their drawing-rooms or boudoirs with the beauties of the floral world somewhat earlier in the season than they can otherwise be obtained. It must not, however, be forgotten that the plants are, as it were, parboiled during the process, and die after a few days.

The collection and preservation of flowers for medicinal purposes and distillation, will be found noticed under **VEGETABLE SUBSTANCES**.

Flowers, Artificial. The beauty and value of these pleasing articles of personal decoration mainly depend upon the taste and ingenuity of the maker. The delicate fingers of woman, and her ready powers of imitation and invention, combined with her natural affection for the chaste and beautiful, have enabled her the more especially to excel in this manufacture. The productions of the female artificial florists of the French capital are justly admired everywhere.

The French employ velvet, kid, and fine cambric for the petals, and taffeta for the leaves. Very recently thin plates of bleached whalebone have been used with great success for some portions of artificial flowers.

As colours and stains, the following are employed in Paris:—

BLUE. Indigo dissolved in oil of vitriol, and the acid partly neutralised with salt of tartar or whiting.

GREEN. A solution of distilled verdigris.

LILAC. Liquid archil.

RED. Carmine dissolved in a solution of salt of tartar, or in spirits of hartshorn.

VIOLET. Liquid archil, mixed with a little salt of tartar.

YELLOW. Tincture of turmeric.

The above colours are usually applied to the petals with the finger.

Flowers. *Syn.* FLORES, L. Among chemists, this term is applied to various pulverulent substances obtained by sublimation, as flowers of antimony, benzoin, zinc, sulphur, &c. The term has been discarded from modern chemical nomenclature, but is still commonly employed in familiar language and trade.

FLUID CAMPHOR. *Prep.* (Sir J. Murray.) From camphor (in powder), 1 dr.; freshly precipitated carbonate of magnesia, 2 drs.; cold distilled water, 1 pint; the solution is effected by forcing in carbonic acid gas under pressure. Each fl. oz. contains 3 grs. of camphor, and 6 grs. of carbonate of magnesia. See **ESSENCE OF CAMPHOR**.

FLUID MAGNE'SIA. *Syn.* LIQUOR MAGNESIÆ CARBONATIS, L. M. BICARBONATIS, L. The preparations sold under this name are

mere solutions of freshly precipitated carbonate of magnesia in water, formed by means of carbonic acid gas, under powerful pressure, and long agitation. Those best known are Sir J. Murray's and Mr. Dinneford's, each fl. oz. of which are said to contain about $17\frac{1}{2}$ grs. of the carbonate, but their actual richness in the latter seldom exceeds 10 or 12 grs., and by the time they reach the consumer is often as low as 5 or 6 grs. Recently precipitated carbonate of magnesia placed in a bottle or other suitable vessel, which is then filled by means of a soda-water apparatus with water fully charged with carbonic acid gas, readily dissolves on slight and cautious agitation, and the aerated water becomes saturated with magnesia. A scruple of carbonate of magnesia put into a soda-water bottle, and thus treated, is all taken up in from 20 minutes to half an hour, and the beverage continues beautifully clear.

FLUMMERY. A species of thick hasty-pudding made with oatmeal or rice, flavoured with milk, cream, almonds, orange flowers, lemons, &c., according to fancy.

Prep. 1. (DUTCH FLUMMERY.) From blanch-mange and eggs, flavoured with lemon peel and sweetened with sugar.

2. (FRENCH FLUMMERY.) From equal parts of blanch-mange and cream, sweetened, and flavoured. The above are poured into forms, and served cold, to eat with wine, spirit, cider, &c.

3. (A. T. Thomson.) Take oatmeal or groats, 1 quart; rub it for a considerable time with hot water, 2 quarts; and let the mixture stand until it becomes sour; then add another quart of hot water, and strain through a hair sieve. Let stand till a white sediment is deposited, decant the fluid portion, and wash the sediment with cold water. This is now to be boiled with fresh water, until it forms a mucilage, stirring the whole time. A light and nutritious food, during early convalescence.

FLUOHYDRIC ACID. See FLUORIDE OF HYDROGEN.

FLUORIDE OF HYDROGEN. HF. *Syn.* FLUOHYDRIC ACID; HYDROFLUORIC ACID; A. HYDROFLUORICUM, L. An acid composed of hydrogen and fluorine. It was discovered by Scheele, but was first obtained in a pure state by Gay-Lussac and Thénard, in 1810.

Prep. Pour concentrated sulphuric acid on half its weight of fluor spar, carefully separated from siliceous earth, and reduced to fine powder. The mixture must be made in a capacious leaden retort, and a gentle heat only applied, and the evolved gas must be collected in a leaden receiver, surrounded by ice.

Prop., &c. A colourless fluid below 59° Fahr., which speedily evaporates in dense white fumes when exposed to the air. Its affinity for water exceeds that of sulphuric acid, and its combination with that fluid is accompanied with a hissing noise, and a considerable increase of its sp. gr. up to a certain point. It attacks

glass and silica, for which reason it cannot be preserved in glass vessels. Bottles of lead, silver, platinum, or pure gutta percha, are used to keep it in. It is highly corrosive, instantaneously destroying the skin on contact, and producing deep and serious ulcerations; its vapour is pungent, irritating, irrespirable, and poisonous. With the bases it unites to form FLUORIDES.

In the arts, hydrofluoric acid is used for etching on glass.

FLUORIDES. Compounds of fluorine with metals and other basic radicals. The fluorides of the metals are, with the exception of those of the alkaline metals, insoluble in water, while the fluorides of hydrogen, boron, and silicon, are gaseous, condensing at a low temperature to volatile liquids.

FLUORINE. F. *Syn.* FLUORINUM, L. An element that has not yet been isolated, owing to its attacking and combining with every element or compound that at present has been exposed to it, except oxygen. It is presumably gaseous, and of a pale greenish-yellow colour.

FLUOSILICIC ACID. *Syn.* FLUORIDE OF SILICON AND HYDROGEN; HYDROFLUOSILICIC ACID. *Prep.* From powdered fluor spar, and siliceous sand or powdered glass, of each, 1 part; concentrated sulphuric acid, 2 parts; mix in a glass retort, apply a gentle heat, and pass the evolved gas into water through a layer of mercury. Decomposition ensues, silica being deposited in a gelatinous state, and hydrofluosilicic acid or fluosilicic acid remains in solution. The acid liquor is used as a test for potassium and barium, with whose salts it yields nearly insoluble precipitates.

FLUX. *Syn.* FLUXUS, FLUOR, L. In medicine, a term formerly applied to several diseases attended with a copious discharge, as diarrhoea (FLUX), dysentery (BLOODY FLUX), English cholera (BILIOUS FLUX), fluor albus (WHITE FLUX), &c. These terms are still current among the vulgar.

Flux. In metallurgy, &c., a term applied to various substances of easy fusibility, which are added to others which are more refractory, to promote their fusion.

Prep. 1. (BLACK FLUX.) Nitre, 1 part; crude tartar or cream of tartar, 2 parts; mix, and deflagrate, by small quantities at a time, in a crucible, heated to dull redness. The product consists of carbonate of potassa, mixed with charcoal in a finely divided state. Used for smelting metallic ores. It exercises a reducing action, as well as promotes the fusion. It must be kept in a dry corked bottle.

2. (CHRISTISON'S FLUX.) Carbonate of soda (cryst.), 8 parts; charcoal (in fine powder), 1 part; heat the mixture gradually to redness. For reducing arsenic.

3. (CORNISH REDUCING FLUX.) Crude tartar, 10 parts; nitre, 4 parts; borax, 3 parts; triturate together.

4. (CORNISH REFINING FLUX, WHITE

FLUX.) Crude tartar and nitre, equal parts, deflagrated together. See BLACK FLUX.

5. (CRUDE FLUX.) Same as BLACK FLUX, omitting the deflagration. Reducing.

6. (FRESSENIUS'S FLUX.) Carbonate of potassa (dry), 3 parts; cyanide of potassium, 1 part. For the arsenical compounds.

7. (LIEBIG'S FLUX.) Carbonate of soda (dry) and cyanide of potassium, equal parts. As the last. See ARSENIOS ACID.

1. (MORVEAU'S REDUCING FLUX.) Powdered glass (free from lead), 8 parts; calcined borax and charcoal, of each, 1 part; all in fine powder, and triturated well together. Used as BLACK FLUX.

9. (WHITE FLUX.) See *above*.

10. (FLUXES FOR ENAMELS.) See ENAMELS.

11. (Various.) Borax, tartar, nitre, sal-ammoniac, common salt, limestone, glass, fluor spar, and several other substances, are used as fluxes in *metallurgy*.

Obs. On the large scale, crude tartar is employed in the preparation of fluxes; on the small scale, commercial cream of tartar or bitartrate of potassa.

FLY. The common house-fly (*Musca domestica*) causes considerable annoyance to the person in hot weather, as well as damage to handsome furniture, especially to picture frames, gilding, and the like. The best way to exterminate them is to expose on a plate one or other of the mixtures given under FLY POISON (*below*). The blow-fly (*Musca vomitoria*), and other insects, may be kept from attacking meat by dusting it over with black pepper, powdered ginger, or any other spice, or by skewering a piece of paper to it on which a drop or two of creosote has been poured. The spices may be readily washed off with water before dressing the meat.

It is a fact not generally known, that flies will not pass through a netting made of fine silk, thread, or wire, even though the meshes may be an inch apart, unless there is a window or light behind it. This affords us a ready means of excluding these insects from all our apartments which have windows only on one side of them, without keeping the latter closed. It is merely necessary to have an ornamental netting stretched across the opening, when, although flies may abound on the outside, none will venture into the room so protected. If, however, there is a window on the other side of the room, they will fly through the netting immediately. See *below*.

Fly Papers. Those papers which, a few years ago, were sold about the streets of London by harsh-voiced cries of "Catch 'em alive-o!" and which might be seen in many shop-windows covered with dead and dying flies, were prepared by rubbing factitious bird-lime over sheets of paper. It would be difficult to conceive a more cruel or more offensive mode of catching flies than that of glueing their living bodies to an adhesive surface. A preferable kind of fly-paper is that called 'PAPIER

MOURE,' which contains a large quantity of arsenic in its substance. This paper is kept wet when in use, and the flies, by sipping the moisture, are poisoned.

Fly Poison. *Prep.* 1. A strong solution of white arsenic (say 1 dr. to the pint), sweetened with moist sugar, treacle, or honey. Sold under the name of 'FLY WATER.'

2. Treacle, honey, or moist sugar, mixed with about $\frac{1}{15}$ th their weight of King's yellow or orpiment.

Obs. Both the above are dangerous preparations, and should never be employed where there are children.

3. (Redwood.) Quassia chips (small), $\frac{1}{4}$ oz.; water, 1 pint; boil 10 minutes, strain, and add of treacle, 4 oz. "Flies will drink this with avidity, and are soon destroyed by it."

4. Black pepper, 1 teaspoonful; brown sugar, 2 teaspoonfuls; cream, 4 teaspoonfuls. See *below*.

Fly Powder. The dark gray-coloured powder (so-called 'sub-oxide') obtained by the free exposure of metallic arsenic to the air. Mixed with sweets, it is used to kill flies.

Fly Water. See FLY POISON (*above*).

FOILS. These are thin leaves of polished metal, placed under precious stones and pastes, to heighten their brilliancy, or to vary the effect. Foils were formerly made of copper, tinned copper, tin, and silvered copper, but the last is the one wholly used for superior work at the present day.

Foils are of two descriptions:—white, for diamonds and mock diamonds, and—coloured, for the coloured gems. The latter are prepared by varnishing or lacquering the former. By their judicious use the colour of a stone may often be modified and improved. Thus, by placing a yellow foil under a green stone that turns too much on the blue, or a red one under a stone turning too much on the crimson, the hues will be brightened and enriched in proportion.

Prep. 1. (CRYSTAL DIAMOND, or WHITE FOIL.)—a. This is made by coating a plate of copper with a layer of silver, and then rolling it into sheets in the flattening mill. The foil is then highly polished, or covered with crystal varnish.

b. The inside of the socket in which the stone or paste is to be set is covered with tin foil, by means of a little stiff gum or size; when dry, the surface is polished and the socket heated, and whilst it is warm, filled with quicksilver; after repose for two or three minutes, the fluid metal is poured out, and the stone gently fitted in its place; lastly, the work is well-fitted round the stone, to prevent the alloy being shaken out.

c. The bottom of the stone is coated with a film of real silver, by precipitating it from a solution of the nitrate in spirit of ammonia, by means of the oils of cassia and cloves. This method vastly increases the brilliancy both of

¹ See SILVERING.

real and factitious gems, and the work is very permanent.

2. (COLOURED FOILS.) The following formulæ produce beautiful coloured effects, when judiciously employed:—

a. (Amethyst.) Lake and Prussian blue, finely ground in pale drying oil.

b. (Blue.) Prussian blue (preferably Turnbull's), ground with pale, quick-drying oil. *Used* to deepen the colour of sapphires.

c. (Eagle marine.) Verdigris tempered in shell-lac varnish (alcoholic), with a little Prussian blue.

d. (Garnet.) Dragon's blood dissolved in rectified spirit of wine.

e. (Vinegar garnet.) Orange lake finely tempered with shellac varnish.

f. (Green.)—a. From pale shell-lac, dissolved in alcohol (lacquer), and tinged green by dissolving verdigris or acetate of copper in it.

β. From sesquiferrocyanide of iron and bichromate of potassa, of each, $\frac{1}{2}$ oz.; ground to an impalpable powder, first alone, and then with gum mastic (clean and also in fine powder), 2 oz.; a little pyroxilic spirit is next added, gradually, and the whole again ground until the mass becomes homogeneous and of a fine transparent green. The beauty increases with the length of the grinding. The predominance of the bichromate turns it on the yellowish green; that of the salt of iron, on the bluish green. For use it is to be thinned with pyroxilic spirit. ('Chem.,' iii, 231.) *Used* for emeralds.

g. (Red.) Carmine, dissolved in spirit of hartshorn, or in a weak solution of salt of tartar, and a little gum (dissolved) added.

h. (Ruby.)—a. From lake or carmine, ground in isinglass.

β. Lake ground in shell-lac varnish. Both are used when the colour turns on the purple.

γ. From bright lake ground in oil. *Used* when the colour turns on the scarlet or orange.

i. (Yellow.)—a. Various shades of yellow may be produced by tinging a weak alcoholic solution of shell-lac or mastic, by digesting turmeric, annotta, saffron, or socotrine aloes in it. The former is the brightest, and is used for topazes.

β. From hay saffron digested in 5 or 6 times its weight of boiling water until the latter becomes sufficiently coloured, and a little solution of gum or isinglass added to the filtered liquor. When dry, a coating of spirit varnish is applied.

Obs. By the skilful use of the above varnishes, good imitations of the gems may be cheaply made from transparent white glass or paste; and by applying them to foils set under coloured pastes (FACTITIOUS GEMS), a superior effect may be produced. The pigments employed must be reduced to the finest state possible by patient grinding, as without this precaution transparent and beautiful shades cannot be formed. The palest and cleanest

mastic and lac, dissolved in alcohol, and also the palest and quickest drying oil should alone be used when these substances are ordered. In every case the colour must be laid on the foil with a broad soft brush; and the operation should be performed, if possible, at once, as no part should be crossed, or twice gone over, whilst wet. If the colour turns out too pale, a second coat may be given when the first one has become quite dry, but this practice should be avoided if possible.

FOMENTATION. *Syn.* FOMENTATIO, FOMENTUM, FOTUS, L. A liquid, either simple or medicated, used for local bathing. Fomentations are distinguished from lotions, chiefly in being applied in a heated state, and in larger quantities, and for a longer period at a time.

Fomentations are chiefly employed to allay pain or irritation, or to promote suppuration or the healthy action of the parts. As the intention is to convey heat, combined with moisture, to the part fomented, the utmost care must be taken to manage the application so as to promote the object in view as much as possible. Flannel cloths wrung out of the hot or boiling liquid, by means of two sticks, turned in opposite directions, form the best vehicles for fomentations. If they are shaken up, and laid lightly over the part, they involve a considerable quantity of air, which, being a bad conductor, retains the heat in them for a considerable time. "In every process of fomenting there should be two flannels, each (say) three yards long, with the ends sewed together, to admit of the boiling water being wrung out of them; and the one flannel should be got ready whilst the other is applied." The fineness or the coarseness of the flannel is not a matter of indifference. The coarser it is the less readily does it conduct heat, and the longer it retains its warmth; therefore it is more efficient for fomenting. White flannel also retains the heat longer than coloured flannel." (Dr. R. E. Griffith.) More harm than good is frequently done by allowing the patient to become chilled during the application. "If only one (flannel) is used, the skin becomes chilled during the time occupied in removing the flannel, soaking it in the water, wringing it out, and reapplying it; but if two are used, one of them is ready, and can be applied the moment the other is taken off, by which means the part is never exposed to the air, no matter how long the fomentation is continued. In some diseases (rheumatism, peritonitis, &c.), the patient is scarcely conscious of a degree of heat which scalds the nurse's hands. In this case the fomenting flannels should be put in a towel, by which means they may be wrung out without being handled by the nurse, and may be applied far hotter than can be done by any other method." (Dr. J. B. Nevins.)

The quantity of liquid forming a fomentation, as well as the size of the cloths employed,

must entirely depend upon circumstances. In some cases (as in slight affections of the face, &c.), the application may be effectually made by holding the part in the steam of the hot liquid, and bathing it continually by means of a sponge or cloth. In some instances $\frac{1}{2}$ pint to a pint of liquid may be found a sufficient quantity; whilst in others, several quarts will be required. Under all circumstances, care must be taken to keep the fomentation as near as possible at the temperature ordered, during the whole time of its application; and, as soon as the operation is finished, to quickly wipe the part dry, and to cover it with ample clothing, in order that the reaction set up may not be prematurely checked.

Fomentations usually consist of simple water, or the decoction of some simple vegetable substance, as chamomiles, elder flowers, or mallows; but, occasionally, the leaves and flowers of aromatic and narcotic plants, and saline matter, are employed under this form. The following formulæ are given as examples:—

Fomentation, Anodyne. *Syn.* FOTUS ANODYNUS, FOMENTATIO ANODYNA, FOMENTUM ANODYNUM, L. *Prep.* 1. Simple decoction of poppy-heads.

2. (Hosp. F.) Poppy-heads (without the seeds), $1\frac{1}{2}$ oz.; water, 3 $\frac{1}{2}$ pints; boil to 2 $\frac{1}{2}$ pints; add of elder flowers, $\frac{3}{4}$ oz.; boil to a quart, and strain. Used to allay pain.

3. (Pierquin.) Opium, 1 oz.; wine, 1 quart; boil to a pint and strain. Used in severe gouty, rheumatic, neuralgic, and syphilitic pains.

4. Opium, 1 oz.; water, 1 quart; boil to $\frac{3}{4}$ pint, add pyroligneous acid, 2 fl. oz.; boil for 10 minutes longer, then further add of sherry wine, $\frac{3}{4}$ pint; and as soon as the whole again boils, strain it for use. Superior to the last, and cheaper.

Fomentation, Antineuralgic. *Syn.* FOMENTATIO ANTINEURALGICA, L. *Prep.* 1. (Mialhe.) Acetate of morphia, 2 gr.; acetic acid, 2 or 3 drops; eau de Cologne, 2 or 3 dr.; dissolve. In facial nevæ.

2. (Trousseau and Reveil.) Cyanide of potassium, 1 dr.; distilled water, 6 fl. oz.; dissolve, and keep it in a well-closed bottle in the dark. Used in neuralgia, especially in that of the face (tic douloureux). A compress of lint or soft linen is dipped in it and applied to the part. It must not be used internally or applied to a wounded surface, as it is very poisonous. See ANODYNE FOMENTATIONS, NOS. 3 and 4 (above), also STIMULANT FOMENTATION.

Fomentation, Antiseptic. *Syn.* FOMENTATIO ANTISEPTICA, L. *Prep.* 1. Decoction of mallows, 4 pints; sal ammoniac, 2 oz.; dissolve, and add of disulphate of quinine, 20 gr., dissolved in camphorated spirit, 4 fl. oz.

2. (Hosp. F.) Decoction of bark, 1 quart; infusion of chamomile, 1 pint; camphorated spirit, 2 fl. oz.; hydrochloric acid, 1 fl. dr. Both are used when there is a tendency to gangrene or putrescence.

Fomentation of Arnica. *Syn.* FOMENTATIO ARNICÆ, L. *Prep.* 1. Flowers of arnica, 1 oz.; water, 3 pints; boil to a quart, and strain. Used in contusions.

2. (Graefe.) Flowers of arnica, 2 oz.; rue (leaves), 1 oz.; boiling water, q. s. to strain 12 fl. oz. of infusion after an hour's maceration at nearly the boiling temperature. Used in contusions and extravasations, especially as an application to black eyes.

3. (Radius.) Flowers of arnica, $\frac{1}{2}$ oz.; boiling vinegar, q. s. to strain 6 fl. oz. of infusion, in which dissolve of carbonate of ammonia, 2 dr. Used in cedema of the scrotum.

Fomentation, Aromatic. *Syn.* FOMENTATIO AROMATICA, FOTUS AROMATICUS, L. *Prep.*

1. Sea wormwood, southernwood, and chamomiles, of each, 1 oz.; laurel leaves, $\frac{1}{2}$ oz.; water, 5 pints; boil to $\frac{3}{4}$ gall, and strain. In rheumatism, cutaneous affections, colic, &c.

2. (Augustin.) Rosemary, $\frac{1}{2}$ oz.; red wine and water, of each, 3 fl. oz.; infuse and strain with expression. In contusions, especially black eyes.

3. (Hosp. F.) Cloves and mace, of each, 1 oz.; opium, 20 gr.; red wine (boiling), 1 pint; digest at near boiling for 1 hour, and strain. Used as both the last.

4. (Rideau.) Bay leaves, rosemary, southernwood, and wormwood, of each, 1 oz.; water, 2 quarts; boil 5 minutes, and strain. As No. 1.

Fomentation, Astringent. *Syn.* FOTUS ASTRINGENS, F. ROBORANS, L. *Prep.* 1. Decoction of oak bark.

2. To each quart of the last, add of alum, 1 dr.

3. (Ph. Chirur.) Bruised galls, 1 oz.; boiling water, 2 $\frac{1}{2}$ pints; digest 1 hour, and strain.

4. (Ricord.) Tannin, 2 $\frac{1}{2}$ dr.; aromatic wine (hot), $\frac{1}{2}$ pint; dissolve.

5. Bistort and pomegranate peel, of each, 2 oz.; sal ammonia, $\frac{1}{4}$ oz.; red wine 1 pint; infuse at a gentle heat. The above are used in hæmorrhages, piles, prolapsus, &c.

Fomentation of Belladonna. *Syn.* FOTUS BELLADONNÆ, L. *Prep.* (Ophthalmic Hosp.) Extract of belladonna, 1 dr.; boiling water 1 pint. Used to dilate the pupil in certain affections of the eye; it is usually applied on the forehead.

Fomentation of Chamomile. *Syn.* FOMENTATIO ANTHEMIDIS, L. *Prep.* Chamomiles, 2 oz.; water, 3 pints; boil 10 minutes, and strain with expression. Emollient.

Fomentation, Diuretic. *Syn.* FOMENTATIO DIURETICA, L. *Prep.* (Trousseau.) Tinctures of squills and foxglove, of each, 2 oz.; hot water, 6 fl. oz.; mix. Applied by lint or linen compresses to the insides of the thighs, in dropsies, when the stomach will not bear diuretics.

Fomentation of Elder Flowers. *Syn.* FOTUS SAMBUCI, L. *Prep.* From elder flowers, 1 oz.; boiling water, 2 quarts; digest in a hot

place for 1 hour, and express the liquor. Emollient.

Fomentation, Emollient. *Syn.* FOMENTATIO EMOLLIENTIS, L. *Prep.* 1. Marshmallow root and poppy-heads, of each 1 oz.; water, 3 pints; boil to a quart, and strain.

2. (P. Cod.) Emollient herbs, 1 oz.; boiling water, 1 quart; infuse 1 hour, and strain with expression. (See above.)

Fomentation, Narcotic. *Syn.* FOMENTATIO NARCOTICA, L. *Prep.* (P. Cod.) Narcotic herbs, 1 oz.; boiling water, 1½ pint; infuse as last.

Fomentation, Resolvent. *Syn.* FOTUS RESOLVENS, L. *Prep.* (Richard.) Fomentation of elder flowers, 8 fl. oz.; liquor of diacetate of lead, ½ fl. dr.; mix. *Used* to discuss tumours, &c.

Fomentation, Stimulant. *Syn.* FOMENTATIO STIMULANS, L. *Prep.* 1. Sesquicarbonate of ammonia, 1 oz.; tincture of cantharides, 2 fl. oz.; warm water, 1 pint.

2. Household mustard, 4 oz.; hot water, 1½ pint; mix. Both the above are rubefacient and counter-irritant, and excellent in rheumatism, neuralgia, &c.

• **Fomentation, Vermifuge.** *Syn.* FOMENTATIO VERMIFUGA, FOTUS ANTHELMINTICUS, L. *Prep.* Leaves and flowers of tansy, wormwood, and chamomile, of each, 3 oz.; water, 1 quart; boil to 1½ pint, and strain. Applied to the abdomen, &c., in worms.

FOOD. *Syn.* CIBUS, MATERIA ALIMENTARIA, L. Anything which feeds or promotes the natural growth of organic bodies, by supplying them with materials which, by assimilation, may be converted into the substances of which they are composed; or which, by its decomposition or slow combustion, maintains the temperature, or some other essential condition of life, at the proper standard. The numerous articles employed as food are all compounds; and in many cases they consist of mechanical mixtures or chemical combinations of two or more compounds. Organized matter, or that which has possessed either animal or vegetable life, or which has been produced by living organs, seems to be alone capable of assimilation, to any extent, by the animal system; and hence it is from the organic kingdom that our aliments are necessarily derived. Water, iron, earthy phosphates, chloride of sodium, and other salts, which form the inorganic constituents of the body, though not of themselves nourishing, are also assimilated when taken in conjunction with organic aliments, and then contribute essentially to nutrition. In the animal and vegetable substances employed as food, these inorganic compounds are provided in small but sufficient quantities to meet the requirements of the healthy body; and in this state of combination alone can they be regarded in the light of aliments. A complete consideration of this subject embraces, not only all the substances used as food, but also those things which when

taken with them improve their flavour, promote their digestion, and render them more wholesome and nutritive; and also their preparation for the table in its various relations with health and disease.

The following 'BILLS OF FARE,' for which we are indebted chiefly to Soyer, Rundell, and others, exhibit the various articles in season at different periods of the year.

FIRST QUARTER. January.—Poultry and Game: Pheasants, partridges, hares, rabbits, woodcocks, snipes, turkeys, capons, pullets, fowls, chickens, and tame pigeons.—Fish: Carp, tench, perch, lampreys, eels, cray-fish, cod, soles, flounders, plaice, turbot, thornback, skate, sturgeon, smelts, whittings, lobsters, crabs, prawns, and oysters.—Vegetables: Cabbage, savoys, colewort, sprouts, leeks, onions, beet, sorrel, chervil, endive, spinach, celery, garlic, scorzonera, potatoes, parsnips, turnips, brocoli (white and purple), shalots, lettuces, cresses, mustard, rape, salsafy, and herbs of all sorts (some dry and some green); cucumbers, asparagus, and mushrooms are also to be had, though not in season.—Fruit: Apples, pears, nuts, walnuts, medlars, and grapes.

February and March.—Meat, fowls, and game, as in January, with the addition of ducklings and chickens.—Fish: As the last two months. (Cod is not thought so good from February to July, although it is still sold at the fishmonger's.)—Vegetables: The same as the previous months, with the addition of kidney-beans.—Fruit: Apples, pears, and forced strawberries.

SECOND QUARTER. April, May, and June.—Meat: Beef, mutton, veal, lamb, and venison (in June).—Poultry: Pullets, fowls, chickens, ducklings, pigeons, rabbits, and leverets.—Fish: Carp, tench, soles, smelts, eels, trout, turbot, lobsters, chub, salmon, herrings, cray-fish, mackerel, crabs, prawns, and shrimps.—Vegetables: As before; and in May, early potatoes and cabbages, peas, radishes, kidney-beans, carrots, turnips, cauliflowers, asparagus, artichokes, and numerous salads (forced).—Fruit: (in June), strawberries, cherries, melons, green apricots, and currants and gooseberries for tarts; pears, grapes, nectarines, peaches, and some other fruit.

THIRD QUARTER. July, August, and September.—Meat, as before.—Poultry, &c.: Pullets, fowls, chickens, rabbits, pigeons, green geese, leverets, and turkey poults. Two former months, plovers and wheat-eats; (in September), partridges, geese, &c.—Fish: Cod, haddocks, flounders, plaice, skate, thornback, mullets, pike, carp, eels, shellfish (except oysters), and mackerel (during the first two months of the quarter, but they are not good in August).—Vegetables: Of all sorts, beans, peas, French-beans, &c.—Fruit: (In July), strawberries, gooseberries, pine-apples, plums (various), cherries, apricots, raspberries, melons, currants, and damsons. (In August and September), peaches, plums, figs, filberts, mulber-

ries, cherries, apples, pears, nectarines, and grapes. (During the latter months), pines, melons, strawberries, medlars, and quinces. (In September), Morella cherries, damsons, and various plums.

FOURTH QUARTER. October, November, and December.—Meat, as before, and doe venison.—Poultry and Game: Domestic fowls, as in first quarter; pheasants (from the 1st of October); partridges, larks, hares, dotterels; (at the end of the month), wild-ducks, teal, snipes, widgeon, and grouse.—Fish: Dories, smelts, pike, perch, halibuts, brills, carp, salmon-trout, barbel, gudgeons, tench, and shellfish.—Vegetables: (As in January), French-beans, last crops of beans, &c.—Fruit: Peaches, pears, figs, bullace, grapes, apples, medlars, damsons, filberts, walnuts, nuts, quinces, services, and medlars. (In November)—Meat, &c.: Beef, mutton, veal, pork, house-lamb, doe venison, and poultry and game as in the last month.—Fish: As the last month.—Vegetables: Carrots, turnips, parsnips, potatoes, skirrets, scorzonera, onions, leeks, shalots, cabbage, savoy, colewort, spinach, chardbeats, chardoons, cresses, endive, celery, lettuces, salad-herbs, and various pot-herbs.—Fruit: Pears, apples, nuts, walnuts, bullace, chestnuts, medlars, and grapes. (In December)—Meat, &c.: Beef, mutton, veal, house-lamb, pork, and venison.—Poultry and Game: Geese, turkeys, pullets, pigeons, capons, fowls, chickens, rabbits, hares, snipes, woodcocks, larks, pheasants, partridges, sea-fowls, guinea-fowls, wild ducks, teal, widgeon, dotterels, dun-birds, and grouse.—Fish: Cod, turbot, halibuts, soles, gurnets, sturgeon, carp, gudgeons, codlings, eels, dories, and shell-fish.—Vegetables: As in last month. Asparagus, &c., forced.—Fruit: As before, except bullace.

FOOL. Cooks give this name to a species of jam made of boiled and crushed fruit, mixed with milk or cream, and sweetened.

Ap'le Fool. From the peeled and cored fruit, placed in a jar, with moist sugar, q.s. to render it palatable, and a very little cider or perry; the jar is set in a saucepan of water over the fire, and the heat continued until the apples become quite soft, when they are pulped through a colander, and a sufficient quantity of milk, a little cream, and some sugar, added to bring them to the proper 'palate.'

Gooseberry Fool. From gooseberries, as the last. Those which are unripe are generally preferred. These preparations, when nicely made, are very pleasant and wholesome.

FOOT (Human.) See **FEET**.

FOOTS. Coarse moist sugar. The scrapings of the sugar hogsheds, refuse sugar, waste, and dirt, is also sold to the publicans under this name, who use it in the adulteration of their beer; chiefly to make it stand more water, and to impart 'briskness.'

FORCEMEAT. *Syn.* FARCE, STUFFING. A species of sausage meat, either served up alone, or employed as an ingredient in other dishes.

Mrs. Rundell truly remarks that "at many tables, where everything else is done well, it is common to find very bad forcemeat or stuffing." To avoid this error, care should be taken to so proportion the ingredients that "no one flavour should predominate; yet if several dishes be served the same day, there should be a marked variety in the tastes of the forcemeats, as well as of the gravies. A general fault is, that the tastes of lemon-peel and thyme overcome all others; therefore they should only be used in small quantities." Forcemeats should be just consistent enough to cut with a knife, but not dry and heavy. Herbs are very essential ingredients; and it is the copious and judicious use of them that chiefly gives the cookery of the French its superior flavour. "To force fowls, meat, &c., is to stuff them." (Mrs. Rundell.)

FORCING. Horticulturalists apply this term to the art of accelerating the growth of plants, so as to obtain fruits or flowers at unusual seasons. Dung-beds, bark-beds, and frames, pits, and houses, with glass roofs, are commonly employed by the gardeners for this purpose.

FORMATE. *Syn.* FORMIATE. Salts, in which one atom of hydrogen in formic acid is replaced by a metal or other basic radical. They are best obtained either by direct saturation of the acid, or by double decomposition; most of them are very soluble, and are decomposed by hot oil of vitriol. Formate of ammonium crystallises in square prisms; formate of sodium, in rhombic prisms; formate of potassium is deliquescent, and crystallises with difficulty; the formates of barium, calcium, magnesium, and strontium, form small prismatic crystals; formate of lead assumes the shape of small colourless needles, soluble in 40 parts of water; the formates of cobalt, iron, manganese, nickel, and zinc, are easily crystallisable, whilst that of copper forms very beautiful, large, bright-blue rhombic prisms; formate of silver is less soluble than the salt of lead, and is decomposed at a gentle heat.

FORMIC ACID. HCHO_2 . *Syn.* HYDROGEN FORMATE. An organic acid, obtained by oxidizing many organic substances, and found in the red ant.

Prep. Sugar, 1 part; water, 2 parts; bin-oxide of manganese, 3 parts; mix in a retort capable of holding fully 10 times the bulk of the ingredients, and add, cautiously, oil of vitriol, 3 parts, diluted with an equal weight of water; as soon as the first violent effervescence has subsided, heat may be applied, and the product collected and purified, as below.

Formate of lead in fine powder is introduced into a long glass tube, one end of which is connected with an apparatus evolving sulphuretted hydrogen, and the other with a receiver. As soon as the salt is entirely decomposed (blackened) a very gentle heat is

applied, and the distilled liquid collected; the product is, lastly, boiled for a minute or less, to expel any adhering sulphuretted gas. This furnishes chemically pure formic acid.

From wood spirit, 1 part; bichromate of potassium and sulphuric acid, of each, 3 parts; the sulphuric acid, diluted with an equal weight of water, being gradually added last. A portion of wood spirit distils over with the acid, and may be again treated with bichromate of potassium and sulphuric acid, when a fresh portion of formic acid will be produced. This process yields a large product.

Prop., purific., &c. The products of the above processes are limpid and colourless; the stronger ones fume slightly in the air, and possess an extremely penetrating odour. The acid obtained by the second process boils at 209° Fahr., crystallises in brilliant scales below 32°, and has the sp. gr. 1.2353. Its vapour is inflammable, and burns with a blue flame. It is extremely corrosive, and rapidly destroys the texture of living organic substances. The products of the other processes are very dilute, and possess the above properties in only a minor degree. They may all be purified and concentrated by saturating them with pure carbonate of sodium or of potassium, and after subjecting the liquid to a gentle heat for a short time, and liberating the formic acid from the salt by means of dilute sulphuric acid, finally submitting the mixture to distillation, when the hydrated acid will come over perfectly pure.

Formic acid reduces the salts of mercury and silver, and forms salts with the bases termed formiates.

Formic acid is readily distinguished from acetic acid, which in many points it resembles, by heating it with a little solution of oxide of silver or mercury; the metal is reduced, and precipitated in a pulverulent state, while carbonic acid is extricated. The odours of the two acids also vary.

FORMULA. [L.] In pharmacy and medicine, a short form of prescription; a recipe. By chemists, the term is applied to a grouping of symbols, expressing the composition of a body; thus, HCl (standing for 1 atom of hydrogen united to 1 atom of chlorine) is the formula for hydrochloric acid. A chemical formula is termed empirical when it merely gives the simplest possible expression of the composition of the substance to which it refers. A rational formula, on the contrary, aims at describing the exact composition of molecule, or combining weight of the substance, but stating the absolute number of atoms of such of the elements essential to that object, as well as the mere relations existing between them. The empirical formula is at once deduced from the analysis of the substance, reckoned to 100 parts; the rational formula requires, in addition, a knowledge of its combining quantity, which can only be obtained by direct experiment, by synthesis, or by the careful examina-

tion of one or more of its most definite compounds. Thus, the composition of acetic acid is expressed by the formula CHO_2 , which exhibits the simplest relations of the three elements; if we want to express the quantities of these, in atoms required to make up one molecule of acetic acid, we have to adopt the formula $\text{C}_2\text{H}_4\text{O}_2$ or $\text{HC}_2\text{H}_3\text{O}_2$.

FORMYL. *Syn.* FORMYLE. A hypothetical organic radical, having the composition C_2H . Its existence was inferred from the constitution of certain organic compounds which are now referred to the methyl-series. Formic acid was supposed to be an oxide of formyl; and chloroform, the terchloride of formyl.

FOX GLOVE. *Syn.* DIGITALIS (B. P.), L. A genus of plants belonging to the natural order *Scrophulariaceæ*. The leaves of the uncultivated '*Digitalis purpurea*,' or purple foxglove are official in our pharmacopœias. They must be gathered before the terminal flowers have expanded. "The petiole and midrib of the leaf being cut off, dry the lamina." (Ph. L.) The seeds (DIGITALIS SEMINA), which were ordered, as well as the leaves, in former pharmacopœias, are said to be in many points preferable to them. When good, the leaves are of a dull-green colour, and possess a feeble narcotic odour, and a bitter, unpleasant taste. Both the dried leaves and the powder should be preserved in corked bottles covered with dark-coloured paper, or in well-closed tin canisters, and kept in a dark cupboard; and the stock should be renewed yearly, as age considerably diminishes the medicinal activity of digitalis.

Action, uses, &c. Foxglove is diuretic, sedative, and antispasmodic, and exerts a specific action over the cerebro-spinal system, promoting the functions of the absorbents, and reducing the force of the circulation in a remarkable manner. It is administered in fevers and inflammations, to reduce the frequency of the pulse, and to allay excessive vascular excitement; in dropsy (unless the habit is full and pulse tight and cordy), as a diuretic, either alone, or combined with squills, calomel, salines, or bitters; in internal hæmorrhages, as a sedative, when the pulse is full, hard, and throbbing; in diseases of the heart and great vessels, and in phthisis, to reduce the force and velocity of the circulation; in epilepsy and insanity, to repress vascular excitement; and in spasmodic asthma, scrofula, and several other diseases, with one or other of the above intentions.

The greatest caution is required in the use of foxglove, as its effects accumulate in the system, and the unwary practitioner is occasionally surprised at the sudden demise of his patient, even after he has left off the use of this drug.—*Dose.* $\frac{1}{2}$ gr. to 1½ gr., in powder, every 6 hours. See EXTRACT, INFUSION, TINCTURE, &c.

FOX'ING. See MALT LIQUORS.

FRACTURE. *Syn.* FRACTURA, L. The breaking or disruption of a bone. When the

bone is nearly divided into two parts, it is called a **SIMPLE FRACTURE**; when the integuments are also lacerated, a **COMPOUND FRACTURE**; and when the bone is splintered, a **COMMUNUTED FRACTURE**.

FRANKINCENSE. *Syn.* COMMON FRANKINCENSE; *THUS* (Ph. L.), L. The turpentine which exudes from the bark of *Abies eccelsa* (Norway spruce fir) and *Pinus palustris* (pitch or swamp pine), hardened by the air. (Ph. L.) The gum-resin olibanum, which is the produce of the *Boswellia thurifera*, is the 'odorous frankincense' of commerce.

Prepared Frankincense. *Syn.* *THUS PRÆPARATUM* (Ph. L.), L. *Prep.* (Ph. L.) Frankincense, 1 lb.; water, q. s. to cover it; boil until the resin is melted, and strain through a hair sieve; when the whole has cooled, pour off the water, and keep the frankincense for use. Resembles common resin in its general properties.

FRAXININ. *Syn.* FRAXIN; FRAXINA, L. A peculiar bitter, neutral, and crystallizable substance, soluble in boiling water, extracted from the bark of *Fraxinus excelsior*, or common ash. It is febrifuge.

FRECKLES. These are round or oval-shaped yellowish spots, similar to stains, developed on the skin. There are two varieties—**FRECKLES**, or **SUMMER FRECKLES**, resulting from the action of the sun and heat during the summer season, and disappearing with the hot weather or exposure; and—**COLD FRECKLES**, which occur at all times of the year. The former are chiefly confined to persons of fair complexion, whilst the latter attack persons of all complexions indifferently, and sometimes assume a lively yellow or greenish colour.

Treatment. Common freckles may generally be removed by the frequent application of dilute spirits, acids, or alkaline solutions; the last two just strong enough to prick the tongue. Cold freckles commonly occur from disordered health, or some general disturbance of the system, to which attention should be chiefly directed. In both varieties the solution of bichloride of mercury (Ph. L.), or Gowland's lotion, will be found a most useful external application. See *below*.

Freckles, Lotion for. *Prep.* 1. Bichloride of mercury, 5 gr.; hydrochloric acid, 30 drops; lump sugar, 1 oz.; rectified spirit of wine, 2 oz.; rose water, 7 oz.; agitate together until the whole is dissolved.

2. Petals or leaves of red roses, 1 oz.; hot water, 12 fl. oz.; infuse an hour, and strain, with expression, $\frac{1}{2}$ pint; add of citric acid, 30 gr.; dissolve, and in a few hours decant and clear.

3. Rose leaves (dried), $\frac{1}{2}$ oz.; lemon juice (freshly expressed) and rum or brandy, of each, $\frac{1}{2}$ pint; digest 24 hours, and squeeze out the liquor for use.

5. (Kittoe's.) Sal ammoniac, 1 dr.; spring water, 1 pint; lavender water or eau de Co-

logne, $\frac{1}{4}$ oz.; mix. The above are applied with the fingers night and morning, or oftener.

Freckles, Pomade for. *Prep.* 1. Citrine ointment, 1 dr.; simple ointment, 7 dr.; otto of roses, 3 drops.

2. Elder flower ointment, 1 oz.; sulphate of zinc (levigated), 20 gr.; mix by porphyzation, or by trituration in a wedgwood-ware mortar. Both the above, applied night and morning, are excellent for either cold or summer freckles.

FREEZING MIXTURES. See ICE and REFRIGERATION.

FRENCH BERRIES. *Syn.* PERSIAN BERRIES, AVIGNON B.; GRAINES D'AVIGNON, Fr. The unripe berries or fruit of the *Rhamnus infectorius*. They are imported from France and Persia; those from the latter country being esteemed the best. Some writers state that the Persian berries are the product of a distinct species, namely, *R. amygdalinus*. They are chiefly used for dyeing morocco leather yellow. Their decoction dyes cloth, previously mordanted with alum, tartar, or protochloride of tin, of a yellow colour; with sulphate of copper, an olive; and with red sulphate of iron, an olive-green colour.

FRENCH POLISH. Several varnishes are used under this name. That most generally employed is a simple solution of pale shell-lac in either methylated spirit or wood naphtha. Sometimes a little mastic, sandarac, or elemi, or copal varnish, is added to render the polish tougher.

Prep. 1. From pale shell-lac, 5 $\frac{1}{2}$ oz.; finest wood naphtha, 1 pint; dissolve.

2. Pale shell-lac, 3 lb.; wood naphtha, 1 gall. Methylated spirit (68 o. p.) may be substituted for the naphtha in each of the above formulae.

3. Pale shell-lac, 5 oz.; gum sandarac, 1 oz.; spirit (68 o. p.), 1 pint.

4. Pale shell-lac, 5 $\frac{1}{2}$ oz.; gum elemi, $\frac{3}{4}$ oz.; spirit, 1 pint.

5. Pale shell-lac, 1 $\frac{1}{4}$ lb.; mastic, $\frac{1}{2}$ lb.; spirit, 2 quarts.

6. Pale shell-lac, 2 $\frac{1}{4}$ lb.; mastic and sandarac, of each, 3 oz.; spirit, 1 gall.; dissolve, add copal varnish, 1 pint, and mix by roughly agitating the vessel. All the above are used in the manner described below.

7. Shell-lac, 12 oz.; wood naphtha, 1 quart; dissolve, and add of linseed oil, $\frac{1}{2}$ pint.

8. Shell-lac, $\frac{1}{2}$ lb.; gum sandarac, $\frac{1}{4}$ lb.; spirit, 1 quart; dissolve, add of copal varnish, $\frac{1}{4}$ pint; mix well, and further add of linseed oil, $\frac{1}{2}$ pint. The last two require no oil on the rubber.

Obs. The preparation of French polish is precisely similar to that of other spirit or naphthalic varnishes. Sometimes it is coloured, in order to modify the character of the wood. A **REDDISH TINGE** is given with dragon's blood, alkanet root, or red sanders wood; and a **YELLOWISH TINGE**, by turmeric root or gamboge. When it is simply desired to **DARKEN** the wood, brown shell-lac is employed to make

the polish; and when the object is to keep the wood **LIGHT COLOURED**, a little oxalic acid (2 to 4 dr. to the pint) is commonly added. These substances are either steeped in or agitated with the polish, or with the solvent, before pouring it on the 'gums,' until they dissolve, or a sufficient effect is produced. French polish is not required to be so clear and limpid as other varnishes, and is, therefore, never artificially clarified. See **VARNISH**, and *below*.

FRENCH POLISHING. This process, now so generally employed for furniture and cabinet work, is performed as follows:—The surface to be operated on being finished off as smoothly as possible with glass paper, and placed opposite the light, the 'rubber' being made as directed *below*, and the polish (see above) being at hand, and preferably contained in a narrow-necked bottle, the workman moistens the middle of the flat face of the rubber with the polish, by laying the rubber on the mouth of the bottle and shaking up the varnish against it, once, by which means the rubber imbibes the proper quantity to cover a considerable extent of surface. He next encloses the rubber in a soft linen cloth, doubled, the rest of the cloth being gathered up at the back of the rubber to form a handle. The face of the linen is now moistened with a little raw linseed oil, applied with the finger to the middle of it, and the operation of polishing immediately commenced. For this purpose the workman passes his rubber quickly and lightly over the surface uniformly in one direction, until the varnish becomes dry, or nearly so, when he again charges his rubber as before, omitting the oil, and repeats the rubbing, until three coats are laid on. He now applies a little oil to the rubber, and two coats more are commonly given. As soon as the coating of varnish has acquired some thickness, he wets the inside of the linen cloth, before applying the varnish, with alcohol, or wood naphtha, and gives a quick, light, and uniform touch over the whole surface. The work is, lastly, carefully gone over with the linen cloth, moistened with a little oil and rectified spirit or naphtha, without varnish, and rubbed, as before, until dry.

The **RUBBER** for French polishing is made by rolling up a strip of thick woollen cloth (list) which has been torn off, so as to form a soft elastic edge. It should form a coil, from 1 to 3 inches in diameter, according to the size of the work.

FRES'CO-PAINTING. See **PAINTING**.

FRICANDEAU. [Fr.] Among *cooks*, a ragout, or fricassée of veal. The same term is also sometimes applied to stewed beef, highly seasoned.

FRICASSEE. [Fr.] A dish prepared by stewing or semi-frying, highly flavoured with herbs, spices, or sauce. Small things, as chickens, lamb, &c., and cold meat, are usually formed into fricassees.

FRICTION. In a general sense, the act of rubbing one body against another; attrition.

Friction. In *mechanics*, this is the resistance which the surface of a moving body meets with from the surface of the body on which it moves. To lessen the amount of friction in machines, various unctuous substances, as oil, tallow, soap, black-lead, &c., are used by engineers. These substances act by imparting smoothness to the points of contact, and thus reduce their resistance to each other. The full consideration of the subject belongs to engineering.

Friction. In *medicine*, friction, whether simple or conjoined with liniments, is a therapeutical agent of considerable power. By it, the circulation is promoted in debilitated parts, and medicinal substances (iodine, mercurials, opium, &c.) are made to penetrate the pores of the skin. "The benefit of friction, which consists of motion and heat, whether or not the same be raised by rubbing the body with a coarse cloth or the flesh-brush, has advantages inconceivable and scarcely credible, by which the obstructions of the pores and cutaneous glandules are opened, their stagnating juices broken into small particles, dissolved, and rendered fit to be carried off in perspiration, in the room of which, as my Lord Verulam well observes, new juice will succeed with new vigour to the body; and longevity, saith that great naturalist, is this way most certainly promoted" (Daniel Turner).

Simple friction is performed by the hand alone, or with a piece of flannel, a hair glove, or a flesh-brush. "If it be properly performed—namely, by short, brisk strokes with the tips of the fingers, and with great celerity, when the naked hand is the agent; and if it be continued for an hour or upwards, and repeated several times a day—its influence in reducing swelled glands and swellings of the joints, as well as in alleviating rheumatic pains, is very great; but, besides being well performed, the friction should be continued for (at least) half an hour, in order to render it useful." (Dr. R. E. Griffith.)

Gentle, slow, and equable friction, by producing a continued repetition of an agreeable impression on the nervous system, acts both as an anodyne and hypnotic. For this purpose "the operator should sit by the side of the bed, and, introducing the hand under the bed-clothes, rub the legs or the arms (or other parts) gently, with equally lengthened but slow movements. When the invalid is a child, its influence is more powerful when aided by a monotonous, but a soft tune, which, although it operates upon a distinct sense, yet, by combination, renders the friction more soporific." (Griffith.)

When the friction is accompanied with the use of any acrid or irritating substance, or is intended to introduce any active remedy into the system, the rubbing should be brisk, and of sufficient force to slightly abrade and in-

flame the cuticle; and should be continued until the substance, which is usually in the form of an ointment, either wholly or partially disappears, owing to its absorption by the skin. The hand of the operator should, in most cases, be guarded by a glove; otherwise he is likely to share with the patient the effects of the medicine, a result not always agreeable or even safe.

FRIGORIFIC MIXTURES. See REFRIGERATION.

FRIT. The pulverulent materials of glass, heated until they coalesce without melting. See ENAMEL, GLASS, &c.

FRITTERS. Fried batter. A species of pancake, containing fruit, sweetmeats, poultry, meat, or fish.

Prep. 1. (M. Alexis Soyer.) "The following is thirty receipts in one:"—Soak crum of bread, 1 lb., in cold water, q.s.; take the same quantity of any kind of boiled or roasted meat (a little fat), and chop it into fine dice; press the water out of the bread; put into the pan butter, lard, or dripping, 2 oz., with chopped onions, two teaspoonfuls; fry two minutes, add the bread, stir with a wooden spoon until rather dry, then add the meat, and season with salt, 1 teaspoonful, pepper, $\frac{1}{2}$ do., and a little grated nutmeg, if handy; stir till quite hot; then further add two eggs, one at a time. mix very quickly, and pour it on a dish to cool; next roll it into the shape of small eggs, then in flour, 'egg' them, and bread-crum them; lastly, fry in abundance of fat to a nice yellow colour, and serve either plain, or with any sharp or other savoury sauce-you fancy. Innumerable dishes can be made in this way; in fact, from everything that is eatable, and at any season of the year—from the remains of meat, poultry, game, fish, vegetables, &c. The same can be done with chopped, dried, or preserved fruits, simply using a $\frac{1}{4}$ lb. more bread, and sifting powdered sugar and cinnamon over them. Cream may also be used for fruit, or curds.

Fritters are also (and more commonly) fried in ordinary batter, instead of bread-crumbs. "There is no end to what may be done with these receipts." "They can be ornamented and made worthy the table of the greatest epicure, if the bread be soaked in cream, and spirits or liquor introduced into them." (Soyer.)

2. Mrs. Rundell:—*a.* (APPLE FRITTERS.) See FRUIT FRITTERS.

3. (BUCKWHEAT FRITTERS, B. CAKES, BUCKINGS.) Made by beating up buckwheat flour to a batter with some warm milk, adding a little yeast, letting it rise before the fire for 30 or 40 minutes, then beating in some eggs and milk or warm water, as required, and frying them like pancakes. Buckwheat fritters, when well prepared, are excellent. Made without eggs, and served up with molasses, they form a common dish in almost every breakfast in North America.

c. (CURD FRITTERS.) From dried curd, beaten with yolk of egg and a little flour, and flavoured with nutmeg.

d. (FRENCH FRITTERS.) Common pancakes, beaten up with eggs, almonds, and flavouring sugar, orange-flower water, and nutmeg), and the paste dropped into a stew- or frying-pan half full of boiling lard, so as to form cakes the size of large nuts, which are cooked till brown.

e. (FRUIT FRITTERS.) From the sliced fruits, with rich batter.

f. (SOUFFLÉ FRITTERS.) Rich pancakes, flavoured with lemon.

g. (SPANISH FRITTERS.) From slices of French rolls soaked in a mixture of cream, eggs, sugar, and spices, and fried brown.

FROG. The esculent variety, in Europe, is the common green or gibbous frog, the *Rana esculenta* of Linnaeus. As an aliment, it is much esteemed on the Continent. Its liver is among the simples of the Ph. L. 1618, and was once considered a useful remedy in certain forms of ague.

FROST-BITES. When those parts of the body in which the circulation of the blood is most languid are exposed to extreme cold, they quickly become frozen, or, as it is called, 'frost bitten.' The fingers, toes, ears, nose, and chin, are most liable to this attack. The remedy is long-continued friction with the hands or cold flannel, avoiding the fire, or even a heated apartment.

FRUIT. *Syn.* FRUCTUS, L. Among botanists, this is the mature ovary or pistil, containing the ripened ovules or seeds. In familiar language, the term is applied to any product of a plant containing the seed, more especially those that are eatable.

Fruits are extensively employed as articles of diet by man, both as luxuries and nutriment. The fruit of the cereals furnishes our daily bread; that of the vine gives us the well-known beverage, wine, whilst other varieties enrich our desserts, and provide us with some of our most valuable condiments and aromatics. The acidulous and subacid fruits are antiseptic, aperient, attenuant, diuretic, and refrigerant. They afford little nourishment, and are apt to promote diarrhoea and flatulency. They are, however, occasionally exhibited medicinally, in putrid affections, and are often useful in bilious and dyspeptic complaints. The farinaceous fruits (grain), as already stated, furnish the principal and most useful portion of the food of man. The oleo-farinaceous (nuts, &c.) are less wholesome and less easy of digestion than those purely farinaceous. The saccharine fruits, or those abounding in sugar, are nutritious and laxative, but are apt to ferment and disagree with delicate stomachs when eaten in excess. Stone fruits are more difficult of digestion than the other varieties, and are very apt to disorder the stomach and bowels.

As a rule, fruit should never be eaten in

matic oil produced. The cup is then filled with hot water, and the steam conveyed to the affected side of the mouth.

FU'MING LIQUORS. See AMMONIUM SULPHYDRATE, ARSENIC TRICHLORIDE, TIN BICHLORIDE, &c.

FUNG'I. In *botany*, a natural order of cellular plants, producing their fructification in the air; growing in or upon decaying or living organic substances, and nourished through their vegetative structure called the spawn or mycelium. Fungi have very variable properties. Some are medical, others edible, others are deadly poisons. The various diseases of plants known as blight, mildew, rust, smut, vine-mildew, potato-disease, ergot, &c., are either caused by or accelerated by the agency of fungi. See AGARIC, MUSHROOM, &c.

FURNACE. An enclosed fireplace for obtaining a high degree of heat. Furnaces vary much in construction and size, according to the particular manufacture in which they are employed. They may be broadly divided into two classes—WIND-FURNACES and BLAST-FURNACES. In the former a high temperature is produced without the aid of bellows by means of a powerful draught. In the latter heated air is blown in through a pipe or pipes at the bottom. For many metallurgic and large chemical operations REVERBERATORY FURNACES are employed. A furnace of this kind is usually long, with a low roof to keep down the flame and hot air upon the 'hearth' or space between the fireplace and the flue.¹ For the smaller operations in chemistry, a variety of furnaces have been invented, and the introduction of coal gas as a fuel by Deville, Griffin, Gore, and others, has wrought a complete change in the arrangements of the laboratory. The GAS-FURNACES of Mr. J. J. Griffin are adapted for almost every operation performed by the aid of heat. Those more recently introduced by Mr. W. Gore are very compact and portable, and will rapidly produce a 'white heat,' without the help of bellows or high chimney, by means of ordinary coal gas and atmospheric air. The first and smallest size consumes 33 cubic feet of gas (value seven farthings) per hour, and is suitable for assayers, jewellers, analytical chemists, experimentalists, dentists, and others. It is capable of fusing eight ounces of copper or six ounces of cast iron; copper begins to melt in it in about twelve minutes from the time of lighting. The second-sized one consumes about twice that quantity of gas, is suitable for manufacturing jewellers generally, and for a great variety of practical persons who require to melt small quantities of gold, silver, copper, german silver, brass, cast iron, glass, and other substances, or require a small crucible heated to high temperatures. It is capable of melting 45 ounces of copper, or 40 ounces of cast iron, and with its heat up it melts one pound of

¹ For an illustration of this kind of furnace, see SODIUM, Carbonate of.

copper in eight minutes; copper begins to melt in about twenty minutes from the time of lighting. See ASSAYING, CHIMNEYS, COPPER, CRUCIBLE, FUEL, &c.

FURNISHING. It is essential for the sake of neatness, and for a pleasing effect to the eye, that there should be a harmony of colours, and also a similarity of style, in the main articles of furniture. The tints of the carpet, of the paper or paint of the walls, and of the window-curtains, should be all in harmony in each room; that is, either possess a general resemblance of colour, or various colours in pleasing contrast and harmony with each other. If the preponderating colour of the curtains is scarlet, and the colour of the walls or carpet blue, a most inharmonious and unpleasant effect is produced; but brown and green, or green and gold, will be in harmony, and may, therefore, be placed together. Carpets being the most expensive articles, it is safest to buy them first, and then to let their colour guide us in the tone and style of the curtains, paper-hangings, chair-covers, hearth-rugs, and the various minor articles. It is also economical to buy carpets of the same pattern for several rooms, because in the event of removal to a house with different sized apartments, a piece of one carpet may be taken to alter the size of another.

FURNITURE. See FRENCH POLISHING, OIL, POLISH, VARNISH, &c.

FURS. Of these the most valuable are Ermine and Sable. Fur skins, when unprepared, or merely dried, go under the name of 'Peltry.' (Brande.)

Furs may be preserved from moths and other insects by placing a little colocynth pulp (bitter apple), or spice (cloves, pimento, &c.), wrapped in muslin, among them; or they may be washed in a very weak solution of corrosive sublimate in warm water (10 or 15 grs. to the pint), and afterwards carefully dried. As well as every other species of clothing, they should be kept in a clean, dry place.

FUSEL-OIL. *Syn.* FUSEL OIL, POTATO-OIL, OIL OF POTATO SPIRIT, GRAIN OIL, GRAIN-SPIRIT OIL, MARC-BRANDY OIL, CRUDE HYDRATED OXYDE OF AMYL. *Source.* An offensive, strong-smelling oil, produced along with alcohol during the fermentation of grain, potatoes, &c., on the large scale, and which gives the peculiar and disagreeable flavour and odour to raw whiskey. It is found chiefly in the last portion of the spirit which passes over, called the 'faints,' to which it imparts its characteristic odour and flavour. By rectifying the faints at a very gentle heat, most of the alcohol and water first pass over together with only a little fusel oil, whilst the latter forms the residuum in the still. Various names (as *above*) are given to the crude oil thus obtained, according to its source. In each case it essentially consists of hydrated oxide of amyl, but trifling and variable quantities of other organic compounds are mixed with it, which slightly

moderately its character, more particularly its odour and flavour. The oil of potato spirit is the purest form of crude fusel oil.

Obs. The exertions of the distiller are directed, as much as possible, to lessen the formation of fusel oil during the fermentation of his 'worts,' and to eliminate, during the distillation and rectification of his liquors, the greatest possible proportion of that with which they may be contaminated.

Prop. *Ƴc.* Fusel oil is a nearly colourless volatile liquid, with a rather high boiling-point, a durable, penetrating, offensive smell, and an acrid, burning taste; when swallowed, it occasions nausea, giddiness, headache, &c.; in slightly larger quantities, vomiting, delirium, oppressive respiration, and lessened sensibility to pain; its vapour also produces these effects. In quantity, it is a narcotic poison. The greater intoxicating power of whiskey, more especially that from raw grain, than other spirit, is due to the larger quantity of fusel oil which it contains. This appears to be well known to the lower class of whiskey drinkers in these countries, and to the consumers of corn brandy in some of the northern parts of Europe. The last are said to frequently demand to be served with "a glass of good fusel." In England fusel oil is chiefly used for lamps and varnishes.

Purific. The AMYLIC ALCOHOL (ALCOHOL AMYLICUM) of the Dublin College is thus prepared. Introduce the ordinary fusel oil of the distilleries into a small still or retort, connected with a condenser, and apply heat; as soon as the oil begins to flow over, unmixed with water, the receiver should be changed, and the distillation resumed, and carried nearly to dryness; the product in the second receiver, and the oily matter which separates from the water in the first receiver, are to be reserved for use. It is employed in the preparation of VALERIANATE OF SODA. See AMYL, HYDRATE.

FUSIBLE ALLOY. *Syn.* FUSIBLE METAL.

Prep. 1. Bismuth, 2 parts; lead, 5 parts; tin, 3 parts. Melts in boiling water.

2. (D'Arcet's.) Bismuth, 8 parts; lead, 5 parts; tin, 3 parts. Melts below 212° Fahr.

3. (Walker.) Bismuth 8, tin 4, lead 5 parts; antimony, 1 part. The metals should be repeatedly melted and poured into drops, until they are well mixed.

4. (Onion's.) Lead, 3 parts; tin, 2 parts; bismuth, 5 parts. Melts at 197° Fahr.

5. To the last, after removing it from the fire, add of quicksilver (warm), 1 part. Liquid at 172°, solid at 140° Fahr.

Obs. The first four of the above are used to make TOY-SPOONS, to surprise children by their melting in hot liquors. A little mercury may be added to lower their melting-points. Nos. 2 and 3 are specially adapted for making ELECTROTYPÉ MOULDS. The beautiful casts of the French medals known to all electrotypers as Clichée moulds are in the alloy No. 3. The above alloys are also used to form PENCILS for

writing on asses' skin, or paper prepared by rubbing burnt hartshorn into it, &c.; also as a METAL BATH in the laboratory. The last is used for ANATOMICAL INJECTIONS.

FUSION. *Syn.* FUSIO, L. The liquefaction of solid bodies by the action of heat. The term AQUEOUS FUSION has been applied to the melting of salts in their combined water when heated; and the term IGNEOUS FUSION, to the liquefaction of bodies by heat alone.

The vessels in which substances are fused are formed of various materials and shapes, according to the properties of the solid operated on, and principally with reference to the degree of heat required for its fusion. In every case the containing vessel should be capable of sustaining the proper degree of heat, without either melting or cracking, and should also be unacted on by the substances melted in them. See CRUCIBLE, FURNACE, &c.

FUSTIC. *Syn.* FUSTIC WOOD. Two distinct dye-stuffs are known by this name, but are distinguished by the adjectives 'old' and 'young.'

Old Fustic. *Syn.* BOIS JAUNE, Fr. The wood of the *Machura tinctoria*. Its decoction dyes woollens yellow of different shades, according to the 'mordant.' Alum, tartar, and spirits of tin brighten the tint; acetate and sulphate of iron and common salt darken it; with sulphate of iron it gives olives and browns; with the indigo vat and sulphate of indigo green. These colours are very permanent. Its yellow turns on the lemon when pale, and on the orange when darker. 1 lb. of old fustic will dye 3 to 5 lbs. of wool.

Young Fustic. *Syn.* YELLOW FUSTIC; FUSTET, Fr. The wood of the *Rhus Cotinus* or Venice sumach. It gives a yellow turning on the green, but its colours are not very permanent. It is chiefly used in combination with other dye-stuffs.

GALBANUM. *Syn.* GUM GALBANUM; GALBANUM (B. P.), L. "A gum-resin derived from an unascertained umbelliferous plant. In irregular tears about the size of a pea, usually agglutinated into masses; of a greenish-yellow colour, translucent, having a strong disagreeable odour, and an acrid bitter taste." (B. P.) Its properties are similar to the other fetid antispasmodic gum-resins. It ranks between ASSAFETIDA and AMMONIACUM.

Strained Galbanum. *Syn.* PREPARED GALBANUM; GALBANUM COLATUM, G. PREPARATUM (Ph. L.), L. From crude galbanum, as PREPARED AMMONIACUM. Formerly the common practice was to melt it in the dry state, by heat cautiously and quickly applied, and to strain it through a piece of coarse canvas stretched across a wooden frame or 'horse.' The 'strained galbanum' of the shops is seldom pure. The following forms are current in the trade for its 'reduction,' as this species of adulteration is technically termed:

1. Galbanum (true), 9 lbs.; strain as above, then add, towards the end, black resin (clean), 3 lbs.; and when the whole is melted, further add of Venice turpentine, 2 lbs.—*Product*. 12 lbs.

2. Strained galbanum and black resin, of each, 6 lbs.; melt, and add, of strained assafoetida, 2 oz.; Venice turpentine, 3 lbs.—*Prod.* 14½ lbs.

Factitious Strained Galbanum. *Syn.* GALBANUM COLATUM FACTITIUM, L. *Prep.* 1. From black resin, 4 lbs.; melt, and add of Venice turpentine, 2 lbs.; assafoetida, 2½ oz.; oils of juniper and fennel, of each, 1½ dr.; water, ½ pint.

2. As the last, adding soft soap, 5 oz. Sometimes the small and 'waste' of the chests are added to the above to improve them.

GALL. *Syn.* BILE; BILIS, CHOLE, FEL, L. A bitter fluid secreted by the liver; in part flowing into the intestines, and in part regurgitating into the gall-bladder. Its uses in the animal economy appears to be—to separate the chyle from the chyme, to promote digestion of oleaginous substances, and to assist in exciting the peristaltic action of the intestines. The faeces appear to owe their colour chiefly to the presence of bile, since, without, they appear of a dirty pipe-clay colour.

The gall of various animals was formerly used in medicine. From whatever source it was obtained, it was believed to be calefacient, desiccant, detergent, discutient, and parturifacient; but besides these properties, each variety was conceived to possess virtues peculiarly its own. Thus, bear-gall (*fel ursi*) was reputed anti-epileptic; eel-gall (*fel anguillarum*) parturifacient; hare-gall (*fel leporis*), "good in catarract;" and ox-gall (*fel bovis*), "sovereign against stiff joints, rheumatics, angry ulcers, and stomach colics." The gall of the bat, goat, hen, hog, partridge, siluris, &c., were also employed as remedies. At the present time ox-gall is the only one used in medicine and the arts.

Ox-gall has been recently reintroduced into medicine by Dr. Alluatt and others, and in certain cases of dyspepsia and biliary derangement appears to be a valuable remedy.

Crude ox-gall is extensively employed by the scourers of woollen cloth, clothes renovators, &c. It rapidly extracts grease and oil from textile fabrics, without injuring the colour. See CONSTIPATION, DYSPESIA, OX-GALL, &c.

Gall, Glass. See SANDIVER.

GALLATE. *Syn.* GALLAS, L. A salt of gallic acid. The alkali gallates are soluble. They rapidly suffer decomposition in the presence of excess of the base, and the liquor gradually acquires a blackish colour. The gallates of most of the other metallic oxides are insoluble.

GALLIC ACID. $H_3C_3H_3O_5$. Aq. *Syn.* ACRIDUM GALLICUM (B. P.), L. "A crystalline acid prepared from galls." (B. P. L.) It may

be also obtained from other vegetable substances. It appears to be a product of the oxidation of tannic acid, and probably does not exist ready formed in recent vegetables.

Prep. 1. (Dumas.) Nut-galls, reduced to powder, are moistened with water, and exposed to the action of the air, in a warm situation (say 70° to 80° Fahr.), for two or three months, adding more water, from time to time, to make up for that lost by evaporation. At the end of the above period the mouldy, dark-coloured mass is strongly pressed in a cloth, and the solid portion boiled in a considerable quantity of water. The solution (filtered whilst hot) deposits, on cooling, crystals of gallic acid, which, after being thoroughly drained and pressed dry between bibulous paper, are purified by boiling them along with about ¼th of their weight of prepared animal charcoal, in 8 parts of water, and filtering, &c., as before.

2. (Graham.) A strong infusion or decoction of galls is precipitated with sulphuric acid, in the cold; the resulting thick mass is mixed with dilute sulphuric acid (cold), and the liquid expressed; the 'marc' is next treated with sulphuric acid, diluted with twice its weight of water, and after boiling the mixture for some minutes, the whole is allowed to cool; the resulting crystals are purified as before.

3. (Liebig.) A strong aqueous solution of tannic acid (tannin) is added to sulphuric acid, as long as a precipitate falls; the powder is collected, washed, and dissolved by the aid of heat in dilute sulphuric acid; the solution, after being boiled for a few minutes, deposits, on cooling, crystals of gallic acid in considerable quantity.

4. (Scheele.) A filtered decoction of galls is exposed for some months in an open vessel; after a time it grows mouldy, and becomes covered with a thick, glutinous pellicle; in two or three months the sides of the vessel and the under portion of the pellicle are found to be covered with small yellow crystals of gallic acid, which are purified as directed above. (See No. 1.)

5. (Ph. D., B. P.) The Dublin Ph. contains two formulæ for gallic acid, the one being based on that of Dumas or Scheele, the other on that of Graham or Liebig.—*a.* From galls (in coarse powder), 1 lb.; water, q. s. to make a stiff paste; a porcelain dish is ordered, and the exposure in the moistened condition is to be continued for 6 weeks; the solution of the first crop of crystals is to be made in 10 fl. oz. of boiling water, and when the filtrate has cooled to 80° Fahr., it is to be poured off from the crystals which have formed, which are then to be washed with ice-cold water, 3 fl. oz., and dried—first in blotting-paper, and finally by a steam or water heat. By boiling the undissolved portion of the galls with 45 fl. oz. of fresh water, more crystals may be obtained.

b. Powdered gall-nuts, 1 lb., are steeped for 24 hours in water, 1 pint, and after being placed in a porcelain displacement apparatus, are treated with water, $1\frac{1}{2}$ pint, added in successive portions; oil of vitriol, 5 fl. oz., diluted with an equal volume of water, and allowed to cool, is now added to the percolated infusion, and after thorough admixture, the liquid is filtered from the viscid precipitate which forms; oil of vitriol, 5 fl. oz. (diluted as before), is then added to the filtrate; the precipitates, enveloped in calico, are submitted to powerful pressure, and subsequently dissolved in oil of vitriol, 16 fl. oz., previously diluted with water, 56 fl. oz.; the solution is boiled for 20 minutes, and set aside for a week; at the end of this time the deposit which forms is dissolved in three times its weight of boiling water, and the solution treated as before.

Prop. Gallic acid forms small, feathery, and nearly colourless crystals, which have a beautiful silky lustre; that of commerce is usually of a pale-yellow colour; it is soluble in 100 parts of cold water, and in 3 parts of boiling water; it is also soluble in alcohol, and slightly so in ether; the aqueous solution is decomposed by exposure to the air; dissolved in hot oil of vitriol, it forms a deep, rich, red solution, which, when thrown into water, drops the gallic acid, deprived of some of its water. This substance is soluble in the alkalies, and dyes cloth like madder. When strongly heated, gallic acid is converted into metagallic acid, or into pyrogallic acid, according to the manner in which the heat is applied.

Tests. Gallic acid is distinguished from tannic acid by not affecting solutions of gelatin, the protosalts of iron, or the salts of the alkaloids, and by giving a deep bluish-black precipitate with the sesquisalts of iron, which disappears when the liquid is heated. It is distinguished from pyrogallic acid by its inferior solubility in water, and by its not affecting the solutions of the protosalts of iron. To detect gallic acid mixed with tannic acid, the latter should be removed, either by digesting the substance in ether, or by immersing for some time in its solution a piece of skin depilated by lime, previously to applying the tests.

Pur. Free from colour; decomposed by heat; soluble in water and in rectified spirit. It turns preparations of the sesquioxide of iron, dissolved in water, of a bluish-black colour, but throws down nothing from a solution of isinglass.

Uses, &c. The principal use of pure gallic acid is in the art of *photography*. It has recently been employed in *medicine*, as an internal astringent, in doses of 3 to 10 grs., thrice a day, or oftener; in hæmorrhage and fluxes, as well as for checking the night sweats in phthisis. Dr. Todd says, that in all cases of internal hæmorrhage, or hæmorrhagic tendency, it is the best astringent or styptic we

possess. As an external astringent, it is greatly inferior to tannic acid. It has been given in doses of 15 to 30 grs. in tape-worm, "but without any benefit." (Pereira.)

Purification. Gallic acid, as obtained by either of the above forms, is never quite pure; but it may be rendered absolutely pure by combining it with oxide of lead, and decomposing the compound (gallate of lead) by sulphuretted hydrogen. The sulphuret of lead acts like animal charcoal in removing the colour. (Liebig.) Commercial gallic acid "may be rendered nearly white by dissolving it in 20 times its weight of boiling distilled water, and causing the solution to traverse a stratum of prepared animal charcoal, spread upon a calico filter. When the liquid passes through colourless, it should be evaporated to 1-6th its volume, and then suffered to cool, in order to the separation of the crystallised acid." (Ph. D.)

GALLIC FERMENTATION. This name has been given to the peculiar process by which tannic acid is converted into gallic acid, under the joint influence of moisture and atmospheric oxygen. According to the researches of M. Antoine Laroque, the peculiar ferment of nut-galls which operates this change also converts sugar into alcohol and carbonic acid, in the same way as yeast does; whilst beer yeast, muscular flesh, and caseous matter, change tannin into gallic acid. The similarity of the gallic and vinous fermentation may hence be reasonably inferred.

GALLS. *Syn.* GALL-NUTS, NUT-GALLS; GALLA (B. P.); GALLÆ (Ph. E.). "Excrescences on *Quercus infectoria* caused by the puncture and deposited ova of *Diplolepis Gallæ tinctoria*." The best galls are bluish-black, heavy, and not yet perforated; intensely astringent. They are imported from Aleppo, and are known in commerce as black or blue galls (GALLÆ NIGRÆ, G. CÆRULÆ). The next quality is termed, from their colour, green galls (GALLÆ VIRIDES). Both are gathered before the insect has escaped, and are styptic and powerfully astringent. White galls (GALLÆ ALBÆ) are lighter, less astringent, and inferior.

Uses, &c. Galls are extensively employed in the art of dyeing, and constitute one of the principal ingredients in all the shades of black, and are also employed to fix or improve several other colours. A decoction of galls, to which a little green copperas and gum arabic has been added, forms common writing ink. In *medicine*, they are used as an astringent, in hæmorrhages and fluxes, in doses of 10 to 20 grs.; and topically, under the form of infusion or decoction, as a gargle in relaxation of the uvula; as an injection in gleet and leucorrhœa; as a lotion or fomentation in flabby ulcers, prolapsus ani, &c.; and as an ointment in piles, watery ulcers, &c. The infusion or decoction is also used as an antidote to poisoning by the alkaloids, and was formerly given

as a tonic in intermittents. See GALLIC ACID, IRE, &c.

GALLSTONE. *Syn.* CALCULUS BILIOSUS, C. CYSTICUS BOVINUS, L. Formed in the gall-bladder of neat cattle in winter, when they are fed upon dry food. Used as a yellow pigment, and in medicine.—*Dose.* 1 gr.; in dyspepsia and flatulency. See CALCULUS.

GALVANIZED IRON. See IRON and ZINCING.

GAMBOGE. *Syn.* (CAMBOGE; CAMBOGIA, L. B. P.) GAMBOGIA, L. "A gum-resin obtained from *Garcinia Morella*." (B. P.) Gamboge is an active hydragogue and drastic purgative, which occasionally proves useful in torpor of the abdominal and pelvic viscera; but which is highly dangerous in an irritable or inflammatory state of the stomach or bowels, and during pregnancy. It is very apt to induce nausea and vomiting. In large quantities it is a violent poison. "The deaths which have occurred from the use of enormous quantities of Morrison's pills, are mainly ascribable to the gamboge contained in those medicines." (Pereira).—*Dose.* 1 to 5 grs., made into pills or mixture, every 4 to 6 hours; in obstinate constipation, in dropsies, in apoplexy and like cerebral affections, and in worms (especially tape-worm), either alone or combined with other cathartics. See COMPOUND EXTRACT OF COLOCYNTH.

GAN'GRENE. See MORTIFICATION.

GAN'TEINE. A composition used to clean kid and other leather gloves.

Prep. 1. (M. Buhau.) Curd soap (in small shavings), 1 part; water, 3 parts; mix with heat, and stir in of essence of citron, 1 part.

2. (SAAPONINE.—Duvignau.) Soap (in powder), 250 parts; water, 155 parts; dissolve with heat, cool, and add, of *eau de javelle*, 165 parts, solution of ammonia, 10 parts, and rub the whole to a smooth paste. Patent. A small portion of either of the above is rubbed over the glove with a piece of flannel (always in one direction), until it is sufficiently clean. See GLOVES.

GARAN'CINE. See Madder Red.

GAR'DENING. See HORTICULTURE.

GAR'GLE. *Syn.* GARGARISM, THROAT-WASH; GARGARISMA, GARGARISMUS, GARGARISUM, L. A liquid medicine applied to the back part of the mouth or upper part of the throat. Gargles are applied by allowing a small mouthful to run as much as possible over the affected part, by holding the head backwards, and breathing through it, by which means the liquid is agitated and its action promoted.

Gargles are not to be swallowed. It often happens, however, that patients, either by accident or from negligence, do swallow a certain quantity, notwithstanding the instructions given them to the contrary. Care should therefore be taken to avoid making gargles of such substances as may occasion unpleasant

symptoms in small doses, though they may not, perhaps, amount to poisoning.

Gargles usually have for their basis either simple water, or milk, wine, or vinegar, diluted with water, to which, in both cases, sugar, honey, or syrup, is generally added. Their other ingredients vary with the indication, but must, in all cases, be either in the liquid form, or soluble in the liquid used as the excipient.

Gargles are commonly dispensed in mixture bottles. The quantity used at a time, under ordinary circumstances, may be about 2-3rds of a wine-glassful.

Gargle. *Syn.* GARGARISMA, G. COMMUNE, G. SIMPLEX, L. *Prep.* 1. (St. B. Hosp.) Honey or honey of roses, 1½ fl. oz.; strong vinegar, 2½ fl. oz.; barley water, 1 pint.

2. (St. George's.) Oxy-mel, 1 fl. dr.; decoction of barley, 5 fl. drs. In common sore throats, &c. The formulæ of several other hospitals are similar.

Gargle of Ac'etate of Ammo'nia. *Syn.* GARGARISMA AMMONIÆ ACETATIS, L. *Prep.* (Wendt.) Solution of acetate of ammonia and honey of roses, of each, 1 fl. oz.; elder-flower water, 8 fl. oz.; mix. In the ulcerated sore throat of scarlet fever.

Gargle of Ace'tic Acid. *Syn.* OXYMEL GARGLE; GARGARISMA ACIDII ACETICI, L. *Prep.* 1. (St. B. Hosp.) Acetic acid, 1 dr.; oxy-mel, 2 fl. drs.; water to make up 4 fl. oz.

2. Barley water, 12 fl. oz.; acetic acid, 1½ fl. oz.; honey, 6 drs. Antiseptic. For sore throat.

Gargle of Al'um. *Syn.* GARGARISMA ALUMINIS, L. *Prep.* 1. (Augustin.) Oak-bark (in powder), 1 oz.; water, 1½ pint; boil to a pint, filter, cool, and add, of alum, ½ dr.; brandy, 2 fl. oz. In inflammation of the mouth and throat.

2. (Cavarra.) Alum, 3 drs.; water, 6 fl. oz.; dissolve. In offensive breath.

3. (Foy.) Alum, 1 dr.; tincture of myrrh, 2 fl. drs.; tincture of bark, 4 fl. drs.; honey of roses, 2 oz.; laudanum, 20 drops; wine, ½ pint. In scurvy.

4. (Grant.) Alum, 1 oz.; tincture of myrrh, ½ fl. oz.; peppermint water, 7 fl. oz. In relaxation of the uvula, &c.

5. (Mid. Hosp.) Alum, 1 dr.; honey, 2 drs.; water to make 6 fl. oz. As No. 4.

6. (P. Cod.) Alum, 40 grs.; honey of roses, 1 oz.; infusion of roses, 6 fl. oz. As the last.

7. (Ratier.) Alum, 1 oz.; infusion of red roses and barley water, of each, 3 fl. oz.; honey of roses, 2 oz. As No. 4.

8. (Westm. Hosp.) Alum, 1 dr.; dilute sulphuric acid, 1 fl. dr.; treacle, 4 drs.; water to 15 fl. oz.

9. (Ph. Wirtem.) Alum and nitre, of each, 3 oz.; cream of tartar, 4 oz.; dilute acetic acid, 4 lbs.; dissolve, evaporate to dryness, and powder the residuum. For use, ½ oz. of the powder is dissolved in water, 8 fl. oz. Highly recommended in inflammation of the fauces

and tonsils. This forms Zobel's 'SPECIFIC FOR QUINSEY.'

Gargle, Antiscorbutic. *Syn.* GARGARISMA ANTISCORBUTICUM, L. *Prep.* (P. Cod.) Bitter species, 1 dr.; boiling water, 8 oz.; macerate 1 hour, strain, and add, syrup of honey, 2 oz.; antiscorbutic tincture, 1 oz.

Gargle, Antiseptic. *Syn.* GARGARISMA ANTISEPTICUM, L. *Prep.* (Fr. Hosp.) Decoction of bark, 6 oz.; camphor, 20 grs.; sal-ammoniac, 12 grs. In putrid sore throat, &c.

Gargle, Astringent. *Syn.* GARGARISMA ASTRINGENS, L. *Prep.* 1. (Collier.) Tincture of galls, 2 fl. drs.; honey, $\frac{1}{2}$ oz.; water, 6 fl. oz. In relaxation of the uvula and fauces.

2. (Collier.) Honey, 4 drs.; tincture of myrrh, 3 drs.; powdered alum, 40 grs.; compound infusion of roses, $5\frac{1}{2}$ fl. oz. As the last, and in fetid sore throat.

3. (Sir A. Cooper.) Alum, 2 drs.; decoction of bark, 12 oz.; honey of roses, $1\frac{1}{2}$ oz.

4. (Dr. A. T. Thomson.) Infusion of roses, 7 fl. oz.; dilute sulphuric acid, 1 fl. dr.; tincture of catechu, 6 fl. drs.; laudanum, $1\frac{1}{2}$ fl. dr. For relaxation of the uvula. See GARGLE OF ALUM.

Gargle of Bo'rax. *Syn.* GARGARISMA BORACIS, L. *Prep.* 1. (Ellis.) Borax, 1 dr.; tincture of myrrh, 4 fl. drs.; clarified honey, 1 fl. oz.; rose water, 4 fl. oz.

2. (Fr. Hosp.) Borax, 2 drs.; honey or capillaire, 1 oz.; rose water, 7 fl. oz.

3. (Guy's Hosp.) Borax, 2 drs.; honey of roses, 1 oz.; barley water, 7 fl. oz.

4. (Mid. Hosp.) Borax, 1 dr.; simple oxymel, 2 drs.; water, to make 3 fl. oz. The above are used in thrush or aphthous sore mouth, pytalism, &c.

Gargle of Capsicum. *Syn.* GARGLE OF CAYENNE PEPPER; GARGARISMA CAPSICI, L. *Prep.* 1. (Dr. Griffith.) Tincture of capsicum, $\frac{1}{2}$ fl. oz.; rose water, 8 fl. oz.

2. (St. B. Hosp.)—a. Capsicum, 3 drs.; common salt, 1 oz.; boiling water, 1 pint; macerate for 12 hours, strain, and add of distilled vinegar, 1 pint.

b. Tincture of capsicum, 1 fl. dr.; compound infusion of roses, 8 fl. oz.

3. (U. C. Hosp.) Tincture of capsicum, 1 fl. dr.; honey 6 drs.; water to 4 fl. oz. *Used* in ulcerated sore throat, scarlet fever, &c.

Gargle of Chlo'rate of Potas'sa. *Syn.* GARGARISMA POTASSÆ CHLORATIS, L. *Prep.* (Beasley.) Chlorate of potassa, 1 dr.; honey of roses, 1 oz.; water, 7 oz. *Used* in malignant sore throat, scarlatina, &c.

Gargle of Chlo'ride of Lime. *Syn.* GARGARISMA CALCIS CHLORINATÆ, L. *Prep.* From chloride of lime, 1 dr.; water, $\frac{1}{2}$ pint; agitate together for 10 minutes, filter through linen, and add of simple syrup, 1 fl. oz. *Used* in putrid sore throat, scarlet fever, &c.

Gargle of Chloride of So'da. *Syn.* GARGARISMA SODÆ CHLORINATÆ, L. *Prep.* 1. (Copland.) Liquor of chloride of soda, 12 fl. drs.; honey, $\frac{1}{2}$ oz.; water, 6 fl. oz.

2. (Hosp. Form.) Chlorinated solution of soda, 4 fl. drs.; water to 4 fl. oz. *Used* as the last.

Gargle of Chlo'rine Water. *Syn.* GARGARISMA CHLORINI, L. *Prep.* 1. (Fr. Hosp.) Chlorine water, $\frac{1}{2}$ fl. oz.; syrup, 1 fl. oz.; water, $4\frac{1}{2}$ fl. oz.

2. (Mid. Hosp.) Chlorine water, 2 fl. oz.; distilled water, 10 fl. oz. *Use.* As the last.

Gargle of Cincho'na Bark. *Syn.* GARGARISMA CINCHONÆ, L. *Prep.* 1. From decoction of cinchona, 7 fl. oz.; simple oxymel, 1 fl. oz. Antiseptic and astringent in relaxation, &c.

2. (Acidulated; GARGARISMA CINCHONÆ ACIDUS, L.) Hydrochloric acid, $1\frac{1}{2}$ fl. dr.; honey, $1\frac{1}{2}$ oz.; decoction of bark to make up 8 fl. oz.

Gargle, Com'mon. *Syn.* GARGARISMA COMMUNE, L. *Prep.* 1. (Ed. Hosp.) Water, 6 fl. oz.; nitre, 1 dr.; honey of roses, 1 oz. For ordinary sore throat, &c.

2. (Lond. Hosp.) Alum, 1 dr.; dilute sulphuric acid, 2 fl. drs.; tincture of myrrh, 4 fl. drs.; water to 12 fl. oz.

Gargle of Cyanide of Mercury. *Syn.* GARGARISMA HYDRARGYRI CYANIDI, L. *Prep.* 1. (Brera.) Cyanide of mercury, 10 grs.; honey of roses, 1 oz.; barley water, 1 pint.

2. (Cullerier.) Cyanide of mercury, 10 grs.; linseed tea, 1 pint. *Used* in the same cases as mercurial gargle.

Deter'gent Gargle. *Syn.* GARGARISMA DETERGENS, L. *Prep.* 1. (P. Cod.) Alcoholised sulphuric acid, 1 fl. dr.; honey of roses, 2 oz.; barley water, 8 oz.

2. (Dr. A. T. Thomson.) Nitre, 2 drs.; honey of roses, 4 fl. drs.; infusion of roses, $5\frac{1}{2}$ fl. oz. In inflammatory sore throat.

Emol'lient Gargle. *Syn.* GARGARISMA EMOLLIENS, L. *Prep.* 1. (Buchan.) Marsh-mallow root, 1 oz.; figs, 2 oz.; water, 1 quart; boil to a pint and strain. Demulcent, soothing.

2. (Trousseau & Reveil.) Barley water, 8 oz.; honey, $1\frac{1}{2}$ oz. Both are used in inflammatory affections of the throat and mouth.

Gargle of Horserad'ish. *Syn.* GARGARISMA ARMORACIÆ, L. *Prep.* (Collier.) Compound spirit of horseradish, 1 fl. oz.; honey, 2 oz.; water, 4 fl. oz. A good gargle for scurvy of the fauces and pharynx, vulgarly called the 'inward scurvy.'

Gargle of Hydrochlo'ric Acid. *Syn.* MURIATIC ACID GARGLE; GARGARISMA ACIDI HYDROCHLORICI, L. *Prep.* 1. (Guy's Hosp.) Hydrochloric acid, 30 drops; honey of roses, 2 oz.; barley water, 6 fl. oz.

2. (Ratier.) Hydrochloric acid, 2 fl. drs.; clarified honey, 2 fl. oz.; barley water, 1 pint.

3. (St. B. Hosp.) Red-rose leaves, 2 drs.; boiling water, 1 pint; hydrochloric acid, $1\frac{1}{2}$ fl. dr.; digest 1 hour, and strain. In inflammatory sore throat, ulcerations of the mouth, scarlet fever, &c.

Gargle of Iodine. *Syn.* GARGARISMA IODINI,

L. Prep. 1. Iodine, 10 grs.; iodide of potassium, 12 grs.; rectified spirit and simple syrup, of each, 1 fl. oz.; water, 5 fl. oz. In chronic enlargement of the tonsils, in scrofulous habits.

2. (Dr. Ross.) Tincture of iodine, 1½ fl. dr.; tincture of opium, 1 fl. dr.; water, 6 fl. oz.

3. (St. T. Hosp.) Compound tincture of iodine, 2 fl. drs.; water, 5 fl. oz. In ulceration of the tonsils.

Mercurial Gargle. *Syn.* GARGARISMA HYDRARGYRI, G. MERCURIALE, L. *Prep.* 1. (G. HYD. BICHLORIDI.) Corrosive sublimate, 2 to 5 grs.; barley water, 1 pint; honey of roses, 2 fl. oz. For syphilitic ulcers in the throat.

2. (Plenck.) Calomel, 6 grs.; quicksilver, 30 grs.; powdered gum, 3 drs.; syrup of poppies, ½ oz.; triturate till the globules of metal disappear, and add of decoction of clematis, 26 fl. oz.; honey of roses, 1 oz.; essence of myrrh, 1 dr. (or tincture of myrrh, 1 fl. oz.). In syphilitic and putrid sore throat.

Gargle of Myrrh. *Syn.* GARGARISMA MYRRHÆ, L. *Prep.* 1. (Ainslie.) Tincture of myrrh, 6 fl. drs.; vinegar, 1 fl. dr.; honey of roses, 1½ fl. oz.; barley water, 12 fl. oz.

2. (Ph. Chirurg.) Tincture of myrrh, ½ oz.; honey of roses, 1½ oz.; lime water, 6 fl. oz. In scarlatina and putrid sore throat. See ASTRINGENT GARGLE, &c.

Gargle of Nitre. *Syn.* GARGARISMA SALIS NITRI, G. POTASSÆ NITRATIS, L. *Prep.* 1. Nitre, 2 drs.; honey or syrup, ½ oz.; rose water, 5½ fl. oz.

2. (Brande.) Nitre, 2 drs.; oxymel, 1 fl. oz.; barley water, 7 fl. oz. In inflammatory sore throat. See COMMON GARGLE.

Gargle of Oak-Bark. *Syn.* GARGARISMA CORTICIS QUERCUS, L. *Prep.* 1. Oak-bark, 2 drs.; boiling water, 6 fl. oz.; macerate 1 hour, and strain.

2. (Ellis.) Decoction of oak-bark, 1 pint; alum, ½ dr.; brandy, 2 fl. oz. In chronic sore throat, relaxation of the uvula, &c.

Gargle of Pellitory. *Syn.* GARGARISMA PELLITORY. *Prep.* 1. Pellitory root, 4 drs.; water, 16 fl. oz.; boil to 8 fl. oz., and add of liquor of ammonia, 2 fl. drs.

2. (Swediaur.) Infusion of pellitory, 1 pint; vinegar, 3 fl. oz.; sal-ammoniac, 3 drs. To promote the maturation and healing of throat ulcers.

Gargle of Ro'ses. *Syn.* GARGARISMA ROSÆ, G. ROSARUM, L. *Prep.* (Kendrick.) Conserve of roses, 3 oz.; boiling water, 16 fl. oz.; infuse 1 hour; add of dilute sulphuric acid, 2 fl. drs., and strain. Antiseptic, astringent; used in several indications.

Spirit Gargle. *Syn.* GARGARISMA SPIRITUOSUM, G. SPIRITUS VINI, L. *Prep.* 1. (Dr. Watson.) French brandy, 1 fl. oz.; water, ½ pint.

2. (St. George's.) Proof spirit, 1 fl. oz.; oxymel, 5 fl. drs.; decoction of barley, to make up 6 fl. oz. In relaxations and salivation.

Stimulant Gargle. *Syn.* GARGARISMA STIMULANS, L. *Prep.* (Dr. Copland.) Infusion of roses, 6½ fl. oz.; dilute hydrochloric acid, 40 drops; tincture of capsicum, 1½ fl. drs.; honey, 3 drs. See GARGLE OF CAPSICUM.

Gargle of Tan'nin. *Syn.* GARGARISMA ACIDI TANNICI, L. *Prep.* 1. (Beral.) Tannin, 1 dr.; honey of roses, 2 oz.; rose water, 2 fl. oz.; distilled water, 8 fl. oz.

2. (Jannart.) As the last, but using only half the quantity of tannin. In salivation and aphthous ulcerations.

Gargle of Verd'igris. *Syn.* GARGARISMA ÆRUGINIS, G. CUPRI ACETATIS, L. *Prep.* (Guy's Hosp.) Oxymel of verdigris, 4 drs.; honey of roses, 2 oz.; barley water, 3½ fl. oz. Used as a detergent for ulcers in the throat. If swallowed, it produces violent vomiting. The addition of 2½ oz. of water to the above produces a gargle sufficiently strong for most cases.

Gargle of Vin'egar. See GARGLE OF ACETIC ACID.

Gargle of Zinc. *Syn.* GARGARISMA ZINCI, G. Z. SULPHATIS, L. *Prep.* (Dr. Copland.) Sulphate of zinc, 20 grs.; oxymel, 1 fl. oz.; rose water, 7 fl. oz. In aphthous sores, relaxations, ulceration of the tonsils, &c.

GAR'LIC. *Syn.* ALLIUM, L. The *Allium sativum* of botanists. It is diaphoretic, diuretic, expectorant, stimulant, and tonic; and externally, irritant, rubefacient, and even vesicant.—*Dose.* ½ dr. to 1½ dr.; in enfeebled digestion, chronic diarrhoea, old chronic coughs, atonic dropsies, and worms. An antispasmodic and counter-irritant liniment is made of the juice, which was formerly esteemed in chest diseases and infantile convulsions. A small clove of garlic, or a few drops of the juice, was formerly introduced into the ear in certain forms of deafness. As a condiment, its properties resemble those of the onion, than which it is much more powerful.

GAR'NET. In *mineralogy*, one of the precious stones or gems. The finest specimens of noble garnet (SYRIAN or ORIENTAL GARNET) are brought from Pegu. According to chemical analysis, the garnet is a double silicate of alumina and lime, coloured with iron and manganese.

Garnet, Facti'tious. See PASTES.

GAR'UM. [L.] A species of pickle or sauce prepared of fish, in a state of incipient putrefaction, strongly salted and seasoned with aromatics. According to Pliny, the Romans used a species of lobster for this purpose.

GAS. *Syn.* GAZ, Fr. A permanently elastic æriform fluid. In English, the term 'air' is now usually restricted to the gaseous mixture forming the atmosphere, but it was formerly used as a synonym for 'gas.' The principal gases are the elementary bodies hydrogen, chlorine, oxygen and nitrogen, and the compounds ammonia, carbonic acid, carbonic

oxide, carburetted hydrogen, hydrochloric acid, phosphoretted hydrogen, protoxide of nitrogen, sulphuretted hydrogen, and sulphurous acid. See these substances under their respective heads.

Gas. *Syn.* **COAL GAS, ILLUMINATING G.** The term 'gas' is popularly applied to the important mixture of hydrocarbons produced by the destructive distillation of pit-coal, and now employed as a source of artificial light in most of large towns of Europe and America. The apparatus used in the manufacture of gas on the large scale consists essentially of a system of closed retorts of cast iron or fire-clay, the exit pipes from which communicate with an hydraulic main, in which the crude gas deposits part of its tar and ammoniacal-liquor. It passes thence into a series of condensing pipes, wherein it deposits more of those impurities; and thence into another series of vessels, called 'scrubbers,' in which its mechanical purification is completed. It is then deprived of its carbonic acid and sulphuretted hydrogen in lime-purifiers, and finally is drawn by exhausting apparatus into the gas-holders, passing on its way through beautiful and delicate apparatus, whereby the pressure and amount of gas are regulated and registered.

Coal gas consists of a mixture of the following bodies:

Marsh gas (light carbonetted hydrogen).

Olefiant gas (heavy " ").

Hydrogen.

Carbonic oxide.

Nitrogen.

Vapours of liquid hydro-carbons.

Vapour of bisulphide of carbon.

The yield of gas, and also the illuminating power of the product, vary greatly with different kinds of coal. The average yield may be roughly estimated at 10,000 cubic feet of gas per ton of coal.¹

The late Charles Mansfield proposed to increase the illuminating power of ordinary coal gas, and to render water gas or even atmospheric air luminiferous, by passing them through sponges or over trays containing mineral naphtha or benzole; and a patent was taken out for this purpose. The gas so treated imbibes or dissolves a portion of the liquid, and burns with increased brilliancy. The method of saturating the gas with the liquid hydrocarbon is as follows:—“The apparatus consists of a brass reservoir or chamber attached to the end of the gas-pipe, near the burner. This reservoir may be in the shape of an oil-flask, made air-tight, with a screw-joint, or other means of supplying any highly volatile oil, turpentine, or mineral naphtha, and should be kept about half full. Into this reservoir the gas-pipe ascends a little above the surface of the oil; a very small jet-pipe of

gas, regulated by a stop-cock, is branched off below this chamber, to supply a minute flame, so as to cause a sufficient evaporation from the oil to unite with the gas in the flask receiver. The whole is, of course, surmounted with the usual burner and lamp-glass."

The naphthalising of gas did not work well on a large scale. Recently, however, an attempt was made to get up a company in England to work a French patented process, which differed only from that of Mansfield's in the substitution of another hydrocarbon (probably a petroleum product) for benzol. The chemical and technical journals exposed M. Mongrue's invention, and prevented the sinking of capital in a worthless undertaking. On a small scale, simple 'naphthalisers' appear to work very well.

The illuminating power of gas, as well as of other sources of light, may be directly ascertained by what is termed the 'comparison of shadows,' or indirectly, and more conveniently, by chemical analysis.² See ILLUMINATION.

GAZOGENE. [Fr.] *Syn.* AÆRATING MACHINE. A portable apparatus for aerating water and other liquids. Many forms have been given to this instrument, but in all the principle is the same. Powders for generating carbonic acid gas are placed in a separate compartment, and the liquid to be aerated in another. The two compartments are connected by a suitable tube, and a second tube, furnished with a spring tap, affords an exit for the aerated liquid. By the aid of the gazogene, water, wine, ale, &c., may in a few minutes be fully saturated with carbonic acid gas, and so rendered brisk and piquant. By using fruit syrups, manufactured from English and foreign fruits, the most delicious aerated summer beverages can be made, resembling those so much esteemed by travellers in the South of Europe and the sea-board cities of the Western world.

GEL'ATIN. *Syn.* GELATINE; GÉLATINE, Fr.: GELATINA, L. Animal jelly, obtained by the action of heat on the organic tissue of the bones, tendons, and ligaments, the cellular tissue, the skin, and the serous membranes, whilst in contact with water. Glue and size are coarse varieties of gelatin, prepared from hoofs, hides, skins, &c.; and isinglass is a purer kind, obtained from the air-bladders and some other membranes of fish.

Prop. Gelatin is insoluble in cold water, but dissolves with greater or less readiness on the application of heat, according to the source whence it is obtained, and in this state forms a tremulous and transparent jelly on cooling; it is insoluble in both alcohol and ether, and is decomposed by the strong alkalis and acids; with tannic acid it forms an insoluble compound of a buff colour, which is the basis of leather; when acted on by cold

¹ For practical details respecting the manufacture of this product, see the article COAL GAS in 'Ure's Dictionary of Arts, Manufactures, &c.'

² See 'Watts's Dictionary of Chemistry,' vol. i.

concentrated sulphuric acid, it yields glycocholate or gelatin sugar; and when boiled with strong alkalies, it yields glycocholate and leucine. Chlorine passed into a solution of gelatin occasions a dense white precipitate (chlorite of gelatin), which ultimately forms a tough, elastic, pearly mass, somewhat resembling fibrin.

Tests. Its aqueous solution is recognised as follows:—1. It gelatinises on cooling.—2. It is precipitated by alcohol.—3. Bichloride of mercury gives a whitish flocculent precipitate.—4. Tannic acid or infusion of galls gives a copious yellowish-white, curdy precipitate, which, on being stirred, coheres into an elastic mass, insoluble in water, and incapable of putrefaction, and which, when dried, assumes the appearance of over-tanned leather.—5. The gelatinising property is destroyed by nitric acid.—6. It is not affected by either alum or acetate of lead. In this respect it differs from chondrin.

Qual. The goodness of commercial gelatin intended for food is readily proved by pouring boiling water over it, and digesting the two together for a short time. If it is pure and wholesome, its colour remains unaltered, and during its solution it continues entirely free from smell. The resulting solution and jelly are also odourless, neutral to test-paper, free from unpleasant taste, and perfectly transparent. If it forms a yellow gluey-looking mass, and evolves an offensive odour, it should be rejected as of inferior quality, and unfit for culinary purposes.

Uses, &c. Gelatin is largely employed as an article of food, as in soups, jellies, &c.; but its value in this respect has been, perhaps, overrated. Animals fed exclusively on gelatin die of starvation. But when mixed with other food, especially with substances abounding in albumen, casein, or fibrin, gelatin may be useful as an aliment, and serve directly to nourish the gelatinous tissues. (Liebig.) Hence gelatin is a fitting substance to form part (but only a part) of the diet of convalescents, as it conveys nutrition directly to these tissues, without tasking the diminished powers of life for its conversion; but its use should be accompanied by a proper quantity of azotised animal food, to supply the elements to the blood, for the support and increase of the muscular tissue, or fleshy portion of the body. In France the gelatin of bones is extracted and employed as a part of the diet in hospitals with the best effect, materially abridging the period of convalescence; but when given alone, all animals soon become disgusted with it, and die if not supplied with other food. (D'Arcet.) See GLUE, ISINGLASS, and below.

Bone Gelatin. Obtained from crushed bones by coction with water, or by the action of steam and water successively, either with or without pressure; or by maceration in dilute hydrochloric acid, to extract the phosphate of lime, the remaining gelatinous mass being well

washed in cold water, and afterwards dissolved in boiling water in the usual manner. A little carbonate of soda is commonly added to the last water. Gelatin has even been extracted from fossil bones. "A soup was prepared from one of the bones of the great mastodon, by the préfet of one of the departments of France." (Pereira.) Butcher's meat contains, on an average, 24% of dry flesh, 56% of water, and 20% of bone. The last will yield, by proper treatment, nearly 1-3rd of its weight of dry gelatin, or a quantity equal to about 6% of the meat from which it is cut. This, as well as other varieties of gelatin, is frequently blanched by sulphurous acid or animal charcoal, and tinged of various colours with the ordinary vegetable dyes. Thus, blue is given with sulphate of indigo or the juice of blue berries; green, with the juice of spinach; and red, with juice of red-beet.

French Gelatin. *Syn.* CAKE GELATIN. Gelatin done up into small thin cakes, like the finer sorts of glue. A good deal of it is prepared in Paris from the cuttings of the skins used in making kid gloves and slippers.

Patent Gelatin. Various qualities of gelatin are manufactured from glue-pieces, or cuttings of the hides of beasts and skins of calves, and from inferior isinglass. According to Mr. Nelson's specification, the crude materials, freed from hair, wool, flesh, and fat, after being thoroughly washed and 'scored,' are macerated for 10 days in a ley of caustic soda; and are then placed in covered vessels at a temperature varying from 60° to 70° Fahr., until they become tender; they are next washed to free them from alkali, and are then exposed to the vapour of burning sulphur until they acquire a sensibly acid reaction; they are now dissolved in water contained in earthen vessels heated to 150° Fahr., and the solution, after being strained, is put into 'settling vessels,' and heated to 100° to 120° Fahr., for 8 or 9 hours; at the end of this time the clear liquor is drawn off, and poured on the 'cooling slabs' to the depth of about $\frac{1}{2}$ an inch. As soon as the jelly is cold, it is cut into pieces, and washed in water until perfectly free from acid. It is then redissolved in water at about 85°, the solution poured out on slabs as before, and when cold, it is cut up, and, lastly, dried on nets.

According to another specification (Rattray's Patent) glue-pieces are steeped in water until they begin to putrefy, then washed with water, drained, and put from 12 to 24 hours into water strongly soured with sulphurous acid; they are afterwards washed first with cold water, and then in water at 120° Fahr., and are lastly converted into size by digestion for 24 hours in water at 120° Fahr., the resulting solution being filtered through bags of double woollen-cloth.

Patent gelatins are often sold cut up in imitation of 'picked isinglass,' to which, for

the preparation of jellies, soups, and blanch-manges, they are not much inferior.

Rough Gelatin. *Syn.* GELATINE BRUT, Fr. From the skulls of oxen, the spongy insides of the horns and ribs, and from several other soft bony parts (deprived of fat), by washing them in water, digesting in an equal weight of hydrochloric acid of 6° Baume, in cold weather, and 4° or 5° in summer, for 10 days, then in acid of only 1° Baume for 24 hours longer; afterwards soaking and washing in successive portions of cold water until all the acid is washed out, adding an ounce of carbonate of soda to the last water. Used to make glue, &c. A similar article is prepared from the bones of sheep. The pieces, after being treated as above, are steeped in boiling water for a few minutes, wiped dry, and shaken together in a bag to remove the internal pellicle; after which they are cut into squares or dice to disguise them, and finally dipped into a hot solution of gelatin to varnish them. In this state the article is called 'GELATINE BRUT FIN.' Used to make soup. It keeps better than the cakes of portable soup. When less carefully prepared, it is also used to make glue for fine work. See BONE GELATIN.

GELÉE (pour le Goître). See LINIMENT OF IODIDE OF POTASSIUM.

GEMS. *Syn.* JEWELS; GEMME, L. "Gems are precious stones, which, by their colour, limpidity, lustre, brilliant polish, purity, and rarity, are sought after as objects of dress and decoration. They form the principal part of the crown jewels of kings, not only from their beauty, but because they are supposed to comprise the greatest value in the smallest bulk; for a diamond, no larger than a nut, or an acorn, may be the representative sign of the territorial value of a whole country, the equivalent in commercial exchange for a hundred fortunes, acquired by severe toils and privations." "Among these beautiful minerals mankind have agreed in forming a select class, to which the title of gems or jewels has been appropriated; while the term precious stone is more particularly given to substances which often occur under a more considerable volume than fine stones ever do. Diamonds, sapphires, emeralds, rubies, topazes, hyacinths, and chrysoberyls, are reckoned the most valuable gems;—crystalline quartz, pellucid, opalescent, or of various hues, amethyst, lapis lazuli, malachite,

jasper, agate, &c., are ranked in the much more numerous and inferior class of ornamental stones." (Ure.)

Tests. The only tests applicable to gems and precious stones are the determination of their relative hardness and their specific gravity. By the first test, pastes or factitious gems are readily detected; but beyond this, owing to the difficulty of applying it, it ceases to be useful to persons unconnected with the trade. The determination of the specific gravity is, however, of more general application, as gems are generally dismounted when offered for sale, or are so set that they may be removed from their 'mountings' without injury or inconvenience. See SPECIFIC GRAVITY, and *below*.

Obs. The relative hardness of the different substances is measured by the power they possess of cutting or scratching the other substances having a smaller number attached to them in the table. Thus, no gem but the DIAMOND (20) will scratch either the RUBY (17) or the SAPPHIRE (16); and, for the same reason, a blue stone that will cut the EMERALD or the TOPAZ can be no other than the SAPPHIRE. The sp. gr. is ascertained in the usual manner, and will be found sufficiently indicative of the true nature of the stone when considered in connection with its other characteristics. The index of refraction is a certain key to the quality of the stone, in the hands of those who are capable of determining it, and may be applied to either mounted or unmounted gems. The most convenient instrument for the purpose is Wollaston's 'REFLECTING GONIOMETER.'

Gems, Factitious. These, with few exceptions, are made of very pure, fusible, highly transparent, and dense glass, usually termed 'PASTE' or 'STRASS,' which is generally formed of oxide of lead, potassa, and silica, with small quantities of other ingredients to increase the brilliancy and clearness. The characteristic tints are imparted by the addition of metallic oxides. The beauty of artificial stones and gems depends, chiefly, upon the tint of the real stones being exactly imitated, and upon proper care and skill being exercised in the cutting, polishing, and mounting them. All the coloured glasses, and enamels, may be worked up into artificial gems. See ENAMELS, PASTES, &c.

GENE'VA. See GIN and HOLLANDS.

GENTIAN ROOT. *Syn.* GENTIANÆ RADIX, L. The dried root of *Gentiana lutea*, or yellow gentian." *Dose.* 10 to 30 grs.; as a simple bitter, tonic, and stomachic, in dyspepsia, loss of appetite, gout, &c. It was formerly a favourite remedy in agues. "Joined with galls or tormentil, and given in sufficient quantity, it has not failed in any intermittents in which I have tried it." (Dr. Cullen.) In excessive doses it is apt to relax the bowels and disturb the system. When taken for some time, it imparts its bitter flavour to the perspiration and urine. See DECOCTION, EXTRACT, &c.

GENTIANIN. *Syn.* GENTIANINE; GENTIANINA, L. A substance obtained by MM. Henry and Caventou from the root of common gentian.

Prep. 1. Gentian root (in powder) is digested for 2 or 3 days in cold ether, with agitation, and the filtered tincture evaporated to dryness; the residuum is dissolved in rectified spirit, and the solution is again evaporated; the semi-crystalline mass is, lastly, redissolved in either alcohol or ether, and crystallised by careful evaporation.

2. (Magendie.) The ethereal extract is exhausted with cold alcohol (rectified spirit), as before, and the resulting tincture is evaporated to dryness; the residuum is dissolved in water, calcined magnesia added in excess, and the whole boiled and filtered; the sediment is digested in ether, and the ethereal tincture allowed to crystallise by slow evaporation.

Prop., &c. Gentianin forms golden-yellow needles, scarcely soluble in cold water, but very soluble in alcohol and ether. It is a

GRECIAN GILDING. In this variety sal-ammoniac and corrosive sublimate, equal parts, are dissolved in nitric acid, and a solution of gold made with this menstruum; after slight concentration the liquid is applied to the surface of silver, which immediately becomes black, but on being heated exhibits a rich gilded surface.

JAPANNER'S GILDING. The surface is covered with oil size thinned with spirits of turpentine, and gold, in powder, is gently dabbed on with a puff of wash leather. This gives the appearance of 'frosted gold.' A coating of varnish is next given, followed by exposure to a gentle heat in the 'stove.'

LEAF GILDING. This term is commonly applied to the gilding of paper, vellum, &c., by applying leaf gold to the surface, previously prepared with a coating of gum water, size, or white of egg. It is usually burnished with an agate or a dog's tooth.

MECHANICAL GILDING. See **CHEMICAL GILDING** (*above*).

MERCURIAL GILDING. See **WASH GILDING** (*below*).

OIL GILDING. This species of gilding may be divided into several operations. The following are the abridged instructions of a Parisian artist on the subject:—1. The surface is prepared by a coating of white lead in drying oil.—2. Another coat is given, made with calcined white lead or massicot, ground in linseed oil and turpentine. 3 or 4 coats of this mixture are often given, at intervals of at least 24 hours, observing to carefully smooth off each coat with pumice stone or shave grass before the application of the following ones.—3. The 'Gold Colour,' or paint, is next applied. It is usually very adhesive gold size, or the bottom of the pot or dish in which painters wash their brushes. For this purpose it is thoroughly ground and strained.—4. When the gold colour becomes partially dry and sufficiently tenacious, the gold leaf is applied, and pressed on with a wad of cotton-wool or a soft brush. It is now left for several days to harden.—5. A coat of spirit varnish is next given, and the object is cautiously passed over a chafing-dish of charcoal, observing to avoid stopping the motion of the piece whilst doing so, as the work would then become discoloured and blistered.—6. The work is 'finished off' with pale oil varnish. For out-door gilding and common work, the varnishing process is generally omitted. This species of gilding is applied to woodwork, plaster, metal, &c.

VARNISH GILDING. This is a mere variety of oil gilding, applied to equipages, furniture, mirror and picture frames, &c., the surface being highly varnished and polished before it receives the size or gold colour; and after the gilding has become quite dry, a coat of spirit varnish, fumed with the chafing dish as above, is applied, followed by 2, 3, or more coats of the best copal varnish, at intervals of 3 or 4

days each. The whole is, lastly, carefully polished with tripoli and water.

WASH GILDING, AMALGAM G., MERCURIAL G., WATER G. This consists in the application of a thin coating of amalgam of gold to the metallic surface (brass, bronze, or copper) to be gilded, and the subsequent volatilisation of the mercury by heat. It is the usual method of gilding articles of copper and its alloys, and possesses great beauty and durability when skilfully executed. The occupation is, however, an unhealthy one, owing to the continual exposure of the workman to the fumes of mercury. The furnace invented by M. D'Arcet obviates this evil, as the whole of the volatilised mercury is carried off, and again condensed for further use. It should, therefore, be adopted by every water-gilder who studies economy and the health of those in his employ.

The process of water gilding consists in several distinct operations, and can only be successfully performed by those who have been schooled in the art by an apprenticeship to the trade. It would, therefore, be waste of space to enter into detail here. Formulæ for several of the articles employed for the purpose will be found in their alphabetical places in this work.

WATER GILDING. See *above*.

Among the applications of the process of gilding that deserve a separate notice are the following:—

The gold letters and figures on the covers of books are thus formed:—Gum mastic, in fine powder, is dusted over the surface to be gilded; an iron or brass tool bearing the design upon its face is then heated to a proper temperature, and gently pressed upon a piece of leaf gold, which slightly adheres to it; the two are then transferred to the cover, and the tool is gently pressed on it, by which means the mastic softens and retains the gold. The loose gold and powdered mastic are then dusted off with a brush. Gold leaf will adhere to leather without the use of mastic, but not so firmly as when it is employed.

The edges of the leaves of books and paper are first cut perfectly smooth, and then washed over with a solution of isinglass in weak spirit, or with a varnish made of Armenian bole, 4 parts, and powdered sugar-candy, 1 part, mixed up to a proper consistence with strained white of egg. The coating is allowed to dry, and is then smoothed with a wet rag, after which the gold leaf is applied and polished with the burnisher.

BRASS BUTTONS, formerly so much in demand, are covered by a rough species of wash gilding. The buttons are polished in the lathe, and thrown into a pan with a little amalgam of gold, and as much aquafortis diluted with water as will wet them all over. Here they are well stirred up, until they assume a silvery appearance, when they are washed with clean water. They are then submitted to a

sufficient heat in a suitable apparatus, until the mercury is volatilised. The buttons are next cooled, and well tossed and rubbed about with a painter's brush; and are, lastly, burnished by washing them well with beer or ale grounds.

Twelve dozen (1 gross) of buttons, of 1 inch in diameter, may be perfectly gilded on both sides with only 5 grs. of gold. By an Act of Parliament, which is still unrepealed, this is the smallest quantity of gold permitted to be used for a gross of buttons of the above size.

GLASS, PORCELAIN, and EARTHENWARE, are gilded by blending powdered gold with gum-water and a little borax, and applying the mixture by means of a camel-hair pencil; the article is then heated in an oven or furnace, by which means the gum is burnt, and the borax, vitrifying, cements the gold to the surface. It is afterwards polished with a burnisher. Names, dates, or any fancy device, may thus be permanently and easily fixed on glass, china, earthenware, &c.

JAPANNED WORK is gilded by the method explained as 'Japanner's gilding' (*above*).

LEATHER is gilded in the same way as the covers of books. (See *above*.) For common work, silver leaf, or even tin foil, is applied to the surface, previously covered with size or white of egg, and after being burnished down and dried, is washed over with gold-coloured lacquer.

The LETTERS of sign-boards and the ornamental gilding for out-door work are done by first covering the design with yellow paint, then with oil gold-size, and when this is nearly dry applying the leaf-gold, observing to shield it properly from the wind, lest it be blown away or become crumpled before being properly attached. The work is, lastly, varnished.

POLISHED METALS may be gilded by one or other of the methods already noticed. Articles in silver, copper, brass, and bronze, are usually coated by the process of wash or water gilding; or, directly, by the application of gold leaf, as follows:—The piece or article is heated to a bluish tint, and gold leaf pressed gently and carefully on it with the burnisher; heat is again applied, and the process repeated with fresh leaves of gold until the gilding has acquired the proper thickness and tone. The surface is lastly polished with the burnisher, or is coloured in the usual manner at the stove. This succeeds with iron, steel, silver, copper, and its alloys, &c. Another method for polished articles in iron and steel, which, however, is less durable than the preceding, is to apply an ethereal solution of gold to the surface with a camel-hair pencil. The ether flies off and leaves the surface coated with gold, which is then polished as before. In this way, any fancy device or writing may be executed on steel or iron with extreme facility.

SILKS, SATINS, WOOLLENS, IVORY, BONE, &c., may be readily gilded by immersing them in a solution of neutral terchloride of gold (1 of

the salt, and 3 to 6 of water), and then exposing them to the action of hydrogen gas. The latter part of the process may readily be performed by pouring some dilute sulphuric acid on zinc or iron filings, in a wide-mouthed bottle, and placing it under a jar or similar vessel, inverted, at the top of which the articles to be gilded are suspended. Flowers or other ornamental designs may be produced by painting them on the surface with a camel-hair pencil dipped in the solution. The design, after a few minutes' exposure to the hydrogen, shines with all the splendour of the purest gold, and will not tarnish on exposure to the air, or in washing.

GILDED THREAD or GOLD THREAD is merely a thread of yellow silk covered with a very thin flattened wire of gold, by means of a revolving wheel.

WIRE (copper, silver, or brass) is occasionally gilded, in coils, by a similar process to that adopted for BUTTONS; but more frequently as follows:—Rods (usually of silver) are covered with gold foil of a thickness proportionate to the quality of the intended wire, and the compound bar is then drawn into wire, in the usual way. 100 grs. of gold was formerly the lowest legal quantity that could be employed for 1 lb. of silver.

Patents. Among the varieties of chemical gilding may be mentioned—

1. (Elkington's patent—GERMAN GILDING, Bonnet's GILDING PROCESS.) The articles to be gilded, after being perfectly cleaned from scale or grease, and receiving a proper 'face,' are suspended, by means of wires, in the gilding liquid (boiling hot), and moved about therein for a period varying from a few seconds to a minute, or longer; the precise time required depending on the newness and strength of the liquid. When sufficiently gilded, the articles are withdrawn from the 'solution of gold,' washed in clean water, and dried; after which they undergo the usual operation of 'colouring,' &c. A dead gold appearance is produced by the application to the articles of a weak solution of nitrate of mercury previously to the immersion in the gilding liquor; or the deadening may be given by applying a solution of the nitrate to the newly gilded surface, and then expelling the mercury by heat.

The gilding liquor.—Take of fine gold, 5 oz. (troy); nitro-muriatic acid, 52 oz. (avoir-dupois); dissolve by heat, and continue the heat until red or yellow vapours cease to be evolved; decant the clear liquid into a suitable vessel; add of distilled water, 4 galls.; pure bicarbonate of potassa, 20 lbs.; and boil for 2 hours. The nitro-muriatic acid is made with pure nitric acid (sp. gr. 1.45), 21 oz.; pure muriatic acid (sp. gr. 1.15), 17 oz.; and distilled water, 14 oz.

This process, though patented by Mr. Elkington in England, was in reality discovered and first practised by M. Bonnet, a foreigner. Articles thus gilded do not bear friction and

the operations of being put in colour (*mise en couleur*) so well as those gilded by the mercurial process, or by the methods of cold or leaf gilding as applied to polished metals.

2. (Talbot's patent.) By this process polished metallic articles are gilded by simple immersion in a solution of gallic acid in water, ether, or alcohol, to which a solution of gold has been previously added. SILVERING and PLATINISING may be effected in the same manner, by using a solution of either of these metals instead of one of gold.

*** These and other chemical processes have been almost completely superseded by the certain and economical process of ELECTRO-GILDING. See ELECTROTYPE.

Gilding Amalgam. See AMALGAM.

Gilding Liquor. This name has been given to various solutions of gold, and to other liquids employed in gilding. The former are noticed elsewhere. Among the latter are the following:

DEADENING AQUAFORTIS. From mercury, 1 part, aquafortis (sp. gr. 1.33), 3 parts; dissolve, and add of soft water, 7 parts. Used to produce a dead-gold effect. It is applied (diluted) to the articles, before spreading the amalgam over them, in water gilding; or before placing them in the 'gilding liquor,' in the chemical processes.

MERCURIAL SOLUTION. From mercury, 10 parts, dissolved in aquafortis (sp. gr. 1.33), 11 parts, and the solution diluted with 25 times its weight of water. Used to moisten the scratch brush before drawing it over the amalgam, in mercurial gilding; also to deaden the gilded surface, by moistening the latter with it, and then exposing the piece to a heat sufficiently high to drive off the mercury.

GILDER'S PICKLE. From alum and common salt, of each, 1 oz.; nitre, 2 oz.; dissolved in water, $\frac{1}{2}$ pint. Used to impart a rich colour to gold surfaces, especially of trinkets. Its application should not be too long continued, as it dissolves a small portion of the gold. For common purposes it is best used largely diluted with water.

VERMEIL, VERMEIL COATING, OR-MOLU C. From annotta and salt of tartar, of each, 1 oz.; dragon's blood, $\frac{1}{2}$ oz.; water, 1 quart; simmer down to about one fourth, add saffron, 20 grs., and when merely tepid, strain through fine muslin into a bottle. Used to give lustre and fire to distemper gilding. A little is floated over the surface with a very soft, flat, camel-hair brush.

Gilding Metal. The metal employed as a base for gilding is usually brass, or a mixture of brass and copper. The following proportions have been recommended:—

1. Copper, 6 parts; brass, 1 part.
2. Copper, 4 parts; Bristol brass, 1 part.
3. Copper, 13 parts; old Bristol brass, 3 parts; tin, 14 parts.

Gilding Powder. *Prep.* 1. Pure gold, 5 drs.; pure copper, 1 dr.; aqua regia, 10 oz.; dissolve, moisten clean linen rags with the

solution, dry them, and burn them to ashes. The latter contain the gold in a state of minute division, and must be carefully collected.

2. Grain gold, 1 dr.; rose copper, 15 grs.; aqua regia, 2 fl. oz.; proceed as last. Used in 'Gold Gilding.'

3. See Gold (in powder).

Gilding Shells. See GOLD SHELLS.

Gilding Size. See GOLD SIZE.

Gilding Wax. *Syn.* GILDING VARNISH, GILDER'S WAX. *Prep.* 1. From bees' wax, 4 oz.; verdigris and sulphate of copper, of each, 1 oz.; melted together.

2. Bees' wax, 4 oz.; verdigris, red ochre, and alum, of each, 1 oz. Used to give a red gold colour to water gilding.

GIN. *Syn.* GENEVA. Corn spirit flavoured with either oil of juniper or oil of turpentine.

Gin was originally and, for some time, wholly imported from Holland, and was a rich, soft spirit, flavoured, chiefly, with juniper berries; on which account it had obtained the name of 'GENEVA,' from 'GENIEVRE,' the French for juniper. After a time the distillation of an imitation geneva sprung up in this country, when the foreign spirit came to be called 'HOLLANDS,' or 'HOLLANDS GENEVA,' to distinguish it from the spirit of home manufacture. The English monosyllable 'GIN' is a corruption of geneva, the primary syllable of which, as in numerous other instances, was seized on by the vulgar, and adopted as a short and convenient substitute for the whole word.

The liquor at present known by the name of 'gin' in this country is a very different article to that imported from Holland, and consists of plain corn-spirit, flavoured with oil of turpentine and small quantities of certain aromatics. The thousand and one receipts for this article, which have from time to time been printed in books, produce a flavoured spirit bearing no resemblance to the more esteemed samples of English gin; and, if possible, the products are even more unlike genuine Hollands. Any person may easily satisfy himself of the truth of this assertion by actual experiment on the small scale. The cause of this incongruity has arisen chiefly from the writers not being practically acquainted with the subject, and from the disinclination of well-informed practical men to divulge, gratuitously, what they conceive to be valuable secrets. Hence the utter failure of any attempts to produce either gin or Hollands from the receipts usually published. The authors appear to have all imbibed a juniper-berry mania—probably from the imbibition of their favourite beverage. Oil of juniper, in the hands of these gentlemen, appears to be a perfect aqua mirabilis, that readily converts whiskey into gin, and imparts the rich creamy flavour of 'Schiedam Hollands' to crude corn or molasses spirit. But theory and experiment sometimes disagree. In prac-

tice, it is found that the true flavour of foreign geneva cannot be imparted to spirit by juniper alone, and that the English gin of the present day depends for its flavour on no such a substance. The following formulæ are merely given as specimens; and it is proper to remark, that every distiller has his own receipt for this notorious beverage. Hence it is that the gins of no two distillers are of precisely the same flavour; and this difference is still more marked when the distillers reside in parts of the country remote from each other. Booth's, Smith's, and Nicholson's gins have each a characteristic flavour, readily perceived by their respective votaries; whilst the difference between 'Plymouth' or 'Bristol gin,' and the 'gin of the metropolis,' is as remarkable as that between 'Barclay's XXX' and 'Guinness's bottled stout.' These variations in flavour generally depend on the use of more or less flavouring matter, or of a spirit more or less clean or free from taint; and, less frequently, on the addition of a small quantity of some peculiar aromatic, which exercises a modifying influence on the chief flavouring ingredient. In many cases the flavour has originated from accident, but the consumers having become accustomed to, and hence relishing, that particular 'palate,' it is found to be unwise or commercially impossible to alter it. Any change in these matters is therefore looked upon in every distillery as a dangerous innovation, which would prove more prejudicial to the prosperity of its exchequer than the repeal of the duty on French wines and brandy, or even a frightful conflagration. The distillers, like the brewers, are thorough conservatives in all matters connected with the flavour of their liquors.

In the preparation of gin, both sweetened and unsweetened, and indeed of liquors generally, the greatest possible care must be taken to avoid an excess of flavouring. The most esteemed samples are those that consist of very pure spirit, slightly flavoured.

Prep. 1. Clean corn spirit, at proof, 80 galls.; newly rectified oil of turpentine, 1½ pint; mix well by violent agitation, add culinary salt, 14 lbs., dissolved in water, 40 galls.; again well agitate, and distil over 100 gallons, or until the faints begin to rise. *Product.* 100 galls. of gin 22 u. p., besides 2 galls. contained in the faints. If 100 galls. at 17 u. p. are required, 85 galls. of proof spirit, or its equivalent at any other strength, must be employed.

2. Proof spirit (as above), 8 galls.; oil of turpentine, 1 fl. oz.; salt, 1½ lb., dissolved in water, 4 galls.; draw over 10 galls., as before. 22 u. p.

3. Clean corn spirit, 80 galls.; oil of turpentine, 1 pint; pure oil of juniper, 3 fl. oz.; salt, 21 lbs.; water, 35 galls.; draw over 100 galls., as before. 22 u. p.

4. To the last, before distillation, add, of

oil of caraway, ½ fl. oz.; oil of sweet fennel, ½ fl. oz.; cardamoms (ground), 8 oz.

5. To No. 3, add, of essential oil of almonds, 1 dr.; essence of lemon, 4 drs.

6. To No. 1, before distillation, add of creasote, 3 fl. drs.

7. To No. 3, add of creasote, 2 drs.

8. Proof spirit, 80 galls.; oil of turpentine, ½ pint; oil of juniper, ½ pint; creasote, 2 drs.; oranges and lemons, sliced, of each, 9 in no.; macerate for a week, and distil 100 galls. 22 u. p.

9. To No. 1, add of rectified fusel oil, ½ pint.

10. To No. 1, add of oil of juniper, ½ pint.

Concluding remarks. The oil of turpentine for this purpose should be of the best quality, and not that usually vended for painting, which always contains resin and often fixed oil. Juniper berries, bitter almonds, and the aromatic seeds, may be used instead of the essential oils; but the latter are the most convenient. Turpentine conveys a plain-gin flavour,—juniper berries or oil gives a Hollands flavour,—creasote imparts a certain degree of smokiness, or whiskey flavour,—lemon and the other aromatics, a creaminess, fulness, and richness. The flavour imparted by cardamoms, when used judiciously, is peculiarly agreeable and appropriate. That from caraways is also in general esteem. Cassia in extremely small proportions also tells well. Fusel oil gives a whiskey-gin flavour; and in conjunction with creasote or crude pyroligneous acid, a full whiskey flavour. The only danger in the employment of all these articles is using too much of them. When this misfortune happens, the remedy is to add sufficient plain spirit to reduce the flavour to the proper standard. The creaminess and smoothness so much admired in 'foreign geneva' results chiefly from age. The English rectifier endeavours to imitate this by the addition of a little sugar. A rich mellowness, that combines well with gins turning on the 'Hollands flavour,' is given by a very small quantity of garlic, and with Canadian balsam or Strasburg turpentine. The peculiar piquancy, or the property of 'biting the palate,' regarded as a proof of strength and quality by the ignorant gin-drinker, is imparted to the liquor by the addition of a little caustic potassa. Sliced horseradish gives piquancy as well as mellowness. Grains of paradise, cayenne pepper, and sulphate of zinc, are also commonly added by fraudulent dealers.

Although gin is always prepared on the large scale by distillation, it may also be made by the simple solution or digestion of the flavouring ingredients in the spirit; but it is, of course, better for distillation. If made in the former way, no salt must be employed. The gin produced by the above formulæ is that denominated in the trade 'UNSWEETENED GIN,' 'GROG GIN,' &c.; but the gin usually sold in the metropolis is a sweetened spirit, and hence is technically dis-

tinguished by the terms 'SWEETENED,' or 'MADE UP.' The generality of London gin-drinkers prefer the latter article, even when weaker and inferior, which it usually is, as the addition of sugar permits adulteration and watering to an enormous extent with absolute impunity. Sweetened spirit cannot be easily tested for its strength, and is taken by the Excise at the strength which it is declared to possess by the dealer. To ascertain whether gin is sweetened or not, a little may be evaporated in a spoon, over a hot coal or a candle, when, if it is pure, it will leave the spoon scarcely soiled; but if, on the contrary, it has been sweetened, a small quantity of syrupy liquid, or sugar, will be obtained, the sweetness of which may be easily recognised by tasting it.

The whole of the casks and utensils employed for gin should be perfectly clean, and properly prepared, so as not to give colour; as, if this spirit acquires the palest coloured tint, its value is lessened, and if much coloured it is rendered unsaleable. When gin has once become much stained, the only remedy is to re-distil it; when it is only slightly stained, the addition of a few lbs. of acetic acid (B. P.) to a pipe or butt, a spoonful or two to a gallon, or a few drops to a decanterful, will usually decolour it, either at once or as soon as it is mixed with water to make grog. See ALCOHOMETRY, CASKS, DISTILLATION, HOLLANDS, SPIRITS, &c., and *below*.

Gin, Cordial. This is gin sweetened with sugar, and slightly aromatised.

Prep. Good gin (22 u. p.), 90 galls; oil of almonds, 1 dr.; oils of cassia, nutmeg, and lemon, of each, 2 drs.; oils of juniper, caraway, and coriander, of each, 3 drs.; essences of orris root and cardamoms, of each, 5 fl. oz.; orange-flower water, 3 pints; lump sugar, 56 to 60 lbs.; dissolved in water, 4 galls. The essences are dissolved in 2 quarts of spirit of wine, and added gradually to the gin until the requisite flavour is produced, when the sugar (dissolved) is mixed in, along with a sufficient quantity of soft water, holding 4 oz. of alum in solution, to make up 100 galls. When the whole is perfectly mixed, 2 oz. of salt of tartar, dissolved in 2 or 3 quarts of hot water, are added, and the liquor is again well rummaged up; after which the cask is bunged up, and allowed to repose. In a week, or less, it will have become brilliant, and may be either 'racked,' or drawn from the same cask. *Product.* 100 galls., about 30 u. p.

Gin, Sweetened. *Prep.* From unsweetened gin (22 u. p.), 95 galls.; lump sugar, 40 to 45 lbs., dissolved in clear water, 3 galls.; mix well, and fine it down as above. *Product.* 100 galls., at 26 u. p. This, as well as the last, is usually 'permitted' at 22 or 24 u. p., which is also done when the gin has been further lowered with water so as to be even 30 or 35 u. p. See SPIRITS, and *above*.

GINGER. *Syn.* GINGER ROOT; ZINGI-

BERIS RADIX, ZINGIBER (B. P.), L. "The scraped and dried rhizome" (rootstock or underground stem) of "*Zingiber officinale*."—(B. P.). Ginger is an aromatic stimulant and stomachic, very useful in flatulence and spasms of the stomach and bowels, and in loss of appetite and dyspepsia, arising from debility, or occurring in old or gouty subjects. A piece chewed an hour before dinner tends to provoke the appetite; as a masticatory, it often relieves toothache, relaxation of the uvula, tender gums, and paralytic affections of the tongue. Made into a paste with warm water, and spread on paper, it forms a useful and simple 'head-ache-plaster,' which frequently gives relief when applied to the forehead or temples. As a condiment and flavouring ingredient, it is perhaps one of the most wholesome of the aromatic kinds, and is less acrid than the peppers. *Dose.* 10 grs. to $\frac{1}{2}$ teaspoonful, stirred up in any simple liquid.

Pur., &c. The best is that known in commerce as 'UNBLEACHED JAMAICA GINGER,' which is an uncoated pale variety, occurring in large, bold, fleshy pieces ('RACES'), which cut soft, bright, and pale-coloured. The inferior varieties occur in smaller pieces, and are darker-coloured, flinty, and shrivelled. The dealers frequently 'dress up' the common dark-coloured gingers by washing them in water, drying them, and then 'rouncing' them in a bag with a little calcined whiting or magnesia (WASHED GINGER); or they bleach them by dipping them into a solution of chloride of lime, or by exposing them to the fumes of burning sulphur (BLEACHED GINGER); or they dip them into a milk formed of quicklime or whiting and water (WHITE-WASHED GINGER). The last has a chalk-white surface, which cannot be mistaken for the natural one. POWDERED GINGER is with difficulty obtained pure and good. The common adulterants are wheat-flour, or East Indian arrow-root, and plantain meal. The first may be detected by the microscope, the others by the flavour and action of hot water. See LOZENGES, &c.

Preserved Ginger. *Syn.* CONDITUM ZINGIBERIS, L. An excellent stomachic sweatmeat or preserve. It is chiefly imported from the West Indies and China. See CANDYING, &c.

A Factitious Preserved Ginger is sometimes met with, prepared from the stalks of lettuce just going to seed, using a concentrated syrup, strongly flavoured with Jamaica ginger. See CANDY, &c.

GINGER BEER. See BEER.

GINGERBREAD. *Prep.* 1. (Dr. Colquhoun.) Flour, 1 lb.; carbonate of magnesia, $\frac{1}{2}$ oz.; mix; add, of treacle, $\frac{1}{2}$ lb.; moist sugar, $\frac{1}{2}$ lb.; melted butter, 2 oz.; tartaric acid (dissolved in a little water), 1 dr.; make a stiff dough, then add of powdered ginger and cinnamon (cassia), of each, 1 dr.; grated nutmeg, 1 oz.; set it aside for half an hour or an hour before putting it into the oven. *Obs.* It should not be kept

onger than two or three hours, at the utmost, before being baked.

2. Flour and treacle, of each, 1 lb.; butter, $1\frac{1}{2}$ oz.; carbonate of magnesia, 1 oz.; add spices (ginger, cinnamon, nutmeg, allspice, cayenne, corianders, &c.) to taste; mix as last. *Obs.* Fit for baking in from four to six hours.

3. Flour, 2 lbs.; carbonate of magnesia, $\frac{1}{2}$ oz.; mix; add, treacle, $1\frac{1}{2}$ lb.; butter, 2 oz.; spice, q. s.; tartaric acid, $\frac{1}{4}$ oz.; mix quickly, and make it into forms. *Obs.* Ripe for the oven in half an hour to one hour.

4. Instead of tartaric acid in the last formula, use cream of tartar (dissolved in water), 2 oz. *Obs.* Ripens in 40 or 60 minutes.

5. Flour or fine pollard, 1 lb.; treacle, $\frac{3}{4}$ lb.; salt of tartar, $\frac{1}{2}$ oz., dissolved in water, q. s.; butter, 1 oz.; spices, to palate. *Obs.* Takes several days to ripen; sometimes a fortnight.

6. (Extemporaneous.)—a. From flour, $1\frac{1}{2}$ lb.; moist sugar and treacle, of each, $\frac{1}{2}$ lb.; butter, $2\frac{1}{2}$ oz.; baker's salt (carbonate of ammonia), $\frac{1}{4}$ oz., dissolved in cold water, q. s.; ginger, 3 drs.; nutmeg, 2 drs.; cassia, 1 dr.; cayenne pepper (best), $\frac{1}{2}$ dr.

b. From flour, 6 lbs.; powered ginger, $2\frac{1}{2}$ oz.; caraway seeds, 1 oz. (and other spices to palate); candied lemon and orange peels, of each, 2 oz.; moist sugar and melted butter, of each, $\frac{1}{2}$ lb.; treacle, 4 lbs.; volatile salt, 2 oz.; water, q. s.; mix as above. May be baked at once.

c. From Jones's patent flour, 2 lbs.; treacle, 1 lb.; moist sugar, $\frac{1}{2}$ lb.; butter, $2\frac{1}{2}$ oz.; spice, q. s.; mix as quickly as possible, and bake it instantly. If the dough is expertly mixed up, the quality of the product is fully equal, if not superior, to that of any of the preceding formulæ.

Obs. Gingerbread is either rolled out into thin sheets and cut into cakes or nuts (GINGER-BREAD NUTS) with the top of a wine-glass or canister, or is formed into thick cakes, which are baked in 'batches' (ordinary GINGERBREAD). Both varieties require a pretty brisk oven; the thinner kinds (nuts, &c.), especially, must be baked as crisp as possible, without being burnt. The varieties called LEMON GINGERBREAD, CARAWAY G., &c., have a perceptible predominance of these flavouring ingredients. The addition of a little alum, dissolved in water, makes the bread both lighter and crisper, and causes it to ripen quicker, but at the same time lessens its wholesomeness.

GINGER CANDY. See CANDYING.

GINGER DROPS. See DROPS (Confectionery).

GLAIRE. White of egg. See ALBUMEN and Egg.

GLANDERS. *Syn.* FARCINOMA, L. A contagious disease, generally confined to the horse, ass, and mule, but communicable to man, in whom it assumes a highly malignant and often fatal character. This disease appears under two forms—1. SIMPLE ACUTE GLANDERS, marked by copious discharge of foul mucous matter from the nostrils and adjacent parts;

and—2. FARCY, FARCIN, or FARCY GLANDERS, when it attacks the lymphatics of the skin, either generally, producing a distended appearance of the vessels, like moles or buttons (LEAD or BUTTON FARCY), or locally, when it takes the form of dropsical accumulations in the legs (WATER FARCY).

Treat. Mr. Youatt considers it useless to attempt the cure of glandered horses; but that farcy in its earlier stages and milder forms may be often successfully treated. "All the mercurials have been used with benefit in farcy; but they must be discontinued as soon as the mouth is sufficiently affected, or sickness, loss of appetite, and like symptoms, are produced." (Blaine.) Feeding the animal entirely on green food appears to be the best mode of treatment in both varieties. The buttons are generally removed with caustic or a red-hot iron.

GLASS. *Syn.* VITRUM, L. This well-known substance is essentially a mixture of silicates with an excess of silica or silicic acid. It generally contains the silicates of potassa, soda, lime, baryta, magnesia, alumina, and lead, coloured by small portions of iron, manganese, cobalt, uranium, copper, or gold. In its usual form, it is brittle, transparent, non-crystalline, insoluble, and fusible; but it sometimes exhibits other properties.

The manufacture of glass is one of the highest beauty, and considering the comparative worthlessness of the materials of which it is made, add the various purposes of a useful, ornamental, and scientific nature which it subserves, it may be regarded as, perhaps, the most important in the history of inventions. The principle of its production is very simple, although great skill and experience are necessary to ensure its excellence. Silica (commonly under the form of sand) is heated with carbonate of potassa or of soda, and slaked lime or oxide of lead, until the mixture fuses, and combination takes place. After a time the melted mass becomes perfectly limpid and free from air-bubbles, when it is allowed to cool until it assumes the peculiar tenacious condition proper for working. The operation of fusion is conducted in large crucibles of refractory fire-clay, which, in the case of 'lead-glass,' are covered with a dome, at the top, and have an opening at the side by which the materials are introduced, and the melted glass withdrawn.

The manufacture of glass is only conducted on the large scale, and the precise character and proportions of the ingredients used by the glass-maker, must necessarily greatly depend upon the nature of the raw materials furnished by his locality, or otherwise at his command. The attention of the manufacturer should be directed to the use of his materials in such proportions as will furnish, in the melting-pot, the proper quantities of the essential ingredients, as determined from the known composition of the best commercial samples. The purity of the raw materials and the accuracy

of his proportions and quantities are proved or disproved by the excellence of the product; and the cause of error (if any) may be at once determined by carefully ascertaining the quality of the ingredients employed, and the composition of the defective glass.

Prep. The following formulæ exhibit the composition of the leading commercial glasses, as shown by chemical analysis, together with the proportions of the raw materials used in their production.

BOTTLE GLASS. Sp. gr. 2.700 to 2.735.—

a. Composition by analysis:—

1. Silica, 53.55%; lime, 29.22%; mixed alkali, 5.48%; alumina, 6.01%; oxide of iron, 5.74%. Dark green.

2. Silica, 52%; baryta, 21.6%; soda, 26.1%; oxides of iron and manganese, 3%. Pale green; very superior.

b. Raw materials used:—

1. Yellow sand, 20%; kelp, 8%; lixiviated wood-ashes, 30%; fresh wood-ashes, 8%; pale clay, 16%; 'cullet' (broken glass), 18%. This is the common mixture for coarse bottles, in Belgium, France, and Germany.

2. To the last add of black oxide of manganese, 2½ to 3%. Has a rich yellowish colour; used for Rhenish-wine bottles.

3. Pale sand, 51%; lixiviated wood-ashes, 33%; pearl-ashes (dried), 8%; common salt, 7½%; white arsenic, ½%; charcoal, q.s. Very pale green.

4. Siliceous sand (pale), 68½%; potash (or its equiv.), 4%; lime, 23½%; heavy spar, 2½%; peroxide of manganese, 1½%. This forms the celebrated 'flask-glass' of St. Etienne.

BROAD GLASS, SPREAD WINDOW GLASS. Sp. gr. 2.642.—

a. By analysis:—

Silica, 69.70%; lime, 13.30%; soda, 15.25%; oxide of iron (and loss), 1.75%.

b. Materials used:—

1. White sand, 50%; dried sulphate of soda, 22%; charcoal (in powder), 9%; 'cullet,' 41%; peroxide of manganese, a little. Pale.

2. White sand, 60%; potashes (good), 24%; common salt, 10%; nitre, 5%; white arsenic, 1%; peroxide of manganese, a little (½ to 1½%); pale 'cullet,' at will (10 to 30%). Very pale. This is the 'spread' or 'sheet window-glass' in common use.

CHEMICAL GLASS. Sp. gr. 2.390 to 2.396.—

a. By analysis:—

1. Silica, 72.80%; potassa, 16.80%; lime (with a trace of alumina), 9.68%; magnesia, 4.0%; traces of oxide of manganese and iron (and loss), .32%. This is the difficultly fusible 'Bohemian tube-glass,' so valuable in chemical manipulations.

2. Silica, 69.3%; potassa, 15.8%; soda, 3%; lime, 7.6%; alumina, 1.2%; magnesia, 2%; oxide of iron, .5%; oxide of manganese (and loss), .6%. English chemical glass (without lead). More fusible than the last.

b. Materials used:—

1. Quartz (hyalin, in powder), 60%; calcined

purified pearlash, 30%; fresh-burnt lime (very pure), 9%; nitre (dried), ½%; arsenious acid or peroxide of manganese, ¼%. Said to be the proportions used in the production of *a.* 1 (*above*).

2. (M. Peligot.) Quartz, 71½%; carbonate of potassa (or its equiv., dry), 20%; quicklime, 8½%; (manganese, a little). Said to be the formula for the hardest and least fusible 'Bohemian tube-glass.' It is very intractable and infusible, except at a very high temperature; but the addition of an exceedingly small quantity of boracic acid, borax, or arsenious acid, causes it to flow into a glass possessing great brilliancy and hardness, and capable of being wrought at the highest heat of the ordinary furnace.

CROWN GLASS, WHITE WINDOW-GLASS. Sp. gr. 2.486 to 2.488.—

a. By analysis:—

1. Silica, 62.8%; potassa, 22.1%; lime, 12.5%; alumina (with traces of oxide of iron and manganese), 2.6%. Crown-glass of Bohemia, according to Dumas. Very beautiful.

2. Silica, 72.5%; soda, 17.75%; lime, 9.75%. English crown-glass; excellent quality, but not so white as the last.

b. Materials used:—

1. Finest white siliceous sand, 64½%; purified potashes (dry), 23%; lime, 12%; white arsenic, ¾%; oxide of manganese, ¼%. Said to be used in Bohemia.

2. (Schweigger.) Pure sand, 57%; dry sulphate of soda, 28½%; quicklime, 11½%; powdered charcoal, 3 or 4%. Corresponds to *a.* 2, *above* (nearly).

3. Pure sand, 40%; soda ash, 24%; lime, 5%; white 'cullet,' 31%. Rather superior to the last.

CRYSTAL, CRYSTAL GLASS. The 'crystal glass' of England is flint glass' of superior quality; that of Bohemia is noticed under **TABLE GLASS**.

FLINT GLASS, CRYSTAL. Sp. gr. 3.000 to 3.620.—

a. By analysis:—

1. (Berthier.) Silica, 59.19%; oxide of lead, 28.68%; potassa, 12.13%; oxides of iron and manganese, traces. Finest colourless English crystal.

2. (Brände; Faraday.) Silica, 52%; oxide of lead, 34%; potassa, 34%. Crystal.

3. (Faraday.) Silica, 44.30%; oxide of lead, 43.05%; potassa, 11.75%; alumina, .50%; oxides of iron and manganese, .12%; (loss 28%). Heaviest of three samples of flint glass examined.

b. Materials used:—

1. Finest Lynn-sand (calcined, sifted, and washed), 51%; litharge (purest), 28% (or red lead, 29%), refined pearlashes (calcined before being weighed), 16%; nitre (purified), 4½%; arsenious acid and peroxide of manganese, of each, ½%. Very fine crystal.

2. (M. Payen.) Fine sand, 46%; red lead, 31%; purified carbonate of potash, 23%. French crystal.

3. (Geddes.) White Lynn-sand, 51%; red

lead or litharge, 33%; refined pearlashes, 13%; nitre, 3%; a very little arsenious acid and peroxide of manganese. Ordinary English flint-glass. Crystal 'cullet' may be added at will to the above. This glass was originally prepared from powdered flints, a fact to which it owes its common name.

OPTICAL GLASS. 1. (Crown glass.) Purest siliceous sand, 55%; carbonate of soda (dry), 12%; chalk (dry), 11%; carbonate of baryta, 22%.

2. (Flint glass).—

a. By analysis:—
Silica, 44.30%; oxide of lead, 43.05%; potassa, 11.75%. This is Guinand's 'dense optical glass.'

b. Materials used:—

1. Purest quartz, 42%; red lead (finest), 42%; purified potash, 14%; purified nitre, 14%. These are the proportions used for the last.

2. (Korner.) Finest quartz (reduced to powder, treated with hydrochloric acid, washed, and dried), 47½%; red lead, 38½%; cream of tartar, 14½%. The above are used by opticians in the construction of achromatic object-glasses.

PLATE GLASS. Sp. gr. 2.488 to 2.600.—

a. By analysis:—

1. (Dumas.) Silica, 75.9%; soda, 17.5%; lime, 3.8%; alumina, 2.8%. French mirror-glass.

2. (Mitscherlich.) Silica, 60%; potassa, 25%; lime, 12.5%; (loss, 2.5%). Finest Bohemian plate.

b. Materials used:—

1. Finest siliceous sand, 45%; dried carbonate of soda, 25%; lime, 5%; nitre (purified), 2%; plate-glass cullet, 23%; peroxide of manganese and cobalt azure, a very little. Ordinary English plate.

2. Whitish quartz sand, 60%; purified carbonate of soda (dried), 20%; lime (slaked by exposure to the air), 9%; plate-glass cullet, 11% (or more). Sometimes as much cullet as sand is used; but in all cases 1½ to 1¾ of its weight in carbonate of soda is added with it, besides that ordered in the formulæ, to compensate for loss of alkali by remelting. Used at the celebrated plate-glass works at Saint-Gobain, France. The product possesses an amount of excellence which British manufacturers have yet failed to equal.

TABLE GLASS, BOHEMIAN CRYSTAL. Sp. gr. 2.6 to 2.8.—

a. By analysis:—

1. (M. Berthier.) Silica, 71.7%; potassa, 12.7%; soda, 2.3%; lime, 10.3%; alumina, 4%; oxides of iron and manganese (and loss), 2.6%. Very white, hard, and beautiful table glass.

2. (Dumas.) Silica, 70%; potassa, 20%; lime, 4%; alumina, 5%; oxide of iron, 6%; peroxide of manganese, 4%. A beautiful white wine-glass.

b. Materials used:—

1. Finest sand, 50%; purified potashes, 25%;

chalk, 10%; nitre, 2%; crystal cullet, 27%; manganese, a little (say 1½%). Used in England recently for table glass.

2. Quartz (hyalin, in powder), 63%; purified potashes, 26%; slaked lime (carefully sifted), 11%; manganese, a little; crystal cullet, at will. Used in Bohemia.

3. (M. Perdonnet.) Powdered quartz, 44%; carbonate of potassa, 33%; quicklime (in fine powder), 22%; nitre, 1%; and a very small quantity of arsenious acid and peroxide of manganese. Said to be the formula used at Neuwelt for the glass *a*, 1 (*above*).

Qual., &c. These are denoted by its hardness, transparency, homogeneity, strength, and power of resisting the action of water, air, light, and the stronger acids and alkalis. The power of glass to resist the action of menstrua is readily tried by exposing it to boiling oil of vitriol, and hot but dilute solution of caustic potassa. Neither of these tests should cause the glass to lose its transparency or to become dim.

Swallowed glass. Glass and enamel, both in fragments and in powder, have occasionally been swallowed, with different results. These bodies are insoluble in the fluids of the body, and, consequently, any injurious action they may exert upon the system whilst they are retained in it must entirely depend upon mechanical attrition or irritation. As treatment, we must administer an emetic, and assist its action by thick mucilaginous liquids, and afterwards have recourse to antiphlogistics, if necessary.

Anal.—*a.* A portion of the sample for examination is heated to dull redness, and then suddenly thrown, whilst still hot, into a vessel of cold water. It is next dried, and reduced to fine powder in an agate or hardened-steel mortar.

b. 100 grs. of the prepared powder is thoroughly mixed with 200 grs. of pure potassic hydrate, and the whole is exposed to heat in a silver or platinum crucible or capsule until perfect fusion takes place; when cold, the crucible and its contents are boiled in about half a pint of distilled water; nitric acid is added to the resulting solution, in excess, and the mixture, together with any sediment, is evaporated to dryness, after which the heat is gradually increased to 400° or 500° Fahr.; the dry residuum is next reduced to powder, and digested in water acidulated with nitric acid, until exhausted of soluble matter; the insoluble portion is then carefully dried, gently ignited, and weighed. The weight in grains represents the per-centage of silica in the sample examined.

c. The mixed liquid and washings of (*b*) is next acidulated with nitric acid, and treated to a stream of sulphuretted hydrogen, which, if it produces a precipitate, is continued for some time; the precipitate is collected on a very small filter, washed, and dried; the filter with the precipitate next placed in a beaker

glass, and strong fuming nitric acid is cautiously added, drop by drop, until complete solution takes place; after boiling the solution for a few minutes, diluting with distilled water, and allowing it to cool, it is precipitated with sulphuric acid, in excess; this precipitate (sulphate of lead) is washed, dried, slightly ignited in a porcelain crucible, and weighed. The weight in grains, multiplied by .7369, gives the per-centage of oxide of lead or litharge.

d. The filtered liquid from (*c*) is evaporated to dryness, and redissolved in water acidulated with hydrochloric acid, and treated with a solution of ammonium chloride, and afterwards with ammonia, in excess; the precipitate (alumina and oxide of iron) is collected, washed, and boiled in a solution of potassium hydrate; the undissolved portion is collected on a filter, washed with boiling water, ignited, and weighed. This gives the per-centage of peroxide of iron.

e. The liquid filtered from the oxide of iron holds the alumina (if any) in solution; a solution of carbonate of ammonium is dropped in; the resulting precipitate is washed, dried, ignited, and weighed. This gives the per-centage of alumina.

f. The filtrate from the alumina and oxide of iron (see *d*), after being evaporated to dryness, is redissolved in a large quantity of distilled water, and is treated with a solution of oxalic acid (a solution of oxalate of ammonium is preferable when no baryta is present); the precipitate is washed, dried, gently ignited, and weighed. The weight of the resulting carbonate of calcium, in grains, multiplied by .56292, gives the per-centage of lime required.

g. The filtrate from (*f*) is now mixed with carbonate of potassium, in considerable excess, and boiled for a long time; the resulting precipitate (if any) is then collected on a filter, slightly washed with hot water, dried, and exposed to a full red heat for some time (say 2 hours); the residuum of the calcination is then weighed. This furnishes the per-centage value of the sample in magnesia.

h. The filtrate from (*f*) is treated with dilute sulphuric acid or the solution of a sulphate, as long as a precipitate falls; the precipitate (sulphate of barytium) is washed, dried, gently ignited, and weighed. The weight, in grains, multiplied by .6589, gives the per-centage of baryta in the sample.

The above may be varied by gently concentrating the liquid filtered from the precipitate of alumina and oxide of iron (see *d*), and precipitating it with dilute sulphuric acid; the mixed precipitate is exhausted by digestion in water holding chloride of ammonium in solution; the undissolved residuum (sulphate of barytium) is washed, dried, and otherwise treated as before; whilst the solution with the washings is treated with a solution of carbonate of ammonium; the precipitate is car-

bonate of calcium, which is to be washed, &c., as directed under (*f*). The liquor, &c., filtered from the lime, is lastly tested for magnesia. (See *g*.)

i. A second 100 grs. of the powdered glass (see *a*) is mixed with 200 grs. of fluor spar, also in powder; the compound is placed in a platinum or leaden capsule, 500 grs. of strong sulphuric acid are added, and the whole cautiously stirred together with a silver stirrer or spoon, care being taken to avoid inhaling the fumes; the heat of a spirit lamp is next applied, and at first is kept at about 212° Fahr., but towards the conclusion of the process is raised to 300° Fahr., or even higher, and is continued for at least 2 hours, or until fumes entirely cease to be evolved; 5 or 6 fl. oz. of distilled water are next poured on the residuary mass, and, after thorough agitation, the whole is thrown on a filter, more water being at last poured on to wash out any remains of soluble matter; to the filtrate, carbonate of ammonium is added in excess, and after a time the earthy salts are removed by filtration; the filtered liquor is now evaporated to dryness, and ignited to dull redness for 2 or 3 minutes; the residuum (sulphate of potassium or sodium, or of both), after being weighed (the weight being carefully noted down), is redissolved in distilled water; a solution of chloride of barium is then added as long as it disturbs the liquor, and after a time the whole is again filtered; the filtrate is concentrated by evaporation, and solution of bichloride of platinum added in excess; the whole is now gently evaporated to dryness, mixed with alcohol, collected on a filter, carefully washed with weak alcohol, dried at a temperature under 212° Fahr., and weighed. The weight, in grains, multiplied by .1940, gives the per-centage of potassa sought.

k. The weight of sulphate of potassium in the ignited residuum in (*i*) is calculated from that of the potassium last found (47 parts of the one being equal to 87 parts of the other), and this weight is deducted from the gross weight of the ignited sulphates; the remainder represents the quantity of sulphate of sodium present. The weight of the latter, in grains, multiplied by .4367, gives the per-centage of pure soda required.

Concluding remarks. One of the chief points to which the skilful glass manufacturer directs his attention, is the quality of the materials. Great care is exercised in the selection of the sand for all the finer varieties of glass. The usual practice is to test it before using it, by exposing it to a very high temperature. The purest sand is that which is the whitest and freest from iron, and which, consequently, suffers the least alteration by this treatment. The alkalies (potash, soda) employed are purified by solution and crystallisation. The red lead and litharge must be pure, and absolutely free from oxide of copper (a common contamination), which gives a green tint to the

glass. The former, which is the most costly, is preferable to the finest crystal. Care must also be taken that the lime, clay, &c., are respectively of proper purity; and that the 'cullet,' or broken glass, which is almost always remelted with the other materials, is of proper quality, and of the same kind as that to which it is added. Potassa produces a better glass than soda, although the latter is now very generally employed, from its lower price. It is, however, quite inadmissible as an ingredient in the manufacture of the better, class of crystal and plate glass, as, however pure it may be, it imparts to the product a slight greenish tinge more or less destructive of its beauty. When sulphate of soda (Glauber salt) is used as a source of soda, it is gently calcined to dissipate its water of crystallisation, and requires the addition of about 8½ of charcoal to effect its reduction in the melting-pot. Common salt is also employed as a source of soda in the same manner. Sometimes native sulphide of lead (galena) is used to decompose the sulphate of soda, and in lieu of part of the oxide of lead; in which case about 5 parts of the sulphuret are taken for every 9 parts of the calcined sulphate.

To anticipate the results of his processes, and to carry out with certainty his various intentions, the glass manufacturer, perhaps more than any other person, requires the aid of science and experience. All his most essential operations depend on chemical principles. The products of his furnaces are not formed by the mere mechanical admixture of their several ingredients whilst in the state of fusion, but result from the play of delicate affinities which only act under certain conditions, and when the materials are presented to each other in uniform and definite proportions. Chemically speaking, the glasses are mixed silicates of the respective bases which enter into their composition (potassium, calcium, lead, &c.), and, like all other compounds which are formed by elective attraction, obey the common laws of combination, as developed by Dalton, and now so successfully applied in almost every department of industrial art. It has been shown by the most careful analysis, that in all the more valuable and beautiful commercial glasses the relative proportions of the materials are conformable to these laws, and that several of them are true atomic compounds, as perfect in this respect as the crystalline bodies commonly denominated salts. In some of the harder glasses of Bohemia the number of atoms or equivalents of silica are to each of the bases with which it is united, nearly as 5 to 1; whilst in a softer glass of German manufacture the proportions of the two are found to be as 4 to 1. The celebrated plate glass of St. Gobain is an atomic compound formed of 1 equivalent of trisilicate of soda united to 1 equivalent of trisilicate of lime, with a small per-centage of alumina in combination with silicic acid, also in atomic

proportion. Glasses in which the ingredients bear no atomic ratio to each other are never homogeneous, but always more or less striated and of unequal colour and refractive power. The absence of atomic proportion between the substances entering into its composition appears to be the only reason why the best English plate and mirror glass is so greatly inferior to that of France and Germany, that comparison of the two becomes absurd. The only variety of glass in the production of which the English manufacturer excels is flint glass or crystal, and here he certainly surpasses all his numerous competitors. The subject is doubtless involved in difficulty, owing to the precise temperature necessary to effect the perfect combination of the bases with the silicic acid, varying with the character of the compound, and not being satisfactorily settled by observation or experience. The modifying influence of temperature is shown by the fact that the lower the heat employed in the process, the smaller the quantity of silica which enters into the composition of the resulting glass; whilst at higher temperatures a part of the base is dissipated in fumes, until such proportions of base and acid result as are required to produce a permanent atomic compound corresponding to the temperature employed. If the heat is excessive or improperly continued, the loss of base produces an opposite effect, and an opaque, semi-vitrified mass is formed, resembling 'Reaumur's porcelain.' The quality of the resulting glass depends on this change being more or less complete. If the furnace yields the right temperature, and the duration of the exposure to its action is neither too short nor too prolonged, nature makes up for the unskilful conduct of the operative, and removes the stumbling blocks which his ignorance had placed in the way of his own attempts at excellence. The proceedings and their results are accidental; but being once obtained, the first are repeated without further trouble or inquiry. This accounts for the same mixture of materials yielding products of different qualities at different times, and in different works, which the operative contents himself with referring to the 'going of the furnace.' The common plan in this country is to regulate the proportions and firing by experience only, rather than by theory and practice combined. Now, although the chemist has much yet to learn on the precise constitution of the glasses, and although theory may not be able to ensure unvarying success, it is nevertheless certain that, in all cases, it can afford much valuable assistance in that direction. Indeed, it has been asserted by one of the leading Continental chemists, that ingredients that will yield the proper equivalent proportions in the melting pot cannot produce a bad glass, if exposed to such a temperature as to permit of perfect combination taking place.

It is found that those glasses which contain

quantity of gliadin. It is prepared by washing paste made of the flour of wheat or rye in successive waters until all starchy matter is removed. The paste may be conveniently enclosed in a bag of fine linen during the washing.

Prop., Uses. Gluten is believed to be eminently nutritious. It is the presence of gluten in wheat flour that imparts to it its viscosity or tenacity, and confers upon it its peculiar excellence for the manufacture of MACARONI, VERMICELLI, and similar pastes. The superiority of wheaten over other bread depends upon the greater tenacity of its dough, which during the fermentation is puffed up by the evolved carbonic acid, and retained in its vesicular texture so as to form a light loaf.

Gluten is grayish coloured, and extensible whilst fresh and moist, like caoutchouc. It turns blue when mixed with guaiacum resin.

Gluten Bread. *Prep.* 1. From wheat flour which has been deprived of about 2-3rds of its starch by washing it with water.

2. From gluten flour. Recommended in diabetes.

Gluten Chocolate. (Gentile's.) A mixture of cocoa and gluten flour. As a nutritious and appropriate food in diabetes.

Gluten Flour. *Prep.* 1. From the waste gluten of the starch works, washed, dried, and ground.

2. (Gentile's.) From the last, mixed with about an equal weight of wheat flour.

GLYCERIN. $C_3H_5O_3$. *Syn.* GLYCERINE, HYDRATED OXIDE OF GLYCERYL; GLYCERINUM, L. A sweet syrupy liquid formed during the saponification of oils and fats.

Prep. 1. Olive oil (or other suitable oil), protoxide of lead, and water, are heated together until an insoluble soap of lead (lead plaster) is formed. The glycerin remains in the aqueous liquid. As this crude solution of glycerin is produced in great quantities in the manufacture of lead plaster, the operative chemist has only to purify it. This may be done as follows:—

The water and washings from lead plaster are mixed together, filtered, and submitted to the action of a stream of sulphuretted hydrogen, to throw down the lead; the supernatant liquor is decanted from the precipitate, filtered, and evaporated to the consistence of a syrup in a water bath. To render it quite pure it is diluted with water, decoloured with a little animal charcoal, filtered, and again evaporated to the consistence of a thin syrup, after which it is further evaporated in vacuo, or over sulphuric acid, until it acquires the sp. gr. 1.265.

2. (M. Bruère-Perrin.) From the sweet liquor of the stearine works (a product of the process of lime-saponification). The quantity of lime present in the sample is first determined by means of oxalic acid, and the proportion of sulphuric acid necessary for its saturation at once calculated and added; the crude liquor is then concentrated in a tinned-

copper vessel, evaporation being promoted by brisk agitation, until the sp. gr. sinks to 10° Baumé; it is next cooled and filtered, and accurately neutralised (if it is required) with carbonate of potassa, after which it is evaporated to the sp. gr. 24° Baumé; on cooling, it deposits gelatinous/sulphate of potassa; the whole is now filtered, the deposit on the filter washed with a little very weak spirit and water, the filtrate and washings mixed together, and evaporated, as before, with agitation, until the sp. gr. 28° Baumé, whilst hot (36° cold), is attained, when the whole is allowed to cool; the clear liquid is, lastly, decanted and filtered. In this state it has an amber colour, but may be rendered colourless and odourless by rediluting it with water, treating it with animal charcoal, filtering, and again evaporating to a proper consistence.

3. By saponifying olive oil with caustic alkali, decomposing the resulting soap with dilute sulphuric or tartaric acid, evaporating the aqueous portion to dryness (nearly), dissolving out the glycerine with cold rectified spirit, and filtering and evaporating the solution as before.

4. The residuary liquor of a soap manufactory is evaporated, and treated with alcohol to dissolve out the glycerin. The spirit is then evaporated off, the glycerin diluted with water, and finally boiled repeatedly with animal charcoal until all colour and odour are removed.

Obs. The products of the above processes are nearly pure, but that of Price's patent process, described below, is to be preferred to any of them.

5. (Commercial.) From sweet stearin-liquor, by precipitating the lime by a stream of carbonic acid gas, or by a solution of carbonate of soda, carefully avoiding adding the latter in excess; the liquor is then boiled a little, filtered, evaporated to a syrupy consistence, and again filtered. This is the common glycerin of the shops. It may be further purified as above.

6. (PRICE'S GLYCERIN—Patent dated 1854.) Superheated steam of from 550° to 600° Fahr. is introduced into a distillatory apparatus containing palm oil or other fatty body. The action of the steam effects the decomposition of the fat, and glycerin and the fatty acids distil over together, but no longer in combination. In the receiver the condensed glycerin, from its higher specific gravity, sinks below the fatty acids. Sufficient steam must be supplied, and the temperature nicely regulated. The glycerin is concentrated by evaporation, and if discoloured, it is redistilled. It is usually prepared with sp. gr. 1.24, and then contains 94% of anhydrous glycerin. It can, however, be concentrated to sp. gr. 1.26 when it contains 98%.

Prop. Pure glycerin is a colourless, odourless, uncrystallisable liquid, sweet to the taste, and of a syrupy consistence; it mixes with

water in all proportions; it is unctuous and emollient, and softens bodies, like oil, but without greasing them; it does not evaporate or change in the air at ordinary temperatures, and is not susceptible of rancidity or spontaneous fermentation; mixed with yeast and kept in a warm place, it is gradually converted into propionic acid; a strong heat decomposes it, with the production of acrolein; it is neutral to test-paper, and possesses neither basic nor acid properties; it is easily charged with the aroma of the essential oils, and may be combined with soap, and many other substances, without undergoing change. Sp. gr. 1.27 (see *above*).

Uses, &c. Glycerin is extensively employed as an excipient for medicines (see GLYCEROL), also, either alone, or in lotions, baths, &c., as a soothing emollient, and is added to poultices and dressings, instead of oil, to prevent their hardening. Diluted with water, it often succeeds in allaying itching and irritation of the skin when all other means fail. As a cosmetic, either made into a lotion or added to soap (glycerin soap), or used in small quantities along with the water employed in washing, it imparts a healthy clearness and a sensation of softness and coolness to the skin, which is very agreeable and refreshing. It is the best remedy known for chapped nipples, hands, lips, &c.; all of which may be prevented by its use as an article of the toilet. Glycerin is sometimes used as a sweetening agent, as a substitute for syrup.

Glycerin Cream for Chilblains. Equal parts of glycerin, soft soap, and cherry-laurel water, mixed together.

Glycerin Cream with Camphor. Glycerin, 2 parts; camphor, 1 part; rectified spirit, 1 part. Mix. For chilblains.

Glycerin Ointment. Glycerin, 8 parts; spermaceti, 4 parts; white wax, 1 part; oil of almonds (fixed), 16 parts. Add the glycerin to the melted ingredients, and stir briskly till cold. For chaps and excoriations.

GLYCEROLE. A pharmaceutical preparation, in which glycerin is employed as the excipient.

Glycerole of Borax. (B. P.) *Syn.* GLYCERINUM BORACIS, L. 1 of borax in $4\frac{1}{2}$ of glycerin.

Glycerole of Carbolic Acid. (B. P.) *Syn.* GLYCERINUM ACIDI CARBOLICI, L. 1 of acid in $4\frac{1}{2}$ of glycerin.

Glycerole of Gallic Acid. (B. P.) *Syn.* GLYCERINUM ACIDI GALLICI, L. 1 of acid in $4\frac{1}{2}$ of glycerin.

Glycerole of Starch. (B. P.) *Syn.* GLYCERINUM AMYLI, L. 1 of starch in $8\frac{1}{2}$ of glycerin.

Glycerole of Tannic Acid. (B. P.) *Syn.* GLYCERINUM ACIDI TANNICI, L. 1 of acid in $4\frac{1}{2}$ of glycerin.

GLYCERHIZIN. *Syn.* LIQUORICE SUGAR. An uncrystallisable variety of sugar obtained from the root of common liquorice (*Glycyrrhiza glabra*). It is yellow, transparent, soluble in both water and alcohol, and is not susceptible of the vinous fermentation.

GLYSTER. See ENEMA.

GNATS and MOSQUITOES. Smoke and strong fumes of any kind will drive away these insects. If you only burn a piece of brown paper in an enclosed space where they are, they soon after 'settle,' and appear to become so stupefied as to remain inactive for some time after. In those parts of the New World where mosquitoes abound, tobacco smoke is commonly had recourse to in-doors, and large fires made of brush-wood or under-wood out-of-doors. Old travellers, when compelled to bivouac during the season in which they are troublesome, are very careful to keep close on the 'lee' of these fires.

GOITRE. *Syn.* DERBYSHIRE NECK; BRONCHOCELE, TRACHEOCELE; HERNIA BRONCHIALIS, L. A tumour on the fore part of the neck. It sometimes occurs in Derbyshire, and is endemic in the Alps and several other mountainous districts. Iodine and the iodides appear to be the only substances capable of curing or even arresting the progress of this disease.

GOLD. Au. *Syn.* AURUM; OR, Fr.; GOLD, Ger. Gold is the most valuable and, probably, the longest known of all the metals. From the remotest period it has been esteemed for its beauty and permanence, and has been taken as the standard measure of value amongst all civilised nations. An account of the uses of gold in the arts, and its influence on society in all ages, as a symbol of wealth and an article of ornament and utility, would embrace the whole history of mankind. At the present day it alike contributes to the conveniences, comforts, and luxuries of life, as often exciting the baser passions of the human heart as promoting the cause of benevolence and virtue.

Gold is found almost invariably in the metallic state. It occurs as gold dust in the sands of various rivers, and in the alluvial soil of auriferous districts, from both of which it is obtained by the simple process of washing. Traces of it are constantly found in the iron and other pyrites of the more ancient rocks. Sometimes it occurs beautifully crystallised in the cubic form, associated with quartz, oxide of iron, and other substances, in regular veins. In the gold fields of California and Australia lumps of nearly pure gold have been discovered in abundance during the last few years. In the former country a mass of gold weighing 28 pounds was found, whilst in our own colonies one weighing 106 pounds was dug out of a quartz rock, near Bathurst. The latter contained upwards of 91 $\frac{1}{2}$ of pure gold, and nearly 8 $\frac{1}{2}$ of silver; being as pure as the English sovereign, or, in trade language, '22 carats fine.'

Prep. This consists merely in the separation of the gold and its subsequent purification. Formerly, the auriferous sulphides, if very poor, were first roasted, then fused into 'mattes' and again roasted; they were next melted with lead, and the alloy thus obtained was refined by cupellation. When the ores were very rich, the preliminary calcination

and fusion were omitted, and the alloy of lead at once formed. This method (by fusion) does not answer well with auriferous copper pyrites or ores very poor in gold. At the present time the method of amalgamation is principally followed. When a 'vein-stone' is to be wrought for gold, it is reduced to powder (on the small scale by hand, on the large scale in stamping mills), and is shaken in a suitable apparatus with water and mercury; an amalgam of gold is formed, which is then separated from the mixture, and its mercury removed by distillation. The gold is next cast into 'ingots.'

Refining. Gold obtained by the first method usually contains a little copper and silver, and frequently tin or iron. Tin may be removed by adding a little corrosive sublimate or nitre to the gold melted in a crucible. The process by amalgamation commonly leaves no other alloy than silver. This metal is removed either in the 'dry way,' by fusing the gold with sulphur or sulphide of antimony; or in the 'wet way,' by 'quartation' and 'parting.' At the Royal Mint, "when gold ingots contain a certain quantity of silver" (say $2\frac{1}{2}\%$ or $3\frac{1}{2}\%$), "instead of leaving it, as formerly, to constitute a part of the standard alloy, it pays to extract it, and to substitute copper in its place. To get the silver out of the said ingots, they are melted with about 3 parts of silver—the resulting alloy is granulated and boiled with sulphuric acid—the gold remains untouched, and all the silver is dissolved and converted into sulphate. . . The sulphate of silver is then decomposed by the immersion of copper plates; the silver is precipitated in a fine, crystalline powder, washed, pressed into masses, and melted, and so affords PURE SILVER, which is afterwards made standard by alloying it with copper, and is used for coinage. The resulting sulphate of copper (which exists in the solution) is then crystallised, and sold." (Brande.) "By first exhausting the gold with nitric acid, and then boiling it in sulphuric acid, some two or three thousandth part of silver which escaped the action of the nitric acid is dissolved out, and perfectly pure gold is obtained." (Ure.)

By a foreign invention, patented in 1851 by Mr. W. E. Newton, the operations of 'separation' and 'refining' are conducted by one process. The argentiferous substance, whether in the state of ore or bullion, is reduced to a granulated or spongy state, by fusion along with zinc, or some other metal cheaper than silver, and the zinc is subsequently removed, by digesting the resulting granulated, laminated, or pulverulent alloy, in dilute sulphuric acid, or other acid. The zinc, &c., is recovered by the usual means. This process, carefully conducted, produces metal of great ductility and purity, containing $99\frac{1}{2}\%$ to $99\frac{3}{4}\%$ of pure gold.

Chemically pure gold is obtained by dissolving the metal in nitro-hydrochloric acid, adding a solution of protosulphate of iron, and

collecting and washing the precipitate. In this state it is a brown powder, which acquires a metallic lustre by friction or heat.

Prop. The most marked properties of gold are its rich yellow colour, its ductility, malleability, insolubility in all menstrua except 'aqua regia' (nitro-hydrochloric acid), aqueous chlorine, and hydrofluoric acid, and its very slight affinity for oxygen. It melts at a bright red heat (2016° Fahr.,—Daniell), and the fused metal has a brilliant green colour. It forms compounds with chlorine, iodine, oxygen, sulphur, &c. Sp. gr. of native gold, 19.3 to 19.7; of pure gold, 19.3 (average); its greatest density is 19.5.

Tests. Metallic gold is characterised by its yellow colour, insolubility in nitric acid, and its ready solubility in aqua regia, forming a rich yellow or amber-coloured liquid, which stains the skin purple. Solutions of gold exhibit the following reactions:—Protosulphate of iron gives a brown precipitate, which acquires a metallic lustre when rubbed;—Protochloride of tin (preferably containing a little perchloride) gives a violet, purple, or blackish precipitate, insoluble in hydrochloric acid;—Sulphuretted hydrogen and hydrosulphide, of ammonia give a black precipitate, insoluble in simple acids;—Ammonia gives a reddish-yellow precipitate ('fulminating gold'), with tolerably concentrated solutions, either at once or on boiling the liquid;—Liquor of potassa gives a reddish-yellow precipitate with neutral solutions of gold, insoluble in excess.

Estim. 1. In the dry way;—

The quantity of gold in an ALLOY is usually estimated by 'assaying' the sample. Before proceeding to the assay, it is necessary to form some estimate of the quantity of other metals (copper or silver, or both) in the specimen to be examined, in order to employ the proper proportion of lead in the 'cupellation.' The experienced assayer commonly does this by the 'assay of the touch,' and, in certain cases, by a rough preliminary assay. The quantity of lead employed may be about 16 times the weight of the copper present in the sample, and when the alloy contains silver an additional allowance of lead, equal to $\frac{1}{10}$ th of its weight, is made on that account. When no silver is present, or it is not required to be estimated, a much larger proportion of lead may be employed. The weight taken for the assay ('assay pound') is usually 12 or 6 grs. The alloy and dose of lead being accurately weighed and separately wrapped in small pieces of paper, the assay may be at once proceeded with.

a. CUPELLATION. This operation, the most important of the whole, has been already described. Unlike silver, gold will bear the highest heat of the furnace without 'vegetating,' 'fuming,' or being absorbed by the cupel. The loss of weight gives the amount of copper in the alloy.

β. QUARTATION. The cupelled sample is

fused with three times its weight of pure silver (called the 'witness'), by which the gold is reduced to one fourth of the mass, or less, and in this state may be easily removed.

γ. PARTING. The alloy, after quartation, is hammered or rolled out into a thin strip or leaf, curled into a spiral form, and boiled for a quarter of an hour, in a small flask, with about $2\frac{1}{2}$ to 3 oz. of nitric acid (sp. gr. 1.3); and the fluid being poured off, it is again boiled in a similar manner with $1\frac{1}{2}$ to 2 oz. more of nitric acid (sp. gr. 1.2), after which the gold is carefully collected, washed in pure water, and dried. When the operation of 'parting' is skilfully conducted, and the acid not too strong, the metal preserves its spiral form; otherwise, it falls into the state of flakes or powder. The second boiling or digestion is technically termed the 'reprise.' The loss of weight by 'parting,' after deducting that of the 'witness,' corresponds to the quantity of silver originally in the specimen.

δ. ANNEALING. This consists in putting the pure gold obtained by the last process into a small porous crucible or cupel, and heating it to redness in the muffle.

ε. WEIGHING. This must be done with the utmost accuracy. The weight, in grains troy, doubled or quadrupled, as the case may be, gives the number of carats fine of the alloy examined, without calculation.

According to the 'OLD FRENCH METHOD' of assaying gold, the following quantities are taken:—For the assay pound, 12 grs.; fine silver, 30 grs.; lead, 108 grs. These having been cupelled together, the (perfect) button is rolled into a leaf ($1\frac{1}{2} \times 5$ inches), twisted on a quill, and submitted to parting with $2\frac{1}{2}$ oz. and $1\frac{1}{2}$ oz. of nitric acid, sp. gr. 1.16 (20° Baumé). The remainder of the process is similar to that above described. Two assays are made in the same manner, with a third on pure gold or gold of a known fineness; and no conclusion is drawn, unless the assay of the latter comes out accurately, and that of the first two correspond to each other.

For alloys containing platinum, which usually consist of copper, silver, platinum, and gold, the method of assaying is as follows:—The alloy is 'cupelled' in the usual way, the loss of weight expresses the amount of copper; and the button, made into a riband and treated with sulphuric acid, indicates, by the portion dissolved, that also of the silver present. By submitting the residuum to quartation, the platinum becomes soluble in nitric acid. The loss after digestion in this menstruum expresses the weight of that metal, and the weight of the portion now remaining is that of the pure gold. Gold containing palladium may be assayed in the same manner.

2. In the wet way:—

The richness in gold of any substance, whether liquid or solid, when the quantity is small (and indeed in all other cases), is most simply and economically performed by the

common method of chemical analysis. The gold may be thrown down from its solution by adding a solution of protosulphate of iron; the precipitate, after being washed, dried, and gently heated, may be weighed as pure gold.

Pois., &c. The soluble preparations of gold (chlorides) are violent poisons. The symptoms resemble those occasioned by corrosive sublimate, but are somewhat less violent. Metallic gold in a minute state of division is also capable of producing very unpleasant consequences, and even endangering life. The antidote is iron filings or a solution of sulphate of iron, given conjointly with an emetic.

Uses. The numerous applications of gold in the arts and the daily transactions of life need only be alluded to here. In *medicine*, gold has been given in the form of powder, in scrofula and syphilis, by Chrestien, Niel, and others, with apparent advantage.—**Dose.** $\frac{1}{4}$ gr. to 1 gr., 3 or 4 times a day, in pills, or as a friction on the tongue and gums. An ointment made of 1 gr. of powdered gold and 30 grs. of lard has been applied by Niel to the skin deprived of the epidermis (endermically), in the above diseases.

The more important chemical compounds containing gold, the alloys and commercial forms of the metal, together with certain facitious substances popularly called 'gold,' are noticed in alphabetical order *below*:—

Gold, Alloys and Preparations of:—

Gold, Dutch. MANNHEIM GOLD, MOSAIC G., OR-MOLT, PINCHBECK, PRINCE'S METAL, RED BRASS, SIMILOR, TOMBAC. These names are applied to several varieties of fine gold-coloured brass, differing slightly in tint and in the proportions of copper and zinc. The terms tombac, prince's metal, similor, and Mannheim gold, are used by some authors to designate alloys consisting of about 85% of copper and 15% of zinc; whereas, according to other authors, prince's metal and Mannheim gold are synonymous, and are composed of 75% copper and 25% zinc; according to another author, similor consists of about 71 $\frac{1}{2}$ % copper and 28 $\frac{1}{2}$ % zinc, and Mannheim gold of 80% copper and 20% zinc; and, again, according to another author, similor and Mannheim gold are synonymous, and are applied to alloys of copper containing from 10 to 12% zinc and from 6 to 8% tin. Seeing that such inextricable confusion exists in the employment of the terms above mentioned, it is desirable to discard them altogether. At the celebrated works of Hegermühl, near Potsdam, the proportions copper, 11 parts, to zinc, 2 parts, are employed to produce a metal which is afterwards rolled into sheets for the purpose of making Dutch leaf-gold. This alloy has a very rich, deep gold colour. Its malleability is so remarkable that it may be beaten out into leaves not exceeding $\frac{1}{15000}$ inch in thickness.

Gold, Facitious. *Prep.* From copper, 16 parts; platinum, 7 parts; zinc, 1 part; fused together. This alloy resembles in colour gold

of 16 carats fine, or $\frac{3}{8}$, and will resist the action of nitric acid, unless very concentrated and boiling.

Gold, Grain. *Syn.* AURUM GRANULATUM, L. *Prep.* From cupelled gold, 1 part; silver, 3 parts; melted together, and poured in a small stream into water; the silver being afterwards dissolved out by digestion in boiling nitric acid, and the grains, after being well washed in water, heated to redness in a crucible or cupel. *Used* to make preparations of gold.

Gold, Jeweller's. This term is applied to alloys of gold used for trinkets and inferior articles of jewellery, ranging from 3 or 4 carats fine upwards; or which are too inferior to receive the 'Hall mark.' The lowest alloy of this class is formed of copper, 16 parts; silver 1 to $1\frac{1}{2}$ part; gold, 2 to 3 parts; melted together. This is worth only from 8s. 6d. to 9s. 6d. the oz.

It has recently been found that gold of the quality of 12 carats, or less, if alloyed with zinc instead of the proper quantity of silver, presents a colour very nearly equal to that of a metal at least $2\frac{1}{2}$ to 3 carats higher, or of 8s. or 10s. an ounce more value; and the consequence has been that a large quantity of jewellery has been made of gold alloyed in this manner; and the same has been purchased by some shopkeepers, very much to their own loss, as well as that of the public; inasmuch as a galvanic action is produced, after a time, upon gold so alloyed, by means of which the metal is split into several pieces, and the articles rendered perfectly useless.

Gold, Leaf. *Syn.* GOLD-LEAF. Gold reduced to leaves by hammering it between thin animal membrane. Its preparation constitutes the trade of the goldbeater. These leaves are only 1-282,000th of an inch in thickness. Gilt silver is hammered in the same way, but the leaves are thicker. The latter is called party gold. Both are used by artists and gilders, and by druggists to gild pills, &c.

Gold, Powdered. *Syn.* DIVIDED GOLD, GILDING POWDER, GOLD BRONZE, GOLD COLOUR; AURI PULVIS. *Prep.* Gold, 1 part; mercury, 7 parts; form an amalgam, and expose it to heat until all the mercury is volatilised; or the mercury may be dissolved out with hot nitric acid. In either case, the residuum is to be powdered, washed, and dried. If the quantity operated on is considerable, the process should be so conducted as to save the mercury.

From gold leaf and honey ground together, as the last, by means of a stone and muller. This is the plan commonly adopted in the small way by artists.

From a solution of gold in aqua regia precipitated by protosulphate of iron, the resulting powder being washed, dried, and gently heated. This gives pure gold.

Uses, &c. Powdered gold is employed in gilding by japanners and by artists. It is either sold in powder (gold in powder), or made

up into shells (gold in shells). Its use in medicine has been already noticed.

Gold, Standard. The standard gold of this country is an alloy of pure gold, 11 parts, with pure copper, 1 part. Formerly the alloy consisted partly of silver, as found in some of the older coins now in circulation. It is often spoken of as 22 carats fine.

Gold, Chlorides of:—

1. Monochloride. AuCl. *Syn.* AUROUS CHLORIDE, PROTOCHLORIDE OF GOLD. A yellowish-white mass, formed when a solution of trichloride of gold is evaporated to dryness, and the residuum is exposed to a heat of about 440° Fahr., until fumes of chlorine cease to be evolved. It is insoluble in water, which decomposes it, slowly when cold, but rapidly by the aid of heat, into metallic gold and the trichloride.

2. Trichloride. AuCl₃. *Syn.* AURIC CHLORIDE, TERCHLORIDE OF GOLD, TRICHLORIDE OF GOLD, AURI CHLORIDUM. *Prep.* Gold, 1 part, dissolved by aid of heat in nitro-hydrochloric acid, 8 parts, and evaporated down to near dryness, and allowed to crystallise.

Prep. Orange-red crystalline needles, or ruby-red prismatic crystals; deliquescent; soluble in water, ether, and alcohol, forming a deep-yellow solution; at the heat of 500° Fahr. it suffers decomposition, chlorine being given off and pure gold left behind. It is reduced by ferrous sulphate, oxalic, sulphurous, formic and phosphorous acids, as well as by most of the metals, to metallic gold. It combines with several of the metallic chlorides, forming a series of double salts, which are mostly yellow when in crystals, and red when deprived of water.

Uses, &c. It has been employed by Duportal, Chrestien, Niel, Cullerier, Legrand, and others, as a substitute for mercury, in scrofula, bronchocele, chronic skin diseases, &c.; also as a caustic.—*Dose.* $\frac{1}{16}$ gr., dissolved in distilled water, or made into a pill with starch; or, in frictions on the gums, in quantities of $\frac{1}{16}$ to $\frac{1}{10}$ gr. Its most important use, however, is as a reagent in photography, large quantities being manufactured for use as a chief agent in toning photographic prints.

To some extent it is also used for electro-gilding, and mixed with excess of bicarbonate of potassium, it forms a good yielding solution for small articles of copper. These are to be first cleaned with dilute nitric acid, and then boiled for some time in the mixture.

The above is the salt generally referred to under the name of the 'chloride of gold,' or in commerce occasionally, as the 'muriate of gold.'

Gold, Chloride of, and Sodium. AuCl₃. NaCl. 2Aq. *Syn.* AUROCHLORIDE OF SODIUM; SODII AUROCHLORIDUM. *Prep.* Auric chloride, 85 parts; chloride of sodium, 16 parts; dissolve in a little distilled water, evaporate until a pellicle forms, then put it aside to crystallise. It forms beautiful orange-coloured rhombic prisms.

Dose, &c. $\frac{1}{16}$ to $\frac{1}{12}$ gr., made into a pill

with starch or lycopodium, in the same cases in which the terchloride is ordered. Mixed with 2 or 3 times its weight of orris powder, it has been used in frictions on the tongue and gums; and an ointment, made with 1 gr. of the salt, mixed with 36 grs. of lard, has been applied to the skin deprived of the epidermis by a blister.

Gold, Cyanide of. AuCy_3 . *Syn.* AURIC CYANIDE. *Prep.* Add a solution of pure cyanide of potassium to a solution of pure auric chloride as long as a precipitate forms, carefully avoiding any excess; wash, and dry the precipitate.

Prop., Uses, &c. This salt is a pale-yellow powder, insoluble in water, but very soluble in a solution of cyanide of potassium, forming the double cyanide of gold and potassium so largely used in the electrotype process. Cyanide of gold is employed to a certain extent in medicine.—*Dose.* $\frac{1}{15}$ to $\frac{1}{10}$ gr., made into a pill, in the usual cases in which gold is administered. The first formula is essentially similar to that of the French Codex.

Gold, Extraction of, by Sodium Amalgam. (Crookes' Method, Patented.) In the extraction of gold by amalgamation serious difficulties are often occurring through the 'flouring' or 'sickening' of the mercury employed, and the prevention of the amalgamation by a coating of tarnish on the gold. So much is this the case that losses of from 30 to 60 per cent. of the gold are usually incurred, and, in many cases, a still more serious loss of mercury.

When certain minerals, as tellurium compounds, pyrites, &c., occur in the gold ore, the mercury is apt, on trituration, to become subdivided into excessively minute globules, which, owing to their tarnished condition, refuse to unite, and are consequently washed away, it being almost impossible to separate them from the heavier portions of the ore. This is technically called 'flouring,' 'granulating,' &c. Besides this, certain of these minerals affect the mercury in another way, that is, by 'sickening' it, or causing it to lose its bright surface and fluidity, and prevents its amalgamating with the gold. Besides the inconvenience and loss thus caused, a further loss of gold takes place from the inability of the ordinary mercury to touch or amalgamate tarnished gold, unless it is ground with it, for a more lengthy period than is found practicable in most cases.

Mr. Crookes, F.R.S., has, by means of the addition of a certain proportion of sodium, in the form of an amalgam, to the mercury, effectually prevented this serious loss of gold and mercury. By adding certain quantities of amalgams B and C, an amount which, differing from each ore, is ascertained by experiment, the 'flouring' and 'sickening' of the mercury is effectually prevented, the mercury remaining throughout in the best condition. The addition of about 1-10th per-centage of amalgam A, at intervals of some hours, increases most powerfully the affinity of the

mercury for the precious metals, and secures a more thorough amalgamation.

This invention has met with general approval, and experiments conducted at many mines show its great practical value, giving an increase of from 5 to 30 per cent. in the yield of gold, and, in fact, with many pyrites that yielded no gold to the ordinary amalgamation process, gave a considerable yield of gold to the sodium amalgamation process. This has led to its use in most mines, both silver and gold, in America.

Gold, Iodide of. AuI_3 . *Syn.* AURIC IODIDE, TRI-IODIDE OF GOLD, GOLD TERIODIDE, AURI IODUM. *Prep.* Add a solution of trichloride of gold to one of iodide of potassium. The resulting precipitate is at first redissolved on agitation, a soluble double iodide being formed; subsequently the iodide of gold is precipitated, leaving the supernatant liquor free of colour.

Prop., Uses, &c. A dark-green powder, easily soluble in hydriodic acid. It is occasionally employed as a medicine, and, like other preparations of gold, is of an alterative character.—*Dose.* About $\frac{1}{16}$ of a grain.

Gold, Oxides of:—

1. Monoxide. Au_2O . *Syn.* AUROUS OXIDE, PROTOXIDE OF GOLD. *Prep.* Formed by treating the aurous chloride with strong potassium hydrate. Green powder, somewhat soluble in potassium hydrate solution, and readily decomposing into metallic gold and auric oxide.

2. Trioxide. Au_2O_3 . *Syn.* AURIC OXIDE, OXIDE OF GOLD, PEROXIDE OF GOLD, AURIC ACID, AURI OXIDUM. *Prep.* Magnesium oxide, 4 parts; auric chloride, 1 part; water, 40 parts; mix, boil, and wash the precipitate with water, dilute nitric acid, and again with water. It must be dried in the shade.

Reddish-yellow powder, easily decomposed by heat; readily soluble in hydrochloric and hydrobromic acids and strong nitric acid, but insoluble in water and the other acids. Forms unstable salts with the alkalis.

Uses, &c. Trioxide of gold has been given in scrofula, &c., in doses of $\frac{1}{16}$ to $\frac{1}{2}$ gr., or 1 gr., in scrofula, syphilis, &c., made into a pill, with extract of mezeoreon.

Gold, Ammonium of.* *Syn.* AURATE OF AMMONIA, BERTHOLLET'S FULMINATING GOLD; AURUM AMMONIATUM, AMMONIE AURAS, L. *Prep.* By adding ammonia to a solution of gold in aqua regia (trichloride), as long as a reddish-yellow precipitate (fulminating gold) forms; the latter must be collected, washed, and dried with the greatest possible caution.

Obs. Ammonia fails to precipitate trioxide of gold from solutions which are not tolerably concentrated, and in those containing free acid or ammoniacal salts the precipitate only forms upon boiling the solution. Before adding the ammonia, it is, therefore, proper to drive off the excess of acid, if any, by the application of heat. See FULMINATING COMPOUNDS.

Gold, Sulphide of. Au_2S_3 . *Syn.* SULPHURET OF GOLD, TERESULPHURET OF G.; AURI

SULPHURETUM, L. *Prep.* Transmit a current of sulphuretted hydrogen gas through a solution of terchloride of gold in water; or add hydrosulphuret of ammonia to the same solution; collect the precipitate, wash it with cold distilled water, and dry it in the shade.

GOLD DETERGENT. *Prep.* (Upton.) Take quicklime, 1 oz.; sprinkle it with a little hot water to slake it, then gradually add boiling water, 1 pint, so as to form a milk. Next dissolve pearlsh, 2 oz., in boiling water, 1½ pint; mix the two solutions, cover up the vessel, agitate occasionally for an hour, allow it to settle, decant the clear, put it into flat half-pint bottles, and well cork them down.

Use. To clean gilding, &c., either alone or diluted with water. It is applied with a soft sponge, and then washed off with clean water. It is essentially a weak solution of potassa, and may be extemporaneously prepared by diluting solution of potassa (Ph. L.) with about 5 times its volume of water.

GOLD SHELLS. Gold leaf or powdered gold ground up with gum-water, and spread upon the insides of shells. *Used* by artists.

GOLD SIZE. *Syn.* GILDING SIZE, GILDER'S s., GOLD COLOUR. *Prep.* 1. (OIL SIZE.) Drying or boiled oil thickened with yellow ochre or calcined red ochre, and carefully reduced to the utmost smoothness by grinding. It is thinned with oil of turpentine. Improves by age. *Used* for oil gilding.

2. (WATER SIZE.) Parchment or isinglass size, mixed with finely ground yellow ochre. *Used* in burnished or distemper gilding.

GOLD-BEATER'S SKIN is prepared from the peritoneal membrane of the cæcum of the ox. It is *used* to separate the leaves of gold whilst under the hammer, as a nearly invisible defensive dressing for cuts, as a fabric for court plaster, &c.

GONG METAL. See BELL METAL.

GONIOM'ETRY. The art of measuring the angles of crystals, by means of a GONIOMETER; a most important matter in *chemistry* and *mineralogy*. The only accurate and simple instrument of this kind is the REFLECTING GONIOMETER invented by Dr. Wollaston. Facility in using this instrument is readily acquired by a few trials.

GOOSE. This bird, the *Anser domesticus*, is a favourite article of food almost everywhere, and may fairly claim a similar position amongst poultry to that occupied by "good Sir Loin" among joints of meat. The vulgar innuendos occasionally heard to its prejudice should be directed against the cook rather than the bird, as it is only when it is unskillfully dressed and too highly seasoned that it is apt to disagree with that "irascible member of the interior," a delicate or overloaded stomach. Undue susceptibility in that quarter may, however, be generally allayed by an oblation, in the shape of a little 'eau de vie,' used as sauce or gravy. Formerly, almost miraculous virtues were attributed to this bird.

Its flesh was said to promote longevity, to cure hydrophobia, and to be aphrodisiac. The fat (GOOSE GREASE; ADIPS ANSERIS), mixed with honey, was supposed to be "good against the bitings of a mad dog." At the present day it is occasionally used in clysters, and, when scented, as a pommade to make the hair grow, for which purpose it is said to be superior to bear's grease. In quantity, it is an emetic of very easy action. The large feathers of the wings (quills) are used for writing. The small feathers form the common stuffing of our beds.

GOOSEBERRY. The fruit or berry of *Ribes grossularis*. Unripe fruit, cold and acidulous; ripe fruit, wholesome and slightly laxative; but the seeds and skins should not be eaten, as they are very indigestible; the juice of the green fruit is made into wine (ENGLISH CHAMPAGNE); the seeds, washed and roasted, were formerly used as a substitute for coffee (GOOSEBERRY COFFEE). Gooseberries are preserved by simply bottling them, and keeping them in a very cold place. See CHEESE, FOOL, FRUIT, &c.

GOULARD. *Syn.* GOULARD'S EXTRACT. See SOLUTION OF DIACETATE OF LEAD.

GOUT. *Syn.* ARTHRITIS, L. A painful disease that chiefly attacks the male sex, particularly those of a corpulent habit and robust frame. Persons who live temperately and take much exercise are seldom troubled with gout. Indolence, inactivity, luxurious habits of life, and free living, are the chief exciting causes of this disease; but excessive study, grief, watchfulness, exposure to cold, and the too free use of acidulous liquors, also occasionally bring it on. In some persons it is an hereditary disease.

Symp. Gout is generally preceded by unusual chilliness of the feet and legs, and a numbness or a sensation of prickling along the lower extremities; the appetite fails, flatulency, indigestion, torpor, and languor ensue, and extreme lassitude and fatigue follow the least bodily exertion; the bowels become costive, and the urine pallid. The fits usually come on in the night; the patient is awakened by the severity of the pain, generally in the first joint of the great toe, or occasionally in the heel, whole foot, or calf of the leg. The pain resembles that of a dislocated joint, accompanied by a sensation resembling the effusion of cold water; the pain increases, rigors and febrile symptoms ensue, accompanied with local throbbing and inflammation. Sometimes both feet and legs are attacked; at others, only one. Towards morning the patient generally falls asleep, and sinks into a state of copious perspiration, from which he awakes comparatively recovered. This constitutes what is called a 'fit of gout.' These fits or paroxysms are apt to return at intervals, commonly every evening, with more or less violence; and when frequent, the disease usually extends its action, the joints become affected, and concretions of a chalky nature (chalk stones,

gout stones) are formed upon them, and they become stiff and nearly immovable.

Treat. A plain or vegetable diet, moderate exercise, and the use of warm laxatives, gentle tonics, diaphoretics, and diuretics, are among the best preventives. The moderate use of alkaline remedies, as potassa and magnesia, has also been recommended. To relieve the fit of gout, or to check it at its commencement, the affusion of cold water will be often found effective. The use of the '*eau médicinale*,' or the '*vinum colchici*' of the Pharmacopœia, may also be had recourse to; a due dose of which taken at bedtime will frequently carry off the paroxysm, and nearly always mitigate the symptoms. The effect of the above remedies do not greatly differ from each other. The action of both medicines is accompanied with great languor, and a deadly nausea or sickness, which terminates in vomiting or a discharge from the bowels, or both. These symptoms have often reached an alarming extent, and in some constitutions follow even a moderate dose. This method of cure should not, therefore, be unadvisedly and incautiously adopted.

• Another remedy which has been recommended for gout is lemon juice, but experience has proved that this agent is not to be depended on. The *dose* proposed by Dr. O. Rees, who originated this treatment, was 2 or 3 fl. oz., twice or thrice a day.

To ensure the efficacy of lemon juice, it must be expressed from the fruit into the glass shortly before being taken. That purchased at the shops is generally stale and disagreeable, and is often worse than useless. In some cases it is advisable to take the juice undiluted, but the more common practice is to mix it with about an equal quantity of water. See RHEUMATISM, COLCHICUM, DRAUGHT (Antiarthritic), LEMON JUICE, VINEGAR OF COLCHICUM, WINE OF COLCHICUM, &c.

Gout Cordial. *Prep.* Rhubarb, senna, coriander seed, sweet-fennel seed, and cochineal, of each, 2 oz.; liquorice root and saffron, of each, 1 oz.; raisins, $2\frac{1}{2}$ lbs.; rectified spirit of wine, 2 galls.; digest for 14 days, press, and filter. *Used* in gout and rheumatism. Aromatic and slightly laxative. *Dose.* 1 to 3 table-spoonfuls.

Gout Medicine. (Duncan's.) A mixture of wine of colchicum, wine of opium, and tincture of saffron.

Gout Remedy. (Alexander's.) According to Dr. Paris, this contains—aniseed, cumin seed, ginger, hermodactyls, pepper, and scammony.

Gout Specific. (Murray's.) A mixture of iodide of potassium, sulphate of magnesia, and wine of colchicum, disguised with an aromatic tincture.

GOUTTES AMERES. [Fr.] See DROPS (Bitter).

GRADUATOR. See VINEGAR.

GRAFTING COMPOST. Clay tempered with water, to which a little linseed oil is

sometimes added. *Used* to cover the joint formed by the scion and stock in grafting.

GRAINS OF PARADISE. *Syn.* GUINEA GRAINS, MALAGUETTA PEPPER. The seeds of the *Annonum melaguetta*. Grains of paradise are hot, acrid, and aromatic, and in general properties similar to the other peppers. In some parts of the world they are used as a condiment. They are principally employed in these countries to impart a false strength to wine, beer, spirits, and vinegar.

GRANIL'LA. A small inferior variety of cochineal (which see).

GRANULATION. The act or process of forming, or breaking into, grains or small masses.

The granulation of MEDICINES has of late years received considerable attention from both foreign and British pharmacentists. In France, granulated powders (POUDRÉS GRANULÉES) are coming into general use in place of impalpable powders, the most unpleasant of all forms of medicine. The French process consists in enveloping the particles of medicines in syrup by means of heat and constant stirring. Mr. Banner, of Liverpool, has lately introduced a method of granulating medicines far preferable to that of the French pharmacentists. The powder to be granulated is placed in a mortar, and mucilage of gum acacia is gradually added until a crumbly mass is made; this is then rubbed through a wire sieve (about 12 meshes to the inch), and the granules produced are spread out on paper, and left to dry spontaneously, or they are placed in a copper pan, and kept in constant motion over a stove until dry; when perfectly dry, they are placed in a mortar, and sufficient quantity of strong tincture of tolu (3 drs. to 1 oz.) is added to them, until by constant stirring they all appear glossy and shining; they are then dried again by a gentle heat, being kept in constant motion. The granules thus formed keep well, are tasteless, and are much more elegant and agreeable preparations than pills or ordinary powders. Many saline substances are granulated by the simple process of dissolving the salt in water, and evaporating to dryness with constant stirring.

METALS are granulated (reduced to drops, grains, or coarse powder) by pouring them, in the melted state, into water. In many cases they are allowed to run through the holes of a species of colander or sieve to produce minute division; and in order to render the drops spherical, they are allowed to fall from a sufficient height to permit of their acquiring the solid state before striking the water. Lead shot is made in this way. Shot towers are often upwards of 100 feet in height. See COPPER, GUNPOWDER, POWDER, ZINC, &c.

GRAPES. *Syn.* UVE, L. The fruit of *Vitis vinifera*, or the common grape vine. Ripe grapes are cooling and antiseptic, and in large quantities diuretic and laxative. They are very useful in bilious affections and dys-

pepsia, and in all febrile, putrid, and inflammatory complaints. The skin and seed, which are indigestible, should be rejected. "Grapes which contain a large quantity of sugar are, if taken without the husks, the safest and most nutritive of summer fruits." (Cullen.) "The subjects of pulmonary affections, who pass the summer in Switzerland, may try the effects of a course of grapes, '*cure de raisins*,' a remedy held in high estimation in several parts of the Continent." (Sir J. Clark.)

Grapes, in bunches, are preserved by wrapping them in silver paper, and packing them in dry bran. Each bunch is suspended by the stem with the fingers of one hand, whilst the bran is poured round it with the other; the jar being occasionally gently shaken as the process of packing proceeds. Some paper is then laid over the top of the jar, the mouth or cover of which is, lastly, tied firmly over with bladder, to exclude the air and moisture. See FRUIT, &c.

GRAPHITE. See PLUMBAGO.

GRAVEL. A collection of small pebbles commonly mixed with sand or clay, or both. Gravel for garden walks is chosen for its fine colour and binding properties. The gravel of Kensington and Wimbledon is esteemed the finest in the world.—Gravel walks, when once in order, may be rendered nearly equal to asphalt by pouring over them tar or a mixture of tar and pitch, absorption being promoted, if required, by the application of a hot iron.

Gravel. In *pathology*, a term popularly applied to calculous matter formed in the kidneys, and passing off in the urine; and sometimes to distinct calculi or concretions in the bladder itself. See CALCULUS.

GRAVIMETER. See HYDROMETER.

GRAVITY. *Syn.* GRAVITATION. The attractive force by which bodies fall towards the centre of the earth. Weight is the measure of gravity. The determination of the relative weights of bodies with reference to a given standard, is explained under SPECIFIC GRAVITY.

GRAVY. The juice or liquid matter that drains from dressed meat after it is placed on the dish for serving. The common practice among cooks is to pour a spoonful or two of boiling water or broth over the joint, to increase the quantity. The natural gravy that oozes from the meat after it is cut is the richest and most wholesome. Made gravies are prepared by adding spice and flavouring to the foregoing, or to strong meat soup. See SAUCE.

GRAY. *Syn.* GREY; GRIS, Fr. A mixture of black and white. Delicate grays result from mixtures of the three elementary colours, red, yellow, and blue, in which the blue preponderates to a greater or less extent.

GRAY DYE. *Syn.* TEINTE GRISE. Gray is dyed with the same materials as black, but both the bath and mordant are used in a more diluted state. COTTON goods may be worked

in sumach and then in copperas; this gives rather a bluish gray, which may be modified to any particular hue by the addition of suitable colouring matter. To make it yellowish, a small amount of fustic and alum are employed; to make it 'fuller,' peachwood and Lima-wood with alum are used. The methods of obtaining gray on SILK and WOOL are very numerous; they are similar in principle to the above, all depending on the blending of the three primary colours, or on the modification of weak blacks. See BLACK DYE.

GREASE. A general term applied to soft animal fats; as BEAR'S GREASE, GOOSE GREASE, &c.

Grease. An inflammatory affection of the heels of horses, which produces dryness, scurfiness, and stiffness. The *treatment* consists of emollient poultices, accompanied with physic and diuretic pills, to subdue the inflammation, followed by mild astringent lotions or ointments.

GREAVES. *Syn.* GRAVES. The sediment of melted tallow, consisting chiefly of animal membranes mixed with fat, made up into cakes. *Used* as a coarse food for dogs.

GRECIAN WATER. See HAIR DYES.

GREEN. *Syn.* VERTIS, L.; VERT, Fr. Of the colour of the leaves of growing plants; *subst.* a green colour.

GREEN DYE. *Syn.* TEINTE VERTE, Fr. All the green dyes in use, with the practically unimportant exceptions of Chinese green and oxide of chromium green, are compounded of blue and yellow. The goods, in practice, are generally dyed blue first, observing to regulate the shade according to that of the intended green; they are then dried, rinsed, and passed through a yellow bath, with the like precautions, until the proper shade is produced. See BLUE DYE, YELLOW DYE, &c.

GREEN PIGMENTS. Several of the green pigments of commerce are obtained from copper. Oxide of chromium furnishes some which are very beautiful. Many are formed by the mere mechanical admixture of blue and yellow pigments. The bright blues and yellows, when mixed in this way, produce the liveliest greens; orange, or red and blue, and the yellowish browns and blue, the more dingy greens. In this way are produced all the extemporaneous greens of the artist. Nickel and titanium also furnish green colours, but these are not in common use. The following list embraces all the best-known and most useful green pigments:—

Green, Arsenical. Arsenite and acetoarsenite of copper. See SCHEEL'S and SCHWEINFURT GREEN (*below*).

Green, Barth's. From yellow lake, Prussian blue, and clay, ground together.

Green Bice. Same as mountain green.

Green, Bremen. This is properly green verditer, but other preparations are frequently sold under the name.

Green, Brighton. A mixture of impure

acetate of copper and chalk, prepared as follows:—

To sulphate of copper, 7 lbs., add sugar of lead, 3 lbs.; each separately dissolved in water, 5 pints; mix the solutions, stir in of whiting, 24 lbs., set the resulting paste on chalk stones, and when dry grind it to powder.

Green, Brunswick. This is properly a crude chloride of copper, but a mixture of carbonate of copper and alumina or chalk is now commonly sold under the name in the shops.

Prep. 1. A saturated solution of sal-ammoniac, 3 parts, is poured over copper filings or shreds, 2 parts, contained in a vessel capable of being closed up, and the mixture is kept in a warm place for some weeks, when the newly formed green pigment is separated from the unoxidised copper, by washing the mixture on a sieve; it is then edulcorated with water, and slowly dried in the shade. Colour very deep and rich. The lighter shades are produced by the addition of sulphate of baryta.

2. A solution of crude carbonate of ammonia or bone spirit is added to a mixed solution of alum and blue vitriol, as long as it affects the liquor; in a short time the precipitate is collected, washed, and dried. The various shades of green are produced by using different quantities of alum, which pales and cheapens it.

Green, Chrome. The superb green pigment used by enamellers under this name is the green oxide or sesquioxide of chromium. A hydrated oxide of chromium forms the emerald green of Pannetier; it is prepared by melting in a crucible equivalent quantities of anhydrous boric acid and bichromate of potassium, and treating the fused mass with water. The hydrated oxide thus produced is washed and finely triturated.

The chrome green of the oil and colour shops is a mixture of chrome yellow and Prussian blue.

Green, Copper. Green blue or mountain green, Brunswick green, emerald green, verditer, and several other well-known pigments, may be thus named.

Green, Emerald. This term is commonly applied to the aceto-arsenite of copper, as prepared in England. It is the same compound, chemically speaking, as Schweinfurt green (which see).

Prep. A pulp is formed with verdigris, 1 part, and boiling water, q. s., and after being passed through a sieve, to remove lumps, is added gradually to a boiling solution of arsenious acid, 1 part, in water, 10 parts, the mixture being constantly stirred until the precipitate becomes a heavy, granular powder, when it is collected on a calico filter, and dried on chalk stones.

Green, Frise. *Syn.* **FRIZZLAND GREEN.** This resembles Brunswick green.

Green, Gellart's. A mixture of cobalt blue and flowers of zinc with some yellow pigment.

Green, Imperial. Schweinfurt green (see below).

Green, Iris. A pigment prepared by grinding the juice of the petals of the blue flag with quicklime. It is very fugitive.

Green Lake. See LAKE.

Green, Mineral. This is the same as mountain green.

Green, Mitis. Another of the many synonyms of Schweinfurt green.

Green, Mountain. This pigment is properly the native green carbonate or bicarbonate of copper (malachite) ground to powder, either with or without the addition of a little orpiment or chrome yellow. That of the shops is commonly prepared by adding a solution of carbonate of soda, or of potassa, to a hot mixed solution of sulphate of copper and alum. Green verditer is commonly sold for this article. According to Watts, mountain green is the same as Neuwieder green.

Green, Neuwieder. Schweinfurt green mixed with gypsum or sulphate of baryta.

Green, Prussian. The sediment of the process of making Prussian blue from bullock's blood or horns, before it has had the hydrochloric acid added to it. It is also prepared by pouring liquid chloride upon freshly precipitated Prussian blue. As now sold, this pigment is generally a mixture of Prussian blue and gamboge.

Green, Rinman's. This resembles that of Gellert.

Green, Sap. A very fugitive pigment, prepared from the juice of buckthorn berries. The berries are allowed to ferment for a week or eight days in a wooden tub. The juice is then pressed out, strained, a little alum added, and the whole evaporated to a proper consistence; it is next run into pigs' bladders, and hung up in a dry situation to harden. An inferior article is made from the juice of black alder, and of evergreen privet. It is a common practice to add $\frac{1}{2}$ pint of lime water and $\frac{1}{4}$ oz. of gum arabic to every pint of either of the above juices.

Green, Scheele's. This is arsenite of copper.

Prep. 1. White arsenic (in powder), 1 part; commercial potash, 2 parts; boiling water, 35 parts; dissolve, filter, and add the solution gradually, whilst still warm, to a filtered solution of sulphate of copper (cryst.), 2 parts, as long as a precipitate falls; lastly, wash the newly formed pigment with warm water, and dry it.

2. (Ure.) Powdered arsenious acid, 11 oz.; carbonate of potassa, $1\frac{1}{2}$ lb.; boiling water, 1 gall.; dissolve, filter, and add the solution, as before, to another solution of crystallised sulphate of copper, 2 lbs., in water, 3 galls. *Prod.* $1\frac{1}{2}$ lb. A very fine grass-green colour.

Green, Schweinfurt. This splendid green pigment is the aceto-arsenite of copper.

Prep. 1. Acetate of copper and arsenious acid, equal parts, are each dissolved separately in the least possible quantity of boiling water,

and the solutions mixed whilst still as hot as possible; an olive-green precipitate falls, which, by being boiled in the liquor 5 or 6 minutes, changes to a dense granular powder of a superb green colour.

2. Instead of boiling the solution containing the precipitate, it is allowed to cool and stand for several hours, or until the powder assumes a granular and beautiful tint. Very rich.

3. (Kastner.) Arsenious acid, 8 lbs., is dissolved in water as before, and added to verdigris, 9 or 10 lbs., diffused through water, q. s., at 120° Fahr., the pap of the latter being first passed through a sieve; the mixed ingredients are then set aside till the mutual reaction produces the proper shade.

4. (Dr. Ure.) Sulphate of copper, 50 lbs., and lime, 10 lbs., are dissolved in good vinegar, 20 galls., and a boiling-hot solution of white arsenic, 50 lbs., is conveyed as quickly as possible into the liquor; the mixture is stirred several times, and then allowed to subside, after which it is collected on a filter, dried, and powdered. The supernatant liquor is employed the next time for dissolving the arsenic.

5. See EMERALD GREEN (*above*).

Obs. This is a very fine, permanent green pigment. "A great deal of needless alarm has been excited about its supposed deleterious effects. It is extensively employed for staining wall-papers, and persons inhabiting rooms thus papered are said to have had their health seriously deranged by the arsenical fumes evolved from it. Now, it is utterly impossible that arsenic could volatilize from such a compound at ordinary temperatures; it does not decompose at any temperature below redness." (Watts.) [It is, however, probable that the air of such apartments is sometimes charged with the poisonous pigment through its becoming mechanically detached from the paper. To breathe an atmosphere so impregnated would be dangerous. The use of papers coloured with Scheele's green, especially of the kind called 'flock,' should, therefore, be carefully avoided.—Ed.]

Verd'igris. See COPPER (Acetates) and VERDIGRIS.

Green Verd'iter. This is essentially a mixture of oxide and carbonate of copper, in uncertain proportions, with chalk. Facticeous green bice and mountain green have a like composition. See VERDITER.

Green, Verona. The mineral called green earth.

Green, Vienna. The same as Schweinfurt green.

GREEN SICKNESS. See CHLOROSIS.

GREEK FIRE. This compound, so much used in ancient warfare, is believed to have had naphtha for its chief ingredient. According to some authorities, it was a mixture of asphalt, nitre, and sulphur.

GREGORY'S SALT. The crude hydrochlorate of morphia, prepared by Gregory's

process. It is a double hydrochlorate of morphia and codeia.

GRINDING. The operation of reducing substances to powder by attrition or friction. In the laboratory, the term is chiefly applied to powdering by means of a mill or by mechanical power, in opposition to simple pounding or trituration in a mortar or with a slab and muller. All the principal powders, paints, &c., sold by the druggist, dyssalter, and colourman, are reduced in the drug or colour mill. Recently machinery has even been applied to the common mortar. An ingenious and very useful contrivance of this kind is the 'mechanical mortar' of Mr. H. Goodhall, of Derby.

GRIND-STONES. (Artificial). Washed siliceous sand, 3 or 4 parts; shell-lac, 1 part; melt together, and form the mass into the proper shape whilst warm, with strong pressure. The fineness of the sand must depend on the work the stone is intended for. The same composition is formed upon pieces of wood, as corn rubbers, and for the purpose of sharpening knives, and cutting stones, shells, &c. See EMERY.

GROATS. *Syn.* GRITS; GRUTELLUM, AVENA DECORTICATA, AVENÆ SEMINA, AVENA (Ph. L.), L. Common oats, deprived of their exterior integuments or husks. This is generally effected in a mill, which, at the same time, cuts them into two or three pieces. When crushed flat, they are denominated EMBDEN GROATS.

GROUT. Mortar reduced to a thin paste with water, used to fill up the joints of masonry and brickwork. A finer kind is used to 'finish off' the best ceilings.

GRUEL. *Syn.* OATMEAL GRUEL, WATER G.; DECOCTUM AVENÆ, L. Oatmeal or groats boiled with water to a proper consistence, and strained. It is variously flavoured to suit the palate; but the addition of a little white sugar, and finely powdered Jamaica ginger, with or without a glass of wine, is the least likely to offend the stomach. Nutmegs, cinnamon, &c., frequently disagree with invalids. Sometimes milk or butter is added. Embden groats require less boiling than the common groats. Of oatmeal, the Scotch is commonly said to be the best.

The following directions for making gruel from oatmeal are given by Dr. A. T. Thomson:—"Oatmeal, 2 oz.; cold water, 1½ pint; rub the meal in a basin, with the back of a spoon, in some of the water, pouring off the fluid after the grosser particles have subsided, but whilst the milkiness remains; repeat this with fresh water, unite the washings, and boil until a soft, thick mucilage is formed."

GUAIACIN. *Syn.* GUAIACIC ACID, PURÆ GUAIACUM RESIN. A substance having the nature of an acid, discovered by Trommsdorff in the wood and bark of *Guaiaecum officinale*.

Prep. The tincture of guaiacum is treated with hydrate of lime, and the guaiacate of lime thus formed is decomposed with dilute sul-

phuric acid; it is purified by dissolving it in alcohol.

Prop., &c. Insoluble in water; soluble in alcohol and ether; it unites with the caustic alkalies, forming alkaline guaiacates (guaiacum soaps); air and light turn it green; gluten, mucilage of gum arabic, &c., turn it blue; nitric acid and chlorine turn it successively green, blue, and brown; tincture of guaiacin, added to hydrocyanic acid and sulphate of copper, produces an intense blue colour. (Pagenstecher.) A delicate photographic paper may be formed by washing unsized paper with an alcoholic solution of guaiacum resin, and afterwards with one of neutral acetate of lead. (Johnston.)

GUAIACUM. *Syn.* GUAIAAC, GUM GUAIACUM, GUAIAACUM RESIN; GUAIAACUM (Ph. L.), (GUAIAAC RESIN, GUAIAACI RESINA, B. P.). The resin prepared by means of fire from the wood of *Guaiacum officinale*, by natural exudation, by incision, or by heat. (B. P.) This substance is often adulterated. When pure, its "fresh fracture is red, slowly passing to green; the tincture slowly strikes a lively blue colour on the inner surface of a thin paring of raw potato." (B. P.) Adulteration with resin may be generally discovered by the odour evolved when the guaiacum is heated. An alcoholic tincture of guaiacum, rendered milky with water, recovers its transparency on the addition of caustic potassa in excess; but this is not the case when resin is present.

Guaiacum is stimulant, sudorific, and alterative.—*Dose.* 10 to 30 grs., either in powder or pills; in chronic rheumatism, gout, obstinate chronic skin diseases, scrofula, syphilis, &c. It forms the active ingredient of the once celebrated 'CHELSEA PENSIONER,' and the 'GOUT

SPECIFIC' of Mr. Emerigon. The latter was made by digesting 2 oz. of guaiacum resin in 48 fl. oz. of rum, for 7 or 8 days. The *dose* of this was a table-spoonful every morning, fasting, for a twelvemonth. Its other properties are similar to those of GUAIACIN, but are less marked. Sp. gr., 1·20 to 1·22.

Guaiacum Wood. *Syn.* LIGNUM VITÆ, GUAIACI LIGNUM (Ph. L.), L. The wood of *Guaiacum officinale*. This is employed under the form of shavings, raspings, and sawdust, in decoctions only. See DECOCTION and BALSAM.

GUANO. *Syn.* HUANCO, Peruv. This substance, now so extensively used in agriculture, is the partially decomposed excrement of certain aquatic birds, chiefly the common penguin, which congregate in countless numbers on the barren and uninhabited islets and rocks on the western coasts of South America and the coasts of Africa. It abounds in ammonia and the phosphates, and is undoubtedly the richest natural manure known. Under judicious application, the increase of the crops of grain, turnips, potatoes, and grass, consequent upon its use, is said to be about 33%. "Guano is peculiarly adapted to horticultural and floricultural improvement, by its relative cleanliness and facility of application." (Ure.)

"According to Denham Smith,¹ South American guano, as imported, presents itself in three distinct states, the three varieties being not unfrequently mixed together in the same bag; the first variety is damp and pulverulent; the second exists as large concretions, presenting various aspects when broken; the third is heavy and crystalline, and is termed 'stone' by the labourers. These three varieties differ widely in composition, as the following comprehensive analysis, by Smith, will show:—

Soluble in Water.			
	I. Pulverulent.	II Concrete.	III. Saline.

"Several of the South American guano beds are now exhausted, but new varieties are constantly being introduced; and although the qualities are continually varying, guanos, on the whole, may be divided into two classes, the one characterised by the abundance of ammonia, the other by that of phosphates, the Peruvian and Angamos being characteristic of the former, and the Saldanha Bay and Bolivian of the latter. In selecting a guano, the following points (Anderson) ought to be attended to by the farmer:—

"1st. The guano should be light coloured and dry, colouring very slightly when squeezed together, and not gritty.

"2nd. It should not have too powerful an ammoniacal smell, and should contain lumps which, when broken, appear of a paler colour than the powder.

"3rd. A bushel should not weigh more than from 56 to 60 pounds.

"These characters are, however, imitated with great skill, so that they cannot be implicitly relied upon, and they are applicable to Peruvian guano only."¹

Purity, Adulteration. Guano, owing to its high price, is very commonly adulterated, or is in an advanced stage of decomposition when sold. Much of what is vended under the name is altogether a fictitious article. These artificial mixtures are made to look so like genuine guano, that the mere practical man, who goes only by their appearance, is very often deceived by them, and, owing to the failure of his crops in consequence, is led to distrust the efficacy of guano as a manure. A sample of pretended guano examined by Johnston was found to contain, in the state in which it was sold, more than half its weight of gypsum, the rest being peat or coal ashes, with a little common salt, crude sulphate of ammonia, and either dried urine or the refuse of the glue manufactories, to give it a smell. "I could not satisfy myself that it contained a particle of real guano."² Ves-

sels which sail hence for the guano stations, are now very commonly ballasted with rough gypsum or plaster of Paris. This substance is mixed with the guano as it is loaded, and enables the importers to deliver from the vessel a "nice-looking, light-coloured article." Purchasers of guano are very desirous of having it delivered from the vessel, as they believe they thus obtain it pure. The favourite material for the adulteration of guano, at the present moment, is a variety of umber, which is brought from Anglesea in large quantities. The rate of admixture is said to be about 15 cwt. of umber to about 5 cwt. of Peruvian guano, from which an excellent-looking article is manufactured, which is sold under the name of 'African guano.'

Pure guano has a pale-brown colour, a more or less offensive odour, and the average sp. gr. of 1·63 to 1·64. If the sp. gr. exceed 1·75, it is either damaged or adulterated; and if it is less than 1·62, it contains an undue quantity of moisture. The best is neutral to test-paper, and sometimes has even an acid reaction; but that of commerce has generally an alkaline reaction, owing to the presence of free ammonia, and, in consequence, turns turmeric paper brown, and gives white fumes when a glass rod dipped in hydrochloric acid is held over it. Triturated with quicksilver or caustic potassa, good guano evolves a powerful odour of ammonia; digested in water, fully one half of it is dissolved; dried by the heat of boiling water, it does not lose more than from 7 to 9% in weight; and burned upon a red-hot shovel, it leaves a white ash, not a red or dark-coloured one, (See directions for selecting guano given *above*, also *below*.)

Analysis or assay. The quantitative analysis of guano, so as to exhibit the names and proportions of all its numerous component substances, is an extremely tedious and difficult matter in the hands of persons unaccustomed to chemical manipulations. As, however, its value to the agriculturist depends chiefly on its richness in ammonia, potassa, and phosphoric acid, the analysis of guano for practical purposes may be reduced to an assay

¹ The above particulars are from an elaborate paper by Dr. H. M. Noad, in the 'Chemist and Druggist,' vol. ii.

² 'Elem. of Agric. Chem.'

for these articles. Indeed, the presence of ammonia (the most valuable of them), in the proper quantity, may be fairly taken as evidence of the presence of the rest. The following methods of testing guano are both simple and accurate, and are so arranged as to permit its per-centage richness in one or more of its leading constituents to be determined without much trouble or expense.

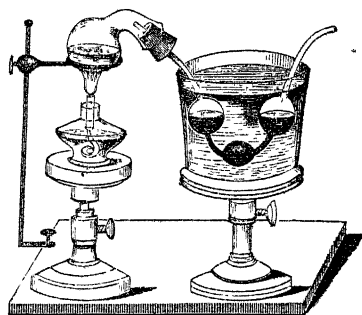

1.—*a.* 100 grs. of the sample for examination (fairly selected) are crushed to a powder, and placed on a small, weighed, and perfectly dry paper filter, and then desiccated, by exposure for 2 or 3 hours to the heat of boiling water. The loss in weight, taken in grains, after deducting 9, indicates the quantity per cent. of water or moisture which the sample contains in excess of that present in good or pure guano.¹

b. The paper filter, with its contents, is next suspended for some time over concentrated sulphuric acid (oil of vitriol) contained in a wide-mouthed bottle or jar, by means of a thread attached to the cork or stopper, care being taken to exclude the external air. The exposure in this way is continued until the guano ceases to diminish in weight, which is ascertained by weighing it at intervals after the first 3 or 4 hours. When this point is arrived at, the filter and its contents are very carefully weighed. The difference between its present weight and its original weight (before the desiccation in *a*), taken in grains, gives the gross quantity of water per cent.

c. The dried guano from (*b*) is next placed in a weighed, smooth crucible or capsule, and exposed to a low red heat until all the organic matter is completely destroyed, and the whole is reduced to a white ash, which is weighed as soon as it has become cold. This weight, in grains, gives the gross weight per cent. of non-volatile matter (fixed alkaline and earthy chlorides, phosphates, and sulphates); the total loss of weight by combustion denotes the gross per-centage of combustible and volatile matter (urea, uric acid, ammoniacal salts, and organic matter). The latter should not be less than 55 to 60%.

2.—*a.* A second 100 grs. of the guano, selected as before, is distilled along with about 75 grs. of fresh-slaked quicklime, and a little water, in a small matrass connected with a tubular, triple bulb-condenser, containing cold distilled water, and immersed in a basin of ice-cold water. (See *engr.*) The condenser is charged by plunging one of its extremities into the water, and sucking at the other, until the liquid reaches the level indicated in the margin. A very gentle heat only, cautiously increased, need be employed. After the process is over, the strength of the solution of ammonia found in the condenser is tested, either by taking its density in a small specific-gravity bottle, or by determining its saturat-

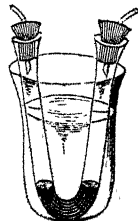

ing power in the manner described under ALKALIMETRY. This furnishes the per-centage

of ready formed ammonia sufficiently accurate for all ordinary purposes, provided proper care is taken.

When extreme accuracy is required, the condenser is charged with a weighed quantity of dilute hydrochloric acid of a known strength, instead of water, and after the process is over, this is tested as before. The quantity of ammoniacal test-liquor (see ALKALIMETRY) now taken to saturate it, deducted from what it would have taken before the exposure in the condenser, gives the per-centage sought.

Another method, giving very accurate results, is to use a rather strong hydrochloric acid (sp. gr. about 1.13) for the condenser; after the operation is over, the contents of the latter are poured into a glass or porcelain capsule, a solution of bichloride of platinum is added, in excess, and the whole is then gently evaporated to dryness; the residuum is rubbed to powder, and exhausted with a mixture of two measures of alcohol and one measure of ether; the undissolved portion is next dried at a heat not exceeding 212° Fahr., and weighed. The weight, in grains, of the ammonio chloride of platinum thus obtained, multiplied by .0763, gives the per-centage of ready-formed ammonia, as before. When hydrochloric acid is used for the condenser, a simple U tube and beaker glass may be employed, if a bulb-condenser is not at hand. (See *engr.*) The advantages resulting from the use of acid instead of water for the condenser is, that with the former no ammonia can possibly escape being absorbed, whilst little care is required to keep the condenser cool.

b. 25 grs. of the guano are next weighed, and after being slightly moistened with a little dilute hydrochloric acid, are thoroughly dried by the heat of boiling water; the dried sample is then mixed in a warm unglazed porcelain mortar with 10 times its weight of

¹ According to Dr. Noad, the proportion of water in genuine guanos ranges from 7 to 20%.

a mixture of 2 parts of quicklime to 1 part of hydrate of soda (both quite dry). This mixture is introduced into a combustion tube of hard Bohemian glass, about 16 or 18 inches long, and $\frac{3}{4}$ of an inch in diameter. (See *engr.*) The mortar is rubbed out with a little of the soda-lime mixture, which is also introduced

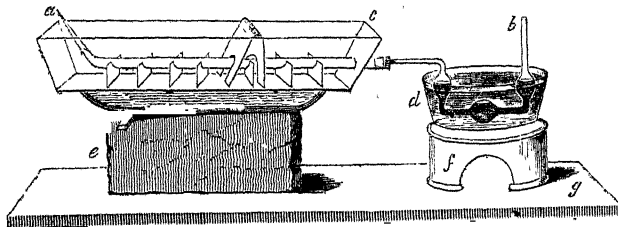

into the tube with that already put there; a little plug of ignited asbestos is then loosely placed over the whole, and the tube is immediately connected with a tubular bulb-condenser, containing moderately strong hydrochloric acid, great care being taken that the joints are made air-tight, which may be determined by the operator sucking a few bubbles out of the apparatus. If, after suction, the liquid remains at a higher level in the furthest bulb (*b*), it is a sign that the connection is sound. This being done, heat is applied to the combustion-tube by means of spirit-lamps; or, more conveniently, by means of the furnace now usually employed in organic analysis. (See *engr.*) The tube is next gradually surrounded with red-hot charcoal, by shifting, by degrees, the screen (*c*), and adding more charcoal, so as to gradually expel the ammonia. The disengagement of gas should take place uninteruptedly, but not too rapidly, in order that the

acid may not ascend into the combustion-tube and spoil the experiment. The non-condensable volatile matters which pass off furnish a key to the progress of the operation. The heat is at length increased to a full red. When gas ceases to be evolved, and the mixture in the tube has become quite white, the experiment is at an end. The point (*a*) of the combustion-tube is broken off, and the ammonia which remains in the tube is expelled by sucking gently at the extremity (*b*) of the bulb-condenser. The latter is then disconnected with the apparatus, and emptied into a glass or porcelain capsule, in order to be tested, as directed under 2, *a*. The quantity of ammonia, in grains, thus found, multiplied by 4, gives the WHOLE QUANTITY OF AMMONIA per cent., both actual and potential, producible from the sample of guano examined.

c. The quantity of ready formed ammonia (see 2, *a*) deducted from the quantity last found (see 2, *b*) gives the quantity of LATENT or POTENTIAL AMMONIA that will be slowly developed by the decomposition of the guano in the soil, and become available for the food of plants. This is the most valuable product of this substance as a manure, and can only be obtained in quantity from well-preserved, dry guano.

3.—*a.* A third quantity of 100 grs. of the guano, selected as before, is triturated and digested for some time with 12 times its weight of hot distilled water, and the whole being thrown on a filter, the undissolved portion is

washed with a little warm distilled water; the solution and 'washings' are then mixed together, and acidulated with nitric acid; a solution of permnate of iron is next added, and afterwards, solution of ammonia, in excess; the liquid is next heated for a short time, and the bulky reddish-brown precipitate is collected, washed with hot water, dried, ignited, and weighed. The weight, in grains, less the weight of the peroxide of iron in the permnate consumed, gives the weight of PHOSPHORIC ACID present in the soluble phosphates contained in the sample. The permnate of iron is made by direct solution in hot strong nitric acid, of twice as much pure iron wire as there is phosphoric acid suspected to be present in the liquid. A slight excess will not alter the result. The number of grains of metallic iron used to form the solution, multiplied by 1.4286,

gives the weight of the peroxide of iron which is to be deducted from the gross weight of the precipitate.

b. The filtrate and 'washings' left from 3, *a*, are mixed, and treated with a little oxalate of ammonia to throw down any lime, and then carefully evaporated to dryness and ignited; the residuum of the ignition, when cold, after being carefully weighed, is treated with the smallest portion of water that will dissolve it; the solution is acidified with hydrochloric acid, and a solution of bichloride of platinum added, in excess; some strong alcohol is next poured in, the precipitate carefully collected on a filter, washed with rectified spirit, dried at 212° Fahr., and weighed. The weight, in grains, multiplied by .1940, gives the percentage of POTASSA sought.

c. The weight of the potassa multiplied by

1.852, and deducted from the weight of the ignited residuum in 3, *b*, already found (see *above*), gives the quantity of CHLORIDE OF SODIUM or COMMON SALT (nearly).

4.—*a*. The insoluble residuum from 3, *a*, dried, and ignited, or the ash from 1, *c*, is digested for 10 or 12 hours in 600 times its weight of water (to which a little common salt or sal-ammoniac may be added), after which the whole is thrown upon a filter; a solution of chloride of barium is then added to the filtrate as long as a precipitate (if any) forms; the latter is collected, washed, dried, ignited, and weighed. The weight, in grains, multiplied by '5843, denotes the quantity of GYPSUM or SULPHATE OF LIME which has been used to adulterate the sample.

b. The insoluble residuum last left on the filter is digested for some time in warm dilute hydrochloric acid; the whole is then thrown upon a filter, and the undissolved portion (SILICA or SAND, with, perhaps, a trace of ALUMINA), is washed, dried, ignited, and weighed. It should not weigh more than 3 to 3½ grs. (3 to 3¼ %).

c. The filtrate and 'washings' from *b* are next mixed together; the mixed liquid is acidified with dilute sulphuric acid and heated until all the hydrochloric acid is expelled, and the whole reduced to a soft pasty-mass; rectified spirit is now poured in, and after active stirring for some time, the mixture is thrown on a filter, and the solid portion washed with a little more rectified spirit; it is then dried, ignited, and weighed. The weight, in grains, multiplied by '7650, gives the quantity of PHOSPHATE OF LIME per cent. required.

d. The filtrate from *c* is diluted with water, and after being boiled for a few minutes, ammonia is added in slight excess, followed by a solution of sulphate of magnesia (previously mixed with as much sal-ammoniac as will prevent ammonia producing a precipitate in it), slowly dropped in as long as it disturbs the liquor; the whole is now allowed to rest for 10 or 12 hours, when the precipitate is collected on a filter, and washed with water alkalised with ammonia, as long as the filtering liquid is rendered turbid by chloride of barium; it is next dried, submitted to intense ignition for some time in a covered platinum crucible, and when cold, carefully weighed. The weight, in grains, multiplied by '6429, indicates the per-centage of PHOSPHORIC ACID in the insoluble phosphates (phosphates of lime, magnesia, &c.) in the sample examined.

5. A fourth 100 grs. of guano is weighed, and exhausted by titration and digestion with hot water (see 3, *a*); the solution is evaporated to dryness by a gentle heat, and the residuum of the evaporation, after being weighed, is powdered and enclosed in a stout phial with 8 times its volume of alcohol, sp. gr. '825 (63 o. p.); the phial is next securely corked and guarded, and exposed for some time, with agitation, to the heat of 212° Fahr.,

the whole is then allowed to cool, the contents of the phial filtered, the undissolved portion washed with hot alcohol, and both the filtrate and the 'washings' gently evaporated to dryness, and weighed. This gives the richness of the sample in UREA, one of the most valuable constituents of the best guano. Its presence is "a certain proof of its entire soundness." (Ure.)

6.—*a*. Another 100 grs. of the guano is taken, and after being exhausted with water, is dried at 212° Fahr., and weighed; it is then digested with heat in 20 times its weight of borax-water (containing 1½ of borax), or in a solution of caustic potassa, and after a time the whole is thrown on a weighed filter, washed with a little cold distilled water, dried by a heat not higher than that of boiling water, and again carefully weighed. The loss, in grains, indicates the proportion per cent. of URIC ACID.

The accuracy of the result may be verified by adding dilute hydrochloric acid, in slight excess, to the filtrate, collecting the bulky, crystalline precipitate of uric acid which forms, washing it carefully with a little rectified spirit, drying it, and weighing it, as before. This weight, which in general is a very little under that denoted above, is the more accurate of the two. The precipitate is shown to be uric acid by its assuming a rich crimson colour when treated with a little nitric acid, which turns to a rich purple (*murexide*) when it is moistened with ammonia water.

b. The quantity of uric acid last obtained, multiplied by 1.1012, gives the per-centage of URATE OF AMMONIA.

Obs. Amongst the numerous constituents of guano, none are so valuable in an agricultural point of view as the three substances referred to in the last two sections. Indeed, almost all the ammonia furnished by this substance to the soil, after the latter, manured with it, has been exposed to the air and rain, is derived from the slow decomposition of urea, or urate of ammonia. It is these substances from which the store of latent, or, as Dr. Ure terms it, potential ammonia, is derived. The ammonia existing in the guano under the form of carbonate, or of soluble salts (ready formed ammonia), is either soon dissipated in air or is washed away by heavy rains, and, therefore, forms the least valuable and durable portion of this manure. It may be even added artificially, a matter almost impossible with the former. An assay, therefore, for the latent ammonia, or the urea, or the urate of ammonia, any one of them singly, at once furnishes us, as we have already hinted, with evidence of the quality of the guano examined, without the expense and trouble of a complete analysis of this substance. Urea and uric acid are only to be found in the very best samples of guano, and their presence is a positive proof of entire soundness and superior quality. The other valuable portions of guano are potassa and phosphoric acid (phosphate of lime chiefly);

the rest are of little importance. (See 2, c, *above*.)

GUARANA'. *Syn.* PAULLINIA, BRAZILIAN COCOA. An alimentary and medicinal substance prepared from the seeds of *Paullinia sorbilis*, a Brazilian tree. The dried seeds, deprived of their aril, are pounded and kneaded into a mass, which is afterwards made into oblong or rounded cakes (GUARANA BREAD). These cakes are used as we use chocolate—mixed with water and sugar, and drank as a beverage. In Brazil this beverage is largely consumed, both on account of its nutritive qualities, and for its stomachic, febrifugal, and aphrodisiac effects. See CHOCOLATE, &c., also *below*.

GUARANINE'. A crystalline substance discovered by M. Martins, in guarana. It appears to be identical with caffeine, the active principle of coffee and tea.

GUDGEON. The *Cyprinus gobeo* (Linn.), a small fresh-water fish, common almost everywhere. The white is considered the best. It was formerly used in medicine.

GUM. *Syn.* GUMMI, L. The general term for an important class of vegetable products. Gums are more or less soluble in cold water, but insoluble in alcohol, ether, and oils. They are obtained from certain plants in amorphous masses; most of them exude spontaneously, or on puncturing the bark. The most perfect type of this class is the substance called GUM ARABIC, or GUM ACACIA. The gums are employed as demulcents in medicines, and are used as cements, and for giving stiffness and gloss to textile fabrics. Among the vulgar the term is often incorrectly applied to the resins and gum resins.

Gum Acacia. *Syn.* GUM ARABIC; ACACIÆ GUMMI (B. P.); G. ARABICUM, G. ACACIA, ACACIA (Ph. L.). L. "From various species" (of *Acacia*) "yielding gum" (Ph. L. & E.), chiefly *Acacia arabica* and *A. vera*. "Whitish or yellowish, transparent or cracked on the surface, and opaque; brittle; it dissolves freely in water." (Ph. L.) It is scentless, and may be bleached by exposure to the sun and air, at the temperature of boiling water. Sp. gr. 1.355. (Ure.) The pure soluble principle of gum arabic is termed ARABIN (which *see*). BARBARY or MOROCCO GUM, GUM SENEGAL, and EAST INDIA GUM, are inferior commercial varieties of the same substance from other species of *Acacia* (see *below*).

Powdered gum arabic (PULVIS ACACIÆ) is frequently adulterated with flour or farina, or with Senegal or other inferior gums. The first may be detected by agitating a little of the powder with cold water; the pure gum dissolves rapidly, whilst the starch or flour falls to the bottom of the vessel. Or, a little of the powder may be mixed with boiling water, and when cold, tested with tincture of iodine; if it contains starch or flour, the paste will assume a blue colour. If it contains cherry-tree gum or tragacanth, it will be only partly so-

luble in cold water, and the paste will be partly coloured, and more or less interspersed with gelatinous clots.

Much of the white gum arabic of the shops is formed by bleaching gum Senegal, by what is called 'Picciotto's process.' The gum is dissolved in water, and sulphurous acid gas passed through the solution. The liquid is afterwards boiled to expel the sulphurous acid, a little of which, however, still remains behind. To obtain the gum in a still whiter state, carbonate of baryta is added, and after agitation, the mixture is filtered; it is afterwards shaken with gelatinous alumina, again filtered, and evaporated. The product (BLEACHED GUM) is very white, but lacks the peculiar toughness and adhesiveness of the best gum acacia.

Gum, Barbary. *Syn.* MOROCCO GUM. An inferior product, consisting of a mixture of several Acacia gums. It is exported from Mogador.

Gum, Bassora. A solution of yellowish gum brought from the neighbourhood of Bassora. It differs from most gums in being nearly insoluble in water. The plant yielding it is believed to be a species of *Mimosa*. It contains the principle, BASSORIN, which also exists in gum tragacanth.

Gum, Bleached. See GUM ARABIC (*above*).

Gum, British. *Syn.* DEXTRIN, STARCH GUM. Starch converted by the action of acids, diastase, or heat, into a soluble substance resembling gum.

Prep. 1. Malt (crushed small), 1 lb.; warm water, 2 galls.; mix, heat the whole to 145° Fahr., add of potato starch, 5 lbs., raise the heat to 160° or 165° Fahr., and mash for about 25 minutes, or until the liquid becomes thin and clear; it must then be instantly run off, and raised to the boiling-point to prevent the formation of sugar; after boiling for 3 or 4 minutes, the whole must be filtered, and evaporated to dryness by a steam heat.

2. By exposing dry potato starch, in a stove, to a heat of about 400° Fahr. Yellow and inferior.

3 (M. Payen.) Dry starch, 1 ton, is moistened uniformly with concentrated nitric acid, 4½ lbs., (diluted with) water, q. s., and the paste or dough is made up into small bricks or loaves, and dried in a stove; it is next reduced to coarse powder, and exposed in a stove-room for some time to a current of air at 160° to 165° Fahr.; it is next ground, sifted, and exposed, as before, to a heat of about 228° Fahr.; it is, lastly, ground, and passed through the 'bolting machine.' Very white and superior. This process has been patented in France by M. Henzé.

4. (Pinel.) Water, 100 galls., nitric acid, ½ gall., and hydrochloric acid, ½ pint, are mixed together, and so much potato starch is mixed as will form a thin paste; in two hours the liquid is drained off, and the solid matter is made up into lumps, which are dried by a gentle heat in a stove-room; they are next

coarsely pulverised, and the powder is exposed on three successive days to the respective temperatures of 100°, 150°, and 190° Fahr.; the whole is then sifted, and, lastly, exposed to a heat ranging from 300° to 350° Fahr. Darker coloured than the last. To give it the appearance of gum arabic, it is made into a paste with water containing 1½ of nitric acid, and after being spread on copper plates in layers $\frac{3}{4}$ to 1 inch thick, it is exposed to a stove heat ranging from 240° to 300° Fahr.

Prop., &c. White; insipid; transparent; friable; soluble in cold water, and in dilute spirit; insoluble in alcohol and ether; its solution yields a precipitate with acetate of lead. Iodine commonly turns commercial dextrin blue, but does not affect the colour of pure dextrin. It is distinguished from ordinary gum by its right-handed polarization of light, and by yielding oxalic but not mucic acid, when treated with nitric acid.

Dextrin is nutritive, emollient, and agglutinant. In France it is largely employed by the pastry-cooks and confectioners, and in medicine as a substitute for gum. The French surgeons also commonly employ it as a 'stiffening' for the splints used for fractured limbs. In this country it is chiefly used as a fine dressing for muslins, silk, and other textile fabrics, and in calico printing. Recently it has been made up into tear-like masses, and sold for gum arabic, to which, however, it is vastly inferior as an agglutinant. See DEXTRIN.

Gum, Cherry-tree. *Syn.* FRUIT-TREE GUM, PLUM-TREE G.; GUMMI CERASI, G. PRUNI, L. An exudation from the stems of cherry, plum, and some other of the *Rosaceae*. It is only partly soluble in water. It contains CERASIN (which see).

Gum, East India. This product, which consists of inferior kinds of gum acacia, is chiefly exported from Bombay, having been previously conveyed there from the coast of Arabia. It varies greatly in quality. Some samples are quite unfitted for making gum-water.

Gum, Insoluble. See BASSORA GUM, CHERRY-TREE GUM, and GUM TRAGACANTH.

Gum, Seed. *Syn.* GUMMI SEMINUM, L. A species of soluble gum extracted from the seed of the flax (linseed), quince, &c.

Gum Senegal. This product, which is largely exported from Portendie, Sierra Leone, and the French settlements on the Senegal, ranks next in quality to gum acacia, and for many purposes, as calico-printing for instance, it answers equally well. The transparent and light-coloured pieces are frequently picked out and sold as gum arabic.

Gum Tragacanth. *Syn.* TRAGACANTH, GUM DRAGON; GUMMI TRAGACANTHA, G. DRACONIS, TRAGACANTHA (Ph. L.), L. The gummy exudation of the *Astragalus verus*, hardened by the air. When digested in water, it swells considerably, a portion is dissolved, and the whole combines to form a thick mu-

cilage. It is totally soluble in boiling water, when some change is supposed to take place in it; a great portion, however, afterwards separates. Sp. gr. 1.384. It is chiefly employed in calico-printing, and by shoemakers and lozenge-makers; by the latter to give toughness to the saccharine mass.

Powdered tragacanth is often adulterated with flour of starch, and not unfrequently with the commoner varieties of gum arabic. According to M. Planché, a mixture of pulverised tragacanth and gum arabic forms, with water, a thinner mucilage than the same quantity of either of these gums alone. This fraud may be detected as follows:—Make a mucilage of the suspected gum, and add thereto a few drops (2 or 3 to the dr.) of alcoholic tincture of guaiacum, taking care to stir it all the while. If the sample contains any gum arabic, the mixture, in the course of a few minutes, assumes a fine blue colour, whilst it does not change colour if the gum tragacanth is pure, 5½ of gum arabic can be thus detected. When the quantity is very small, one to four hours may elapse before the colour is developed. Starch and flour are detected in the manner noticed under GUM ARABIC.

Gum, Turkey. Various qualities of gum acacia are sold under this name.

GUM RESINS. *Syn.* GUMMI RESINÆ, L. Vegetable products in which the properties of gum and resin are combined. They are partly soluble in water, and partly in alcohol. Many of them form a species of emulsion when triturated with the former fluid. The principal gum resins are AMMONIACUM, ASSAFETIDA, EDELLIUM, GALBANUM, GAMBAGE, MYRRE, OLIBANUM, OPOPONAX, SAGAPENUM, and SCAMMONEY.

GUN BAR/RELS. See BROWNING.

GUN COT/TON. See PYROXYLIN.

GUN MET'AL. An alloy containing 90-5½ of copper and 9-5½ of tin, used for casting pieces of ordnance (erroneously termed 'brass guns'), also those parts of machinery which are subjected to considerable friction. See ALLOYS, BRONZE, STEREO-METAL, &c.

GUN POWDER. This substance is a mechanical mixture of saltpetre, charcoal, and sulphur. It is seldom prepared on the small scale.

Prep. The saltpetre having been treble refined, by boiling, skimming, filtering, and crystallising, is melted into cakes, which are then brushed to remove any adhering grit or dirt, broken into pieces with a mallet, ground to a fine powder in a mill, and sifted through a fine bolting sieve of brass wire. The charcoal is that of the alder or willow, and is carefully burnt, as already described, and is then reduced to powder. The sulphur is refined by distillation, and ground to the same fineness as the charcoal and saltpetre. The ingredients are weighed out in the proper proportions, and mixed together in a machine consisting of a wooden drum, having a shaft

passing through its centre, to which numerous 'flyers' in the shape of knife-blades are attached, the drum and flyers revolving in a contrary direction. When mixed, the charge is carried to the 'incorporating mill,' where it is ground under vertical iron 'mill-stones,' with a small quantity of distilled water, until the ingredients are thoroughly incorporated. The product of this operation is then pressed into a hard cake, which is next broken into pieces, granulated by means of sieves, and after being 'glazed' by friction, and the dust separated, is dried, with proper precautions, in a stove heated to about 130° by steam pipes.

The proportions of saltpetre, charcoal, and sulphur, used for different kinds of powder, differ very slightly. In 'sporting powders' the proportion of saltpetre is generally from 1 to 3½ greater than in the Government powders. In 'miners' powders' it is about 10½ less, an excess of sulphur being used. The following are the proportions adopted by European powers:—

	Saltpetre.	Charcoal.	Sulphur.
England	75	15	10
France	75	12·5	12·5
Austria	75	15	10
Prussia	75	13·5	11·5
Russia	73·78	13·59	12·63
Spain	76·47	10·78	12·75
Sweden	76	15	9

(Capt. Jervis-White Jervis.)

Obs. The quality of gunpowder is best estimated by actual trial of its power and cleanliness in use. It should be dry, hard, and free from dust; the grains should be of a uniform size, and glossy, and the colour a dark-gray or brownish-gray, not perfectly black. A very little placed on a piece of paper and fired should instantly explode with a flash, and neither leave an appreciable residue on the paper nor burn it. Dried by the heat of boiling water, or in vacuo, it should not lose more than ½ to 1% of its weight. Damp powder rapidly 'fouls' the gun. Gunpowder, containing more than 7% of water, does not recover its strength by simply drying it. The sp. gr. ranges between 1·795 and 1·800.

Gunpowder, White. *Syn.* **BLASTING POWDER.** *Prep.* 1. See **BLASTING POWDER**, No. 3.

2. Yellow prussiate of potash and white sugar, of each, 1 part; chlorate of potassa, 2 parts; powder each separately, and mix them well, but carefully, with a bone or wooden knife. It may be granulated like gunpowder, by making the powder into a paste with a little water, and pressing the mass through a parchment sieve.

GUNJAH. See **HEMP** (Indian).

GUT. *Syn.* **FISHING GUT, SILKWORM G.**

¹ See the precautions noticed under **BLASTING POWDER** page 230.

This is obtained from the *Bombyx mori* (Linn.) or silkworm caterpillar. *Prep.* The silkworms, when just ready to spin, are steeped in strong vinegar for 12 hours in warm weather, or 2 or 3 in cold weather, and are then broken in half, and stretched out as far as possible on a board, furnished with slits or pegs to hold them; in this state they are allowed to dry in the sun or a warm place.

Obs. Used by anglers. The worms may be known to be going to spin by refusing food, and by having a fine silken thread hanging from the mouth.

GUTTA PERCHA. The concrete juice of the *Isonandra Gutta*, a tree growing only in the Malayan Archipelago, and of other species of the same genus. The stem of the gutta-percha tree grows to the diameter of 5 or 6 feet, and on being notched yields a milky juice, which, after exposure to the air for some time, solidifies, forming the gutta percha of commerce. It arrives in this country in irregular blocks of some pounds in weight, usually containing a large portion of impurities in the form of pieces of wood, stones, and earth. To prepare this crude product for manufacturing into useful articles, the blocks are first cut into slices, and then torn into shreds. These are softened by hot water, and kneaded in a 'masticator,' the stones, earth, and other impurities, being gradually washed away by water. After several hours the gutta percha is found to be kneaded into a perfectly homogeneous mass, which is rolled or drawn into sheets, bands, or tubes, as required.

Prop., &c. Gutta percha is a tough, inelastic substance, becoming soft and plastic at 212° Fahr., at which temperature two pieces may be firmly welded together. It is one of the best insulators of electricity, is impervious to moisture, and resists the action of acids and alkalis to a great extent. Its best solvents are benzol, chloroform, bisulphuret of carbon, rectified mineral naphtha, and rectified oil of turpentine. All these dissolve it readily. According to the analysis of Payen, the purified gutta percha of commerce consists of 75 to 82% of chemically pure gutta percha, which is insoluble in ether and alcohol, and a white and a yellow resin, soluble in boiling alcohol.

Uses. These are numerous and varied. No substance, perhaps, with the exception of caoutchouc, has been 'tortured' to so many different purposes. Its perfect plasticity when warm, and its capability of receiving the most delicate impressions, render it invaluable in many cases where India rubber would be useless. Beautiful mouldings, picture-frames, and a number of ornamental articles, are made from it. To the chemist and photographer it is of great use as a material for making bottles, carboys, photographic baths, and voltaic battery cells. One of the most important uses to which it has been applied

is for enclosing the metallic wires used for telegraphic purposes. Its indestructibility by water, its plasticity, and high insulating power, have rendered it particularly valuable for this purpose. At the International Exhibition of 1862 the Gutta Percha Company exhibited one mile of covered wire perfectly insulated, which was hardly thicker than common sewing cotton. Gutta percha may be rolled into thin transparent sheets, which, being perfectly impervious to moisture, are well adapted for surgical purposes. Again, a solution of gutta percha in chloroform forms an excellent dressing for incised wounds, and a protection for abraded surfaces, burns, &c. It is used in the same way as collodion.

Purified Gutta Percha. Dr. Cattell, of London, has succeeded in purifying gutta percha so perfectly from all extraneous matter, that it presents the appearance of ivory. The raw material is dissolved in a certain solvent, and the solution most carefully filtered until it leaves on evaporation the gutta percha in a pure milk-white condition.

GYPSUM. This is native sulphate of lime. When baked, to deprive it of water, and ground, it forms PLASTER OF PARIS. Gypsum is an excellent manure for certain soils.

HADDOCK. A small sea-fish, allied to the cod, and esteemed an excellent article of food. It is the *Gadus aeglefinus* of Linnæus. Split, smoked, and dried, it is common in the smaller shops of London.

HÆMATEMESIS. In *pathology*, vomiting of blood. See STOMACH DISEASES.

HÆMATITE. *Syn.* HEMATITE. In *mineralogy*, one of the most important iron ores. Two kinds are distinguished, the red, which is an anhydrous peroxide of iron, and the brown, which is the hydrated peroxide.

HÆMATOCRYSTALLIN. A crystalline substance obtained by the action of oxygen and afterwards carbonic acid on the 'clot' of blood.

HÆMATOSIN. *Syn.* HÆMATIN, RED PIGMENT OF BLOOD. The red colouring principle of the blood. It is not known in a state of purity. It differs from the other animal principles in containing, as an essential ingredient, the sesquioxide of iron.

HÆMATOXYLIN. A principle obtained by Chevreul from common logwood (*Hæmatoxylon campechianum*), and on which its colour appears to depend.

Prep. 1. Infuse logwood chips in water, at a temperature of about 180° Fahr., for 12 hours, filter, and evaporate to dryness in a water bath; digest the residuum in rectified spirit for 24 hours, again filter and evaporate; then add a little water; again gently evaporate and set aside the solution in a cold place that crystals may form; these must be washed in rectified spirit and dried.

2. Digest powdered hard extract of logwood in rectified spirit, and proceed as last.

3. Powdered logwood is mixed with sand and digested for several days in pure ether; the resulting liquid is filtered, evaporated to a syrup, and set aside to crystallise.

Prop., &c. Brilliant reddish-white or straw-yellow crystals, soluble in boiling water, forming an orange-red solution which turns yellow as it cools, but resumes its former colour on being heated. Alkalies in excess change its colour successively into purple, violet, and brown; acids brighten it; with the metallic oxides it forms compounds having a blue, purple, or violet colour.

HÆMOP'TYSIS. In *pathology*, spitting of blood. It generally arises from extreme fullness of the blood-vessels of the lungs, or the rupture of blood-vessels, as a consequence of ulceration; but sometimes it is induced by excessive exertion or external violence. Depletion, aperients, acidulous and astringent drinks, and nauseants, are the usual remedies. Acetate of lead, in small doses, has been recommended for this affection. When this substance is given, it should be accompanied with a sufficient quantity of free acetic acid, to prevent its being converted into the poisonous carbonate of lead in the system.

HÆMORRHAGE. *Syn.* HEMORRHAGE; HÆMORRHAGIA, L. A bleeding or flow of blood. Bleeding may be divided into active, passive, and accidental.—Active hæmorrhage is that arising from a full state of the vessels, or plethora.—Passive hæmorrhage, from general debility of the system, and of the blood-vessels in particular.—Accidental hæmorrhage, from external violence, as blows, wounds, &c. The first generally requires depletion, and the second the usual treatment to establish the general health and vigour of the body. The bleeding from wounds, if extensive, should be arrested by tying the ruptured blood-vessels; or where this cannot be done, and in less important cases, by the application of styptics, as creasote, sulphate of iron, infusion of galls, compound tincture of benzoin, &c.

HAIR. *Syn.* CAPILLUS, PILUS, L. The hair of the human head has continually formed a subject for the chisel of the sculptor, the pencil of the artist, and the lay of the poet. Nor is this surprising, since all the features of the face, as well as the head it covers, derive from it additional finish and unequalled grace. The hair is, indeed, one of the greatest auxiliaries of personal beauty, and imparts to it some of its principal charms. All nations, in all ages of the world, have been unanimous in their admiration of luxuriant and flowing or gracefully arranged hair.

Of all organic substances, hair is the one least liable to suffer spontaneous change. It is also less affected by aqueous liquids than most other substances. Hence its value in various branches of the useful arts.

The preservation of the hair of the head, independently of its connection with personal

and the next day pour off the liquid portion from the white sediment which forms the dye. Used like No. 1. It is applied for 8 or 10 minutes for a brown; 30 minutes, or longer, for a black. For the first, it is washed off with water containing a little common soda.

27. The juice of the bark or shell of green walnuts, applied with a sponge. (Paulus Ægineta.)

28. A leaden comb used daily is said to darken the hair, but we have known persons persevere in its use for months without any perceptible change occurring. Premature baldness is a frequent consequence of its use.

Obs. It is right to inform the reader that all those compounds which contain nitrate of silver stain the skin as well as the hair. These stains may be removed, when quite recent, by rubbing them with water containing a little sulphhydrate of ammonium (see *above*) or iodide of potassium in solution; but as this is attended with some trouble and inconvenience, the best way is to avoid the necessity of doing so. The hair-dressers adopt the plan of smearing hard pomatum over the skin immediately surrounding the hair, to protect it from the dye. By very skilful manipulation, and the observance of due precautions, the hair may be thoroughly moistened with the above fluids, without touching the adjacent skin, but this can only be done, in the case of the hair of the head, by a second person. This has led to a preference being given by many to the compounds containing lead, as the colouring matter formed in them does not stain the skin. The hue given by the latter (when pale) is very apt to possess an unnatural redness, but all the shades of colour given by the preparation of silver are rich and unexceptionable. Pyrogallie acid, and the juice of walnuts, also stain the skin, although less intensely and permanently than nitrate of silver.

The detection of dyed hair is often a matter of importance in medico-legal research. The presence of silver may be shown by digesting the hair in a little weak chlorine water or hydrochloric acid, when the resulting chloride of silver may be dissolved out with liquor of ammonia, and submitted to the usual tests. Hair containing lead, when digested in dilute nitric acid, gives a solution of nitrate of lead, in which form it is readily detected. See **LEAD** and **SILVER**.

All the preceding compounds are for dyeing living hair (human); horse-hair, bristles, &c., and other dead hair, may be readily stained by steeping them in any of the ordinary liquid dyes, more especially those employed for wool and silk. See **POMMADES**, **WASHES**, &c.

HALL MARKS. The 'Hall Marks' on articles in gold and silver not only inform us of their fineness, but furnish us with other important particulars.

The Hall Mark (proper) denotes the place of manufacture or assav. being an anchor, for

Birmingham; a dagger or 3 wheat sheaves, for Chester; Hibernia, for Dublin; castle and lion for Edinburgh; castle with 2 wings, for Exeter, tree and salmon with a ring in its mouth, for Glasgow; leopard's head, for London; 3 castles, for Newcastle-on-Tyne; a crown, for Sheffield; and five lions' heads and a cross, for York.

The Duty Mark is the head of the Sovereign, showing that the duty is paid.

The Date Mark is a letter of the alphabet, which varies every year, and with the different companies. The Goldsmith's Company of London have used, from 1719 to 1755 Roman capital letters, from 1756 to 1775, small Roman letters; from 1776 to 1795 old English letters; from 1796 to 1815, Roman capital letters, from A to U, omitting J; from 1816 to 1835, small Roman letters, a to u, omitting j; from 1836, old English letters.

The Standard Mark for gold is, for England, a lion passant; Edinburgh, a thistle; Glasgow, a lion rampant; Ireland, a harp crowned. For silver, a figure of Britannia. If under 22 carats, gold has the figures 18.

The Manufacturer's Mark is the initials of the maker, as S. H., W. T., C. E., &c.

HALOGENS. In chemistry, a name given by Berzelius to chlorine, bromine, iodine, and fluorine. These elements unite with metals to form compounds called 'haloid salts.'

HAMS. These are usually prepared from the legs of bacon pigs, but those of the sheep are also sometimes used for the same purpose. **SMOKED HAM** is strong eating, and rather fit for a relish than for diet, and should be particularly avoided by the dyspeptic and by convalescents.

Choice. A sharp knife thrust under the bone should have a pleasant smell when withdrawn. The recently cut fat should be hard and white, the lean fine-grained, and of a lively red. Those short in the hock are the best.

Curing. An ordinary sized ham requires nearly three weeks, if wet salted, and about a month if dry salted, to cure it perfectly. At the expiration of this time they are ready for smoking. **MUTTON HAMS** should not lie in pickle longer than 12 or 14 days.

Cooking. Hams should be put into the water cold, and should be gradually heated. A ham of 14 lbs. will take about 4 hours, one of 16 lbs. will take 4½ hours, and one of 20 lbs. about 5½ hours, to dress it properly. "If it is an old ham, it should be soaked for 12 hours previously." (Soyer.)

Pres. Most grocers and dealers in hams enclose them, after being smoked, in canvas, for the purpose of defending them from the attacks of the little insect, the *Dermestes lardarius*, which, by laying its eggs in them, soon fills them with its larvæ or maggots. This troublesome and expensive process may be altogether superseded by the use of pyroligneous acid, applied by means of a painter's brush.

HANDS. Dirty and coarse hands are no less the marks of slothfulness and low breeding, than clean and delicate hands are those of cleanliness and gentility. To promote the softness and whiteness of the skin, mild emollient soaps, or those abounding in oil, should alone be used, by which means CHAPS and CHILBLAINS will generally be avoided. The coarse, strong kinds of soap, or those abounding in alkali, should for a like reason be rejected, as they tend to render the skin rough, dry, and brittle. The immersion of the hands in alkaline lyes, or strongly acidulated water, has a like effect. When the hands are very dirty, a little good soft soap may be used with warm water, which will rapidly remove oily and greasy matter. Fruit and ink stains may be taken out by immersing the hands in water slightly acidulated with oxalic acid or a few drops of oil of vitriol, or to which a little pearl-ash or chloride of lime has been added; observing afterwards, to well rinse them in clean water, and not to touch them with soap for some hours, as any alkaline matter will bring back the stains, after their apparent removal by all the above substances, except the last.

The use of a little chloride of lime and warm water, or Gowland's lotion, imparts a delicate whiteness to the skin; but the former should be only occasionally used, and should be well washed off with a little clean water to remove its odour. Glycerine employed in the same manner renders the skin soft, white, and supple. The use of a little sand or powdered pumice stone with the soap, will generally remove the roughness of the skin frequently induced by exposure to cold. The hands may be preserved dry, for delicate work, by rubbing a little club moss (*LYCOPodium*), in fine powder, over them. A small quantity of this substance sprinkled over the surface of a basin of water will permit the hand to be plunged to the bottom of the basin without its becoming wet.

HANG'ING. In cases of suspended animation from hanging, the assistance must be prompt and energetic. The body, on its discovery, should be instantly relieved from the state of suspension and all pressure about the throat. The remedial treatment chiefly consists, in the severer cases, in cupping the temples or opening the jugular vein, and so relieving the head of the blood which is accumulated in its superficial veins in consequence of strangulation. When the body is cold, friction, and the other means used for restoring the animal heat in drowned persons, should be resorted to. See ASPHYXIA and DROWNING.

HARDNESS. Compactness; solidity; the power of resisting abrasion. Mineral substances are frequently distinguished and identified by their relative hardness. This is ascertained by their power to scratch or be scratched by one another. A valuable table on this subject will be found in the article on **GENS.**

HAR'MALINE. *Syn.* HARMALINA. An alkaloid, forming yellow-brown crystals, discovered in the seeds of *Peganum harmala*. It has a bitter astringent and acrid taste, is soluble in alcohol, and forms yellow, soluble salts with the acids. It has been proposed as a yellow dye. By oxidation it yields another compound (harmine), which is a magnificently red dye-stuff, easily prepared and applied. The seeds are produced abundantly in Southern Russia.

HAR'NESS POLISH. See BLACKING, &c.

HART'S HORN. *Syn.* CORNU CERVI, C. CERVINUM, CORNU (Ph. L.), L. The "horn of the *Cervus elephas*" (Ph. L.) or stag.

Burnt Hartshorn. *Syn.* CORNU USTUM (Ph. L.), CORNU CERVI USTUM, L. *Prep.* (Ph. I. 1836.) Burn pieces of harts' horns until perfectly white, then grind and prepare them in the same way as directed for prepared chalk.

Obs. Finely powdered bone-ash is usually sold for burnt hartshorn, and possesses exactly the same properties. *Dose.* 10 to 30 grs., or more, 2 or 3 times a day, in rickets, &c.

Hartshorn Shavings. *Syn.* HARTSHORN RASPINGS; RASURA CORNU CERVI, RAMENTUM C. C., L. Obtained from the turners. Boiled in water, it yields a nutritive jelly. Used by straw-plait workers to stiffen bonnets, &c.

HATCH'ING. See INCUBATION.

HATS. Those should be chosen possessing a short, smooth, fine nap, and a good black colour; and sufficiently elastic to resist ordinary wear and tear, without breaking or giving way. The HAT BRUSH for daily use should be made of soft hairs, but a stiffer one should be employed occasionally, to lay the nap smooth and close. Grease may be removed by means of porous brown paper, and pressure with a hot iron.

HEAD'ACHE. *Syn.* CEPHALALGIA, L. *In pathology*, pain in the head. The symptoms of this very general complaint are too well known to require any description. According to pathologists, headache arises either from a sympathy with the stomach and chylopoietic (chyle-forming) viscera, or from a weakness or exhaustion of the power of the encephalon. The former may be called SYMPATHETIC HEADACHE, and the latter NERVOUS HEADACHE. When it attacks only one side of the head it is called HEMICRANIA. The treatment of the first form should consist in restoring the healthy action of the stomach, by the administration of aperients, and by the use of proper food, and exercise; or when that viscus is overloaded with undigested food, by the exhibition of an emetic. For this purpose $\frac{1}{4}$ to $\frac{1}{2}$ an oz. of ipecacuanha wine may be taken in a cupful of warm water, which will generally relieve the stomach, especially if its action is assisted by drinking copiously of warm water. Headache is a common accompaniment of indigestion and stomach disease, and in general it will be found that whatever will remove the one will also cure the other. Nervous head-

aches are relieved by nervous tonics and stimulants, as bark, cascarella, calumba, and gentian, camphor, ammonia, ether, and wine, the latter in a state of considerable dilution. A cup of strong coffee or strong green tea often acts like a charm in removing this species of headache. Small doses of tincture of henbane have also often a like effect. 20 or 30 drops of laudanum, or, preferably, half that number of liquor opii sedativus, may be taken with advantage as an anodyne, and to induce sleep. Amongst popular remedies may be mentioned 'nasal stimulants,' as snuff (cephalic), smelling salts, and aromatic vinegar, the use of which is familiar to every one; and local applications, as very cold water, ether, vinegar, strong spirits, Cologne water, &c., all of which are rubbed over the part of the head affected, with the fingers, or a linen rag dipped in them is laid thereon instead. Pressure on the head has also been used with advantage. Silence, darkness, and repose, are powerful remedies, alike suitable to every variety of headache; and change of air, scene, and occupation, are especially beneficial to those resulting from excessive mental anxiety or exertion. Blisters are extensively applied behind the ears in cases of violent headache.

Headache is often symptomatic of other diseases, especially those of the inflammatory and nervous kind, rheumatism, &c. In all these the primary disease should be sought out and attempted to be cured. In many cases these attacks rapidly yield to a few doses of compound decoction of sarsaparilla containing a little iodide of potassium. Headache in pregnancy may generally be removed by proper attention to the bowels; observing to assist their action, should they require it, by the use of some mild aperient, as castor oil, lenitive electuary, seidlitz powders, &c. When the constitution is very robust, blood may be taken. Headache in bed may frequently be relieved by washing the head with cold water, and discontinuing the use of a nightcap, at the same time preserving the feet warm by wearing worsted socks or stockings.

HEADING. *Syn.* BEER HEADING, CAULIFLOWER H. *Prep.* 1. Alum and green copperas, equal parts, in fine powder.

2. Alum, copperas, and common salt, equal parts.

Used by brewers to make their beer keep its head or froth.

HEALTH. That state of the living body in which all its functions are duly performed. See **HYGIENE**.

HEARING. See **DEAFNESS**, **EAR**, &c.

HEARTBURN. *Syn.* **CARDIALGIA**, **L.** Anxiety and pain about the region of the stomach, generally attended by a sense of gnawing and heat; hence its popular name. Faintness, nausea, and eructation of a thin, acidulous, watery liquid, especially in the morning, are common symptoms of this complaint. The usual causes of heartburn are excess in

eating and drinking, the use of improper food, and sedentary habits. A good remedy is a teaspoonful of carbonate of magnesia, or carbonate of soda, in a glass of peppermint or cinnamon water, to which a little powdered ginger may be added with advantage. This dose may be taken 2 or 3 times daily until the disease is removed. Articles of food that easily undergo fermentation should at the same time be avoided, and a dry diet had recourse to as much as possible. Soda water, toast-and-water, and weak spirit-and-water, are the most suitable beverages in this complaint.

HEAT. *Syn.* **CALORIC**; **CALORICUM**, **L.** The consideration of this subject belongs to physics and chemistry. Much useful information, in connection with it, will, however, be found in this work under the heads **EBULLITION**, **EVAPORATION**, **EXPANSION**, **REFRIGERATION**, &c.

HEAVY SPAR. Native sulphate of barium. See **BARYTA**.

HEDERIN. *Syn.* **HEDERINA**, **L.** From the decoction of the ground seeds of ivy (*Hedera helix*), boiled in water, along with a little slaked lime or magnesia, the precipitate being afterwards digested in rectified spirit, and the filtered tincture evaporated. Febrifuge and sudorific.

HEL'ENIN. See **INULIN**.

HELIOGRAPHY. See **PHOTOGRAPHY**.

HEL'LEBORE. *Syn.* **BLACK HELLEBORE**; **HELLEBOBUS** (**Ph. L.**), **L.** "The rhizome and root" of "*Helleborus niger*" (**Ph. L.**) or black hellebore. It is alterative and emmenagogue, in small doses (2 to 8 grs.); and a drastic hydragogue purgative and anthelmintic in larger ones (10 to 20 grs.). See **WHITE HELLEBORE**.

HELLEBOR'IN. *Syn.* **SOFT RESIN OF HELLEBORE**. An odourless, acrid substance, extracted by alcohol from black hellebore, and on which, according to Vauquelin, the activity of that drug depends.

HEM'LOCK. *Syn.* **CONII FOLIA** (**B. P.**); **CONIUM** (**Ph. L. E. & D.**), **L.** In *pharmacy*, "the fresh and dried leaf of the wild herb *Conium maculatum*," or spotted hemlock. The first is used to make the extract; the last, the tincture and powder.

Hemlock is a powerful narcotic acid, occasioning stupor, delirium, paralysis, convulsions, coma, and death. In small doses it is anodyne, alterative, resolvent, antispasmodic, and anaphrodisiac, and has been exhibited in cancer, dropsy, epilepsy, rheumatism, scrofula, syphilis, and other diseases.—*Dose.* 3 or 4 grs. of the powder, twice or thrice daily, until some obvious effect is produced.

Hemlock, whether in leaf (*conii folia*) or powder (*pulvis conii*) rapidly deteriorates by keeping. When good, the powder, triturated with solution of potassa, exhales a powerful odour of conia.

In cases of poisoning by hemlock, the treat-

ment is similar to that noticed under ACONITE. See CONINE, EXTRACT, TINCTURE, &c.

HEMP. *Syn.* CANNABIS, L. In *botany* the typical genus of the natural order *Cannabaceae*. The common hemp, from the fibres of which cordage is made, is the species *Cannabis sativa*. The fruit of this plant (hemp seed) is demulcent and oleaginous. It is said that the plumage of bullfinches and goldfinches fed on it for too long a time, or in too large a quantity, changes from red and yellow to black.¹

Hemp, Indian. *Syn.* HASHISH, CANNABIS INDICA. This plant, now so largely used in medicine, is a variety of *Cannabis sativa*, or, perhaps, the same simply rendered more active by climate. The parts employed in Asia for the purposes of intoxication, and in Europe as medicine, are the herb or leaves and the resin. The 'gunjah' sold in the bazaars in the East Indies is the plant, just after flowering, dried, and pressed together. Bang, 'bhang,' 'subjee,' or 'sidhee,' consists of the larger leaves and capsules without the stalk. The concrete resinous exudation from the leaves, stems, and flowers, is called 'churru,' and in this country 'resin of Indian hemp.' 'Hashish' seems to be a general term for the preparation of hemp.

Indian hemp is anæsthetic, anodyne, exhilarant, antispasmodic, hypnotic, and narcotic. In the East it is commonly used as an intoxicant, either by smoking it, like tobacco, or swallowing it. The inebriation produced by it is of an agreeable or cheerful character, exciting the party under its influence to laugh, dance, sing, and to commit various extravagancies. It also acts as an aphrodisiac, augments the appetite for food, and, in some cases, occasions a kind of reverie and catalepsy. In this country its action is less marked. It has here been chiefly administered under the form of alcoholic or resinous extract. See EXTRACT OF INDIAN HEMP.

HEN'BANE. *Syn.* HYOSCYAMI FOLIA (B. P.); HYOSCYAMUS (Ph. L. E. & D.), L. In *pharmacy*, "the fresh and dried stalk-leaf of the biennial herb, *Hyoscyamus niger*" (Ph. L.), or common biennial or black henbane. The first is used for preparing the extract; the last, for the powder and tincture.

Henbane is anodyne, hypnotic, antispasmodic, and sedative. It differs from opium in not being stimulant, and by not confining the bowels; and hence may be administered in cases in which that drug would be improper. In large doses it acts as a powerful narcotic poison, producing obscurity of vision, dilation of the pupils, delirium, phantasms, coma, &c. —*Dose.* 3 to 10 grs., in powder. It is usually given in the form of extract or tincture. The antidotes, &c., are the same as those noticed under OPIUM.

HE'PAR. *Syn.* LIVER. A name given by the older chemists to various combinations of

¹ Burnett, 'Outlines of Botany.'

sulphur, from their brownish or liver colour; as 'hepar antimonii,' 'hepar sulphuris,' &c. See ANTIMONY (Liver of), POTASSIUM (Sulphuret), &c.

HERBARIUM. [Eng. L.] *Syn.* HORTUS SICCUS, L. A collection of dried specimens of plants; hence called HORTUS SICCUS, or dry garden. Plants for the herbarium should be gathered on a dry day, and carried home in a tin-box; ('VASCULUM'), or other convenient receptacle which will preserve them fresh for a time. Those which have collected moisture in their leaves should be allowed to dry, their stalks being placed in water to keep them alive. Plants with very thick, succulent leaves or stems must be killed by immersion in hot water before they can be safely placed in the drying press. The press consists simply of a few stout boards with a screw—or, still better, a number of heavy weights, bricks, or stones—for pressing them together. The specimens of plants, when all superficial moisture has been removed, are placed between layers of bibulous paper (BOTANICAL PAPER), care being taken that the parts of each are arranged in a natural manner. The sheets containing the specimens are then placed between the boards, and pressure is applied. This must be very gentle at first, and should be gradually increased as the plants become dry. The paper is changed every day or every second day, and the damp sheets are dried for use at a future time. When properly dried, the specimens are placed on sheets of writing paper, and fixed by a few stitches of thread, a little gum, or strips of gummed paper. The name of the genus and species, and the locality where found, &c., are then marked beside each. Camphor or a little corrosive sublimate may be used to preserve herbaria from the ravages of insects. The preparation of an herbarium offers an almost endless source of amusement to the ingenious, whilst the specimens so collected, if well preserved, are almost as useful to the botanist as the living plants.

HERBS. *Syn.* HERBÆ, L. The collection and drying of herbs for medicinal purposes and perfumery are noticed under VEGETABLE SUBSTANCES.

Amongst cooks, several aromatic herbs, either fresh or dried, are used for seasoning. "In many receipts is mentioned a bunch of sweet herbs, which consists, for some stews and soups, of a small bunch of parsley, two sprigs of thyme, and one bayleaf; if no parsley, then of four sprigs of winter savory, six of thyme, and one bayleaf." (Soyer.)

HEE'NIA. See RUPTURE.

HER'RING. A well-known small sea-fish, belonging to the family of *Clupeidae*, a branch of the order *Malacopterygii*. As an article of food, herrings are of a vast importance to a large proportion of the population of Europe. When recently caught and dressed by broiling or boiling, they are wholesome and agreeable;

but if fried, or long kept, they become strong and oily, and are then apt to offend the stomach. The preparation of salted and dried or smoked herrings (bloaters, red herrings) furnishes employment for thousands, both in these countries and Holland. Real Yarmouth bloaters and Dutch herrings are highly esteemed by many as a relish. Salted herrings are said to be diuretic. The pickle was formerly used in clysters, dropsies, &c. M. Soyer calls this fish "the poor man's friend," and tells us that, after being "cleaned and scaled, and the head removed," it should be "opened in the back, and the gut taken out." Also that "the way to ascertain if a herring is too salt, is to take the fish in the left hand, and pull out a few of the fins from the back, and to taste them. You may thus find out the quality and flavour. This plan is adopted by the large dealers."

HESPERIDIN. A peculiar substance obtained from the white portion of the rind of oranges, lemons, &c. It forms crystalline silky needles, is odourless, tasteless, fusible, soluble in alcohol and ether, less soluble in water.

HIC'COUGH (hik'-ūp). *Syn.* HICCUP; SINGULTUS, L. A convulsive motion of the diaphragm and parts adjacent. The common causes are flatulency, indigestion, acidity, and worms. It may generally be removed by the exhibition of warm carminatives, cordials, cold water, weak spirits, camphor julep, or spirits of sal-volatile. A sudden fright or surprise will often produce the like effect. An instance is recorded of a delicate young lady that was troubled with hiccough for some months, and who was reduced to a state of extreme debility from the loss of sleep occasioned by it, that was cured by a fright, after medicines and topical applications had failed. A pinch of snuff, a glass of iced soda water, or an ice-cream, will also frequently remove this affection.

HI'ERA-PI'CRA. See POWDER OF ALOES AND CANELLA.

HIP'POCRAS. An aromatic medicated wine, formerly much used in England, and still employed on the Continent.

Prep. Lisbon and Canary wine, of each, 12 pints; cinnamon, 2 oz.; white canella, $\frac{1}{2}$ oz.; cloves, mace, nutmeg, ginger, and galangal, or cardamoms, of each, 1 dr.; bruise the spices, and digest them in the wine for three or four days; strain, and add of lump sugar, $2\frac{1}{2}$ lbs.

HIPPURIC ACID. $\text{HC}_5\text{H}_7\text{NO}_3$. *Syn.* ACRIDUM HIPPURICUM, L. A compound discovered by Liebig in the urine of the horse, cow, and other graminivora, in which it exists as hippurate of potassium or sodium.

Prep. Concentrate fresh cow's urine by a gentle heat to about $\frac{1}{10}$ th its bulk, filter from deposit, mix the liquid with excess of hydrochloric acid, and set it aside to crystallise. It may be decoloured by redissolving it in boiling water, and treating it with animal

charcoal, or with a little chloride of lime along with some hydrochloric acid, and re-crystallising it.

Obs. Hippuric acid, when pure, forms long, slender, milk-white, square prisms; it is soluble in 400 parts of cold water; it also dissolves in hot alcohol. When strongly heated, it yields benzoic acid, benzoate of ammonia, and benzonitrile, with a coaly residue. The urine of horses or cows, left to itself for some time, or evaporated at a boiling temperature, yields not a trace of hippuric acid, but only benzoic acid. Nitric acid and hot oil of vitriol convert it into benzoic acid. Boiling hydrochloric acid converts it into benzoic acid and glycol. With the bases it forms salts which are called hippurates. See BENZOIC ACID.

HIPS. *Syn.* HEPS; ROSA CANINA (Ph. L.). The fresh fruit of the dog rose (*Rosa canina*, or wild briar. *Used* to make a conserve.

HOLLANDS. *Syn.* GENEVA, SCHIEDAM HOLLANDS GIN, DUTCH G. *Prep.* 1. The materials employed in the distilleries of Schiedam, in the preparation of this excellent spirit are 2 parts of the best unmalted rye and 1 part of malted bigg, reduced to the state of coarse meal by grinding. About a barrel (36 galls.) of water, at a temperature of from 162° to 168° Fahr., is put into the mash-tun for every $1\frac{1}{2}$ cwt. of meal, after which the malt is introduced and stirred, and, lastly, the rye is added. Powerful agitation is next given to the magma till it becomes quite uniform, when the mash-tun is covered over with canvas, and left in this state for two hours. Agitation is then again had recourse to, and the transparent 'spent wash' of a preceding mashing is added, followed by as much cold water as will reduce the temperature of the whole to about 85° Fahr. The gravity of the wort at this point varies from 33 to 33 lbs. A quantity of the best pressed Flanders yeast equal to 1 lb. for every 100 galls. of the mash materials, is next stirred in, and the whole is fermented in the mash-tun for about 3 days or until the attenuation is from 7 to 4 lbs (sp. gr. 1.007 to 1.004). During this time the yeast is occasionally skimmed off the fermenting wort. The wash, with the grains, is then transferred to the still, and converted into 'low wines.' To every 100 galls. of the liquor, 2 lbs. of juniper berries (3 to 5 years old), and about 1 lb. of salt, are added, and the whole is put into the low-wine still, and the fine spirit drawn off by a gentle heat, and receiver only being employed. The product per quarter varies from 18 to 21 galls. of spirit, 2 to 3 o. p.

2. (BEST HOLLANDS.) Hollands rectified to the strength of 24° Baumé (sp. gr. 912 or about 6 o. p.).

3. (ENGLISH-MADE).—*a.* From juniper berries (at least a year old, and crushed in the hands), 3 lbs.; rectified spirit, 14 galls. (of proof spirit, 24 galls.); digest with agitation

for a week, and then express the liquor; after 24 hours' repose, decant the clear portion, add it to good corn spirit, at 2 or 3 $\frac{1}{2}$ overproof, 90 or 100 galls., and mix them well together.

b. From juniper berries, 2 $\frac{1}{2}$ lbs.; sweet fennel seed, 5 oz.; caraway seed, 3 $\frac{1}{2}$ oz.; proof spirit, 2 galls.; corn spirit, 90 or 100 galls.

c. As the last, with the addition of Strasburg turpentine or Canadian balsam, 1 lb.

d. To either of the last two or three, add a very small quantity of ground cardamoms or horse-radish. Some compounders also add 4 or 5 cloves of garlic, or about 15 grs. of assafœtida, with 1 gr. of ambergris rubbed to a powder with a little white sand or lump sugar. Good plain gin may be advantageously employed in lieu of the corn spirit ordered above, when expense is no object.

Obs. The last four forms, which are only given as examples, produce a very pleasant spirit, if it is kept for some time to 'mellow.' Age is one of the principal causes of the 'creaminess' of foreign gin, which usually lies in bond for some time before being consumed. The product is, however, much superior if the ingredients are rectified along with 20 galls. of water, and about 14 lbs. of salt, by a gentle heat.

It will be seen from the above that the superior flavour of Hollands spirit depends more on the peculiar mode of its manufacture than on the quantity of juniper berries employed; 2 lbs. of them, when new, being barely equivalent to 1 oz. of the essential oil; and when old, to less than $\frac{1}{2}$ oz., a quantity wholly insufficient to flavour 100 gallons of spirit. The Dutch distillers, most noted for this liquor, add a little pure Strasburg turpentine and a handful or two of hops to the spirit, along with the juniper berries, before rectification. The former substance has a pale yellowish-brown colour, and a very fragrant and agreeable smell, and tends materially to impart that fine aroma for which the best geneva is distinguished. At Rotterdam sweet fennel seed is commonly added as a flavouring; and at Weesoppe Strasburg turpentine and fennel seeds, or the essential oil of fennel, are frequently substituted for a large portion of the juniper berries.

Schiedam Hollands is considered the best; the next quality is that of Rotterdam; after these comes that of Weesoppe.

Attempts have been made by Mr. Robert Moore, and others, to introduce into general consumption in this country a home-made liquor, resembling and prepared in the same manner as foreign geneva, "but the palates of our gin-drinkers were too corrupted to relish so pure a spirit."

HOMŒOPATHY. *Syn.* HOMŒOPATHIA, L. A medical hypothesis promulgated at the commencement of the present century by the late Dr. Hahnemann, of Leipsic, according to which diseases may be cured by the administration of minute doses of medicines capable

of producing in healthy persons affectio similar to those it is intended to remove. The doctrine that "*similia similibus curantur*," had long previously been practically acted on to a limited extent, in certain cases, in legitimate medicine (allopathy, heteropathy), although not verbally recognised as belonging to its system. The administration of infinitesimal doses is an absurdity which homœopathy, however, alone can claim. According to this method, the millionth of a grain is often an excessive dose; whilst billionths and decillionths, quantities so small as to be vastly beyond human perception, form the common doses. This reduces the whole practice of homœopathy to a system of doing nothing beyond regulating the diet and habits of the patient. "All judicious practitioners have long been agreed that there are many cases which are best treated in the manner just mentioned, and in which physic does more harm than good; in which, in short, a sensible physician endeavours to amuse the patient, whilst nature cures the disorder; so that the frequent success of homœopathic treatment may be explained, without admitting the principle upon which it is presumed to be founded." (Brande.)

HON'Y. *Syn.* MEL (B. P.), L. The sweet substance elaborated by the domestic bee from the juices of the nectaries of flowers, and deposited in the cells of wax forming the honey-comb.

Var. Pure honey consists of a syrup of uncrystallisable sugar and crystalline saccharine grains, resembling grape sugar.—'Virgin honey' is that which flows spontaneously from the comb.—'Ordinary honey,' that obtained by heat and pressure. The former is pale and fragrant; the latter darker, and possessing a less agreeable taste and smell.—'English honey' is chiefly collected from furze and broom flowers, and is more waxy than that from the South of Europe;—'Narbonne honey,' chiefly from rosemary, and other labiate flowers, very fine;—'Poisonous honey' is found near Trebizond, in Asia.

Pur. Honey is frequently adulterated with treacle, potato-sugar syrup, potato farina, starch, and wheat flour. The first may be detected by the colour and odour; the second, in the way noticed under SUGAR; and the others by the honey not forming a nearly clear solution with cold water, and striking a blue colour with iodine. When it contains wheat flour, and is heated, it at first liquefies, but on cooling it becomes solid and tough. The absence of starchy matter or flour is easily proved by the following test:—Boiled with water for five minutes, and allowed to cool, it should not become blue with iodine water—indicating absence of flour.

Uses, &c. Honey is nutritive and laxative, but rather apt to gripe. It is employed in the preparation of OXYMELS and GARGLES, and also to cover the taste of nauseous medi-

cines, which it does better than sugar. Clarified honey is alone ordered to be used in medicine.

Honey, Clarified. *Syn.* REFINED HONEY, STRAINED H.; *MEL DEPURATUM* (Ph. D.), *MEL PRÆPARATUM*, L. The honey is simply melted by the heat of a water bath, and strained whilst hot through flannel (Ph. D.); or—it is melted as last, and the scum removed (Ph. U. S.); or—it is melted with 1-3rd its weight of water, skimmed, strained through flannel, and evaporated until it reaches the sp. gr. 1.261. (P. Cod.) Honey is not to be employed without being despumated. (Ph. L.)

Obs. Clarified honey is less agreeable than raw honey, and has lost the crystalline character of the latter; but it is less liable to ferment and gripe. The use of copper and iron vessels or implements should be avoided, as honey acquires a dark colour by contact with them. Berlin-ware, stone-ware, or well-silvered or tin copper pans, should alone be used. On the large scale, one or other of the following plans are adopted:—

1. The honey is mixed with an equal weight of water and allowed to boil up 5 or 6 times without skimming; it is then removed from the fire, and after being cooled, brought on several strong linen strainers, stretched horizontally, and covered with a layer of clean and well-washed sand, an inch in depth; the sand is rinsed with a little cold water, and the mixed liquor is finally evaporated to the thickness of syrup.

2. Dissolve the honey in water, as last, clarify with white of egg, and evaporate to a proper consistence.

3. Dissolve in water, add 1½ lb. of animal charcoal to every ¼ cwt. of honey, gently simmer for 15 minutes, add a little chalk to saturate excess of acid, if required, strain or clarify, and evaporate.

4. Honey, 1 cwt.; water, 9 galls.; fresh burnt animal charcoal, 7 lbs.; simmer for 15 minutes, add a little chalk to saturate free acid (if required), strain or clarify, and evaporate as before.

HONEYS. (In *pharmacy*.) *Syn.* MELLITA, L. These are minor preparations, now almost superseded by 'syrups' (SYRUP). The *mellita* of the Ph. L., including two 'oxymels,' are only four in number.

Honey of Bo'rax. *Syn.* MEL BORACIS (B. P. Ph., L. E. & D.), L. *Prep.* (B. P.) Finely powdered borax, 1; clarified honey, 7; mix. Astringent, detersive, and cooling. It is employed in aphthæ of the mouth, excessive salivation, &c. A great improvement would be to dissolve 1 of borax in 1 of glycerin, and then add 6 of honey.

Honey of Col'chicum. *Syn.* MEL COLCHICI, L. *Prep.* (Beasley.) Dried colchicum, 1 part; water (at 140°), 16 parts; infuse for 12 hours, strain, let it settle, and boil the clear liquor with white honey, 12 parts, to the consistence of a syrup. See COLCHICUM.

Honey of Lig'norice. *Syn.* MEL GLYCYRRHIZATUM, L. *Prep.* (Ph. Hamb.) Honey and

a strong infusion of liquorice boiled to a proper consistence. Emollient, pectoral, and laxative.

Honey of Male Fern. *Syn.* MEL FILICIS, L. *Prep.* (Dunglison.) Ethereal extract of male fern, 30 grs.; honey of roses, 4 drs.; mix. In tape-worm.—*Dose.* One half at bed-time, followed by the remainder in the morning.

Honey of Mercury. *Syn.* MEL HYDRARGYRI, L. *Prep.* (Bell.) Mercury, 1 dr.; honey, 1 oz.; triturate till the globules disappear. Allard adds of oil of cloves, ½ dr. Properties similar to those of mercurial pill. It is chiefly used as an application to ulcers of the throat.

Honey of Ro'ses. *Syn.* MEL ROSE (Ph. L. & E.), L. *Prep.* 1. (Ph. L.) Dried petals of the red rose (the leaves separated), 4 oz.; boiling water, 16 fl. oz.; macerate for 2 hours, lightly press them in the hand, and strain; then add 8 fl. oz. more of boiling water to the roses, macerate for a short time, and again gently express the liquor; to this add half of the first infusion, and set aside the other half; next add to the mixed liquors, honey, 5 lbs., and evaporate in a water bath, so that, the infusion which was set aside being added, it may become of a proper consistence.

2. (Ph. E.) Dried rose petals, 4 oz.; boiling water, 2½ pints; infuse for 6 hours, and gently squeeze out the liquor; after the impurities have subsided, decant the clear, add of honey, 5 lbs., and evaporate, as before, to a proper consistence, removing the scum which forms. Used to make astringent gargles. It must not be boiled in a copper or iron vessel, as they will spoil the colour. The last form is that commonly adopted in trade.

Honey of Squills. *Syn.* MEL SCILLÆ, *he sa* *Prep.* 1. Thick clarified honey, 3 lbs.; tincture sp of squills, 2 lbs.; mix.

2. (Soultzheim.) Dried squills, 1 oz.; boiling sk water, ½ pint; infuse 2 hours, strain, add of honey, 12 oz., and evaporate to a proper consistence. Resembles OXYMEL OF SQUILLS (nearly).

Honey of Vi'olets. *Syn.* MEL VIOLE, L. *Prep.* From clarified honey, 2 parts; expressed and depurated juice of violets, 1 part. Resembles syrup of violets.

HONEY DEW. *Syn.* ROS MELLIFUS, L. A sweetish matter ejected upon the leaves of plants by certain aphides.

HOOPING COUGH. See WHOOPING COUGH.

HOPS. *Syn.* LUPULUS (B. P.), L. "The catkins of the female plant of the *Humulus lupulus*" or common hop. (B. P.) "The dried strobiles." (Ph. D.) The hops of commerce are the strobiles or catkins (LUPULI STROBILI, L. AMENTA) of the hop plant. The yellow powder or small lupulinic grains or glands (LUPULIN), which are attached to the strobiles, are the portion on which their characteristic qualities chiefly depend.

The hop is tonic, stomachic, and moderately narcotic. It is used in diseases of local debility with morbid vigilance and other nervous

in great abundance, and may be collected over water.

Prop. Colourless; neutral; nearly inodorous; burns with a yellow flame, producing pure water and carbonic acid; explodes when kindled in contact with air or oxygen.

2. Heavy Carburetted Hydrogen. C_2H_4 . See OLEFIANT GAS.

Obs. COAL GAS, OIL GAS, and RESIN GAS, consist, for the most part, of mixtures of these two gaseous hydrocarbons in uncertain proportions, obtained respectively from coal, oil, and resin, by the action of heat, and used for the purposes of illumination. See GAS.

Oxides of Hydrogen. There are two well-defined compounds of hydrogen and oxygen:—

1. Suboxide of Hydrogen. H_2O . Water (see).

2. Peroxide of Hydrogen. HO . *Syn.* HYDROXYL, BINOXIDE OF HYDROGEN, DEUTOXIDE OF H., OXYGENATED WATER; HYDROGENII BINOXIDUM, L. This singular fluid was discovered by M. Thénard, in 1818.

Prep. (Odling.) A known quantity of pure hydrochloric acid, diluted with 8 or 10 times its volume of distilled water, is placed in a glass beaker surrounded with ice or a freezing mixture. A quantity of binoxide of barium rather less than sufficient to neutralise the acid is then ground to a fine paste with distilled water, and added gradually to the acid, in which it should dissolve without effervescence. Diluted sulphuric acid is next added cautiously, to precipitate the barium, and reproduce hydrochloric acid to act upon a fresh quantity of peroxide. The liquid having been filtered from the insoluble sulphate of baryta, a second proportion of binoxide of barium paste is added gradually, as before. The treatment with sulphuric acid, filtration and addition of binoxide, is repeated 6 or 7 times. Sulphate of silver is then very carefully added, so as exactly to precipitate in the form of chloride of silver the whole of the chlorine. After filtration, pure baryta, first as a paste and then in solution, is cautiously added, to precipitate exactly the sulphuric acid set free from the sulphate of silver. Filtration is again resorted to, and the clear liquid (aqueous solution of peroxide of hydrogen) is placed in a dish over oil of vitriol in vacuo, in order that the water mixed with it may evaporate.

Prop., &c. A colourless, transparent, somewhat syrupy liquid, of sp. gr. 1.452. It has a metallic taste, and corrodes the skin. It is easily resolved into oxygen and water. It mixes freely with water, and becomes more permanent by the dilution. It bleaches organic substances, and acts as a powerful oxidating agent. Under certain circumstances, however, it plays the part of a reducing agent. To the chemist, peroxide of hydrogen and its analogue, binoxide of barium, have been of great service as instruments of research. The only use to which binoxide of hydrogen has

been applied in the arts, is to restore the blackened lights of paintings, which have become darkened by sulphuretted hydrogen.

Phosphuretted Hydrogen. See PHOSPHORUS.

Sulphides of Hydrogen. See SULPHUR.

HYDROMEL. *Syn.* HYDROMEL, L. An aqueous solution of honey. *Prep.* (P. Cod.) Honey, 2 oz.; boiling water, 32 oz.; dissolve, and strain. A refreshing and slightly laxative drink; in fevers, hoarseness, sore throats, &c.

HYDROMETER. *Syn.* AREOMETER, GRAVIMETER; HYDROMETRUM, L. An instrument for ascertaining the specific gravities of liquids, and hence their strength, the latter being either in inverse or direct proportion to the former. Hydrometers are of two kinds:—

1. Those which are always immersed to the same depth in distilled water, and the liquid to be tried, small weights being used for the purpose, as in FAHRENHEIT'S and NICHOLSON'S hydrometers; and 2nd, those which are suffered to rise or sink freely in the liquid, until they come to a state of rest, as in SYKE'S, BAUMÉ'S, &c. In both cases a correction must be made for any variation in temperature.

Of the two kinds, the first give the most accurate results, and have the great advantage of being applicable to liquids either lighter or heavier than water, but the second are the readier in practice, requiring less time, and less skill to use them. The following are those best known:—

BAUMÉ'S HYDROMETER or **AREOMETER**, which is very generally employed on the Continent, consists of two distinct instruments, the one for liquids heavier than water, the other for liquids lighter than that fluid. The first floats at the 0, or 'zero,' of the scale, in distilled water, at the temperature of 58° Fahr., and each degree, marked downwards, indicate a density corresponding to one per cent. of common salt. The hydrometer for liquids lighter than water is poised so that the 0 of the scale is at the bottom of the stem, when it is floating in a solution of 1 oz. of common salt in 9 oz. of water, and the depth to which it sinks in distilled water shows 10°; the space between these fixed points being equally divided, and the graduation continued upwards to the top of the scale.

The temperature at which these instruments were originally adjusted by Baumé was 12.5° Centigrade (54.5° Fahr.). They are now commonly adjusted in this country at 58° or 60° Fahr. Hence arise the discrepancies observable in the published tables of the "correspondence between degrees of Baumé and real specific gravities."

CARTIER'S HYDROMETER, which is much used in France for light liquids, has the same point for the zero of its scale as Baumé's, but its degrees are rather smaller, 30° Baumé being equal to 32° Cartier.

FAHRENHEIT'S HYDROMETER consists of a hollow ball, with a counterpoise below, and a

very slender stem above, terminating in a small dish. The middle, or half-length of the stem, is distinguished by a fine line across it. In this instrument every division of the stem is rejected, and it is immersed in all experiments to the middle of the stem, by placing proper weights in the little dish above. Then, as the part immersed is constantly of the same magnitude, and the whole weight of the hydrometer is known, this last weight, added to the weights in the dish, will be equal to the weight of fluid displaced by the instrument, as all writers on hydrostatics prove. And accordingly, the sp. gravities for the common form of the tables will be had by the proportion—

As the whole weight of the hydrometer and its load, when adjusted in distilled water, is to the number 1000, so is the whole weight when adjusted in any other fluid, to the number expressing its specific gravity.

GAY-LUSSAC'S ALCOHOLOMETER is used to determine the strength of spirituous liquors. It, at once, indicates on the stem, the percentage of absolute alcohol in the liquid examined. The original experiments of Gay-Lussac having been made on liquids at a temperature of 59° Fahr., all examples examined by the alcoholometer, must either be brought to that temperature previous to being tested, or a correction made in the strength found.

NICHOLSON'S HYDROMETER is constructed on the same principle as Fahrenheit's. It has, in addition to the small dish for weights above, a little cup attached below, for holding any solid body whose weight in water is required. It is chiefly intended for taking the sp. gr. of minerals.

RICHTER'S HYDROMETER resembles, for the most part, Gay-Lussac's.

SYKES'S HYDROMETER is that adopted by the Revenue authorities in England for ascertaining the strength of spirits, and has been already fully noticed.

TRAILL'S HYDROMETER resembles Gay-Lussac's (nearly).

TWADDELL'S HYDROMETER is much used in the bleaching establishments of Scotland, and in some parts of England. According to this scale, 0 is equal to 1000 or the sp. gr. of distilled water, and each degree is equal to '005; so that, by multiplying this number by the number of degrees marked on the scale, and adding 1, the real specific gravity is obtained.

Obs. Hydrometers, unless manufactured with great care and skill, merely afford approximate results, but which are nevertheless sufficiently correct for all ordinary purposes. They also require several ounces of liquid to float them, and hence cannot be used for very small quantities. Those of Fahrenheit, Nicholson, and Sykes, are the most accurate, both in principle and application. They are all employed with a tall glass cylinder, termed a sample, test, or hydrometer glass, in the way

already noticed; but the thermometer for ascertaining the temperature must be covered with a glass case, or arranged with a folding scale, to allow of its immersion in corrosive liquids.

ALCOHOLOMETERS, ELAIOMETERS, SACCHAROMETERS, URINOMETERS, &c., are simply hydrometers so weighted and graduated as to adapt them for testing spirits, syrups, urine, &c. See ALCOHOLOMETRY, ALCOHOLIMETRY, ARROMETER, SPECIFIC GRAVITY, &c.

HYDROMETRY. *Syn.* ARROMETRY. The art of determining the specific gravity of liquids, and hence their strength and commercial value. The instruments used are noticed above; their action depends upon the fact that a floating body displaces a bulk, equal to itself in weight, of the fluid in which it floats, and consequently that a body of a given weight sinks deeper in a lighter than in a heavier fluid. In hydrometric determinations the temperature of the samples must be carefully attended to, for fluids expand as their temperature is increased. The hydrometers used in England are generally adjusted to the standard temperature of 60° Fahr., and when 'Hydrometer Tables,' giving the corrections for the variations of the thermometer, are not accessible, the fluids to be examined should be brought to this standard temperature by applying heat directly to the vessel, when the temperature is below the standard, or by surrounding the vessel with cold water, when it is above the standard. The principal applications of hydrometry are described in different parts of this work. See ACETIMETRY, ALCOHOLOMETRY, CHLOROMETRY, SPECIFIC GRAVITY, &c.

HYDROP'ATHY. *Syn.* WATER CURE; HYDROPATHIA, L. A mode of curing diseases by the copious use of pure cold water, both internally and externally, together with dry sweating, and the due regulation of diet, exercise, and clothing. This "treatment of diseases undoubtedly includes powerful therapeutic agents, which, in the hands of the educated and honourable practitioner, might be most beneficially resorted to as remedial agents." (Pereira.)

HYDROPHOBIA. *Syn.* CANINE MADNESS; RABIES CANINA, L. A disease which is generally considered as the result of a morbid poison being introduced into the system by the bite of a rabid animal. A clear case of idiopathic or spontaneous hydrophobia has never yet been known to occur in the human subject.

The common symptoms of hydrophobia are great excitability and horror at the sight of water or the attempt to drink, fever, vomiting, excessive thirst, spitting of viscid saliva, difficult respiration, irregular pulse, convulsions, syncope, delirium, and death.

The whole materia medica has been, unfortunately, unsuccessfully sought without the discovery of a single remedy for this

disease, or even a palliative of its severer symptoms.

The treatment of the recent bites of venomous animals has been fully explained, and need not be repeated here. To prevent secondary or constitutional effects arising, the use of lemon juice, or arsenical solution, has long been popular. (Graham, and others.) Dr. Buchan remarks that "vinegar is of considerable use, and should be taken freely."

HYDROSULPHURIC ACID. See SULPHUR.

HYGIENE. *Syn.* HYGIÈNE, Fr. Health; its preservation, promotion, and restoration. That department of medicine and civil government which relates to health. See AIR, BATH, EXERCISE, FLANNEL, FOOD, NUTRITION, SLEEP, VENTILATION, &c.

HYOCHOLIC ACID. $C_{25}H_{40}O_4$. *Syn.* GLYCOHYOCHOLALIC ACID. A compound peculiar to the gall of pigs, discovered by Strecker and Gundelach.

Prep. The fresh gall of pigs is mixed with a solution of sulphate of sodium; the precipitate is dissolved in absolute alcohol, and decolourised by animal charcoal. From this solution ether throws down hyocholate of sodium, which, on the addition of sulphuric acid, yields hyocholic acid as a resinous mass, which is dissolved in alcohol, re-precipitated by water, and dried. When heated with alkaline solutions, glycocine and a new crystalline acid (hyocholalic acid) are formed. When boiled with acids, it yields glycocine and hyodyslysin.

HYOSCYAMINE. *Syn.* HYOSCYAMIA, HYOSCYAMINA, DATURINE, DATURIA. An alkaloid obtained from common henbane (*Hyoscyamus niger*), and also from the thorn apple (*Datura stramonium*). See DATURINE.

HYPNOTICS. *Syn.* HYPNOTICA, L. Agents or medicines which induce sleep, as opium, morphia, henbane, Indian hemp, lactucarium, &c. Agents which prevent sleep are called agrypnotics (*Agrypnotica*, Ir.), or anthyptotics (*Anthyptotica*, L.).

HYPOCHLO'RIC ACID. See CHLORINE.

HYPOCHONDRI'ASIS. *Syn.* HYPOCHONDRICISM. The 'hip' or 'hyp,' the 'vapours,' depression of spirits, 'blue devils.' This disease chiefly affects persons of the melancholic temperament, and is commonly induced by hard study, irregular habits of life, want of proper social intercourse, living in close apartments, and insufficient out-of-door exercise. The treatment may, in most cases, be similar to that recommended for DYSPESIA, observing, however, that success depends more on amusing and engaging the mind, and in gradually weaning it from old conceits, than in the mere administration of medicine. When the patient is tormented with a visionary or exaggerated sense of pain, or of some concealed disease, or a whimsical dislike of certain persons, places, or things, or groundless apprehensions of personal danger or poverty, or the conviction of

having experienced some dreadful accident or misfortune, the better way is to avoid any direct attempts to alter his opinions, but to endeavour to inspire confidence in some method of relief. Greting mentions the case of a medical man who conceived that his stomach was full of frogs, which had been successively spawning ever since he had bathed, when a boy, in a pool in which he had perceived some tadpoles; and he had spent his life in endeavouring to get them removed. One patient, perhaps, fancies himself a giant; another, as heavy as lead; a third, a feather, in continual danger of being blown away by the wind; and a fourth, a piece of glass, and is hourly fearful of being broken. Marcellus Dentatus mentions a baker of Ferrara who thought himself a lump of butter, and durst not sit in the sun, or come near the fire, for fear of being melted. The writer of this article once knew a man who always put on his coat the wrong side in front, because he conceived his face looked behind him. In such cases it is useless to argue with the patient, as it only causes irritation, and increases the malady. The restoration of the bodily health, and a sudden surprise or change of scene, will often effect a cure.

HYPONITRIC ACID. See NITROGEN.

HYPONITROUS ACID. See NITROGEN.

HYPOPHOSPHITES. See PHOSPHORUS.

HYPOPHOSPHITE. A salt of hypophosphorous acid.

HYPOSULPHATE. *Syn.* DITHIONATE; **HYPOSULPHAS**, L. A salt of hyposulphuric acid.

HYPOSULPHITE. *Syn.* THIOSULPHATE; **HYPOSULPHIS**, L. A salt of hyposulphurous acid.

HYPCSULPHUROUS ACID. See SULPHUR.

HYRA'CEUM. A substance produced by the Cape badger (*Hyraa Capensis*), and proposed as a substitute for CASTOREUM. Pereira considered it to be inert and useless.

HYSTERIC. *Syn.* HYSTERIA, PASSIO HYSTERICA, L. In pathology, a nervous affection peculiar to women, attacking in paroxysms or fits, preceded by dejection, tears, difficult breathing, sickness, and palpitation of the heart. The treatment of this disease varies with the causes and the symptoms. Bleeding, cupping, and depletives, are generally had recourse to in robust and plethoric habits, and stimulants and tonics in those of a weakly or relaxed constitution. Affusion of cold water and nasal stimulants will frequently remove the fit in mild cases. Exercise, proper amusements, and regular hours and diet, are the best preventives. See DRAUGHT (Antihysterical and Hydrocyanic), &c.

ICE. *Syn.* GLACIES, L. Water in the solid state. On being cooled, water gradually contracts until the temperature has fallen to 39° Fahr., when it begins to expand. At the freezing-point, 32° Fahr., under ordinary con-

ditions, water crystallises or freezes, and in consequence of the continued expansion, the sp. gr. of ice, as compared with that of water at 39·9°, is as ·94 to 1·00. Ice has the peculiar property of reuniting by the contact of adjoining surfaces after having been broken into fragments (REGELATION). Coloured water and salt water, by freezing, produce colourless and fresh ice; and clean solid ice, when thawed, furnishes water equal in purity to that which has been distilled.

The use of ice in the preparation of ICE-CREAMS, ICED-LIQUORS, &c., is noticed elsewhere. The confectioner collects his ice as early as possible during the winter, and stores it in a well-drained well or excavation, somewhat of the form of an inverted sugar-loaf, contained in a small shed or building called an ICE-HOUSE. This building should always be situated on a dry sandy soil, and, if possible, on an eminence. The door should be on the north side, and the roof should be conical and thickly thatched with straw.

In *medicine*, ice is frequently employed externally in inflammation of the brain, to resolve inflammation, to stop hæmorrhage, to constrict relaxed parts, and as an anodyne, to deaden pain. For these purposes it is pounded small, in a cloth, and placed in a bladder or bag of gauze (ICE-CAP, ICE-POULTICE) before applying it. Internally, ice or ice-cold water has been given with advantage in heartburn, typhus, inflammation and spasms of the stomach, to check the vomiting in cholera, and to arrest hæmorrhage, whether bronchial, gastric, nasal, or uterine. Very recently, ice has been proposed as a remedy in the treatment of diphtheria. Small lumps of ice, or a small glassful of pounded ice-and-water, will often temporarily restore the tone of the stomach and nervous system during hot weather, when all other means fail. Ice-creams, taken in moderation, act in the same way.

In the warmer climates of Europe an ICE-HOUSE or an ICE-SAFE (a REFRIGERATOR) is a necessary appendage to every respectable dwelling, not merely for the purpose of pleasing the palate with iced beverages, but to enable the residents to preserve their provisions (fish, meat, game, milk, butter, &c.) in a wholesome state from day to day. See REFRIGERATION.

ICELAND MOSS. *Syn.* CETRARIA (B.P.), LICHEN ISLANDICUS, L. The lichen termed *Cetraria Islandicus*. It is much employed, both as a nutritious food and as a mild mucilaginous tonic, in catarrh and consumption. It may be purified from its bitter principle by a little cold solution of potassa.

ICES. (In *confectionery*.) These are commonly composed of cream or sweetened water, variously flavoured, and congealed by ice or a freezing mixture. Sometimes, instead of cream, the materials of a custard are used. The mixed ingredients are placed in a tin furnished with

a handle at top, called a 'freezer,' or 'freezing-pot,' which is then plunged into a bucket containing ice broken small, and mixed with about half its weight of common salt, and is kept in rapid motion, backwards and forwards, until its contents are frozen. As the cream congeals and adheres to the sides, it is broken down with the ice-spoon, so that the whole may be equally exposed to the cold. As the salt and ice in the tub melt, more is added, until the process is finished. The 'ice-pot,' with the cream in it, is next placed in a leaden 'ice-stand,' is at once surrounded with a mixture of ice and salt, and closely covered over. In this state it is carried into the shop. The glasses are filled as required for immediate use, and should have been previously made as cold as possible.

PLAIN ICE-CREAM, or CREAM FOR ICING, is commonly made by one or other of the following formulæ:—

1. New milk, 2 pints; yolks of 6 eggs; white sugar, 4 oz.; mix, strain, heat gently, and cool gradually.

2. Cream, 1 pint; sugar, 4 oz.; mix, as above.

3. Cream and milk, of each, 1 pint; white sugar, $\frac{1}{2}$ lb.

FLAVOURED ICE-CREAMS are made by mixing cream for icing with half its weight of mashed or preserved fruit, previously rubbed through a clean hair sieve; or, when the flavour depends on the juice of fruit or on essential oil, by adding a sufficient quantity of such substances. RASPBERRY and STRAWBERRY ICES are made according to the former method; LEMON, ORANGE, NOYEAU, and ALMOND ICES, by the latter method. In the same way any other article besides cream may be frozen.

CHOCOLATE FOR ICING is made by rubbing 1 oz. of chocolate to a paste with a table-spoonful of hot milk, and then adding 'cream for icing,' 1 pint.

COFFEE FOR ICING is made of cream for icing, 1 quart, to which a small teacupful of the strongest possible clarified coffee has been added, together with 2 oz. of sugar and the yolks of 3 or 4 eggs. See ICING (*below*).

ICING. (For cakes.) *Syn.* SUGAR ICE. The covering of concentered sugar with which the confectioners adorn their cakes. *Prep.* Beat the white of eggs to a full froth, with a little rose or orange-flower water; then add, gradually, as much finely powdered sugar as will make it thick enough, beating it well all the time. For use, dust the cakes over with flour, then gently rub it off, lay on the icing with a flat knife, stick on the ornaments while it is wet, and place it in the oven for a few minutes to harden, but not long enough to discolour it. It may be tinged of various shades by the addition of the proper 'stains.'

IDRIALIN. A fusible, inflammable substance, found associated with the native cinabar of the mines of Idria, in Carniola. It is extracted from the ore by means of oil of

turpentine. It is only slightly soluble in alcohol and ether. When pure, it is white and crystalline.

IDRYL. A hydrocarbon generally found associated with idrialin.

IGASURIC ACID. *Syn.* **ACIDUM IGASURICUM, I.** An acid associated with strychnine in the St. Ignatius' bean and in nux vomica. It may be obtained by digesting the rasped or ground beans first in ether and then in boiling alcohol, evaporating the latter decoction to dryness, diffusing the residuum through water, adding a little carbonate of magnesium, again boiling for some minutes, filtering, washing the powder with cold water, and digesting it in alcohol, and filtering. The igasurate of magnesium thus obtained is dissolved in boiling water, the solution decomposed by acetate of lead, and the precipitate (igasurate of lead), after being washed and diffused through distilled water, is decomposed by sulphuretted hydrogen. The solution thus obtained yields crystals (igasuric acid) on being evaporated. It is soluble in both water and alcohol.

IGNITION. In the laboratory, this term is commonly applied to the act of heating to redness or luminousness. See **CALCINATION**.

ILLUMINATION. The act of illuminating or making luminous. For supplying artificial light to streets and the interiors of houses coal gas and oils and fats are generally employed. These illuminating agents are compounds rich in carbon, upon the presence of which the brightness of their flames depends. Flame is gas or vapour heated to incandescence during the process of combustion. A flame containing no solid particles emits but a feeble light, even if its temperature is the highest possible. Pure hydrogen, for instance, burns with a pale, smokeless flame, though with the production of considerable heat. On the other hand, wax, paraffin, coal gas, &c., while undergoing combustion, give out considerable light, because their flames contain innumerable solid particles of carbon, which act as radiant points. To give the greatest degree of luminosity to flame, the supply of air must be proportioned to the character of the burning substance, and be insufficient for the instantaneous combustion of the evolved gases; in which case the hydrogen takes all the oxygen, and the larger portion of the carbon is precipitated, and burnt in the solid form, at some little distance within the outer surface of the flame. When the supply of air is sufficient for the immediate and complete combustion of the whole of the combustible matter, no such precipitation takes place, and the flame is neither white nor brilliant. The richest coal gas, mixed with sufficient air to convert all its hydrogen and carbon into water and carbonic acid, explodes with a pale blue flash; yet the same gas, when consumed in the ordinary way, burns with a rich white flame. Every one must have noticed the effect of a gust of wind upon the flaring gas-jets of a butcher's shop; the plentiful supply of air

causes complete combustion, and so converts the bright white flames into dull blue streaks of fire. When the supply of air is insufficient to cause the combustion of the newly formed solid carbon at the instant of its development, and whilst it is in an incandescent state, the flame becomes red and smoky, and unburnt sooty particles are thrown off. The same occurs when the temperature of any portion of the hydrogen is reduced below that intensity required for the combustion of the newly separated charcoal. Solid bodies, as tallow, oils, and fats, which burn with flame, are converted into the state of gas by the heat required to kindle them, and it is this gaseous matter which suffers combustion, and not the substance which produces it.

The relative value of the ordinary illuminating agents has been accurately determined by Dr. Frankland. According to his experiments, the quantities of various substances required to give the same amount of light as would be obtained from 1 gallon of Young's Paraffin oil are as follows:—

Young's Paraffin oil	. 1.00 gall.
American rock oil ¹	. 1.26 "
Paraffin candles	. 18.6 lbs.
Sperm	. 22.9 "
Wax	. 26.4 "
Stearic	. 27.6 "
Composite	. 29.5 "
Tallow	. 39.0 "

The following table exhibits the comparative cost of the light of 20 sperm candles, each burning 10 hours at the rate of 120 grs. per hour; also the amount of carbonic acid produced and heat evolved per hour, in obtaining this quantity of light:—

	Cost. s. d.	Carb. acid per hour in cub. feet.	Units of heat. per hour.
Wax . . .	7 2½	...	8.3 ... 82
Spermaceti . . .	6 8	...	6.7 ... 66
Paraffin candles 3 10	10.1 ... 100
Tallow . . .	2 8	...	3.0 ... 29
Rock oil . . .	0 7½	...	5.0 ... 47
Paraffin oil . . .	0 6	...	4.0 ... 32
Coal gas . . .	0 4½
Cannel gas . . .	0 3

These figures prove that coal-gas and the mineral oils are the cheapest and best illuminating agents, producing the largest amount of light with the least development of heat.

The light emitted by incandescent lime (**DRUMMOND LIGHT, HYDRO-OXYGEN LIGHT, LIME LIGHT, OXYHYDROGEN LIGHT**) is intensely brilliant, and is often made use of to enable workmen to continue operations at night. It is obtained by directing the flame produced by the combustion of a mixture of hydrogen (or coal gas) and oxygen upon a small cylinder of lime. In the improved form of

¹ Acknowledged to be an inferior sample.

this light the lime is protected from crumbling by a cage of platinum wire, and is caused to rotate slowly by means of clockwork, so as constantly to expose a fresh surface to the flame. When reflected from a 'parabolic mirror' in a pencil of parallel rays, the Drummond light has been recognised during daylight at a distance of 108 miles. The lime light produced with coal gas and oxygen is used for the **MAGIC LANTERN** and **GAS MICROSCOPE**.

Another powerful illuminator is the **ELECTRIC LIGHT**. It is produced by the passage of a strong current of voltaic electricity between two pencils of hard charcoal or coke, such as that deposited in the retorts of gas-works. The electric light has been successfully applied to lighthouse illumination. It is too intense, and its cost is too great, for its application to domestic purposes. See **CANDLES**, **FLAME**, **GAS**, **PHOTOMETRY**, &c.

ILLUTATION. See **BATH** (Mud).

IMAGINATION. The influence of the imagination, both in the production and cure of disease, has been long admitted by medical practitioners. It is probably the most powerful therapeutic agent known. "Extraordinary cures have been ascribed to inert and useless means, when, in fact, they were referable to the influence of the imagination." (Dr. Pereira.)

IMPERIAL. *Syn.* **POTUS IMPERIALIS**, **PRISANA I.**, *L.* *Prep.* 1. Cream of tartar, $\frac{1}{4}$ oz.; 1 lemon, sliced; lump sugar, 2 oz.; boiling water, 1 quart; infuse, with occasional stirring until cold, then pour off the clear portion for use.

2. A lemon, sliced; sugar, 1 oz.; boiling water, 1 pint.

3. Yellow rind and juice of lemon; citric acid, 1 dr.; sugar, $2\frac{1}{2}$ oz.; hot water (which has been boiled), 1 quart; as No. 1. Refrigerant and slightly diuretic. *Used* as a common drink in fevers, dropsy, &c., and as a summer beverage.

IMPLEMENTS (Agricultural). "Almost all the operations of agriculture may be performed by the plough, the harrow, the scythe, and the flail; and these are the sole implements in the primitive agriculture of all countries. With the progress of improvement, many other implements (and machines) have been introduced, the more remarkable of which are the **DRILL PLOUGH**, the **HORSE BOX**, the **WINNOWER MACHINE**, the **THRESHING MACHINE**, the **HAY-MAKING MACHINE**, and the **REAPING MACHINE**. The object of all these implements and machines is to abridge human labour, and to perform the different operations to which they are applied with a greater degree of rapidity, and in a more perfect manner, than before." (London.) On the perfection of agricultural implements and machines depends much of the improvement of which this art is susceptible. See **AGRICULTURE**, &c.

IMPROVING. The trade name for 'doc-

toring,' 'adulterating,' or 'lowering,' the quality of any substance, with the view of cheapening it or increasing its bulk. See **WINE**, &c.

INCENSE. *Prep.* 1. Olibanum, 2 or 3 parts; gum benzoin, 1 part.

2. Olibanum, 7 parts; gum benzoin, 2 parts; cascarilla, 1 part. Placed on a hot plate or burned, it exhales an agreeable perfume. Used in some of the rituals of the Roman Catholic Church.

INCINERATION. The reduction of organic substances to ashes by combustion. See **CALCINATION**.

INCOMBUSTIBILITY. The property of being incapable of being kindled, or of being consumed by fire. Substances possessing this property are said to be 'incombustible' or 'fire-proof.'

INCOMBUSTIBLE FABRICS. *Syn.* **NON-INFLAMMABLE FABRICS**. The fashion of wearing light gauzy dresses extended by hoops or crinoline has made death from fire a common casualty. With a view of diminishing the danger to which women expose themselves, chemists have lately devoted considerable attention to the problem of rendering muslin and other light fabrics non-inflammable. This object may be attained by steeping the fabric in almost any saline solution. Thus, cotton or linen stuffs prepared with a solution of borax, phosphate of soda, phosphate of ammonia, alum, or sal-ammoniac, may be placed in contact with ignited bodies without their suffering active combustion or bursting into flame. The salts act by forming a crust of incombustible matter on the surface of the fibres. They do not, however, prevent carbonisation taking place, when the temperature is sufficiently high. It is by a knowledge of this property of culinary salt, that jugglers are enabled to perform the common trick of burning a thread of cotton whilst supporting a ring or a small key, without the latter falling to the ground. The cotton is reduced to a cinder, but, from the action of the salt, its fibres still retain sufficient tenacity to support a light weight.

The addition of about 1 oz. of alum or sal-ammoniac to the last water used to rinse a lady's dress, or a set of bed furniture, or a less quantity added to the starch used to stiffen them, renders them uninflammable, or at least so little combustible that they will not readily take fire; and if kindled, are slowly consumed, without flame. None of the above-named salts are adapted for fine soft muslins, which mostly require chemical treatment, because they injure the texture, rendering the fabric harsh and destroying all its beauty. The salt which is found to answer most completely all the required conditions is **TUNGSTATE OF SODA**. "Muslin steeped in a solution containing 20% of this salt is perfectly non-inflammable when dry, and the saline film left on the surface is smooth and of a fatty appearance like talc, and

therefore does not interfere with the process of ironing, but allows the hot iron to pass smoothly over the surface. The non-fulfilment of this latter condition completely prevents the use of many other salts—such as sulphate or phosphate of ammonia, which are otherwise efficacious in destroying inflammability—for all fabrics which have to be washed and ironed.” (Watts.)

The addition of a little phosphoric acid or phosphate of soda to the ‘tungstate’ is recommended, for without this addition a portion of the ‘tungstate’ is apt to undergo a chemical change and become comparatively insoluble. Messrs. Versmann and Oppenheim, the introducers of tungstate of soda, give the following formula for a solution of minimum strength:—

Dilute a concentrated solution of neutral tungstate of soda with water to 28° Twaddell (sp. gr. 1.14), and then add 3½ of phosphate of soda. This solution is found to keep and to answer its purpose very well; it is now constantly used in the Royal Laundry.

PAPER, WOOD, &c., may also be rendered comparatively incombustible by soaking them in saline solutions. See ASBESTOS, FIRE, &c.

INCOMPATIBLES. In *medicine and pharmacy*, substances which exert a chemical action on each other, and cannot, therefore, with propriety, be prescribed together in the same formula or prescription. The principles on which we should act to avoid prescribing or dispensing incompatibles, are briefly developed under the heads **AFFINITY** and **DECOMPOSITION**. To this we may add that, if a substance is endowed with well-marked therapeutical or poisonous properties, independent of those which may exert a chemical effect upon the tissues, its mode of action will neither be changed nor destroyed by the combinations which it forms, provided always that the new compounds are not insoluble in water.

“It is not necessary to give two incompatible medicines at the same time, in order to produce decomposition; it is sufficient if they are given within a very short interval of each other. Thus, a sick person, who has been treated with lead externally, or even internally, will present a discoloration of the skin, if he takes a sulphur bath four or five days after the lead treatment has been discontinued. If a person is rubbed with iodide of potassium shortly after having applied Vigo’s plaster (plaster of ammoniacum with mercury), or the Neapolitan ointment (mercurial ointment), iodide of mercury and caustic potash will be formed, which will cause vesication. So also vomiting occurs if lemonade made with tartaric acid is taken five or six days after the administration of white oxide of antimony.” (Trousseau and Reveil.)

Lists of incompatibles are published in many pharmaceutical and medical works, but are, in reality, of little use beyond illustrating rules

and principles which are familiar to every chemist, and which every prescriber should also be intimately acquainted with.

INCRUSTATION, Prevention of, in Steam Boilers. With all qualities of water commonly used for feeding steam boilers there is a tendency to the production of hard calcareous deposits or layers of incrustation within the boiler, due to the separation of lime salts (particularly the carbonate and sulphate, or mixtures of these with a certain amount of carbonate of magnesia) as the direct consequence of the accumulation of these impurities from large quantities of water evaporated. The sparing solubility of the sulphate of lime (gypsum) in hot water fully accounts for its deposition in the boiler, and the carbonate of lime (chalk) is thrown down, not only as the result of direct evaporation, but by the ebullition expelling free carbonic acid, which holds this body to some extent in solution. Rain water, which of itself is too pure to give rise to these incrustations, cannot be used *alone* for boiler purposes, for it has been found to exert a highly corrosive action upon the iron plates and fittings. It can, however, be advantageously employed in conjunction with ‘hard’ spring or river waters, and has the effect of diminishing the incrustation merely as the result of dilution. The drain pipes leading from the roof of the factory may be placed in connection with the tank or well from which the supply of water is drawn for the boilers. It will be seen, hereafter, that the self-same remedy is efficient both as a means of preventing incrustation and obviating corrosion, and that by using one of the alkaline substances about to be specified this twofold advantage may be secured. Iron will not rust when immersed in water containing a mere trace of caustic alkali, and it is a common observation that the iron vessels used in the preparation of potash and soda remain for any length of time free from all appearance of rust. This singular property is, no doubt, susceptible of important applications, amongst them may be mentioned the better protection of iron ships from the attack of bilge water, of hydraulic rams, moulding boxes, smiths’ tools, and other objects liable to be placed at times under the influence of water. Some forms of surface-condensers become quickly corroded in consequence of the purity of the water accumulating in them by the process of distillation, and a small dose of caustic alkali is then useful as a means of protection; the engine-cylinders also are to some extent preserved when alkaline anti-incrustation fluids are introduced into the boiler, for the minute quantity which is carried forward mechanically in the form of spray mixed with the steam suffices to preserve the iron. Whilst a tendency to ‘priming’ undoubtedly results from a too liberal use of soda or other alkali in the boiler, it will in practice be found easy to adjust the proportion of this ingredient, so as to secure immunity from corrosion and

incrustation, and, at the same time, avoid the tumultuous kind of ebullition known as 'priming.' In all cases it is advisable to carry out a rigid system of inspection, and it is only in the way of saving fuel and labour that the application of boiler-fluids is to be recommended.

Much benefit has often resulted from a coating of coal-tar or 'dead oil' applied to the interior surfaces below the water line, when the boiler is opened for cleaning and inspection. These will tend very considerably to lessen the adhesion of calcareous crusts, and are not in any way affected by the boiler fluids in common use. Soda crystals and caustic soda may be used with great success in boilers to effect the immediate precipitation of the lime salts, and they act by throwing down a finely divided form of carbonate of lime, which in time furnishes nuclei for the deposition of subsequent accretions both of the carbonate and sulphate, so that they are prevented from crystallising upon the walls of the boiler. A granular mud is thus formed, which subsides quickly and may be for the most part got rid of through the 'blow-off cock,' which should be opened for this purpose two or three times every day, and run out with as little water as possible.

The use of caustic soda has undergone a thorough trial at the hands of Mr. J. Spiller, F.C.S., in the boilers of the Royal Arsenal, Woolwich, and we are favoured with the following general instructions regarding its use, which are based upon an experience of upwards of ten years. The caustic soda should be dissolved in water so as to make a concentrated solution of specific gravity 1.300. This, being perfectly miscible with water, may be introduced into the boiler with the feed-water at any time when, from the pressure of steam, it may not be convenient to pour it through the safety valve or other openings in the boiler. But when the steam is down there is no difficulty in introducing the prescribed dose by using a tin funnel with flattened aperture to pass it through the safety valve; or a tubular arrangement with double cocks will answer at all times. Half a gallon per diem is the average quantity found sufficient for a 20-horse stationary boiler, working with Thames water for ten hours daily. If the water should happen to be unusually hard a larger dose may be employed, but it would not be expedient to add in one charge more than the amount required for the day's consumption. Locomotive and multitubular boilers have been worked successfully with caustic soda, and it is here that the importance of using anti-incrustation fluids makes itself most apparent.

Many other methods have at various times been proposed to prevent the formation of deposits in steam boilers. Dr. Ritterband's method consists in simply throwing a little sal-ammoniac into the boiler, by which carbonate of ammonia is formed, which passes off with the steam, and chloride of calcium, which

remains in solution. In Holland this plan has been used with satisfaction for locomotive boilers. About 2 oz. of the salt may be placed in the boiler twice a week. The chloride of tin is equal to sal-ammoniac, and is similar in its action. Carbonate of soda has been recommended by Kuhlmann and Fresenius of Germany, and by Crace Calvert of England. It is now employed generally in the boilers of engines in Manchester. The common plan adopted by working engineers to prevent incrustations from either variety of water is, on each occasion of cleaning out the boiler, to introduce some substance which, by its mechanical action, shall prevent the precipitated earthy matter caking together, or adhering to the boiler plates. Some common tar, bitumen, or pitch, appears to answer well under most circumstances. Mr. Ira Hill recommends the use of 3 or 4 shovelfuls of coarse sawdust. He states that, after adopting the use of this article, he never had any difficulty from lime, although using water strongly impregnated with it, and has always found the inside of his boilers as smooth as if just oiled. We have worked a powerful boiler daily for months without opening the 'man-hole,' after throwing a few pounds of potatoes into it. In all cases, when the earthy matter can be kept in a state of solution, or precipitated in a pulverulent form, it is easily removed from the boiler by what engineers term 'priming,' which is allowing the hot water to be blown over with the steam, so that, after a sufficient time, the whole original contents of the boiler are removed, and replaced by fresh water. Before doing so, however, it is of consequence to cut off the communication with the cylinders, and to open the waste-steam cock.

INCUBATION (Artificial). The hatching of eggs by artificial heat. This has been practised by the Egyptians from a very remote period. M. Bonnemain has the honour of having introduced this art to Western Europe, in 1775, and having been the first to pursue it successfully on the commercial scale. The source of heat employed by him was a circulatory hot-water apparatus, and the temperature maintained by it 100° Fahr. His plan was to introduce, daily, 1-20th only of the eggs the apparatus was capable of receiving, so that on the 21st day the first chickens were hatched, and a like number every day afterwards as long as the supply of eggs was kept up. Among the trays containing the eggs he placed saucers of water, to compensate for the absence of moisture derived in natural incubation by transpiration from the body of the hen. The chickens, as soon as hatched, were transferred to a 'nursery' or 'chick-room,' also artificially heated, and were fed with crushed millet seed. Several attempts have been made of late years to introduce artificial incubation into this country, with variable success.

INCUBUS. See NIGHTMARE.

INDIA RUBBER. See CAOUTCHOUC.

INDIGESTION. See DYSPEPSIA.

INDIGO. *Syn.* INDICUM, PIGMENTUM INDICUM, L. A blue dyestuff extracted from several plants growing in India and America, especially from the leguminous species *Indigofera tinctoria* and *I. cærulea*. It exists in the plant as a colourless juice. The method of manufacture consists in steeping the plant in water until fermentation sets in; the colouring matter dissolves in the water, forming a yellow solution, which is drawn off from the rest of the vegetable matter, and agitated and beaten to bring it freely into contact with the air for about 2 hours; this treatment causes the indigo to form and settle down as a blue precipitate; this is cut, while soft, into cubical cakes, and dried by artificial heat. To hasten the formation of the indigo, a little lime water is sometimes added to the yellow solution. The indigo of commerce contains INDIGO-BLUE or INDIGOTIN, its most important constituent, INDIGO-RED, and many other substances, some of which must be regarded as accidental impurities or adulterations.

Prop. Tasteless; scentless; of an intense blue colour, passing into purple; when rubbed with a smooth hard body, it assumes a coppery hue; insoluble in water, cold alcohol, ether, alkalies, hydrochloric acid, dilute sulphuric acid, and the cold fixed and volatile oils; slightly soluble in boiling alcohol and oils; freely soluble in concentrated sulphuric acid, and, when decoloured or reduced by contact with deoxidising substances, in alkaline lyes; soluble in creasote; its colour is destroyed by chromic acid, nitric acid, and chlorine; when suddenly heated, it gives off rich purple fumes, which condense into brilliant copper-coloured needles.

Pur. The best indigo is that which has the deepest purple colour, and assumes the brightest, coppery hue when rubbed with the nail; its fracture is homogeneous, compact, fine-grained, and coppery; its powder is of an intensely deep blue tint, and light enough to swim on water; and it leaves only a fine streak when rubbed upon a piece of white paper. In general, when indigo is in hard, dry lumps of a dark colour, it is considered of bad or inferior quality. Indigo, when in hard or brittle lumps, or in dust or small bits, is often adulterated with sand, pulverised slate, and other earthy substances.

Estimation. Various methods for estimating the value of samples of indigo have been proposed, but none of them can be depended upon to give perfectly accurate results. The plan recommended by O'Neill¹ is perhaps the best; it is performed as follows:—

Weigh 25 grs. of a fair sample of the indigo finely ground; and to soften and disintegrate it still further, boil it for a short time with weak caustic soda, and then, if there be any

¹ See 'Dictionary of Calico Printing and Dyeing.'

soft lumps or clots, strain through calico; mix this with 3 quarts of water in a narrow-necked bottle which it will nearly fill, and add 400 grs. of quicklime, which has been slaked as perfectly as possible; shake well up, and add 1000 grs. measure of solution of 'green copperas' (protosulphate of iron) at 30° Twaddell; cork the bottle closely, and leave it for three days, frequently shaking it in the interval. The indigo will be dissolved by this time; 1 quart of the clear solution is drawn off, shaken up in a bottle to oxidise it, acidified with acetic acid, and the pure indigo (INDIGOTIN) collected upon a filter, dried, and weighed. Four times the weight of the pure indigo is the per-centage of indigo in the sample.

Uses. As a dye stuff, indigo is of great importance, both from the beauty and permanence of the colour it yields, and from the ease with which it is applied to fabrics of all materials. As a medicine, it has been employed in various affections of a spasmodic character, as chorea, convulsions, epilepsy, hysteria, &c. In large quantities, it often induces giddiness, vomiting, and diarrhoea; and when continued for some time, muscular twitchings, resembling those arising from strychnine.—*Dose.* Beginning at about 15 grs., and gradually increased to 1, 2, or even 3 drs., at which it should be continued for 3 or 4 months; made into an electuary with honey or sugar, to which some aromatic may be added. See INDIGO DYE, INDIGOTIN, &c.

Indigo, Sul'phate of. *Syn.* SULPHINDYLIC ACID, SULPHINDIGOTIC A., SAXONY BLUE, SOLUBLE INDIGO.

Prep. By gradually adding indigo (in fine powder), 1 part, to fuming sulphuric acid (Nordhausen sulphuric acid), 5 parts, or oil of vitriol, 8 parts, contained in a stone-ware vessel placed in a tub of very cold water, to prevent the mixture heating; the ingredients are stirred together with a glass rod at short intervals until the solution is complete, after which the whole is allowed to repose for about 48 hours, by which time it becomes a homogeneous pasty mass of an intense blue colour, which in a dull light appears nearly black.

Obs. In this state it forms 'BARTH'S BLUE,' or the 'CHEMIC BLUE' or 'INDIGO COMPOSITION' of the dyer. Diluted with about twice its weight of soft water, it is converted into the 'SAXONY BLUE' or 'LIQUID BLUE' of the shops, also used for dyeing. When commercial sulphate of indigo is diffused through a large quantity of water, nearly boiling, and wool (old white flannel rags, &c.) is macerated in it for some time, the latter absorbs the whole of the sulphate and is dyed blue, whilst the liquor assumes a greenish-blue colour. Wool, so prepared, when well rinsed in cold water, and boiled for some minutes in a large quantity of that liquid containing 1½ or 2½ of carbonate of potassa, or a quantity equal to about 1-3rd that of the indigo originally employed, gives up its blue colour, and be-

comes of a dull brown. The liquid is now a rich blue-coloured solution of sulphindylate of potassa, from which the salt may be obtained by cautious evaporation. This compound is prepared on the large scale, by diluting sulphate of indigo with about 12 times its weight of soft water, and imperfectly saturating the solution with carbonate of potassa; the sulphindylate falls down as a dark-blue coppery looking powder, soluble in 140 parts of cold water and in about 90 parts of boiling water. This substance is kept both in the moist and dry state, and is known in commerce under the respective names of 'DISTILLED INDIGO,' 'PRECIPITATED INDIGO,' 'SOLUBLE INDIGO,' 'INDIGO PASTE,' 'BLUE CARMINE,' 'DISTILLED BLUE,' 'SOLUBLE BLUE,' &c. It is extensively used in dyeing; and when mixed with starch, whilst in the moist state, and made into cakes or knobs, it constitutes the finest variety of the 'BLUE' used by laundresses for tinging linen. The ammonia and soda salts may be prepared in the same way as the potassa salt, by substituting the carbonates of those bases for carbonate of potassa. The ammonia salt is very soluble.

INDIGO BLUE. See INDIGOTIN.

INDIGO DYE. There are two methods of preparing solutions of indigo for dyeing.—1. By deoxidising it, and then dissolving it in alkaline menstrua.—2. By dissolving it in sulphuric acid. The former method is used in preparing the ordinary INDIGO VAT of the dyers.

1.—*a.* (COLD VAT.) Take of indigo, in fine powder, 1 lb.; green copperas (clean cryst.), $2\frac{1}{2}$ to 3 lbs.; newly slaked lime, $3\frac{1}{2}$ to 4 lbs.; triturate the powdered indigo with a little water or an alkaline lye, then mix it with some hot water, add the lime, and again well mix, after which stir in the solution of copperas, and agitate the whole thoroughly at intervals for 24 hours. A little caustic potassa or soda is frequently added, and a corresponding portion of lime omitted. For use, a portion of this 'preparation vat' is ladled into the 'dyeing vat,' as wanted. After being employed for some time, the vat must be refreshed with a little more copperas and fresh-slaked lime, when the sediment must be well stirred up, and the whole thoroughly mixed together. This is the common vat for cotton.

b. (POTASH VAT.) Take indigo, in fine powder, 12 lbs.; madder, 8 lbs.; bran, 9 lbs.; 'potash,' 24 lbs.; water at 125° Fahr., 120 cubic feet; mix well; at the end of about 36 hours add 14 lbs. more potash, and after 10 or 12 hours longer further add 10 lbs. of potash, and rouse the whole up well; as soon as the fermentation and reduction of the indigo are well developed, which generally takes place in about 72 hours, add a little fresh-slaked lime. This vat dyes very quickly, and the goods lose less of their colour in alkaline and soapy so-

lutions than when dyed in the common vat. It is well adapted for woollen goods.

c. (WOAD VAT.) As the last, but employing woad instead of madder; the vat is 'set' at 160° Fahr., and kept at that temperature until the deoxidation and solution of the indigo has commenced. The last two are also called the 'warm vat.'

d. (PASTEL VAT.) This is 'set' with a variety of woad which grows in France, and which is richer in colouring matter than the plant commonly known as 'woad.'

Obs. Wool, silk, linen, and cotton, may each be dyed blue in the indigo vat. The goods, after being passed through a weak alkaline solution, are subjected to the action of the vat for about fifteen minutes; they are then freely exposed to the air; the immersion in the vat and the exposure are repeated until the colour becomes sufficiently deep. Woad and madder improve the richness of the dye. Other deoxidising substances, besides those above mentioned, may be used to effect the solution of the indigo; thus a mixture of caustic soda, grape sugar, indigo, and water, is often employed on the Continent for this purpose; and orpiment lime, and pearlash are also occasionally used. When properly prepared, the indigo vat may be kept in action for several months by the addition of one or other of its constituents, as required. An excess of either copperas or lime should be avoided.

2. Solution of sulphate of indigo is added to water, as required, and the goods, previously boiled with alum, are then immersed in it, and the boiling and immersion are repeated until the wool becomes sufficiently dyed.

Obs. With this every shade of blue may be dyed, but it is most commonly employed to give a ground to logwood blues. The colouring matter has affinity for woollen and silk with or without 'mordant,' but none for cotton. A solution of soluble indigo (sulphindylate of potassa or soda), in water very slightly acid with sulphuric acid, imparts a very fine blue to cloth, superior in tint to that given by the simple sulphate. See DYEING, &c.

INDIGO PURPLE. *Syn.* PHŒNICINE. The name given by Mr. Crum to the purple precipitate obtained by filtration from a solution of indigo in fuming sulphuric acid, when largely diluted with water.

INDIGO RED. *Syn.* INDIGO RESIN, RED RESIN OF INDIGO. This is prepared by boiling alcohol (sp. gr. .830), on powdered indigo previously exhausted by digestion in dilute acids and in a strong alkaline solution. When heated, it is converted into a white sublimate (deoxidised indigo red), but recovers its red colour by the action of nitric acid.

INDIGO WHITE. *Syn.* INDIGOGENE, INDICYLE, REDUCED INDIGO, HYDROGENISED I., HYDRATE OF I. Reduced or deoxidised indigo blue.

Prep. The yellow alkaline solution obtained

by one or other of the processes noticed under INDIGOTIN is carefully protected from the air, both before and after precipitation with hydrochloric acid; and the precipitate, after being rapidly washed with recently boiled distilled water, or with very dilute sulphurous acid, is drained on a filter, dried in vacuo, and then at once transferred to a well-stoppered bottle.

Prop., &c. A grayish-white mass of minute crystals, generally light blue on the surface, and rapidly turning blue on exposure to the air; soluble in alkalies, alcohol, and ether, to which it imparts a yellow colour. These solutions deposit indigo blue on exposure to the air. A solution of this substance constitutes the indigo vat of the dyer (see *above*).

INDIGOTIN. *Syn.* CERULIN, INDIGO BLUE. This is the pure blue principle of indigo. It appears to be the oxide of the same organic radical of which indigo white is probably the hydrate.

Prep. 1. Indigo (in fine powder) is digested successively in dilute hydrochloric acid, solution of potassa, and alcohol; the dried residuum is crude indigotin.

2. Indigo (in fine powder), 1 part; green sulphate of iron, 2 parts; hydrate of lime, 3 parts; water, 15 parts; mix, agitate occasionally until the colour is destroyed, then decant the clear portion, precipitate with dilute hydrochloric acid, and wash the powder, first with water, and then with boiling alcohol, until the latter ceases to acquire a yellow colour.

3. Caustic soda and grape sugar, of each, 1 part; water, 20 parts; powdered indigo, 5 parts; mix, and proceed as last. The above are essentially the same as the indigo vat, but on the small scale.

4. The process for estimating the value of indigo given under INDIGO is a good process for obtaining indigotin.

Obs. The product from all the above exceeds 50% of the indigo operated on.

5. (Taylor.) Powdered indigo, 2 parts; plaster of Paris, 1 part; water, q. s. to reduce the mixture to a thin paste; spread the mass evenly upon an oblong iron plate to the depth of about $\frac{1}{4}$ inch, and dry it by a gentle heat. It must then be held over the flame of a spirit lamp, when a disgusting odour will be evolved, the mass will begin to smoke, and in a few minutes will be covered with a heavy purple vapour, which will condense into brilliant flattened prisms or plates of an intense copper colour, forming a thick velvety coating over the surface immediately exposed to the heat. Should the mass catch fire, it may be instantly extinguished by a drop of water let fall upon it. *Prod.* 15 to 18%. See INDIGO, &c.

INDURATION. In *pathology*, an increase in the consistence of any portion of the body, usually resulting from chronic inflammation, pressure, or friction.

INFANCY. "The domestic treatment of

infants and children is comprised in the application of the laws of health to the mother as well as to the child. The position of parent is one of serious responsibility, both morally and physically, and the edict has gone forth that 'the sins of the parent shall be visited on the children.' If we could ensure good mothers, we could vastly improve the race of men. The nursing mother of a sick infant must, by following faithfully the rules of health in respect of the four great hygienic principles—food, clothing, exercise, and ablution—give health with her milk to her offspring; she must also pay close attention to her mind, avoid all sources of irritation and anxiety, and remember that an angry mother sours her milk, and produces a fractious and often a diseased infant. I am quite of opinion, that if mothers were sound in constitution, and bestowed the requisite care upon the maintenance of their health, we should hear little of diseases of children. In children, as well as in parent, the rules of health must be carried out," and their neglect cannot fail to bring with it a heavy retribution. (Eras. Wilson.) See EXERCISE, NURSING, &c.

INFANT'S PRESERVATIVE (Atkinson's).

Carbonate of magnesia, 6 drs.; white sugar, $2\frac{1}{2}$ oz.; oil of aniseed, 20 drops; compound spirit of ammonia and rectified spirit, of each, $2\frac{1}{2}$ fl. drs.; laudanum, 1 fl. dr.; syrup of saffron, 1 oz.; caraway water, q. s. to make the whole measure 1 pint. Antacid, anodyne, and hypnotic.

INFECTION. *Syn.* CONTAGION. The communication of disease, either by personal contact with the sick or by means of effluvia arising from their bodies. Attempts have been made to restrict the term contagion to the former, and infection to the latter, but this distinction is now discarded by the majority of writers. The following are the principal diseases which are commonly regarded as contagious:—chicken-pox, cholera, cow-pox, dysentery, erysipelas, glanders, gonorrhoea, hooping-cough, hydrophobia, itch, measles, mumps, ophthalmia (purulent), plague, scald-head, scarlet fever, smallpox, syphilis, yaws. See DISINFECTANT, &c.

INFLAMMABLE AIR. See HYDROGEN.

INFLAMMATION. *Syn.* INFLAMMATIO, L. In *pathology*, a certain state of disease. The common symptoms of inflammation are pain, swelling, heat, and redness, attended with fever, and general constitutional derangement when severe.

The treatment of inflammations, whether trifling or serious, is essentially the same in principle, and only differs in degree. This consists in the adoption of the usual means for lowering the force of the circulation and the frequency of the pulse; of which bleeding, purging, a low diet, and the use of refrigerant drinks and lotions, form the most important part. The constitutional derangement or symptomatic inflammatory fever, and inflam-

fresh tops before the flowers are formed. Vermifuge.—*Dose.* A teacupful 3 or 4 times a day; also used as an astringent gargle and lotion. For internal use, an equal weight of liquorice root (sliced) is commonly added.

Alkaline Infusion. *Syn.* INFUSUM ALKALINUM, L. *Prep.* (Beasley.) Hickory ash, 1 pint; wood soot, $\frac{1}{2}$ pint; boiling water, 1 gall.; in 24 hours decant the clear. "A popular remedy in America for dyspepsia with acidity."

Infusion of Aloes. *Syn.* INFUSUM ALOES, L. *Prep.* 1. From hepatic or Socotrine aloes (in powder), 2 drs.; carbonate of potassa, $1\frac{1}{2}$ dr.; boiling water, 1 pint.

2. (Compound; INFUSUM ALOES COMPOSITUM, L.)—a. As the COMPOUND DECOCTION OF A. (Ph. L.), but using only a pint of boiling water.

b. (Fothergill.) Calumba and rhubarb, of each, 1 oz.; aloes, 2 drs.; lime water, 16 fl. oz.; spirit of horseradish, 1 fl. oz.; macerate in the cold for 12 hours, and strain. The last three, like the decoction, are aperient, antacid, stomachic, tonic, and emmenagogue.—*Dose.* 1 table-spoonful to a small wine-glassful, in water. The last one is an admirable medicine in dyspepsia, loss of appetite, and troublesome constipation.

Infusion of American Calumba. *Syn.* INFUSUM FRASERE, L. From the dried root of American calumba (*Fraseria Carolinensis*). A pure, powerful, and excellent bitter, destitute of aroma, and fully equal to gentian. (Lindley.)

Infusion of American Centaury. *Syn.* INFUSUM SABATI, L. From the herb (*Sabbatia angularis*). A pure bitter tonic, without astringency or aroma.

Infusion of American Senna. *Syn.* INFUSUM CASSIE MARYLANDICE, L. *Prep.* (Martin.) Leaves of American or wild senna (*Cassia Marylandica*), $1\frac{1}{2}$ oz.; coriander seed, $\frac{1}{2}$ dr.; boiling water, 1 pint. Purgative.

Infusion of Angelica. *Syn.* INFUSUM ANGELICE, L. From the root of garden angelica. A warm stomachic and diaphoretic; and, in large doses, aperient. It is a popular remedy in dyspepsia, flatulent colic, and heartburn.

Infusion of Aniseed. *Syn.* ANISEED TEA; INFUSUM ANISI, L. Carminative; an excellent adjunct to purgatives, to prevent griping; given to infants to relieve colic, &c. Dr. Prout recommends the use of water at 120° or 125° Fahr.

Antiscorbutic Infusion. *Syn.* INFUSUM ANTISCORBUTICUM, MISTURA ANTISCORBUTICA, L. *Prep.* Water trefoil (*Menyanthes trifoliata*), 1 oz.; orange peel, 2 drs.; boiling water, 1 quart; infuse for 8 or 10 hours, strain, and add of compound spirit of horseradish, 5 fl. oz. In scurvy.

Infusion of Arnica. *Syn.* INFUSUM ARNICE, L. 1. From the flowers of mountain arnica or German leopard's bane (*Arnica montana*). Cottereau orders 1 oz., Dr. Pereira $\frac{1}{2}$ oz., and Dr. A. T. Thomson, $\frac{1}{2}$ oz. of the

flowers to the pint. The first is the usual quantity. The dose of the first is a table-spoonful; of the second, $\frac{1}{2}$ to 1 fl. oz.; of third, $\frac{1}{2}$ to 1 wine-glassful.

2. (Compound; INFUSUM ARNICE COMPOSITUM, L.—Ph. Copenh.) Flowers of arnica, 1 dr.; peppermint, 2 drs.; chamomiles, $\frac{1}{2}$ oz.; boiling water, $\frac{1}{2}$ pint.—*Dose.* 1 fl. oz. As the last.

Infusion of Arnica-root. *Syn.* INFUSUM ARNICE RADICIS, L. *Prep.* (Ph. Castr. Ruth.) Arnica root, 40 grs.; water, 1 lb.—*Dose.* 1 fl. oz. As the above.

Astringent Infusion. *Syn.* INFUSUM ASTRINGENS, MISTURA A., L. *Prep.* 1. From oak-bark.

2. Infusion of cusparia, 17 fl. oz.; tincture of catechu or kino, 1 fl. oz.; powdered ipecacuanha, 1 dr.; powdered opium, 12 grs.; mix. In diarrhoea, &c. It must be well shaken before pouring out the dose.

Infusion of Balm. *Syn.* INFUSUM MELISSÆ, L. *Prep.* (Plenck.) Fresh herb, 5 drs.; boiling water, 1 pint; infuse for 15 minutes.

Infusion of Barberry. *Syn.* INFUSUM BARBERIS, L. *Prep.* (Dr. Copland.) From the bark of the barberry shrub (*Berberis vulgaris*). In jaundice, biliary fluxes, and other cases where heat and acrimony prevail; either alone or combined with a little carbonate of soda or potassa, and tincture of calumba.

Infusion of Bark. See INFUSION OF CINCHONA.

Infusion of Bay-leaves. *Syn.* INFUSUM LAURI, L. LAURI NOBILIS, L. From the leaves or the berries of the sweet bay (*Laurus nobilis*). Aromatic, stimulant, and emmenagogue; in very large doses, emetic and poisonous. It is chiefly given in colic, flatulence, paralysis of the extremities, and obstructed menstruation.

Infusion of Beef. See ESSENCE, TEA, &c.

Infusion of Belladonna. *Syn.* INFUSUM BELLADONNÆ, L. *Prep.* 1. (Dr. Paris.) Leaves of deadly nightshade (dried), 4 grs.; boiling water, 2 fl. oz.; for a dose.

2. (Compound;—Dr. Saunders.) Leaves (dried), $\frac{1}{2}$ dr.; boiling water, 12 fl. oz.; infuse, strain, and to every 7 fl. oz. of the infusion add of compound tincture of cardamoms, 1 fl. oz.

Infusion of Bistort. *Syn.* INFUSUM BISTORTÆ, L. *Prep.* (Radius.) Bistort or snake-weed root (*Polygonum Bistorta*), $\frac{1}{2}$ oz.; boiling water, 1 pint; infuse 2 hours, and strain. In passive hæmorrhages.

Infusion of Black Snake-root. *Syn.* INFUSUM CIMICIFUGÆ RACEMOSÆ, L. In dropsy, rheumatism, and chest complaints.

Infusion of Bleeding Thistle. *Syn.* INFUSUM CARDUI BENEDICTI, L. From the whole herb. In small doses it is diaphoretic; in larger ones, tonic, stomachic, and deobstruent; taken warm, it is occasionally given to promote the action of emetics. The properties of carduus benedictus "are such as to lead us to the belief

that it has been superseded by other not more efficacious remedies." (Lindley.)

Infusion of Blood-root. *Syn.* INFUSION OF PULMONARIA; INFUSUM SANGUINARIÆ, L. *Prep.* Blood-root (*Sanguinaria Canadensis*), $\frac{1}{2}$ oz.; boiling water, 1 pint. Stimulant and emetic.

Infusion of Blue Flag. *Syn.* INFUSUM TRIDIS VERSICOLORIS, L. *Prep.* 1. From the flowers of blue flag (*Iris versicolor*).—2. From the root or rhizomes. The first is used chiefly for its rich colour, as a test, &c.; the second is diuretic and cathartic, and apt to produce distressing nausea and prostration.

Infusion of Boneset. *Syn.* INFUSUM EUPATORII, L. *Prep.* 1. (Ph. U.S.) From the dried leaves and flowers of boneset or thoroughwort (*Eupatorium perfoliatum*). Diaphoretic, nauseant, and emetic when warm; tonic when cold.

2. (Compound; INFUSUM EUPATORII COMPOSITUM, L.—Ellis.) Boneset and sage, of each, $\frac{1}{2}$ oz.; cascarrilla, 1 dr.; boiling water, 1 $\frac{1}{2}$ pint; infuse until cold, and strain. In hectic fever. A wine-glassful of either of the above, given hourly, in these diseases, until perspiration and nausea are induced, has been highly recommended in influenza.

Infusion of Brazil-wood. *Syn.* INFUSUM LIGNI BRASILIENSIS, L. From ground or rasped Brazil wood. When wanted to keep, rectified spirit, 3 fl. oz., is added to every pint. Used for colouring, and as a test.

Infusion of Broom. *Syn.* INFUSUM SCOPARI, L. See DECOCTION OF BROOM.

Infusion of Buchu. *Syn.* INFUSUM BUCHU (B. P.), I. BUCKU (Ph. E.), I. DIOSMÆ, L. *Prep.* 1. (B. P.) From bruised buchu leaves, 1 oz.; boiling distilled water, 1 pint: infuse for an hour and strain. Diuretic, sudorific, tonic; in dyspepsia, &c.; but chiefly in chronic affections of the bladder and urethra attended with copious secretion.—*Dose.* 1 to 2 oz.

2. (Compound; INFUSUM BUCHU COMPOSITUM, I. DIOSMÆ C., L.—Radius.) Leaves of buchu and whortleberry, of each, $\frac{1}{2}$ oz.; boiling water, 8 oz. (say $\frac{1}{2}$ pint); digest for half an hour, strain, and add of syrup of senega, $\frac{1}{2}$ fl. oz.—*Dose.* 1 or 2 table-spoonfuls every hour; in atony of the bladder and mucous discharges.

Infusion of Buckbean. *Syn.* INFUSUM ME-
NYANTHIS, L. From the herb or root of buck-
bean or marsh trefoil (*Menyanthes trifoliata*).
Bitter, stomachic, tonic, and diuretic; in large
doses, purgative, vermifuge, and emetic. It
has been recommended in agues, gout, dropsy,
scurvy, worms, &c. The chief consumption of
this plant is by the brewers; "2 oz. being equal
to 1 lb. of hops." (Gray.)

Infusion of Burdock. *Syn.* INFUSUM BAR-
DANÆ, L. From the root of common burdock.
Aperient, diuretic, diaphoretic, and tonic; in
gout, rheumatism, skin diseases, &c. See DE-
COCTION and EXTRACT.

Infusion of Calumba. *Syn.* INFUSUM CA-
LUMBÆ (B. P.),—L. *Prep.* 1. (B. P.) Calumba,

in coarse powder, 1 oz.; cold distilled water,
2 oz.; macerate one hour, and strain. In-
fusion of calumba is a good tonic and sto-
machic bitter.—*Dose.* 1 to 3 fl. oz.; in dys-
pepsia, &c., and for restraining vomiting and
diarrhœa during pregnancy or dentition. It
is preferably joined with small doses of the
carbonates of soda, potassa, ammonia, or
magnesia, when there is acidity; or with
chalybeates, when there is paleness and a
low pulse; with all of which substances it
may be mixed without suffering any sensible
alteration.

2. (Concentrated; INFUSUM CALUMBÆ CON-
CENTRATUM, L.)—*a.* Calumba, in coarse pow-
der, 5 $\frac{1}{2}$ oz.; cold distilled water, 12 fl. oz.;
digest, with frequent agitation, for 3 or 4
hours, then express the liquor, and repeat the
digestion with 5 $\frac{1}{2}$ fl. oz. more of tepid water;
after another hour, express this portion also,
using as much force as possible; next mix the
liquors, heat them quickly to the boiling-point
in a shallow vessel, and pour the infusion,
whilst still hot, into a strong bottle, and when
it has cooled a little add of rectified spirit, 4
fl. oz., secure down the stopper or cork, and
agitate well for a few minutes; the bottle must
now be set aside for a week, after which the
clear portion is to be decanted from the dregs.
Very superior.

b. (Wholesale.) From calumba (reduced to
coarse powder), 5 $\frac{1}{2}$ lbs.; rectified spirit, 5 pints;
(diluted with) water, 12 pints; digest for a
week, or proceed by displacement. Should
there be any difficulty in obtaining it free
from cloudiness, the whites of 4 or 5 eggs, pre-
viously mixed with about a $\frac{1}{4}$ pint of cold
water, may be added to the infusion, which,
after being well agitated for about 10 minutes,
must be allowed to repose for 7 or 8 days, and
then decanted from the dregs. Should it not
be perfectly transparent, it may be filtered
through blotting paper.—*Product.* 20 lbs.

Obs. The concentrated infusion produced by
the above formulæ is of very superior quality,
and has acquired an extensive sale in the
wholesale trade. 1 part added to 5 $\frac{1}{4}$ parts of
water makes a perfectly transparent liquid,
possessing exactly similar virtues to the INFU-
SION OF CALUMBÆ—B. P.

Infusion of Cantharides. *Syn.* INFUSION OF
SPANISH FLIES; INFUSUM CANTHARIDIS, I.
LYTTÆ, L. *Prep.* (Soubeiran.) Spanish flies
(powdered), 20 grs.; boiling water, q. s. (about
3 $\frac{1}{2}$ fl. oz.) to yield 3 fl. oz., after expression and
filtration.

Infusion of Capsicum. *Syn.* INFUSUM CAP-
SICI, L. *Prep.* 1. (Pereira.) Capsicum (pow-
dered), $\frac{1}{2}$ oz.; boiling water, 1 pint.—*Dose.* $\frac{1}{2}$
fl. oz.

2. (Stephen's 'PEPPER MEDICINE'—Pereira.)
Red pepper (*Capsicum frutescens*), 2 table-
spoonfuls (or 3 of cayenne pepper); common
salt, 2 teaspoonfuls; boiling water, $\frac{1}{2}$ pint; to
the strained liquor, when cold, add of very
sharp vinegar, $\frac{1}{2}$ pint.—*Dose.* 1 table-spoonful,

slowly swallowed, every half hour, in cholera, malignant sore throat, scarlatina, &c.

Infusion of Caraway. *Syn.* CARAWAY TEA; INFUSUM CARUI, L. *Prep.* From bruised caraway seed, 3 drs.; boiling water, 1 pint. In the flatulent colic of infants, and as an adjunct to aperient medicine.

Infusion of Carrot Seed. *Syn.* INFUSUM DAUCI, I. CAROTÆ, L. Diuretic; in dropsy and nephritic complaints; $\frac{1}{2}$ to 1 pint being taken daily.

Infusion of Cascarilla. *Syn.* INFUSUM CASCARILLÆ (B. P.), L. *Prep.* 1. (B. P.) Cascarilla, in coarse powder, 1 oz.; boiling distilled water, 10 oz.; infuse for one hour in a closed vessel, and strain.—*Dose.* 1 to 2 oz., usually combined with carbonate of soda and tincture of cascarrilla. It is an excellent medicine in dyspepsia, debility, diarrhoea, &c.

2. (Concentrated; INFUSUM CASCARILLÆ CONCENTRATUM, L.)—*a.* Cascarrilla (good and fragrant, bruised), 6 $\frac{1}{2}$ lbs.; rectified spirit of wine, 3 pints; cold water, 6 pints; macerate in a close vessel for 14 days, express the liquor, and filter.

b. As the last, but proceeding by the process of percolation.

Obs. If the preceding processes are well managed, the product is 10 lbs., and resembles brandy in colour and transparency, and is delightfully fragrant. 1 part of this infusion mixed with 6 $\frac{1}{2}$ parts of water makes a preparation exactly resembling the INFUSION OF CALUMBA—B. P.

3. (Alkaline; INFUSUM CASCARILLÆ ALKALISATUM, L.)—*Ph. Palat.* Cascarrilla, 3 oz.; carbonate of potassa, 2 drs.; boiling water, 16 fl. oz. Antacid and tonic.—*Dose.* 1 table-spoonful.

Infusion of Cassia. *Syn.* CASSIA TEA; INFUSUM CASSIÆ PISTULÆ, L.; EAU DE CASSE, Fr. *Prep.* (Soubeiran.) Cassia pods (bruised), 4 oz.; boiling water, 1 $\frac{1}{2}$ pint. Laxative.

Infusion of Catechu. *Syn.* COMPOUND INFUSION OF CATECHU; INFUSUM CATECHU (B. P.), L. *Prep.* (B. P.) Catechu in coarse powder, 160 grs.; cinnamon, bruised, 30 grs.; boiling water, macerate for half an hour in a covered vessel, and strain. Astringent in diarrhoea.—*Dose.* 1 to 2 oz. three or four times a day, or after every liquid dejection.

Infusion of Cayenne Pepper. See INFUSION OF CAPSICUM.

Infusion of Centaury. *Syn.* INFUSUM CENTAURI, L. From the flowering tops of common or lesser centaury (*Erythraea centaurium*). Bitter, febrifuge, stomachic, and vermifuge. A popular remedy in obstructions, jaundice, debility, dyspepsia, &c.; and externally, for the itch, and to destroy pediculi. An infusion is also made of the root, which is about one half more powerful than the tops. The plant is "a valuable native medicine; in the places where it grows it is carefully collected for use in rustic pharmacy." (Lindley.)

Infusion, Cephalic. *Syn.* INFUSUM CEPHALICUM, L. *Prep.* (Edin. Hosp.) Valerian root, 2 oz.; rosemary tops, 4 drs.; boiling water, 1 quart; infuse 12 hours, strain, and add aromatic water, 4 fl. oz. As an antispasmodic, and in various affections of the head.

Infusion of Chamomile. *Syn.* CHAMOMILE TEA; INFUSUM ANTHEMIDIS (B. P.), I. CHAMÆMELI, L. *Prep.* 1. (B. P.) Chamomile flowers, $\frac{1}{2}$ oz.; boiling water, 10 oz.; infuse for fifteen minutes, and strain.

Tonic, bitter, and stomachic; also emetic. It should be drunk cold, as it is emetic when warm.—*Dose.* As a stomachic, 1 to 3 oz.; as an emetic, 5 to 10 oz.

2. (Concentrated; INFUSUM ANTHEMIDIS CONCENTRATUM, L. From chamomiles, 5 $\frac{1}{2}$ oz.; water, 1 pint; boil till the mixture weighs exactly 21 oz.; express the liquor by means of a powerful tincture-press, cool, and add of essential oil of chamomile, 15 drops, dissolved in rectified spirit, 5 fl. oz.; agitate well, let it repose until the next day, then decant the clear, and filter. Strongly bitter and odorous, and beautifully transparent. 5 $\frac{1}{2}$ times as strong as the ordinary INFUSION—B. P.

Infusion of Cherry-laurel. *Syn.* INFUSUM LAURO-CERASI, L. *Prep.* (Dr. Cheston.) Fresh leaves of the common or cherry-laurel (*Cerasus Lauro-cerasus*), 2 $\frac{1}{2}$ oz.; boiling water, 1 pint; infuse, strain, and add of clarified honey, 2 $\frac{1}{2}$ oz. As a lotion in cancer of the lip, and as a wash for malignant ulcers.

Infusion of Chiretta. *Syn.* INFUSUM CHIRATÆ, L. *Prep.* 1. (B. P.) Chiretta, cut small, 1 oz.; distilled water, at 120° F., 40 oz.; infuse half an hour, and strain.—*Dose.* 1 to 2 oz.

Obs. Chiretta is a pure tonic bitter, closely allied to gentian, and has been long esteemed in the East Indies as a remedy for acidity, flatulence, and dyspepsia, especially when occurring in gouty or debilitated habits. It is usually given in combination with carbonate of soda or salts of iron. The whole of the plant is employed.

2. (Concentrated; INFUSUM CHIRETÆ CONCENTRATUM, L.) From chiretta, 4 oz.; for each pint of the product, prepared as either CONC. INFUSION OF CALUMBA or CASCARILLA. Eight times as strong as the common infusion.

Infusion of Cinchona. *Syn.* INFUSION OF BARK; INFUSUM CINCHONÆ, L. *Prep.* 1. (B. P.) Yellow cinchona (calisaya) bark, in coarse powder, 1 oz.; boiling distilled water, 1 pint; infuse for 2 hours in a covered vessel, and strain.

Obs. Infusion of bark is tonic and stomachic, and in very large doses febrifuge. It is an extremely useful medicine in dyspepsia, debility, and during convalescences, and is often a valuable adjunct to more active remedies. Like the decoction, it is most energetic when strained whilst hot. The addition of 1 fl. dr. of diluted sulphuric acid to the water before pouring it on the bark increases its solvent power, and, consequently, the strength of the infusion.—*Dose.* 1 to 3 fl. oz.

2. (Concentrated; INFUSUM CINCHONÆ CONCENTRATUM, L.)—*a.* Yellow bark (coarsely powdered), 4 lbs.; boiling water, 8 lbs.; digest for 12 hours, express the liquid, add rectified spirit, 2 lbs., and after 24 hours' repose, decant the clear portion.

b. Yellow bark (in coarse powder), 4 lbs.; cold water, 8 lbs.; rectified spirit, 2 lbs.; dilute sulphuric acid, 4 fl. oz.; mix the fluids, and either macerate the bark in them for a week in a closed vessel, or proceed by the method of displacement. Very superior.

Obs. 1 fl. dr. of either of the above, added to 7 fl. drs. of water, produces an extemporaneous infusion of cinchona resembling that of the pharmacopœia. The concentrated preparation of the Ph. L. being more than 8 times the usual strength, is placed amongst LIQUORS.

3. From PALE BARK:—*a.* (Ph. L.; INFUSION OF PALE CINCHONA; INFUSUM CINCHONÆ PALLIDÆ—Ph. L.) From pale bark, as INFUSION OF CINCHONA—Ph. L.

b. (Ph. D.; INFUSUM CINCHONÆ—Ph. D.) Crown or pale bark, 1 oz.; boiling water, $\frac{1}{2}$ pint; infuse 1 hour in a covered vessel, and strain through paper.

Obs. "This infusion is inferior to the preceding" (from yellow bark) "in activity, and is a very unnecessary one. It is said to oppress the stomach less than that of the other cinchona bark; the reason is obvious—it is weaker." (Pereira.)

c. (Concentrated; INFUSUM CINCHONÆ PALLIDÆ CONCENTRATUM, L.) As CONCENTRATED INFUSION OF CINCHONA, but using pale bark. The concentrated preparation of the Ph. L. will be found under LIQUORS.

Infusion of Cin'namon. *Syn.* CINNAMON TEA; INFUSUM CINNAMOMI, L. In flatulence, dyspepsia, and nervous colics.

Infusion of Cloves. *Syn.* CLOVE TEA; INFUSUM CARYOPHYLLORUM, I. CARYOPHYLLI (B.P.), L. *Prep.* 1. (B.P.) Cloves (bruised), 1 oz.; boiling distilled water, 20 oz.; infuse for half an hour, and strain. Aromatic, stimulant, and stomachic, either alone or in combination; in colic, dyspepsia, gout, &c.—*Dose.* 1 to 2 oz.

2. (Concentrated; INFUSUM CARYOPHYLLI CONCENTRATUM, L.)—*a.* Bruised cloves, 3 oz.; boiling water, 16 fl. oz.; infuse as above and strain; when cold, add of rectified spirit, $\frac{1}{2}$ pint, and filter.

b. Bruised cloves, $1\frac{1}{2}$ lb.; rectified spirit, 1 quart; cold water, 3 quarts; macerate for 7 days, and express the liquid; sprinkle the marc with water, 12 fl. oz., and after the lapse of an hour, again submit it to the press; lastly, filter the mixed liquors. Very fine. The above are about 8 times the strength of the INFUSION OF CLOVES—Ph. L.

Infusion of Coffee. *Syn.* INFUSUM CAFFEE, L. *Prep.* (Dr. McBride.) Unroasted coffee berries (bruised), 30 in no.; cold water, 1 quart; macerate 2 or 3 hours. In calculus, &c.—*Dose.* $\frac{1}{2}$ pint every morning.

Obs. Sir J. Floyer and Sir J. Pringle cured asthma with a strong solution of roasted coffee. M. Bouchardat prescribes a strong infusion made by displacement (percolation), and mixed with a little brandy, in poisoning by opium and other like narcotics, after the administration of emetics and ioduretted water. M. Honore also employs very strong-made coffee in albuminuria. Clausen gives it in gout, and Parker employs it as a nervous stimulant in lieu of ammonia and wine, for persons of a slightly sensitive and excitable temperament.

Infusion of Contrayer'va. *Syn.* INFUSUM CONTRAYERVÆ, L. *Prep.* (Pereira.) Contrayer'va (in powder), 1 oz.; boiling water, 12 fl. oz. Stimulant, tonic, and diaphoretic; in low fevers, &c.

Infusion of Copal'che Bark. *Syn.* INFUSUM COPALCHI CORTICIS, L. *Prep.* (Dr. Stark.) Bark of copalche bush (*Croton pseudo-China*), $\frac{1}{2}$ oz.; boiling water, 1 pint; digest 2 hours, and strain. A warm bitter and stomachic.

Infusion of Corsican Moss. *Syn.* INFUSUM HELMINTHOCORII, L. *Prep.* (Farr.) Corsican moss, 5 drs.; boiling water, 1 pint; macerate for 10 or 12 hours, and strain. *Ad libitum*, in cancer. See DECOCTION.

Infusion of Cuspa'ria. *Syn.* INFUSION OF ANGOSTURA BARK; INFUSUM CUSPARIÆ (B.P.), I. ANGUSTURÆ, L. *Prep.* (B.P.) Cusparia, in coarse powder, 1 oz.; distilled water, at 120°, 20 oz.; infuse 2 hours, and strain. Stimulant and tonic; in typhus fever, bilious diarrhœa, dysentery, &c.

Infusion of Daffodil. *Syn.* INFUSUM NARCISSI PSEUDO-NARCISSI, L. *Prep.* (Dufresnoy.) Flowers of daffodil (*Narcissus Pseudo-Narcissus*), 3 to 16 in no.; boiling water, 1 pint. Expecterant, nauseant and emetic. In whooping-cough.

Infusion of Dah'tia Pet'als. From the violet or blue varieties. Used for its colour, and as a test.

Infusion of Dandelion. *Syn.* INFUSION OF TARAXACUM; INFUSUM TARAXACI, L. 1. From the sliced root. Stimulant, resolvent, and tonic.

2. (Concentrated; INFUSUM TARAXACI CONCENTRATUM, L.) From the root (sliced), 1 lb.; exposed to a current of warm dry air until crisp, then coarsely pulverised, and digested for a week in a mixture of rectified spirit, 12 fl. oz.; cold water, $\frac{1}{2}$ pint. 8 times the usual strength.

3. (Compound; INFUSUM TARAXACI COMPOSITUM, L.—Meigs.) Infusion of dandelion, 4 fl. oz.; extract of do., 2 drs.; sesquicarbonate of soda, $\frac{1}{2}$ dr.; tartrate of potassa, 3 drs.; tincture of rhubarb, 3 fl. drs.; tincture of henbane, 20 drops. In dropsical and visceral affections.—*Dose.* 1-3rd part, thrice daily. See DECOCTION, EXTRACT, &c.

Infusion of Digita'lis. See INFUSION OF FOXGLOVE.

Diuretic Infusion. *Syn.* INFUSUM DIURETICUM, L. *Prep.* 1. Broom tops, 1 oz.;

boiling water, 1 pint; infuse 1 hour, strain, cool, and add of sweet spirits of nitre, 3 fl. drs.—*Dose*. A wine-glassful every other hour.

2. Infusion of foxglove, 1 fl. oz.; tincture of foxglove, $\frac{1}{2}$ fl. dr.; acetate of potassa, 1 dr.; laudanum, 10 drops.—*Dose*. 1 table-spoonful twice or thrice a day, carefully watching the effects.

3. Juniper berries, 2 oz.; aniseed, $\frac{1}{2}$ oz.; boiling water, 1 pint; infuse 1 hour; strain, and when cold, add of compound spirit of juniper, 2 fl. oz.; tincture of squills, 1 fl. dr.; nitre, 1 dr.—*Dose*. $\frac{1}{2}$ a teacupful frequently. All the above are used as diuretics in dropsy. See INFUSIONS OF BROOM, FOXGLOVE, and JUNIPER.

Infusion of Dog'wood. *Syn.* INFUSUM CORNUS FLORIDÆ, L. From the bark of American dogwood (*Cornus Florida*). See DECOCTION.

Infusion of El'der Flowers. *Syn.* ELDER-FLOWER TEA; INFUSUM SAMBUCI FLORUM, L. From the picked flowers, $\frac{1}{2}$ oz.; boiling water, 1 pint. Pectoral, expectorant, and diaphoretic, either alone or sweetened with honey.

Infusion of El'ecampane. *Syn.* INFUSUM INFUSION OF Elm-bark. *Syn.* COMPOUND INFUSION OF ELM-BARK; INFUSUM ULMI COMPOSITUM, L. *Prep.* (Cadet.) Elm-bark, bitter-sweet, burdock, and fumitory, of each, 2 drs.; boiling water, 1 pint; digest for 4 hours, strain, and add of syrup of sarsaparilla, 1 oz. The whole to be taken in 24 hours, in divided doses, in the chronic exanthemata. See DECOCTION.

Infusion of Er'got of Rye. *Syn.* INFUSUM ERGOTÆ (B. P.), L. *Prep.* 1. (B. P.) Ergot, 1, in coarse powder, 1 oz.; boiling distilled water, 40 oz.; infuse $\frac{1}{2}$ an hour in a covered vessel, and strain. Should be made fresh when required.—*Dose*. 1 to 2 oz. every $\frac{1}{2}$ hour or hour, as a parturient. Also as an injection for gleet.

2. (Concentrated.) See LIQUOR OF ERGOT.

Infusion of Fen'nel. *Syn.* FENNEL TEA; INFUSUM FENICULI, L. *Prep.* From sweet fennel-seeds, $\frac{1}{2}$ oz.; boiling water, 1 pint. In griping and windy colic of infants; a few drops to $\frac{1}{2}$ a teaspoonful for a dose, or a little by way of enema.

Infusion of Flax-seed. See INFUSION OF LINSEED.

Infusion of Fox'glove. *Syn.* INFUSUM DIGITALIS (B. P.), L. *Prep.* 1. (B. P.) Digitalis, dried, 30 grs.; distilled water, 10 oz.; infuse 1 hour, and strain.—*Dose*. $\frac{1}{4}$ to $\frac{1}{2}$ oz.

2. (Ph. E.) Foxglove (dried), 2 drs.; boiling water, 18 fl. oz.; spirit of cinnamon, 2 fl. oz.

3. (Ph. D.) Foxglove (dried and reduced to a coarse powder), 1 dr.; boiling water, 9 fl. oz.; infuse 1 hour. The product should measure about 8 fl. oz. The last two are of double the strength of the infusion Ph. L., and the dose must consequently be only 2 to

4 fl. drs. "I believe this, when properly made, to be the most effectual of the preparations of foxglove." (Pereira.) See FOXGLOVE.

Infusion of Fu'mitory. *Syn.* INFUSUM FUMARIÆ, L. From the herbaceous portion of common fumitory (*Fumaria officinalis*). Aperient and diaphoretic; in obstinate skin diseases and chronic obstructions of the liver.

Infusion of Galls. *Syn.* INFUSUM GALLÆ, L. 1. From Aleppo galls, coarsely powdered. In diarrhœa, hæmorrhages, &c.; also freely, in cases of poisoning by the alkaloids; and diluted with 3 or 4 times its volume of water, for injections, embrocations, gargles, &c.

2. (Compound; INFUSUM GALLÆ COMPOSITUM, MISTURA GALLÆ, L.—Ellis.) Infusion of galls, 4 fl. oz.; prepared chalk, $\frac{1}{2}$ oz.; powdered gum, 1 dr.; tincture of opium, $\frac{1}{2}$ fl. dr.—*Dose*. 1 table-spoonful every 2 hours, in diarrhœa, &c.

Infusion of Gar'lic. *Syn.* INFUSUM ALLII, L. *Prep.* (White.) Garlic (recent), $\frac{1}{2}$ lb.; water, 4 lbs.; place them in a covered pot, set it in a very slow oven for 3 or 4 hours, and when cold, express the fluid portion.—*Dose*. In epilepsy, 2 teaspoonfuls before and after every meal; in chronic diarrhœa, a teaspoonful after every motion.

Infusion of Gen'tian. *Syn.* INFUSUM GENTIANÆ, L. *Prep.* 1. (Beral.) Gentian (bruised), 2 drs.; boiling water, 1 pint; infuse 5 or 6 hours, and strain. Stomachic.

2. (Compound; INFUSUM GENTIANÆ COMPOSITUM—B. P.)

Prep. a. (B. P.) Gentian, sliced, 1 oz.; orange peel, cut small, 1 oz.; lemon peel (fresh), 2 oz.; boiling distilled water, 1 pint; infuse for an hour in a covered vessel, and strain.—*Dose*. 1 to 2 oz.

b. (Ph. E.) Sliced gentian root, $\frac{1}{2}$ oz.; bitter orange peel (dried and bruised) and coriander seeds, of each, 1 dr.; proof spirit, 4 fl. oz.; digest for 3 hours, then add of cold water, 16 fl. oz., and in 12 hours more strain.

c. (Ph. D.) Gentian and dried orange peel, of each, 2 drs.; boiling water, $\frac{1}{2}$ pint; macerate 1 hour, and strain.—*Dose* of the last two, $\frac{1}{2}$ to 1 fl. oz.

3. (Concentrated Compound; INFUSUM GENTIANÆ COMP. CONCENTRATUM, L.)—a. Gentian root (bruised), 4 $\frac{1}{2}$ lbs.; boiling water, q. s. to cover it; infuse with occasional agitation for 2 hours, express the liquor, wash the marc with a little boiling water, and evaporate to 13 quarts; when cold, strain through flannel, add of rectified spirit, 1 gal., and pour the mixed fluids on dried orange peel, 4 $\frac{1}{2}$ lbs., and fresh lemon peel, 9 lbs.; macerate for 1 week, then express the liquor in a powerful press, and filter through paper.

b. Gentian and dried orange peel, of each, 4 $\frac{1}{2}$ lbs.; fresh lemon peel, 9 lbs.; cold distilled water, 13 quarts; rectified spirit, 1 gal.; macerate for 14 or 15 days, with frequent agitation, then express the liquid, add 1 dr. each of

the essential oils of lemon and orange, agitate well, and filter through paper.

c. Gentian, $1\frac{1}{4}$ lb.; essence of lemon, 1 dr.; essence of orange, $\frac{1}{2}$ dr.; essence of cedrat, 15 drops; rectified spirit, 1 quart; cold water, 3 quarts; digest for 10 days and filter.

4. (With RHUBARB; INFUSUM GENTIANÆ ET RHEI, MISTURA STOMACHICA, L.) From gentian and rhubarb (bruised), of each, 2 drs.; boiling water, 1 pint; digest 1 hour, and strain; to the cold infusion add of sesquicarbonate of ammonia, 1 dr. An admirable medicine in dyspepsia, hysteria, loss of appetite, constipation, chronic rheumatism, &c.

Infusion of Gin'ger. *Syn.* GINGER TEA; INFUSUM ZINGIBERIS, L. From the best unbleached Jamaica ginger, freshly bruised or grated. In flatulence, colic, and indigestion.

Infusion of Gin'seng. *Syn.* GINSENG TEA; INFUSUM GINSENG, I. RADICIS G., L. *Prep.* Ginseng (the root of *Panax Schinseng*), $\frac{1}{2}$ oz.; ginger (grated), 1 dr.; boiling water, 1 pint; macerate 1 hour, then add of cinnamon (bruised), $\frac{1}{2}$ dr.; infuse for another hour, and strain. Ginseng tea, made according to the above formula, has a wonderful reputation in China, as a stimulant, restorative, and aphrodisiac. In Europe, however, it is merely regarded as an aromatic demulcent.

Obs. American ginseng (the root of *Panax quinquefolium*) may be substituted for the Asiatic product.

Infusion of Gold'thread. *Syn.* INFUSUM COPTIS, L. From the root of *Coptis trifolia*. Bitter, stomachic; in dyspepsia, and as a mouth-wash in thrush.

Infusion of Gua'co. *Syn.* INFUSUM GUACO, L. From the bruised leaves and stems of guaco or huaco (*Mikania Guaco*). Sudorific and vulnerary; reputed in South America to be a powerful remedy for the bites of venomous serpents and for hydrophobia, but the trials in this country do not show it to be of any value in such cases.

Infusion of Guaiac'um. *Syn.* COMPOUND INFUSION OF GUAIAIACUM, I. OF THE WOODS; INFUSUM GUAIACI COMPOSITUM, AQUA BENEDICTA COMPOSITA, L. *Prep.* (Ph. D. 1826.) Guaiacum shavings, 6 oz.; bruised liquorice root, 1 oz.; saffraas bark, $\frac{1}{2}$ oz.; coriander seeds, 3 drs.; lime water, 96 fl. oz. (say 5 pints); infuse for 2 days, and strain.—*Dose.* 3 to 4 fl. oz., twice or thrice a day, in scrofula, rheumatism, gout, eruptions, &c.

Infusion of Gum. *Syn.* INFUSUM ACACIÆ, L. From gum acacia and lump sugar, of each, 2 oz.; boiling water, 1 pint; macerate until dissolved, then cool, and add of orange-flower water, $\frac{1}{2}$ fl. oz. A pleasant demulcent in coughs, hoarseness, &c.

Infusion of Hedge Hys'sop. *Syn.* INFUSUM GRATIOLÆ, L. *Prep.* (A. T. Thomson.) Hedge hyssop (*Gratiola officinalis*), dried, 2 drs.; boiling water, 8 fl. oz. Cathartic, diuretic, emetic, and vermifuge.—*Dose.* 3 to 6 fl.

drs.; in dropsies, gout, jaundice, &c. See EXTRACT.

Infusion of Hem'lock. *Syn.* INFUSUM CONII, I. CONII MACULATI, L. *Prep.* (Guy's Hosp.) Dried leaves of hemlock, and coriander seeds, of each, 2 drs.; boiling water, 8 oz.; infuse for 2 hours. Combined with acetate of ammonia, tincture of henbane, and syrup of poppies, in pulmonary complaints, &c.

Infusion of Henbane. *Syn.* INFUSUM HYOSCYAMI, L. *Prep.* 1. From fresh leaves, $\frac{1}{2}$ oz.; boiling water, 1 pint. As a lotion for painful ulcers, swelled face, &c.

2. (Compound; HENBANE FOMENTATION; INFUSUM HYOSCYAMI COMPOSITUM, L.—Radius.) Henbane leaves, poppy heads, and mallows, of each, 1 oz.; boiling water, 2 quarts. For painful ulcers, and in facial neuralgia, &c.

Infusion of Hops. *Syn.* HOP TEA; INFUSUM HUMULI, I. LUPULI (Ph. L.); L. *Prep.* (Ph. L.) Hops, 6 drs.; boiling distilled water, 1 pint; macerate for 4 hours in a covered vessel (press), and strain. Tonic and anodyne. Well-hopped mild ale is a good substitute.

Infusion of Horehound. *Syn.* HOREHOUND TEA; INFUSUM MARRUBII, L. From the leaves; demulcent, pectoral; a popular remedy in coughs, colds, hoarseness, and chest affections generally, taken freely.

Infusion of Horserad'ish. *Syn.* INFUSUM ARMORACIÆ, L. 1. From horseradish alone. Diuretic and stomachic.

2. (Compound; INFUSUM ARMORACIÆ COMPOSITUM, L.—Ph. L.) Horseradish (sliced) and mustard seed (bruised), of each, 1 oz.; boiling distilled water, 1 pint; macerate for 2 hours in a covered vessel, strain, and add of compound spirit of horseradish, 1 fl. oz. Stimulant, stomachic, and diuretic; in dropsies, paralysis, scurvy, chronic rheumatism, &c.

Infusion of Hys'sop. *Syn.* HYSSOP TEA; INFUSUM HYSSOPI, L. 1. From the leaves of *Hyssopus officinalis* (Linn.). Stimulant, stomachic, emmenagogue, and expectorant; in dyspepsia, flatulency, hysterical affections, &c.; also used by boxers as a wash for black eyes.

2. (Compound; INFUSUM HYSSOPI COMPOSITUM, L.—Ratier). Hyssop leaves, $2\frac{1}{2}$ drs.; liquorice, 2 drs.; boiling water, 1 quart. As a demulcent drink in catarrhal affections.

Infusion of Indian Sarsaparil'la. *Syn.* INFUSUM HEMIDESMI, L. From Indian or scented sarsaparilla (*Hemidesmus Indicus*). Dr. Ashburner orders it to be made with lime water (cold); but this plan is seldom followed.—*Dose and uses*, same as those of infusion of sarsaparilla.

Infusion of Iron (Bitter). *Syn.* INFUSUM FERRI AMARUM, L. *Prep.* (Dr. R. E. Griffith.) Iron filings, 3 oz.; gentian and ginger, of each, bruised, 1 oz.; orange peel, $\frac{1}{2}$ oz.; strong old cider, 1 pint; infuse for a month, frequently stirring, and filter.—*Dose.* $\frac{1}{2}$ to 1 dr., 3 or 4 times daily, as a chalybeate tonic.

Infusion of Ju'niper. *Syn.* INFUSUM JUNIPERI, I. BACCÆ J., L. 1. From the berries

alone. As a stimulant diuretic, in dropsies, &c.

2. (Compound; INFUSUM JUNIPERI COMPOSITUM, L.)—*a.* (Guy's Hosp.) Juniper berries, 2½ oz.; boiling water, 1 pint; to the strained solution, when cold, add, of compound spirit of juniper, 10 fl. drs.; bitartrate of potassa, 1 dr.

6. (Parrish.) Ginger, juniper berries, and mustard seed, of each, bruised, ½ oz.; horse-radish and parsley root, of each, bruised, 1 oz.; cider, 1 quart; infuse, and strain with expression. All the above are used in dropsies.

Infusion of Ki'no. *Syn.* INFUSUM KINO, L. From kino, 5 drs.; boiling water, 1 pint. In diarrhoea, and diluted with 4 or 5 times its bulk of water, as an injection in chronic gonorrhoea.

Infusion of Lime Flowers. *Syn.* LINDEN-FLOWER TEA; INFUSUM TILIAE, L. 1. From the flowers of the lime or linden tree (*Tilia Europaea*). Antispasmodic, diaphoretic, and cephalic.

2. (Compound; INFUSUM TILIAE COMPOSITUM, L.—Foy.) Chamomiles, linden flowers, and orange leaves, of each, 2 drs.; boiling water, 1 quart; infuse, strain, and add of syrup, 2 fl. oz. In nervous headaches, &c. The above are much used on the Continent.

Infusion of Linseed. *Syn.* LINSEED TEA, FLAXSEED T.; INFUSUM LINI (B. P.), L. *Prep.* (B. P.) Linseed (bruised), 160 grs.; fresh liquorice root (sliced), 60 grs.; boiling distilled water, 10 oz.; infuse for 4 hours and strain. A cheap and useful demulcent in pulmonary and urinary irritation; especially in catarrhs, gonorrhoea, &c.; *ad libitum*. Dr. Pereira recommends the addition of sliced lemon and sugar-candy, to render it more palatable. See DECOCTION.

Infusion of Liquorice. *Syn.* INFUSUM GLYCYRRHIZÆ, L. From the fresh root, sliced. Demulcent and laxative; taken *ad libitum*.

Infusion of Lit'mus. *Syn.* INFUSUM LACMI, L. Used for its colour, and as a liquid test, and to make test-paper.

Infusion of Lobe'lia. *Syn.* INFUSUM LOBELIÆ, I. L. INFLATÆ. From lobelia or Indian tobacco. In asthma chiefly.—*Dose.* 1 to 2 table-spoonfuls every half hour, until it occasions nausea.

Infusion of Log'wood. *Syn.* LOGWOOD TEA; INFUSUM HÆMATOXYLI, L. From logwood chips. One of the best remedies known for simple diarrhoea arising from weakness; also used as a colour and test. See DECOCTION, EXTRACT, &c.

Infusion (Maiden-hair). *Syn.* INFUSUM ADIANTI, L. From either common maiden-hair (*Adiantum capillus Veneris*), or Canadian maiden-hair (*Adiantum pedatum*). They are both slightly bitter, aromatic, and pectoral. The infusion forms an excellent demulcent drink in catarrhs.

Infusion of Malam'bo Bark. *Syn.* INFUSUM CORTICIS MALAMBO, L. *Prep.* (Ure.) Bark

(from *Croton Malambo*), 2 drs.; boiling water 1 pint. An aromatic tonic and astringent.

Infusion of Mallow Flowers. *Syn.* INFUSUM MALVÆ FLORUM, L. Pectoral and laxative. Chiefly used as a test.

Infusion of Malt. *Syn.* MALT TEA, SWEET WORT; INFUSUM BYNES, I. MALTI, L. Prepared with hot water (165° to 170° Fahr.). Demulcent and laxative. A useful drink in sore throat, inflammatory fevers, &c. Some persons flavour it with sliced lemon.

Infusion of Ma'rygold. *Syn.* INFUSUM CALENDULÆ, L. From the flowers of the common marygold (*Calendula officinalis*). Carminative, diaphoretic, and emmenagogue. It has been recently recommended in cancerous affections, both internally and as a lotion. Radius adds syrup of orange peel to flavour it.

Infusion of Mat'ico. *Syn.* INFUSUM MATICONIS, I. MATICÆ, I. MATICO, L. 1. From the leaves of the matico plant (*Artanthe elongata*). Aromatic, bitter, stimulant, and reputed hæmostatic; in internal hæmorrhages and mucous discharges. The Indians of South America use it as an aphrodisiac. (Martius.)

2. (Compound; INFUSUM MATICONIS COMPOSITUM, L.—Watmough.) Matico and senna, of each, 2 drs.; boiling water, 1 pint. In hæmorrhagic and other discharges, piles, &c.; a wine-glassful repeatedly.

Infusion of May-weed. *Syn.* INFUSUM COTULÆ, L. From the dried flowers of may-weed or stinking chamomile (*Anthemis cotula*). Bitter, stomachic, and diaphoretic; in large doses, emetic and sudorific; chiefly in hysterical affections, scrofula, &c.

Infusion of Mea'dow Rue. *Syn.* INFUSUM THALICTRI FLAVI, L. From the herb meadow rue (*Thalictrum flavum*). In hydrophobia, taken plentifully.

Infusion of Mil'foil. *Syn.* YARROW TEA; INFUSUM MILLEFOLII, L. In dropsies, and as a fomentation to bruises. See EXTRACT, &c.

Infusion of Min't. *Syn.* MINT TEA. 1. (Ph. D.—INFUSUM MENTHÆ SIMPLEX.) From the dried leaves of green or spearmint. Carminative and stomachic; chiefly used as a vehicle for other medicines. A wine-glassful *ad libitum*.

2. (Compound; INFUSUM MENTHÆ COMPOSITUM.) To mint tea 6 fl. oz., add of oil of spearmint, 3 drops, previously triturated with lump sugar, 2 drs., and dissolved in compound tincture of cardamoms, ½ fl. oz. A useful remedy in colic, flatulence, &c.; as the last.

Infusion of Mu'dar. *Syn.* INFUSION OF MUDAR-BARK; INFUSUM CORTICIS MUDARIS, L. From the root bark of *Calotropis gigantea*. Resembles infusion of ipecacuanha.—*Dose.* 1 to 3 teaspoonfuls, as an alterative; a wine-glassful as an emetic. In the East Indies it is highly esteemed in epilepsy, hysteria, syphilis, convulsions, and various spasmodic diseases.

Infusion of Net'tle Seed. *Syn.* INFUSUM

URTICÆ SEMINUM, L. Prep. (Garde.) Seed of common nettle (*Urtica dioica*), 2½ drs.; boiling water, 18 fl. oz.; infuse 3 hours, strain, and add of syrup, 2 fl. oz. Astringent, diuretic, and pectoral.

Infusion of Nux Vomica. Syn. INFUSUM NUCIS VOMICÆ, L. Prep. (Hosp. F.) Nux vomica (ground or rasped), 1 dr.; boiling water, 1 pint; digest 3 hours, and strain. It must be taken with caution, and the effects watched. See EXTRACT, NUX VOMICA, and STRYCHNINE.

Infusion of Orange Peel. Syn. INFUSUM AURANTII, B. P. Prep. 1. Dried bitter orange peel, cut small, 1 oz.; boiling water, 20 oz.; infuse for 15 minutes, and strain.—*Dose.* 1 to 2 oz. Bitter and stomachic.

2. (Compound; **INFUSUM AURANTII**—Ph. E., I. A. COMPOSITUM—Ph. L. & D., L.) —*a.* (Ph. L. & E.) Dried bitter orange peel, ½ oz.; fresh lemon peel, 2 drs.; cloves (bruised), 1 dr.; distilled water, 1 pint; macerate for 15 minutes in a covered vessel, and strain.

b. (Ph. D.) Dried orange peel, 3 drs.; cloves, ½ dr.; boiling water, ½ pint; macerate half an hour. An agreeable stomachic. It is chiefly employed as a vehicle for other medicines.

c. (B. P.) Dried bitter orange peel, cut small, ½ oz.; fresh lemon peel, 120 grs.; cloves (bruised), 60 grs.; boiling water, 20 oz. Infuse for 15 minutes, and strain.—*Dose.* 1 to 2 oz.

3. (Concentrated Compound; **INFUSUM AURANTII CONCENTRATUM, I. A. COM. CONC., L.**) —*a.* Seville orange peel (dried), 3½ lbs.; fresh lemon peel, 1½ lb.; bruised cloves, ¾ lb.; boiling water, 9 pints; infuse for 20 minutes, press out the liquor, and, when cold, add of rectified spirit, 1 quart, and filter.

b. Dried orange peel, 18 oz.; fresh lemon peel, ½ lb.; bruised cloves, ½ lb.; rectified spirit, 1 pint; cold water, 3 pints; macerate for 1 week, press, and filter. Very superior.

Obs. 1 fl. dr. of either of the above, added to 7 fl. drs. of water, makes a similar (preferable) preparation to the COMPOUND INFUSION OF ORANGE PEEL.—Ph. L.

Infusion of Pareira. Syn. INFUSUM PAREIRÆ (Ph. E. & D.), I. P. BRAVE, L. Prep. 1 (Ph. E.) Velvet leaf or pareira brava root, 6 drs.; boiling water, 1 pint; macerate for 2 hours in a lightly covered vessel, and strain.

2. (Ph. D.) Pareira (bruised and torn), ½ oz.; boiling water, 9 fl. oz.; macerate 1 hour, and strain. In irritation and mucous discharges from the urinary organs. The corresponding preparation of the Ph. L. will be found among the DECOCTIONS.

Infusion of Parsley Root. Syn. INFUSUM PETROSELINI, L. From the root of garden parsley. Aromatic, diuretic, and slightly aperient. It has been highly recommended by Dr. Chapman and others in dropsy, in the strangury arising from blisters, &c.; taken

freely, either alone or combined with a little sweet spirit of nitre.

Infusion of Peach Leaves. Syn. INFUSUM PERSICÆ, I. P. FOLII, L. Prep. (Pereira.) Peach leaves (dried), ½ oz.; boiling water, 1 pint; macerate an hour, and strain.—*Dose.* 1 to 2 table-spoonfuls, twice or thrice a day; to allay irritation of the bladder and urethra, and as a vermifuge.

Pectoral Infusion. Syn. INFUSUM PECTORALE, L. Prep. (Hosp. F.) Linseed (bruised), ½ oz.; coltsfoot leaves, ½ oz.; liquorice root (sliced) and poppy-heads, of each, ¼ oz.; boiling water, 1 pint; digest two hours, and strain. In coughs, colds, hoarseness, &c., accompanied with a dose of aperient medicine. See SPECIES, &c.

Infusion of Pennyroyal. Syn. PENNYROYAL TEA; INFUSUM PULEGII, I. MENTHÆ PULEGII, L. A popular remedy for nausea, flatulence, colds, hooping-cough, hysterical affections, obstructed menstruation, &c.

Infusion of Peppermint. Syn. PEPPERMINT TEA; INFUSUM MENTHÆ PIPERITÆ, L. In flatulence, colic, griping, &c., and as a vehicle for other medicines.

Infusion of Periwinkle. Syn. INFUSUM VINCÆ MINORIS, L. From the leaves of lesser periwinkle (*Vinca minor*). Astringent and tonic; in diarrhoea, dysentery, &c. Mr. Weathers employs it in passive hæmorrhages, and others have recommended it as an external tonic applied to the perineum, &c., in piles, relaxation of the genitals, &c.

Infusion of Persimmon. Syn. INFUSUM PERSIMMONIS, L. From the bark of persimmon (*Diospyros Virginiana*). Astringent; very valuable in diarrhoea, hæmorrhages, agues, &c.; and as a gargle in ulcerated sore throat.

Infusion of Peru'vian Bark. See INFUSION OF BARK.

Infusion of Pinkroot. Syn. PINKROOT TEA, WORM T.; INFUSUM SPIGILLÆ, L. 1. From Indian pinkroot. Vermifuge; either combined with or followed by a purge after the third or fourth dose. The dose for a child 3 to 5 years old is 1 to 2 table-spoonfuls.

2. (Compound; **INFUSUM SPIGILLÆ COMPOSITUM, I. S. CUM SENNÆ, L.—Ellis.**) Pinkroot, ½ oz.; senna, 2 drs.; fennel seed, 3 drs.; manna, 1 oz.; boiling water, 1 pint.—*Dose.* ½ wine-glassful to a child 2 or 3 years old; in worms. See EXTRACT.

Infusion of Pleurisy Root. Syn. INFUSUM ASOLEPIADIS TUBEROSÆ, L. From the root of butterfly weed or pleurisy root (*Asclepias tuberosa*). Expectoant and diuretic; in large doses, purgative; in colds, pleurisy, pneumonia, &c. According to Bigelow, it is a valuable mild tonic and stimulant.

Infusion of Poison-oak. Syn. INFUSUM RHODIS TOXICODENDRI, L. Prep. From the dried leaves of the poison-oak (*Rhus toxicodendron*), 3 drs.; boiling water, 1 pint. Stimulant and narcotic; chiefly in palsy and mania.

Infusion of Poppy-heads. Syn. POPPY TEA:

INFUSUM PAPAVERIS, L. From poppy-heads (capsules of *Papaver somniferum*). Soothing, anodyne. Sweetened with honey, it is a popular remedy for tickling cough, restlessness, &c.; also used hot, as an embrocation, in painful tumours, inflammations, &c. See **INFUSION OF RED POPPY**.

Infusion of Pur'ging Flax. *Syn.* **INFUSUM LINI CATHARTICI, L.** From the dried leaves of purging flax (*Linum catharticum*). Cathartic. The dose should be repeated at intervals of an hour or an hour and a half, until it operates.

Infusion of Quas'sia. *Syn.* **QUASSIA TEA; INFUSUM QUASSIÆ (B. P., Ph. L. E. & D.), L.** *Prep.* 1. (B. P.) Quassia, in chips, 60 grs.; cold distilled water, 10 oz.; infuse for half an hour, and strain.—*Dose.* 1 to 2 oz.

2. (Ph. L.) Quassia (sliced), 40 grs.; boiling distilled water, 1 pint; infuse for 2 hours in a covered vessel, and strain.

3. (Ph. E.) Quassia, 1 dr.; boiling water, 1 pint.

4. (Ph. D.) Quassia (rasped), 1 dr.; boiling water, 8½ fl. oz.

5. (Ph. U. S.) Quassia, 2 drs.; cold water, 16 fl. oz.; macerate for 12 hours, and strain. As a bitter tonic, in loss of appetite, dyspepsia, &c.; either combined with alkaline carbonates or chalybeates. Sweetened with moist sugar or honey, it forms a common FLY-WATER or FLY-POISON.

6. (Compound; **INFUSUM QUASSIÆ COMPOSITUM, L.—Ellis.**) Quassia, serpentry, and dried orange peel, of each, ¼ oz.; boiling water, 1 pint. A stimulant stomachic.

Infusion of Red Cab'bage. *Syn.* **INFUSION OF BLUE CABBAGE.** Used as a colour, and to make test-paper. It will not keep without the addition of about 1-10th of its weight of rectified spirit.

Infusion of Red Pop'py. *Syn.* **RED-POPPY TEA; INFUSUM RHEADOS, L.** From the petals of the red or corn poppy. Anodyne and pectoral. Sweetened with sugar or honey, it is a popular remedy in catarrhal affections; but the use of this, as well as of **INFUSION OF POPPY-HEADS**, should be accompanied by a dose of aperient medicine.

Infusion of Rhat'ny. *Syn.* **INFUSUM KRAMERIÆ (B. P.), INFUSUM RHATANIÆ, I. KRAMERIÆ (Ph. L. & D.), L.** *Prep.* 1. (B. P.) Rhatany, bruised, 1 oz.; boiling distilled water, 20 oz.; infuse 1 hour, and strain.—*Dose.* 1 to 2 oz.

2. (Ph. L.) Rhatany root, 1 oz.; boiling distilled water, 1 pint; macerate for 4 hours in a covered vessel, and strain.

3. (Ph. D.) Rhatany, ½ oz.; boiling water, 9 fl. oz.; macerate 1 hour, and strain. Astringent and tonic; chiefly in chronic diarrhoea.

4. (Concentrated; **INFUSUM KRAMERIÆ CONCENTRATUM, L.**) From 8 times the usual quantity of ingredients, as **INFUSION ON CAS-CARILLA**.

Infusion of Rhododen'dron. *Syn.* **INFUSUM RHODODENDRI, L.** From the leaves of yellow rhododendron (*Rhododendron chrysanthum*), ½ oz.; boiling water, ½ pint. Highly recommended by Pallas and Koelpin in gout, chronic rheumatism, and syphilis. It has marked narcotic properties.

Infusion of Rhubarb. *Syn.* **INFUSUM RHEI (B. P., Ph. L. E. & D.), L.** *Prep.* 1. (B. P.) Rhubarb (in thin slices, 1 oz.; boiling distilled water, 40 oz.; infuse for 1 hour, and strain.—*Dose.* 1 to 2 oz.

2. (Ph. L.) Rhubarb (sliced), 3 drs.; boiling distilled water, 1 pint; macerate for 2 hours in a covered vessel, and strain.

3. (Ph. D.) Rhubarb, 2 drs.; boiling water, 9 fl. oz.; macerate 1 hour.

4. (Ph. E.) Rhubarb (in coarse powder), 1 oz.; boiling water, 18 fl. oz.; infuse for 12 hours, add of spirit of cinnamon, 2 fl. oz.; and strain through linen or calico. Stomachic and purgative; along with neutral salts or aromatics.

Obs. The infusion of the Ph. E., being fully double as strong as that of the Ph. L. & D., must be taken in proportionate doses.

5. (Concentrated; **INFUSUM RHEI CONCENTRATUM, L.—a.** Rhubarb (in coarse powder), 10 oz.; rectified spirit, 1 pint; cold distilled water, 1 quart; digest 10 days, with frequent agitation, then express the liquor, and filter it; or proceed by the method of displacement.

b. Rhubarb, 3 lbs. 5 oz.; cold distilled water, 11 pints; rectified spirit, 5½ pints; as the last.

Obs. 1 fl. dr. of either of the above, added to 7 fl. drs. of water, forms 1 fl. oz. of liquid, resembling, and in many points preferable to, the infusion of the Ph. L. The above is the only way a fine, rich-coloured, and transparent concentrated preparation can be made, that will keep well. Should it not prove perfectly limpid, it may be clarified in the way already mentioned.

6. (Alkaline; **INFUSUM RHEI ALKALINUM, I. R. CUM POTASSÂ, L.—Copland.**) Rhubarb, 2 drs.; carbonate of potassa, 1 dr.; boiling water, ½ pint; macerate for 4 hours, strain, and add of tincture of cinnamon, ½ fl. oz. In dyspepsia, acidity, heartburn, &c.

Infusion of Ro'ses. *Syn.* **INFUSUM ROSÆ, L.** 1. (Simple.) From the petals of red roses. Used as colouring and for a test; mixed with vinegar and sweetened with honey, it forms a popular gargle in sore throat.

2. (Compound; **INFUSUM ROSÆ—Ph. E., I. ROSÆ COMPOSITUM—Ph. L., I. R. ACIDUM—B. P., Ph. D.)** *Prep.*—a. Red rose petals (broken up), 1 oz.; dilute sulphuric acid, ½ oz.; boiling distilled water, 40 oz.; infuse for half an hour with the acid and water, and strain.—*Dose.* 1 to 2 oz.

b. (Ph. L.) Petals of the red or damask rose (dried and pulled asunder), 3 drs.; boiling water, 1 pint; mix, and add of dilute sulphuric acid, 1½ fl. dr.; macerate for 2 hours, strain off the liquor, and dissolve in it white

sugar, 6 drs. The Edinburgh form is nearly similar.

c. (Ph. D.) Petals, 2 drs.; boiling water, $\frac{1}{2}$ pint; infuse 1 hour, strain, and add of dilute sulphuric acid, 1 fl. dr.

Obs. A vessel of glass or stoneware should be used to make the infusion in, as metallic vessels injure the colour of the liquid, and are also attacked by the acid. The best plan is to add the dilute sulphuric acid to the water before pouring it on the leaves. The infusion may be squeezed out of the leaves with the hands.

The COMPOUND INFUSION OF ROSES is principally used as a vehicle for sulphate of quinine, saline purgatives, and some other medicines. It is astringent and refrigerant, and, when diluted with water, forms a pleasant drink in febrile disorders, phthisical sweats, hæmorrhages, diarrhœa, &c. It also makes a very useful astringent gargle.—*Dose.* 1 to 4 fl. oz.; either alone or diluted with water. It is incompatible with the alkalies and earths, and their carbonates and bicarbonates.

3. (Concentrated; INFUSUM ROSÆ CONCENTRATUM, L.)—a. Rose petals, 10 oz.; boiling distilled water, 3 pints; infuse for 2 hours, with frequent agitation, express the liquid, strain through a clean hair sieve, and add of dilute sulphuric acid, $4\frac{1}{2}$ fl. oz.; after agitation for 5 or 6 minutes, and repose for 2 or 3 hours, decant the clear portion, and filter through paper supported on calico; next, dissolve in the liquid $1\frac{1}{2}$ lb. of the finest white sugar, broken up into small lumps, but perfectly free from dust and dirt; lastly, pour the infusion into clean, stoppered, green-glass bottles, and, as much as possible, keep them from the light, and in a cool place.

b. Rose petals, $3\frac{1}{2}$ lbs.; boiling water, 2 galls.; diluted sulphuric acid, 24 fl. oz.; finest white sugar, $6\frac{1}{2}$ lbs.; as the last.

c. The same quantity of dilute sulphuric acid and cold water, as before; mix, and infuse the rose leaves in the liquid for 48 hours, then express, filter, and add the sugar. Product very fine, and keeps well without becoming gelatinous.

Obs. This preparation is 8 times as strong as that of the Ph. L. (2, a). Great care should be taken that the utensils are perfectly clean, especially the press, if one is employed; and earthenware glazed with lead should be avoided. The pressing should also be conducted as rapidly as possible, to avoid the colour being injured by the iron. Clean wrought iron does not readily injure the colour of infusion of roses before the addition of the acid. When the last formula is adopted, strong pressure of the leaves with the hands can alone be safely had recourse to. If the infusion does not filter quite clear though paper, it should be set aside for a few days, when, in general, it will be found to filter more readily and satisfactorily. Should it be wanted for immediate sale, the addition of the whites of 2 or 3 eggs, diluted

with 2 or 3 ounces of water, followed by violent agitation of the liquid for a few minutes, and repose for an hour or two, will usually render it 'fine,' when it may be either decanted, or filtered should it require it. It will now pass rapidly through ordinary filtering paper, and at once run clear.

Infusion of Rue. *Syn.* RUE TEA; INFUSUM BUTÆ, L. Carminative, antispasmodic, emmenagogue, and vermifuge. It is a popular and useful remedy in flatulent colic, infantile convulsions, epilepsy, hysteria, suppressed menstruation, &c.

Infusion of Sage. *Syn.* SAGE TEA; INFUSUM SALVIE, L. 1. From the leaves of common garden sage. Carminative and stomachic. In flatulence and dyspepsia, and diluted with water as a drink, to lessen the night sweats in phthisis and fever, and to stop the secretion of milk after weaning.

2. (Compound; INFUSUM SALVIE COMPOSITUM, L.—Ellis.) Sage and boneset, of each, $\frac{1}{2}$ oz.; cascarella, 1 dr.; boiling water, $1\frac{1}{2}$ pint; infuse until cold. A wine-glassful every 3 or 4 hours in hectic fever.

Infusion of Sarsaparilla. *Syn.* INFUSUM SARZÆ, I. SASSAPARILLÆ (Ph. U. S.), L. 1. From the bruised root. Dr. Hancock adds $\frac{1}{2}$ fl. dr. of hydrochloric acid to each pint of the water employed, as a menstruum, by which, he says, the efficacy of the infusion is greatly increased. At St. George's Hospital a little liquorice root and solution of potassa is added for the same purpose.

2. (Compound; INFUSUM SASSAPARILLÆ COMPOSITUM, L.—Ph. D. 1826.) Sarsaparilla root (washed clean with a little cold water, and sliced), 1 oz.; lime water (cold), 16 fl. oz.; macerate for 12 hours, and strain. Inferior to the simple infusion, since both earths and alkalies lessen the solvent action of water on sarsaparilla. *Use* of both the above, similar to that of the DECOCTION.

Infusion of Sassafras. *Syn.* SASSAFRAS TEA; INFUSUM SASSAFRAS, L. From sassafras chips. Alterative, stimulant, and sudorific; a popular remedy in various cutaneous, rheumatic, scrofulous, and syphilitical affections. Hufeland recommends the addition of a little liquorice root.

Infusion of Savine. *Syn.* SAVINE TEA; INFUSUM SABINE, L. *Prep.* (Pereira.) Fresh savine leaves or herb, 1 dr.; boiling water, 8 fl. oz.; infuse in a covered vessel. Stimulant, emmenagogue, and vermifuge; in chlorosis, and suppressed menstruation depending on a torpid action of the uterine vessels; in chronic rheumatism, worms, &c.—*Dose.* 1 to 2 table-spoonfuls, cautiously administered.

Infusion of Saxifrage. *Syn.* SAXIFRAGE TEA; INFUSUM PIMPINELLÆ, L. From the root of burnet saxifrage (*Pimpinella Saxifraga*). Astringent; in diarrhœa, and externally as a wash to remove freckles.

Infusion of Scutellaria. *Syn.* INFUSUM SCUTELLARIÆ, L. *Prep.* (Dr. Spalding.) Dried

herb of *Scutellaria lateriflora*, in powder, 1½ teaspoonful; boiling water, 1 pint. By teacupfuls, thrice daily, to prevent hydrophobia.

Infusion of Sen'ega. *Syn.* INFUSION OF RATTLE-SNAKE ROOT, SENEKA TEA; INFUSUM SENEGÆ (B. P., Ph. E.), I. POLYGALÆ (Ph. D.), L. *Prep.* 1. (B. P.) Senega, bruised, 1 oz.; boiling distilled water, 20 oz.; infuse 1 hour, and strain.—*Dose.* 1 to 2 oz.

2. (Ph. E.) Senega snake-root (bruised), 10 drs.; boiling water, 1 pint; infuse for 4 hours in a covered vessel, and strain.

3. (Ph. D.) Polygala root, ½ oz.; boiling water, 9 fl. oz. Stimulant, expectorant, and diuretic, either alone or combined with ammonia; in catarrhs, &c. See DECOCTION, EXTRACT, &c.

Infusion of Sen'na. *Syn.* SENNA TEA; INFUSUM SENNÆ (B. P., Ph. E.), I. SENNÆ COMPOSITUM (Ph. L. & D.), L. *Prep.* 1. (B. P.) Senna, 1 oz.; ginger, sliced, 30 grs.; boiled distilled water, 10 oz.; infuse 1 hour, and strain.—*Dose.* 1 to 2 oz.

2. (Ph. L.) Senna, 15 drs.; ginger (bruised), 4 scruples; boiling water, 1 pint; macerate for an hour in a covered vessel, and strain.

3. (Ph. E.) Senna, 1½ oz.; ginger, 4 scrup.; boiling water, 1 pint. (See No. 9, below.)

4. (Ph. D.) Senna, ½ oz.; ginger, ½ dr.; boiling water, ½ pint. Purgative.—*Dose.* 1 to 2 wine-glassfuls. It is usually given in doses of 1 to 1½ fl. oz., combined with 3 to 6 drs. of Epsom salts, or other saline purgative, under the name of 'BLACK DRAUGHT.'

Obs. This infusion is very apt to spoil in warm weather, to prevent which Mr. Squire recommends the addition of 1 gr. of nitrate of potassa to each ounce.

5. (Concentrated; INFUSUM SENNÆ CONCENTRATUM, L.)—a. Senna, 2 lbs. 1 oz.; tepid water, 1 quart, macerate for 12 hours, frequently stirring with a stick, and express the liquor; to the 'marc,' add of tepid water, 1½ pint, repeat the maceration for 3 hours, and again express the liquor with powerful pressure; mix the infusions, and after 2 hours' repose decant the clear portion, and evaporate it as rapidly as possible, by steam or a chloride of sodium bath, until it measures 1½ pint; pour this into a strong bottle, and when nearly cold, add of rectified spirit, ½ pint; bruised ginger, 3½ oz.; macerate a week with frequent agitation, and after repose for a few days decant the clear portion, and add dilute spirit (1 to 4), q. s. to make the whole measure exactly a quart.

b. Take 8 times the quantity of senna and ginger ordered in the Ph. L., put them into a splacement apparatus, either alone or mixed with clean washed sand, and transmit water, mixed with ¼th part of rectified spirit, through the mass, until the proper quantity of infusion obtained.

c. (Wholesale.) Alexandrian senna (best),

7 lbs.; unbleached Jamaica ginger (finest, bruised), 3 lbs.; rectified spirit and water, of each, 1 gal.; macerate for 14 days, press out the fluid, filter, and set it aside in a well-corked bottle; then take of good East India senna, 25 lbs.; and the 'pressings' or 'marc' from the tincture, and macerate in the least possible quantity (10 or 12 galls.) of cold distilled water, for 12 or 14 hours, employing frequent agitation with a wooden spatula; next press out the liquid, and again macerate the 'marc' in cold distilled water (5 or 6 galls.) for 2 hours; press, mix the two liquors, strain, heat gradually to the boiling-point, carefully separate the coagulated albumen, and afterwards evaporate as quickly as possible to exactly 9 quarts; put the liquid at once into a vessel capable of holding 5 gallons, bung close to exclude the air, and when nearly cold add the 'tincture' obtained from the Alexandrian senna and the ginger; the whole must now be well agitated together, and allowed to stand for a week, when the clear portion must be carefully decanted into bottles (Winchester quarts) for sale.

d. As the last, but employing hot water, and limiting the period of the infusions to 2 hours and 1 hour.

Obs. The preceding formulæ are at present employed in the wholesale trade, by nearly all those houses that are most noted for the superior quality of their 'CONCENTRATED INFUSIONS.' The products of the whole are excellent. That from c is very beautiful, and contains all the valuable active matter that it is possible to extract from the ingredients, under the circumstances. It also keeps well. The last one, like all preparations of senna made with hot water, is apt to drop a large deposit on standing, from which the last portion of the infusion is obtained with difficulty. They each furnish a liquid, of which 1 fl. dr. added to 7 fl. drs. of pure water forms 1 fl. oz. of a preparation precisely similar in medicinal qualities to the INFUSUM SENNÆ COMP.—Ph. L.

From the extreme bulkiness of senna, it has become a practice with certain unprincipled druggists to employ only ½ or ¼ of the proper quantity of that drug, and to add burnt sugar or treacle to bring up the consistence and colour, and alkaline solution of gamboge to impart the necessary purgative quality. CONCENTRATED INFUSION OF SENNA, as generally met with, is nearly worthless. This arises from either the employment of inferior senna, or the destruction of its active principle, by the lengthened exposure to heat and atmospheric oxygen during its manufacture.

6. (With COFFEE; INFUSUM SENNÆ CUM CAFFEA, L.)—a. (Foy.) Senna, 2 drs.; roasted coffee (ground), 1 dr.; boiling water and hot milk, of each, 3 fl. oz.; infuse for 12 hours (4?), and strain. For an adult; to be taken in the morning fasting.

6. (Guersand and Blake.) Senna, 10 to 30 grs. (according to age); hot coffee and hot milk, at will; infuse, and when cold, strain, and sweeten it with sugar, q. s. As a purge for children.

7. (With LEMON JUICE; INFUSUM SENNÆ LIMONIATUM, L.) From senna, 1½ oz.; fresh lemon peel, 1 oz.; lemon juice, 1 fl. oz.; boiling water, 16 fl. oz.; infuse.

8. (With RHUBARB; INFUSUM SENNÆ ET RHEI, L.—Ellis.) Senna, 6 drs.; manna, 1 oz.; rhubarb and cardamoms, of each (bruised), 2 drs.; boiling water, 1 pint; infuse 1 hour and strain.

9. (With TAMARINDS; INFUSUM SENNÆ COMPOSITUM—Ph. E., SENNÆ CUM TAMARINDIS, L.—Ph. E.) Senna, 3 drs.; tamarinds, 1 oz.; coriander seeds, 1 dr.; sugar, ½ oz.; (if brown, 1 oz.); boiling water, 8 fl. oz.; infuse for 4 hours, with agitation, and then strain through calico. Pleasanter than the ordinary infusion of senna.

10. (With TARTAR; INFUSUM SENNÆ TARTARIZATUM, L.) From senna, 1½ oz.; coriander seeds, 4 drs.; cream of tartar, 2 drs.; boiling water, 16 fl. oz.

Infusion of Serpentry. *Syn.* INFUSUM SERPENTARIÆ (B. P., Ph. L. & E.). *L. Prep.* 1. (B. P.) Serpentry, bruised, 1 oz.; boiling distilled water, 40 oz.; infuse 2 hours, and strain.—*Dose.* 1 to 2 oz.

2. (Ph. L.) Serpentry or Virginian snake-root, ½ oz.; boiling distilled water, 1 pint; macerate for 4 hours in a closed vessel, and strain. The form of the Ph. E. is similar. As a stimulating expectorant and diaphoretic; in chronic catarrhs, low fevers, agues, &c.

3. (Compound; INFUSUM SERPENTARIÆ COMPOSITUM, L.—Guy's Hosp.) Virginian snake-root and contrayerva, of each, 5 drs.; boiling water, 1 pint; macerate 2 hours, strain, and when cold add of tincture of serpentry, 2 fl. oz. As the last.

Infusion of Simaruba. *Syn.* INFUSUM SIMARUBÆ (B. P., Ph. E. & D.). *L. Prep.* 1. (B. P.) Simaruba, bruised, 3 drs.; boiling water, 1 pint; infuse 2 hours, and strain.—*Dose.* 1 to 2 oz.

2. (Ph. E. & Ph. L. 1836.) Bark of the bitter simaruba or mountain damson, 3 drs.; boiling water, 1 pint; macerate 2 hours, and strain.

3. (Ph. D.) Simaruba bark, 2 drs.; boiling water, 9 fl. oz. Tonic, and, in large doses, emetic; in chronic diarrhoea and dysentery, either alone or combined with opium; and in agues, dyspepsia, &c.

4. (Compound; INFUSUM SIMARUBÆ COMPOSITUM, L.—Foy.) Simaruba bark and wormwood, of each, 2 drs.; boiling water, 1 pint; infuse for 15 minutes, strain, and add of syrup of gentian, 1 fl. oz. In agues and dyspepsia.

Infusion of Slippery Elm. *Syn.* INFUSUM ULMI (Ph. U. S.), I. U. FULVÆ, L. *Prep.* (Ph. U. S.) Inner bark of slippery elm (*Ulmus*

fulva), 1 oz.; boiling water, 16 fl. oz.; infuse for 2 hours, and strain. Demulcent.

Infusion of Soap-wort. *Syn.* INFUSUM SAPONARIÆ, L. From soap-wort root (*Saponaria officinalis*). Aperient and demulcent; also reputed alterative and antisypilitic.

Infusion of South'ernwood. *Syn.* SOUTHERNWOOD TEA; INFUSUM ABROTANI, L. From the herb southernwood or old man (*Asinthium Abrotanum*). Antispasmodic, tonic, and vermifuge; in hysteria, difficult and painful menstruation, worms, &c.

Stimulant Infusion. *Syn.* INFUSUM STIMULANS, L. *Prep.* (Dr. Paris.) Black mustard seed (bruised) and dittander, of each, ½ oz.; boiling water, 16 fl. oz.; macerate for 1 hour, strain, and when cold add of spirit of sal-volatile, 1 fl. dr.; spirit of pimento, ½ fl. oz.—*Dose.* 2 table-spoonfuls, 3 times a day; in palsy.

Infusion of Stink'ing Hel'lebo're. *Syn.* INFUSUM HELLEBORI FETIDI, L. *Prep.* (Woodville.) Dried leaves of setter-wort or *Helleborus foetidus*, ½ dr. (or green herb, 2 drs.); boiling water, 16 fl. oz.; macerate 1 hour, and strain. Aperient and vermifuge; and emetic, in large doses. It is chiefly used against the large round worms of children and females, taken fasting.

Infusion of Snc'cory. *Syn.* CHICORY TEA; INFUSUM CHICORII, L. From the dried root. Aperient, deobstruent, and tonic; either alone or sweetened with honey or sugar.

Infusion of Sweet Flag. *Syn.* CALAMUS TEA, SWEET-FLAG T.; INFUSUM ACORI, L. CALAMI AROMATICI, L. An aromatic stimulant, tonic, and stomachic. See SWEET FLAG.

Infusion of Tam'arinds. *Syn.* INFUSUM TAMARINDI, L. Cooling and laxative; in sore throat, febrile affections, &c., taken *ad libitum*. See INFUSION OF SENNA.

Infusion of Tan'sy. *Syn.* TANSY TEA; INFUSUM TANACETI, L. From the dried herb, or the green herb, using double the quantity. Aromatic, bitter, tonic, and vermifuge.

Infusion of Tar. *Syn.* TAR WATER, TAR TEA; INFUSUM PICIS LIQUIDÆ, AQUA P. L. (Ph. D.), L. *Prep.* 1. (Bishop Berkeley.) Wood tar, 1 quart; cold water, 1 gal.; stir with a stick for 15 minutes, then allow the tar to subside, strain, and keep it in well-stoppered jars.

2. (Ph. D.) As the last. Taken to the extent of a pint daily in chronic catarrhal and nephritic affections; also used as a lotion in chronic cutaneous diseases, especially those of the scalp in children. See DECOCTION.

Infusion of Tarax'acum. See INFUSION OF DANDELION.

Infusion of Tobac'co. *Syn.* TOBACCO WATER; INFUSUM TABACI, L. *Prep.* (Ph. D. 1826.) Tobacco leaves, 1 dr.; boiling water, 16 fl. oz.; macerate for an hour. Used for enemas; in strangulated hernia, obstinate colic, &c., observing not to administer more than one half at a time; also as a wash to kill pediculi.

Infusion, Ton'ic. See INFUSIONS OF CALUMBA, CASCARILLA, GENTIAN, &c., also MIXTURES.

Infusion of Tre'foil. See INFUSION OF BUCKBEAN.

Infusion of Tul'ip-tree Bark. *Syn.* INFUSUM LIRIODENDRI, L. From the bark of the tulip tree (*Liriodendron tulipifera*). Diaphoretic, stimulant, stomachic, and tonic; in dyspepsia, fevers, &c.; also used to flavour liquors.

Infusion of Tur'meric. *Syn.* INFUSUM CURCUMÆ, L. Used as a test and to prepare test-paper. When required for keeping, about 1-7th of its volume of rectified spirit must be added.

Infusion of Valer'ian. *Syn.* INFUSUM VALERIANÆ (B. L., Ph. L. & D.), L. *Prep.* 1. (B. P.) Valerian, bruised, 120 grs.; boiling distilled water, 10 oz.; infuse 1 hour and strain.—*Dose.* 1 to 2 oz.

2. (Ph. L.) Valerian root, $\frac{1}{2}$ oz.; boiling distilled water, 1 part; infuse for an hour in a covered vessel, and strain.

3. (Ph. D.) Valerian, 2 drs.; boiling water, 9 fl. oz. Antispasmodic and nerveine; in hysteria, hypochondriasis, epilepsy, and low fevers.

4. (Compound; INFUSUM VALERIANÆ COMPOSITUM, L.) Yellow cinchona bark, 1 oz.; valerian, $\frac{1}{2}$ oz.; boiling water, 1 pint; as before. In debilitated nervous habits.

Infusion of Vanil'la. *Syn.* VANILLA TEA; INFUSUM VANILLÆ, L. *Prep.* Vanilla, $1\frac{1}{2}$ dr.; boiling water, 1 pint. A stimulant antispasmodic; in hysteria, rheumatism, anaphrodisia, &c.; but chiefly used as a flavouring for liqueurs, confectionery, &c.

Infusion of Vittie Vayr. *Syn.* VITTIE VAYR TEA; INFUSUM VETIVERÆ, L. From the roots of *Andropogon muricatus* (VETIVER, VITTIE VAYR, or OUSOUS). Antispasmodic, diaphoretic, and stimulant, and, when warm, diaphoretic and emmenagogue; in rheumatism, gout, slight febrile cases, &c.; and as a prophylactic of cholera. See ESSENCE.

Infusion of Wall-pellitory. *Syn.* INFUSUM PARIETARIÆ, L. From the dried herb (*Parietaria officinalis*). Aperient, diuretic, and pectoral; in asthmas, dropsies, calculous affections, &c.

Infusion of Wal'nut Leaves. *Syn.* WALNUT-LEAF TEA; INFUSUM JUGLANDIS, L. From the fresh leaves of the common walnut (*Juglans regia*); also from the inner wood-bark, and the green rind of the fruit. See DECOCTION and EXTRACT.

Infusion of Water-fen'nel. *Syn.* INFUSUM FÆLLELANDRI, L. *Prep.* (Bird.) Seeds of water-fennel, 5 drs.; boiling water, 1 pint.—*Dose.* 3 to 4 fl. drs., to check excessive expectoration.

Infusion of Whor'tleberry. *Syn.* INFUSUM UVÆ URSI, L. With alkalies, henbane, or opium, in diseases of the urinary organs; and with sulphuric acid and foxglove, in affections of the lungs. See DECOCTION and EXTRACT.

Note.—Infusum Uvæ Ursi of the Brit. Pharmacopœia.

Infusion of Wild-cherry Bark. *Syn.* INFUSUM PRUNI VIRGINIANÆ (Ph. U. S.), L. *Prep.* (Ph. U. S.) Wild cherry-tree bark (*Prunus Virginiana* or *Cerasus Serotina*), $\frac{1}{2}$ oz.; cold water, 16 fl. oz.; infuse 24 hours, and strain. A valuable tonic and febrifuge. Wild-cherry bark also exercises a sedative action on the circulatory and nervous system, and is much used in America in a variety of diseases.

Infusion of Wild G'nger. *Syn.* INFUSUM ASABI CANADENSIS, L. From the root of wild ginger or Canada snake-root (*Asarum Canadense*). A warm stimulant diaphoretic; in the same cases as INFUSION OF VIRGINIAN SNAKE-ROOT.

Infusion of Will'ow Bark. *Syn.* INFUSUM SALICIS, L. From the bark of the white or common willow (*Salix alba*). Astringent, tonic, and febrifuge; often used instead of INFUSION OF CINCONA.

Infusion of Win'ter Green. *Syn.* INFUSUM PYROLÆ, I. CHIMAPHILÆ, L. Astringent, tonic, and diuretic; in dropsy, nephritic pains, and chronic affections of the urinary organs. It blackens the urine, like uva ursi. See DECOCTION.

Infusion of Wood Soot. *Syn.* SOOT TEA; INFUSUM FULIGINIS LIGNI, L. Antacid and stimulant. A similar preparation is also made from coal-soot, which is reputed antispasmodic and vermifuge.

Infusion of Worm'wood. *Syn.* WORMWOOD TEA; INFUSUM ABSINTHII, L. From the fresh tops of the plant, or from only half the quantity of the dried herb. In loss of appetite, dyspepsia, amenorrhœa, leucorrhœa, gout, worms, &c. See BITTERS.

INHALATION. *Syn.* INHALATIO, L. In medicine, the drawing in or inspiring of vapour with the breath. Inhalations (INHALATIONES) are vapours or gases inhaled for the purpose of medicating the mucous membrane of the air-passages. The substances that are to furnish the vapours or fumes are put into a vessel called an 'inhaler,' (see INHALER), which may be simply a small covered pot or mug of metal or glass, furnished with a short flexible tube, terminating in a small mouth-piece. In many cases even this simple apparatus may be dispensed with, and the fumes inhaled by holding the head over a vessel containing a little of the substance furnishing them; or, as with chloroform, a little may be dropped on a handkerchief or napkin, which is then held to the nose.

The following are the principal substances that are employed for inhalations at the present day:—

1. Carbonic acid gas and nitrous oxide; occasionally used in phthisis, by means of a bladder and mouth-piece.

2. Chlorine gas; exhibited by adding 5 or 6 drops of aqueous chlorine to the water (tepid) of the inhaler, which should be, in this case, of glass; employed in France for phthisis, but seldom used in England.

3. Chloroform; as an anæsthetic.
4. Vapour of iodine, administered in the same way as chlorine; occasionally used in phthisis.
5. Oxygen and hydrogen gases, either alone or diluted with air; employed in asthma and phthisis, by means of a bladder and mouth-piece.
6. Tar vapour, obtained by heating tar, mixed with a little carbonate of potash, over a spirit lamp, occasionally employed in bronchitis, and recommended by Sir A. Crichton in phthisis, but appears of little value in the latter.
7. Steam of hot water; in bronchitis, and to allay the cough in phthisis; small quantities of the seeds of henbane, opium, poppy-heads, &c., are frequently added to produce an anodyne effect. See CIGARS (in pharmacy), DISINFECTANTS, FUMIGATION, &c.

INJECTION. *Syn.* INJECTIO, L. In medicine, any liquid medicine thrown into a cavity of the body by means of a syringe or an elastic bag. Those thrown into the rectum are commonly called 'clysters' or 'enemata,' and are noticed under the head of ENEMA. The following are the principal injections employed in medical practice at the present day:—

Injection of Ac'etate of Ammo'nia. *Syn.* INJECTIO AMMONIÆ ACETATIS, L. *Prep.* (Ph. Chirur.) Solution of acetate of ammonia (Ph. L.), 1 part; water, 3 parts. Refrigerant.

Injection of Ac'etate of Cop'per. *Syn.* INJECTIO CUPRI ACETATIS, L. *Prep.* From verdigris, 10 grs.; oil of almonds (hot), 4½ oz.; triturate until dissolved, and strain. Detergent.

Injection of Ac'etate of Lead. *Syn.* INJECTIO PLUMBI ACETATIS, L. *Prep.* 1. Sugar of lead, ½ dr.; distilled water, ½ pint.

2. (Dr. Collier.) Acetate of lead, 40 grs.; rose water, 8 fl. oz. Astringent and sedative. See SEDATIVE INJECTION.

Injection of Ac'etate of Zinc. *Syn.* INJECTIO ZINCI ACETATIS, L. *Prep.* 1. (Ellis.) Acetate of zinc, 8 grs.; rose water, 4 fl. oz.

2. (Brodie.) Sulphate of zinc, 1 dr.; sugar, of lead, 80 grs.; water, 1 pint; dissolve separately, mix, and filter. Astringent.

Injection, Alkaline. *Syn.* INJECTIO ALKALINA, I. LITHONTRIPTICA, L. *Prep.* (Chevallier.) Carbonate of soda, 1 dr.; Castile soap, 2 drs.; water, 12 fl. oz.; dissolve. In certain forms of calculus.

Injection of Al'um. *Syn.* INJECTIO ALUMINIS, L. *Prep.* 1. (Dr. Collier.) Alum, 18 grs.; rose-water, 6 fl. oz.; dissolve. For the urethra.

2. (Collier.) Alum, 3 drs.; water, 1 quart. For the vagina.

3. (Ph. Ch.) Alum, 4 grs.; rose-water, 4 fl. oz. The above are all astringent.

Injection of Ammo'nia. *Syn.* INJECTIO AMMONIÆ, L. *Prep.* 1. (Dr. Ashwell.) Li-

quor of ammonia, 1 to 2 fl. drs.; milk, 1 pint. In obstructed menstruation.

2. (Lavagna.) Liquor of ammonia, 8 to 20 drops; milk, 2 fl. oz. As the last, thrice daily, beginning with the least quantity of ammonia.

3. Liquor of ammonia, 1 fl. dr.; mucilage, 1 oz.; water, 9 fl. oz. As the last.

Injection of Ammo'nio-Sulphate of Cop'per. *Syn.* INJECTIO CUPRI AMMONIATI, L. *Prep.* (Swediaur.) Ammonio-sulphate of copper, 5 grs.; rose water, 8 fl. oz. In chronic gonorrhœa.

Injection of Bichlo'ride of Mer'cury. *Syn.* INJECTIO HYDRARGYRI BICHLORIDI, L. *Prep.*

1. Corrosive sublimate, 2 grs.; rose water, 5 fl. oz.; hydrochloric acid, 1 drop.

2. Corrosive sublimate and sal-ammoniac, of each, 5 to 10 gr.; waters, 1 pint.

3. Sublimate, 5 grs.; rose water, 2½ fl. oz. Used to promote healthy action, and to prevent infection.

Injection of Cal'omel. *Syn.* INJECTIO CALOMELANOS, I. HYDRARGYRI CHLORIDI, L. *Prep.* (St. B. Hosp.) Calomel, 1 dr.; mucilage, 1 fl. oz.; water, ½ pint. Some persons order 'quince mucilage.'

Injection of Car'bonate of Lead. *Syn.* INJECTIO CERUSSÆ, I. PLUMBI CARBONATIS, L. *Prep.* (Hosp. F.) Carbonate of lead (finely levigated), ½ dr.; sulphate of zinc, 8 grs.; mucilage, 1 oz.; rose water, 5 oz. Cooling and astringent.

Injection of Chlo'ride of Lime. *Syn.* INJECTIO CALCIS HYPOCHLORIS, L. *Prep.* 1. Chloride of lime, ½ dr.; water, ½ pint; agitate well together, and filter. To prevent infection.

2. (Detmold.) Chloride of lime, 2 drs.; decoction of rhatany, 13 fl. oz.; dissolve, and filter. In foul discharges, especially in ozæna, or fetid ulceration of the nose.

3. (Rousse.) Chloride of lime, 20 grs.; water, 7 fl. oz.; wine of opium, 1 fl. oz. In foul discharges, and to allay irritation.

Injection of Chlo'ride of So'da. *Syn.* INJECTIO SODÆ HYPOCHLORIS, L. *Prep.* From solution of chloride of soda, 1 fl. dr.; rose water, 3 fl. oz. As the last.

Injection of Chlo'ride of Zinc. *Syn.* INJECTIO ZINCI CHLORIDI, L. *Prep.* From chloride of zinc, 2 grs.; rose water, 3 fl. oz.; hydrochloric acid, 1 drop. In gonorrhœa.

Injection of Copai'ba. *Syn.* INJECTIO COPAIBÆ, L. *Prep.* 1. (Abernethy.) Copaiba, 2 drs.; thick mucilage, 5 drs.; lime water, 6 fl. oz.; make an emulsion.

2. (Plenck.) Copaiba, ½ oz.; yolk of egg, q. s.; lime water, 6 fl. oz.; honey of roses, 3 oz. As the last.

3. (Ricord.) Copaiba, 6 drs.; yolk of egg, q. s.; decoction of poppies, 3 to 4 fl. oz. In ulcers of the rectum, vagina, and urethra; and in gonorrhœa.

Injection of Cre'asote. *Syn.* INJECTIO CREASOTI, L. *Prep.* (Dr. Allnatt.) Creasote, 20 drops; white sugar, 2 drs.; liquor of potassa, 2

.; triturate, and add of water, 8 fl. oz. in gonorrhœa and piles.

Injection of Cubebs. *Syn.* INJECTIO CUBEBS, L. *Prep.* (Soubeiran.) Cubebs (in powder), 1 oz.; extract of belladonna, 1 dr.; gum water, 16 fl. oz.; infuse in a covered vessel, and strain. Stimulant and narcotic. In gonorrhœa and leucorrhœa.

Injection for the Ear. *Syn.* INJECTIO ACOUS-ICA, L. *Prep.* 1. Ox-gall, 3 drs.; balsam of Peru, 1 dr.; mix. In hardened wax, dryness of membranes, &c.

2. Oil of almonds or olives, 2 oz.; oil of bergamot, 20 drops; tincture of castor, 1 fl. dr.; it of camphor, $\frac{1}{2}$ dr.; laudanum, 3 drops; mix. In ear-ache and chronic deafness.

3. (Alibert.) Balsam of Peru, 2 drs.; tincture of musk, 4 or 5 drops; otto of roses, 1 or 2 drops; decoction of St. John's wort (warm), 16 fl. oz.; agitate together, and after repose allow the clear. In discharges from the

Obs. Mr. Yearsley states that drops and injections for the ear should be used with very great caution, and only under proper advice, they otherwise often aggravate the ailment, instead of curing it.

Injection of Ergot. *Syn.* INJECTIO ERGOTÆ, SECALIS CORNUTI, L. *Prep.* 1. (Boudin.) Ergot, 1 dr.; boiling water, 8 fl. oz.; infuse until cold. When the urethra is highly sensitive.

2. (Descrolles.) Powdered ergot, 1 oz.; boiling water, 1 pint. Both the above are used in chronic inflammation of the vagina, and in gonorrhœa.

Injection of Gallic Acid. *Syn.* INJECTIO ACIDI GALLICI, L. *Prep.* (Dunglison.) Gallic acid, $\frac{1}{2}$ dr.; water, 1 pint. In leucorrhœa.

Injection of Galls. *Syn.* INJECTIO GALLÆ, L. *Prep.* From galls (bruised), 2 drs.; boiling water, 1 pint; infuse 1 hour, and strain. Astringent; in leucorrhœa.

Injection of Hydrochloric Acid. *Syn.* INJECTIO ACIDI HYDROCHLORICI, L. *Prep.* From hydrochloric acid, 10 drops; soft water, 1 fl. oz. To prevent and to remove recent infection; also to remove particles of lime and from the eye.

Injection of Hydrocyanic Acid. *Syn.* INJECTIO ACIDI HYDROCYANICI, L. *Prep.* Medicinal hydrocyanic acid, 1 fl. dr.; soft water or almond emulsion, $\frac{1}{2}$ pint. Anodyne; to allay excessive irritability, both in chronic ophthalmia and gonorrhœa, and to relieve chordee; but in all cases it must be used with caution, and at first largely diluted with water.

Injection of Iodide of Iron. *Syn.* INJECTIO FERRI IODIDI, L. *Prep.* 1. (Ricord.) Iodide of iron, 6 grs.; water, 5 fl. oz. In gonorrhœa, gradually increasing the quantity of iodide.

2. (Soubeiran.) Iodide of iron, 3 to 4 drs.; water, 1 pint. In suppressed and painful menstruation, leucorrhœa, &c. Both are astringent and well adapted to scrofulous patients.

Injection of Iodide of Potassium. *Syn.* INJECTIO POTASSII IODIDI, L. *Prep.* (Fus.) Iodide of potassium, 3 grs.; pure water, 1 pint. As a stimulant to fistulous sinuses and ulcers in persons of scrofulous habits.

Injection of Iodine. *Syn.* IODURETTED INJECTION; INJECTIO IODURETA, I. IODINII, L. *Prep.* 1. (M. Ameuille.) Tincture of iodine, 1 part; water, 5 or 6 parts. In refractory fistula.

2. (M. Bonnet.) Iodine, 1 part; iodide of potassium, 2 parts; water, 10 parts. In scrofulous hydrarthrosis, &c.

3. (Bransby Cooper.) Compound tincture of iodine, 2 fl. drs.; water, 6 fl. drs. In hydrocele.

4. (Guibourt.) Iodine, 4 grs.; iodide of potassium, 8 grs.; water, 1 pint. To stimulate fistulous sinuses.

5. (Velpéau.) Tincture of iodine, 1 fl. dr.; water, 3 fl. drs. In hydrocele.

Lithontripitic Injection. *Syn.* INJECTIO LITHONTRIPTICA, I. VESICALIS, L. *Prep.* (Dr. Hoskins.) Nitro-saccharate of lead, 1 gr.; saccharic acid, 5 drops; rub together, then add of distilled water, 1 fl. oz. As a solvent for phosphatic calculi. See ALKALINE INJECTION.

Mercurial Injection. *Syn.* INJECTIO MERCURIALIS, I. HYDRARGYRI, L. *Prep.* 1. Quicksilver, 1 dr.; gum mucilage, $1\frac{1}{2}$ oz.; triturate until the globules disappear, and gradually add of water, $1\frac{1}{2}$ fl. oz.

2. (Hosp. F.) Quicksilver and balsam of copaiba, of each, 4 drs.; yoke of an egg; rose water, $\frac{1}{2}$ pint. An awkward and useless preparation.

Injection of Morphia. *Syn.* INJECTIO MORPHIÆ, L. *Prep.* (Brera.) Morphia, 2 grs.; oil of almonds (warm), 1 oz.; triturate together until united. Anodyne and emollient. To ease the pain in ear-ache, acute gonorrhœa, piles, &c.

Injection of Nitrate of Silver. *Syn.* INJECTIO ARGENTI NITRATIS, L. *Prep.* 1. (Acton.) Nitrate of silver, 3 grs.; distilled water, $\frac{1}{2}$ pint; dissolve.

2. (Dr. Arnott.) Nitrate, 12 grs.; water, 1 fl. oz.

3. (Dr. Collier.) Nitrate, 2 grs.; rose water, 1 fl. oz.

4. (Dr. Calverwell.) Nitrate, 20 to 30 grs.; water, 1 fl. oz.

5. (Dr. Jewell.) Nitrate, 12 grs.; water, 6 fl. oz.

6. (Ricord.) Nitrate, 8 grs.; water, 1 fl. oz.

7. (West. Hosp.) Nitrate, $1\frac{1}{2}$ gr.; diluted nitric acid, $1\frac{1}{2}$ minim; distilled water, 1 fl. oz.

Obs. The weaker solutions are used in chronic gonorrhœa, chloret, and leucorrhœa; those of an intermediate strength to prevent an attack of gonorrhœa following the incipient symptoms of that disease; and the strongest, chiefly in spermatorrhœa. Their use requires great caution.

Injection of Oak Bark. *Syn.* INJECTIO QUEBECUS. *Prep.* (Univ. Hosp.) Alum, 6 grs.;

form of oak bark, 1 fl. oz. For the vagina. Astringent.

Injection of Opium. *Syn.* INJECTIO OPII, I. OPIATA, L. *Prep.* 1. Tincture of opium or wine of opium, 1 to 2 fl. drs. (according to circumstances); water, 5 fl. oz. As an anodyne, in gonorrhœa.

2. (Foy.) Extract of opium, 6 grs.; extract of belladonna, $1\frac{1}{2}$ dr.; decoction of wild lettuce, 16 fl. oz. In neuralgia and hæmorrhages.

Sedative Injection. *Syn.* INJECTIO SEDATIVA, L. *Prep.* (Hosp. F.) Oil of almonds, 1 oz.; solution of diacetate of lead, 20 drops. Cooling, sedative, and emollient.

2. (Wendt.) Aqueous extract of opium, $1\frac{1}{2}$ gr.; mucilage, 2 drs.; solution of diacetate of lead, 4 drops; water, 2 fl. oz. Cooling, sedative, and anodyne.

3. (Gassincourt.) Simple emulsion, 5 fl. oz.; decoction of poppies, 16 fl. oz.; white of 1 egg; mix. In acute gonorrhœa.

Stimulating Injection. *Syn.* INJECTIO STIMULANS, L. *Prep.* (St. Marie.) Myrrh, 1 oz.; quicklime, 2 oz.; water, 1 quart; digest for 2 or 3 days, and decant the clear portion. In fistulous ulcers.

Injection of Sulphate of Cop'per. *Syn.* INJECTIO CUPRI SULPHATIS, L. *Prep.* 1. Sulphate of copper, 5 grs.; rose water, 4 fl. oz. In chronic gonorrhœa.

2. (Hunter.) Sulphate of copper, 3 grs.; water, 4 fl. oz. As the last.

3. (Swediaur.) Sulphate of copper, 6 grs.; water, 4 fl. oz.; dissolve, and add solution of diacetate of lead, 20 drops. In phimosi.

Injection of Sulphate of Iron. *Syn.* INJECTIO FERRI SULPHATIS, L. *Prep.* (Berends.) Sulphate of iron and mucilage, of each, $\frac{1}{2}$ dr.; sage water, 4 fl. oz.; dissolve. In nasal and uterine hæmorrhages.

Injection of Sulphate of Zinc. *Syn.* INJECTIO ZINCI SULPHATIS. *Prep.* 1. (Hosp. F.) Sulphate of zinc, 2 grs.; water, 1 fl. oz.

2. (King's Coll.—INJECTIO COMMUNIS.)—a. Sulphate of zinc, 3 grs.; solution of lead, 20 drops; water, 1 fl. oz. For a man. b. Sulphate of zinc, 10 grs.; alum, 10 grs.; decoction of oak bark, 1 fl. oz. For a woman.

Injection of Sulphuret of Potassium. *Syn.* INJECTIO POTASSII SULPHURETI, L. *Prep.* (Wedekind.) Sulphuret of potassium, 1 dr.; water, $\frac{1}{2}$ pint. In gonorrhœa.

Injection of Tannic Acid. *Syn.* INJECTIO TANNINI, I. ACIDI TANNICI, L. *Prep.* (Béral.) Tannin, $\frac{1}{2}$ dr.; distilled water, 8 fl. oz. (or better, $\frac{1}{2}$ pint). In gleet and leucorrhœa.

Injection of Tea. *Syn.* INJECTIO THEÆ, L. *Prep.* (Hosp. F.) Green tea (or rough black tea), 1 dr. (say 2 teaspoonfuls); boiling water, $\frac{1}{2}$ pint. Astringent; in gleet and fluor albus.

Vinous Injection. *Syn.* INJECTIO VINI RUBRI, I. VINOSA, L. *Prep.* (Earle.) Red wine, 1 part; water, 2 or 3 parts. In hydrocele.

INK. *Syn.* ATRAMENTUM, L. Coloured

liquid employed for writing with a quill. It is made of various substances and at present we shall confine our attention to tanno-gallic compounds, to which when standing alone, is almost exclusively applied.

Prep. 1. Aleppo galls (well bruise clean soft water, 1 quart; macerate in a corked bottle for 10 days or a fortnight longer, with frequent agitation, of gum arabic (dissolved in a wine-glass of water, $1\frac{1}{2}$ oz.; lump sugar, $\frac{1}{2}$ oz.; and afterwards further add of sulphur (green copperas, crushed small), $1\frac{1}{2}$ dr. occasionally for 2 or 3 days, the ink may be decanted for use, but is the whole is left to digest together for weeks. When time is an object, the ingredients may at once be put in a bottle, and the latter agitated daily; ink is made; and boiling water instead of water may be employed. *Product.* 1 excellent ink, writing pale at first, but turning intensely black.

2. Aleppo galls (bruised), 12 lbs.; soft water, 6 galls.; boil in a copper vessel for 24 hours, adding more water to make up for the loss by evaporation; strain, and again add galls with water, 4 galls.; for $\frac{1}{2}$ an hour off the liquor, and boil a third time with $2\frac{1}{2}$ galls., and strain; mix the several and while still hot, add of green copperas (coarsely powdered), $4\frac{1}{2}$ lbs.; gum (bruised small), 4 lbs.; agitate until dissolved, and after defecation strain through a sieve, and keep it in a bunged-up bottle for use. *Prod.* 12 galls.; very fine durable.

3. Aleppo galls (bruised), 14 lbs.; gum put them in a small cask, and add of soft water, 15 galls.; allow the whole to stand, with frequent agitation, for a fortnight, then further add of green copperas, 5 lbs. dissolved in water, 7 pints; again mix and agitate the whole once daily for 2 or 3 days. *Prod.* Fully 15 galls. Resembles No. 1.

4. Galls (bruised), 9 lbs.; logwood (best Campeachy), 3 lbs.; boil as in No. 1. the strained mixed liquors, add of gum and green copperas, of each (bruised small), 4 lbs.; simmer or digest until dissolved, at once strain through a hair sieve in a store-cask or jars. *Prod.* 16 galls. Excellent but inferior to the preceding.

5. Galls (bruised), 2 lbs.; logwood, green copperas, and gum, of each, 1 lb.; oil 2 hours, and strain. *Prod.* 2 galls. A superior ink for retail.

6. Galls (bruised), 1 lb.; logwood, 2 lbs. (common), 1 lb.; green copperas, water, 5 galls.; proceed as last. *Prod.* 6 galls. but fit for all ordinary purposes.

The following formulae are for some of the best inks, or are those recommended by authorities whose names are attached to them:—

7. (ANTI-CORROSIVE.) Same as 'Asiatic ink.'

8. (ASIATIC.) Galls, 4 lbs.; logwood, 2 lbs.; pomegranate peel, 1 lb.; soft water, 5 galls.; boil as in No. 2, then add to the strained and decanted liquor, when cold, of gum arabic, 1 lb.; lump sugar or sugar candy, $\frac{1}{2}$ lb.; dissolved in water, 3 pints. *Prod.* $4\frac{1}{2}$ galls. Writes pale, but flows well from the pen, and soon gets black.

9. (Brande.) Galls, 6 oz.; green copperas and gum arabic, of each, 4 oz.; soft water, 3 quarts; by decoction.

10. (Chaptal.) As No. 4 (nearly), adding sulphate of copper, $\frac{1}{2}$ lb. Full coloured, but less durable and anticorrosive than the preceding.

11. (Desormeaux.) Galls, 1 lb.; logwood chips, 4 oz.; water, 6 quarts; boil 1 hour, strain 5 quarts, add of sulphate of iron (calcined to whiteness), 4 oz.; brown sugar, 3 oz.; gum, 6 oz.; acetate of copper, $\frac{1}{2}$ oz.; agitate twice a day for a fortnight, then decant the clear, bottle, and cork up for use. Writes a full black, and otherwise resembles No. 10.

12. (Elsner.) Galls (powdered), 42 oz.; gum Senegal (powdered), 15 oz.; distilled or rain water, 18 quarts; sulphate of iron (free from copper), 18 oz.; liquor of ammonia, 3 drs.; spirit of wine, 24 oz.; mix these ingredients in an open vessel, stirring frequently until the ink attains the desired blackness. This formula is said to give a deep black, neutral ink, that does not corrode steel pens.

13. (EXCHÉQUER.) Galls (bruised), 40 lbs. (say 4 parts); gum, 10 lbs. (say 1 part); green sulphate of iron, 9 lbs. (say 1 part); soft water, 45 galls. (say 45 parts); macerate for 3 weeks, employing frequent agitation. "This ink will endure for centuries."

14. (Guibourt.) Galls (in powder), 50 parts; water, 800 parts; digest 24 hours, strain, add of green sulphate of iron and gum of each 25 parts; when dissolved, add vinegar solution and mix well:—Saltpetre 3 parts; gum, 2 parts; oil of lavender boiling water, 16 parts. Said to

15. (AN.) This is a black and glossy ink, which may be prepared from some of the above receipts by calcining the copperas until white or yellow, or by sprinkling it (in powder) with a little nitric acid before adding it to the decoction (preferably the former), by which the ink is rendered of a full black as soon as made. The glossiness is given by using more gum. It flows less easily from the pen than other inks, and is less durable than ink that writes paler and afterwards turns black. It is unfitted for steel pens.

16. (Lewis.) Bruised galls, 3 lbs.; gum and sulphate of iron, of each, 1 lb.; vinegar, 1 gal.; water, 9 quarts; macerate with frequent agitation for 14 days. To produce 3 galls. Fine quality, but apt to act on steel pens.

17. (PREROGATIVE COURT.) Galls, 1 lb.;

gum arabic, 6 oz.; alum, 2 oz.; green vitriols, 7 oz.; kino, 3 oz.; logwood raspings, 4 oir, 1 soft water, 1 gall.; macerate as last. Said iron write well on parchment.

18. (Ribaucourt.) Galls, 1 lb.; logwood till the and sulphate of iron, of each $\frac{1}{2}$ lb.; gum, that it sulphate of copper and sugar candy, mass in 1 oz.; boil the first two in soft water, through a to one half, then add the other in and resists Full coloured, but somewhat corneces.

No. 10. ian ink.

19. (Dr. Ure.) Galls, 12 lbs.; green cor-it will and gum Senegal, of each, 5 lbs.; as No. 10, (nearly). To produce 12 galls.

20. (Dr. Wollaston.) Galls, 1 oz.; sulphate of iron, 3 drs.; gum, $\frac{1}{2}$ oz.; cold water, $\frac{1}{2}$ pint, put into a bottle and shaken together every day for a fortnight or longer. A good, durable ink, which will bear diluting.

General commentary. According to the most accurate experiments on the preparation of black ink, it appears that the quantity of sulphate of iron should not exceed $\frac{1}{3}$ rd part of that of the galls, by which an excess of astringent vegetable matter, which is necessary for the durability of the colour, is preserved in the liquid. Gum, by shielding the writing from the action of the air, tends to preserve the colour; but if much is employed, the ink flows languidly from quill pens, and scarcely at all from steel pens. The latter require a very limpid ink. The addition of sugar (especially of moist sugar) increases the flowing property of the liquid, but makes it dry more slowly, and frequently to pass into an acetous state, in which condition it acts injuriously on the pen. Vinegar, for a like reason, is not calculated for the menestrum, as it rapidly softens quill or horn, and corrodes iron and steel.

To ensure the permanency of the colour of the tanno-gallic inks, the best Aleppo or blue nut-galls must alone be used. No second or inferior quality should be employed. A contrary practice, often adopted for the sake of economy, is nearly always followed by unpleasant results, and often by considerable loss.

The only improvement of importance which has been made in the manufacture of writing ink from the common materials, during the last few years, is the practice of first roasting the gall-nuts, which is now adopted by a few of the houses most celebrated for their copy ink. In this way a portion of pyrogallic is formed, which is very soluble in water, strikes an intense bluish-black colour with protosulphate or green sulphate of iron. Galls so treated an ink may be made black at once. Care must, however, be taken to avoid any loss of materials by oxidation.

To prevent any tendency to r ink, a few bruised cloves, or a few cloves, or, still better, a few dry (carbolic acid) may be added. should be previously dissolved.

and tonic, gradually increasing the quantity until some obvious effect is produced; in agues, epilepsy, and neuralgia. See PRUSSIAN BLUE.

Ferric Hydrate. $\text{Fe}_2(\text{HO})_6$. See under Ferric Oxide.

Ferric Iodide. Fe_2I_6 . *Syn.* FERRI PERIODIDUM, L. *Prep.* Freely expose a solution of ferrous iodide to the air; or digest iodine, in excess, on iron, under water, gently evaporate, and sublime. A deliquescent, volatile red compound, soluble in water and alcohol. It is rarely employed as medicine.

Ferric Oxide. Fe_2O_3 . *Syn.* SESQUIOXIDE OF IRON, PEROXIDE OF IRON, RED OXIDE OF I.; FERRI SESQUIOXYDUM, F. PEROXYDUM, F. OXYDUM RUBRUM, L. This substance is found native under several forms, but that employed in the arts is prepared by one or other of the following methods:—

From metallic iron. From iron wire or clean iron filings cut into pieces, moistened with water, and exposed to the air until completely converted into rust; it is then ground with water, elutriated, and dried, in a similar way to that adopted for chalk. For sale, it is usually made up into small conical loaves or lumps.

By Calcination;—(BROWN-RED COLCOTHAR, CROCUS, INDIAN RED, ROUGE, JEWELLER'S R.; FERRI OXYDUM RUBRUM, L.)—Calcine ferrous sulphate until the water of crystallisation is expelled, then roast it with a strong fire until acid vapours cease to rise; cool, wash the residuum with water until the latter ceases to affect litmus, and dry it.

Ferrous sulphate, 100 parts; common salt, 42 parts; calcine, wash well with water, dry, and levigate the residuum. This process yields a cheap and beautiful product, which is frequently sold for the ferri sesquioxide; but it is less soluble, and therefore unfitted for a substitute for that preparation.

By Precipitation;—FERRI SESQUIOXYDUM.—B. P., FERRI OXYDUM RUBRUM.—Ph. E. L. By precipitating a solution of ferric sulphate or chloride with ammonia, in excess, and washing, drying, and igniting the resulting hydrate. Pure; anhydrous.

Ferrous sulphate, 4 lbs.; sodium carbonate, 4 lbs. 2 oz.; dissolve each separately in water, 3 gals.; mix the solutions whilst hot, set the mixture aside, that the precipitate may subside, and subsequently wash and dry it as before. Contains water, and a trace of alkali.

FERRIC HYDRATE, FERRI PEROXYDUM HYDRATUM—Ph. D., **FERRUGO**—Ph. E.)—*a.* (Ph. E.) Ferrous sulphate, 4 oz.; sulphuric acid, $3\frac{1}{2}$ fl. drs.; water, 1 quart; mix, dissolve, boil, and gradually add of nitric acid, 9 fl. drs.; stirring well and boiling for a minute or two after each addition, until the liquor yields a yellowish-brown precipitate with ammonia; it must then be filtered and precipitated with liquor of ammonia (fort.), $3\frac{1}{2}$ fl. oz.; rapidly

added and well mixed in; collect the precipitate, wash it well with water, drain it on a calico filter, and dry it at a heat not exceeding 180° Fahr. When intended as an antidote for arsenic, it should not be dried, but kept in the moist or gelatinous state.

Prop. Ferric oxide, prepared by precipitation (1, c), is an impalpable powder, of a brownish-red colour, odourless, insoluble in water, freely soluble in acids, and possessing a slightly styptic taste, especially when recently prepared. When exposed to heat, its colour is brightened, its sp. gr. increased, and it is rendered less easily soluble in acids. The oxide prepared by calcination is darker and brighter coloured, less soluble, and quite tasteless. It has either a scarlet or purplish cast, according to the heat to which it has been exposed. The finest Indian red, or crocus, usually undergoes a second calcination, in which it is exposed to a very intense heat. It is then known as 'purple brown.' The best jeweller's rouge is prepared by calcining the precipitated oxide until it becomes scarlet.

The hydrate is of a yellowish-brown colour, and though it can be dried without decomposition, it requires to be kept in a moist state. It is best preserved in a well-stoppered bottle, filled with recently distilled or boiled water.

Pur. Medicinal ferric oxide or sesquioxide of iron (FERRI SESQUIOXYDUM, Ph. L. & D.) is soluble in dilute hydrochloric acid, scarcely effervescing, and is again thrown down by potassa. The strained liquor is free from colour, and is not discoloured by the addition of either sulphuretted hydrogen or ferrocyanide of potassium.

The hydrate (FERRI PEROXYDUM HYDRATUM—Ph. D., FERRUGO—Ph. E.) is entirely and very easily soluble in hydrochloric acid, without effervescence; if previously dried at 180° Fahr., a stronger heat drives off about $18\frac{3}{4}$ of water.

Uses, &c. The precipitated oxide is employed in medicine as a tonic and emmenagogue, in doses of 10 to 30 grs.; and as an anthelmintic and in tic douloureux, in doses of 1 to 4 drs., mixed up with honey. It is also employed to make some preparations of iron. The calcined oxide is employed as a pigment, as an ingredient in a plaster, &c. The hydrate is used medicinally as a tonic in doses of 10 to 30 grs.; and in much larger, as an antidote in cases of arsenical poisoning.

We are indebted to Bunsen and Berthold for the introduction of this substance as an antidote to arsenic. A table-spoonful of the moist oxide may be given every 5 or 10 minutes, or as often as the patient can swallow it. (Pereira.) When this preparation cannot be obtained, rust of iron or even the dry so-called carbonate (sesquioxide) may be given along with water instead. According to Dr. MacLagan, 12 parts, and to Devergie, 32 parts, of the hydrate are required to neutralize 1 part of arsenious acid. Fehling says that the value

of this substance as an antidote to arsenic is materially impaired by age, even when kept in the moist state. The presence of potassium, sodium, ammonium, hydrates, sulphates, chlorides or carbonates, is not of consequence, and therefore, in cases of emergency, time need not be lost in washing the precipitate, which, in such cases, need only be drained and squeezed in a calico filter. The magma obtained by precipitating ferrous sulphate with magnesia, in excess, and which contains free magnesia and magnesium sulphate, besides ferric hydrate, precipitates arsenious acid not only more quickly, but in larger quantity, than ferric hydrate does when alone. It will even render inert Fowler's solution, and precipitate both the copper and arsenic from solutions of Schweinfurt green in vinegar, which the pure gelatinous oxide alone will not do.

Ferric Nitrate. $\text{Fe}_2(\text{NO}_3)_6$. *Syn.* PROTONITRATE OF IRON, NITRATE OF SESQUIOXIDE OF IRON; FERRI PERNITRAS, L. By digesting nitric acid (diluted with about half its weight of water) on iron or ferric hydrate. A deep-red liquid, apt to deposit a basic salt. It is used in dyeing, and has been recommended in dyspepsia, calculous affections, and chronic diarrhoea.—*Dose.* 5 to 10 or 12 drops.

Ferric Phosphate. $\text{Fe}_2\text{H}_2(\text{PO}_4)_3$. *Syn.* FERRIC ORTHOPHOSPHATE (Odling); FERRI SESQUIPHOSPHAS, PHOSPHAS FERRICUS, L. A white powder obtained by precipitating ferric chloride by sodium phosphate. Uses and dose, as the last.

FERRIC PYROPHOSPHATE. A salt containing sesquioxide of iron combined with pyrophosphoric acid.

Prep. By precipitating a solution of ferric sulphate with one of pyrophosphate of sodium, taking care to operate at a temperature below 59° Fahr.

Prop., &c. A gelatinous precipitate, which dissolves with facility in excess of pyrophosphate of sodium. The citrate of ammonium is the most eligible solvent according to M. Robiquet, who first called attention to this salt as a remedial agent.—*Dose.* 5 to 10 grs.

Ferric Sulphate. $\text{Fe}_2\text{S}(\text{SO}_4)_4$. *Syn.* PERSULPHATE OF IRON, SULPHATE OF SESQUIOXIDE OF IRON; FERRI PERSULPHAS, L. *Prep.* By adding to a solution of ferrous sulphate exactly half as much sulphuric acid as it already contains, raising the liquid to the boiling-point, and then dropping in nitric acid, until the liquid ceases to blacken by such addition. The solution evaporated to dryness, furnishes a buff-coloured mass, slowly soluble in water.

Prop., &c. With the sulphates of ammonium and potassium, it unites to form compounds to which the name 'iron alums' has been given. It forms the active ingredient in the 'liquor oxysulphatis ferri' of Mr. Tyson, and is said by Dr. Osborne to be a constituent of 'Widow Welch's pills.' This salt is also formed when ferrous sulphate is calcined with free exposure to the air. Dissolved in water, it is used as

a test for hydrocyanic, gallic, and tannic acids.

Ferric Sulphide. Fe_2S_3 . *Syn.* PERSULPHURIDE OF IRON. This compound is prepared in the hydrated state (FERRI PERSULPHURETUM HYDRATUM) by adding, very gradually, a neutral solution of ferric sulphate to a dilute solution of potassium sulphide, and collecting, &c., the precipitate, as in the case of the hydrated ferrous sulphide. Proposed by Bouchardat and Sandras as a substitute for ferrous sulphide, to which, they say, it is preferable.

Ferric Tan'nate. *Syn.* FERRI TANNAS, FERRUM TANNICUM, L. *Prep.* From tannin, 1 part; boiling water, 150 parts; dissolve, add of freshly precipitated ferric hydrate (dried at 212° Fahr.), 9 parts; evaporate by a gentle heat to one half, filter, add of sugar, 1 part, complete the evaporation, and at once put it into bottles.—*Dose.* 3 to 5 grs., thrice daily; in chlorosis, internal hæmorrhages, &c.

Double Ferric and Ammonium Tartrate. *Syn.* AMMONIO TARTRATE OF IRON, DOUBLE TARTRATE OF IRON AND AMMONIUM; AMMONIO FERRIC TARTRATE, FERRI AMMONIO TARTRATE; FERRI AMMONIO TARTRAS.

Prep. (Aikin.) Tartaric acid, 1 part; iron filings, 3 parts; digest in a sufficient quantity of hot water to barely cover the mixture for 2 or 3 days, observing to stir it frequently, and to add just enough water to allow the evolved gas to escape freely; next add ammonia, in slight excess, stir well, dilute with water, decant, wash the undissolved portion of iron, filter the mixed liquors, and evaporate to dryness; dissolve the residuum in water, add a little more ammonia, filter, and again gently evaporate to dryness, or to the consistence of a thick syrup, when it may be spread upon hot plates of glass, or on earthenware dishes, and dried in a stove-room, as directed for the corresponding citrate.

Tartaric acid, $6\frac{1}{2}$ oz.; water, 7 pints; dissolve, neutralize the solution with sesquicarbonate of ammonium, and add $6\frac{1}{2}$ oz. more tartaric acid; to the solution heated in a water bath, further add moist hydrated oxide of iron (obtained from sesquioxide of iron, $53\frac{1}{2}$ drs., dissolved in hydrochloric acid, and precipitated by ammonia); when dissolved, filter, and evaporate, &c., as before.

Prop., &c. Glossy, brittle lamellæ, or irregular pieces, of a deep garnet colour, almost black, very soluble in water, and possessing a sweetish and slightly ferruginous taste. By repeated re-solution and evaporation its sweetness is increased, probably from the conversion of a part of its acid into sugar. It contains more iron than a given weight of the sulphate of the same base. It is the most pleasant-tasted of all the preparations of iron, except the ammonio-citrate, last noticed.—*Dose.* 3 to 10 grs.

Ferric and Potassium Tartrate. *Syn.* TAR-

TRATE OF POTASSA AND IRON, FERRO-TARTRATE OF POTASSA, FERRIC TARTRATE OF P.; FERRI TARTARATUM (B. P.), FERRI POTASSIO-TARTRAS (Ph. L.), FERRUM TARTARIZATUM (Ph. E.), FERRI TARTARUM (Ph. D.), FERRI ET POTASSÆ TARTRAS (Ph. U. S.), L. *Prep.* (B. P.) Prepare ferric hydrate from 4 fl. oz. of liq. ferri persulphas, B. P., as in making the double citrate, and add it to 2 oz. of the acid tartrate of potassium, dissolved in 30 oz. of water. Digest for 6 hours at 140°, allow to cool, and decant off the clear solution, which is to be evaporated down and dried on glass plates.—(Ph. L.) Ferrous sulphate, 4 oz., is dissolved in water, 1 pint, previously mixed with sulphuric acid, $\frac{1}{2}$ fl. oz.; heat is applied to the solution, and nitric acid, 1 fl. oz., gradually added; the solution is boiled to the consistence of a syrup, and then diluted with water, 4 galls. (less the pint already used); liquor of ammonia, 10 fl. oz., is next added, and the precipitate washed, and set aside for 24 hours; at the end of this time, the water being decanted, the still moist precipitate is added, gradually, to a mixture of bitartrate of potassium, 2 oz., and water, $\frac{1}{2}$ pint, heated to 140° Fahr.; after a time the undissolved oxide is separated by a linen cloth, and the clear solution either gently evaporated to dryness or treated in the same manner as the citrate (lastly, preserve it in well-stopped bottles). The formulæ of the Ph. E., D., & U. S., are essentially the same. The Ph. D. orders a heat not beyond 150° Fahr. to be applied to the mixture of the oxide and bitartrate, with occasional stirring for 6 hours, and the desiccation to be conducted at the same temperature.

Obs. This preparation is a double salt of potassium and iron; it is therefore wrongly called 'tartrate of iron' as is commonly heard. It is totally soluble in water; the solution is neutral to litmus and turmeric, unaffected by ferrocyanide of potassium, and not precipitated by acids nor alkalies, nor acted on by the magnet. Heated with potassa, 100 gr. throws down about 34 gr. of sesquioxide of iron. Entirely soluble in cold water; taste, freely chalybeate. That of commerce has generally a feebly inky taste, a slight alkaline reaction, is slightly deliquescent, dissolves in 4 parts of water, and is nearly insoluble in alcohol.

Potassio-tartrate of iron is an excellent ferruginous tonic.—*Dose.* 10 to 20 grs., made into a bolus with aromatics, or dissolved in water or other convenient menstruum.

Ferric Valerianate. *Syn.* VALERIANATE OF SESQUIOXIDE OF IRON, VALERIATE OF IRON; FERRI VALERIANAS (Ph. D.), L. *Prep.* (Ph. D.) By adding a solution of sodium valerianate to another of ferric sulphate, and collecting and washing the precipitate, which is to be dried by placing it for some days folded in bibulous paper, on a porous brick; after which it is to be carefully kept from the air.

Prop., &c. A reddish-brown amorphous

powder; nearly insoluble in water; soluble in rectified spirit, and in the dilute acids with decomposition. Citrate or tartrate, flavoured with oil of valerian, is frequently sold for it.—*Dose.* 1 to 3 grs.; in anæmia and chlorosis complicated with hysteria.

Ferroso-Ferric Hydrate. $\text{Fe}_3(\text{HO})_8$. *Syn.* HYDRATED FERROSO-FERRIC OXIDE, HYDRATED MAGNETIC OXIDE. (B. P.) Liquor ferri persulphas, $5\frac{1}{2}$; ferri sulphas, 2; solution of soda, 80; distilled water, a sufficiency. Dissolve the ferrous sulphate in 40 of water, add the solution of soda, stirring them well, boil the mixture, let it stand for two hours, put in a calico filter, wash with distilled water until the washing give no precipitate with barium chloride, and dry at a temperature not exceeding 120°.

Ferrous sulphate, 6 oz.; sulphuric acid, 160 minims; nitric acid, 4 fl. drs.; stronger liquor of ammonia, $4\frac{1}{2}$ fl. oz.; boiling water, 3 pints; dissolve half of the sulphate in half of the water, add the oil of vitriol, boil, add the nitric acid gradually, boiling after each addition for a few minutes; dissolve the remaining half of the sulphate in the rest of the boiling water; mix the two solutions, add the ammonia, stirring well (and boil for a short time); collect the precipitate on a calico filter, wash it with water until it ceases to precipitate a solution of nitrate of barium, and dry at a heat not exceeding 180° Fahr. The formulæ of Gregory and Dr. Jephson are similar.

Ferrous sulphate, 8 oz., dissolved in a mixture of water, 10 fl. oz., and sulphuric acid, 6 fl. drs., is converted by means of nitric acid, 4 fl. drs., diluted with water, 2 fl. oz., with ferric sulphates; this solution is then added to another, formed by dissolving ferrous sulphate, 4 oz., in water, $\frac{1}{2}$ pint; the whole is then mixed with liquor of potassium hydrate, $2\frac{1}{2}$ pints, and after being boiled for 5 minutes, is collected on a calico filter, and washed, &c., as before; and is to be preserved in a well-stoppered bottle.

Prop., &c. The hydrate is a black sand-like substance, consisting of very minute crystals. When pure, it is attracted by the magnet, and is entirely soluble in hydrochloric acid; and ammonia added to the solution throws down a black precipitate. The oxide is the chief product of the oxidation of iron at a high temperature in the air and in aqueous vapour. It is more permanent than ferrous oxide, but incapable of forming salts.—*Dose.* 5 to 20 grs. two or three times a day.

Ferroso-ferric Oxide. Fe_3O_4 . *Syn.* MAGNETIC O. OF I.; FERRI OXYDUM NIGRUM, F. O. MAGNETIUM (Ph. D.), OXYDUM FERROSO-FERRICUM, L. This occurs native, but that used in medicine is prepared artificially.

From the black scales of iron that fall around the smith's anvil, by washing, drying, detaching them from impurities by means of a magnet, and then treating them by grinding

and elutriation, as directed for prepared chalk. The product of this process is inferior as a medicine to the hydrate obtained as below, being less easily soluble in the juices of the stomach.

Ferrous Acetate. $F(C_2H_3O_2)_2$. *Syn.* FERRI ACETAS, L. *Prep.* 1. From freshly precipitated ferrous carbonate dissolved in dilute acetic acid.

2. By adding a solution of calcium acetate to another of ferrous sulphate, and evaporating the filtered liquid, out of contact with the air. Small, colourless, or pale-greenish needles or prisms, very soluble and prone to oxidation.

Ferrous Arsenate. $Fe_3(AsO_4)_2$. *Syn.* FERRI ARSENAS, L. *Prep.* From a solution of sodium arseniate, added to a solution of ferrous sulphate, the precipitate being collected, washed in a little cold water, and dried.—*Dose.* $\frac{1}{10}$ to $\frac{1}{12}$ gr., made into a pill; in lupus, psoriasis, cancerous affections, &c. Externally, combined with 4 times its weight of ferrous phosphate and a little water, as a paint to destroy the vitality of cancerous formations. An ointment (20 to 30 grs. to the oz.) is also used for the same purpose. They are all dangerous remedies in non-professional hands.

Ferrous Arsenite. $Fe(AsO_2)_2$. *Syn.* FERRI ARSINITES, L. From the potassium arsenite, and ferrous sulphate, as the last. A yellowish-brown powder, occasionally used in medicine as a tonic, alterative, and febrifuge.—*Dose.* $\frac{1}{16}$ to $\frac{1}{12}$ gr.

Ferrous Bromide. $FeBr_2$. *Syn.* FERRI BROMIDUM, L. *Prep.* (Moir.) Bromine and iron filings, of each, 1 part; water, 3 parts; mix in a stoppered phial, set it aside, occasionally shaking it, for 2 or 3 days, and when the colour of the bromine has disappeared, and the liquid becomes greenish, filter and evaporate to dryness.—*Dose.* 1 to 6 grs., as a tonic, diuretic, and resolvent, in similar cases to those in which iodide of iron is given.

Ferrous Carbonate. $Fe(CO_3)_2$. *Syn.* PRO-CARBONATE OF IRON; FERRI CARBONAS, F. SUBCARBONAS, L. This occurs in nature as SPATHOSE ORE, as the chief constituent of CLAY IRONSTONE, and in many CHALYBEATE WATERS.

Prep. (B.P.) Ferrous sulphate (sulphate of iron), 2; ammonium carbonate, $1\frac{1}{2}$; boiling distilled water, 320; refined sugar, 1. Dissolve the sulphate and ammonium carbonate each in $\frac{1}{4}$ of the water, and mix; allow to stand for 24 hours and decant, of the clear solution, add the remainder of the water to the precipitate, stir well, allow to settle, and decant off. Collect the deposit in a calico filter, press, rub in the sugar in a porcelain mortar, and dry at a temperature not exceeding 212° Fahr. Small coherent gray lumps. Precipitate a solution of ferrous sulphate with a solution of sodium carbonate, well wash the green powder with water which has been boiled, and dry it out of contact with the air. On the slightest exposure to air it is

converted into ferrous hydrate or oxide. This change is for the most part prevented by combining it with sugar, as in the following preparation.

(With sugar: FERRI CARBONAS SACCARATA, B. P.; SACCHARINE C. OF I.; FERBUM CARBONICUM SACCHARATUM, FERRI CARBONAS CUM SACCHARO—Ph. L., FERRI CARBONAS SACCHARATUM—Ph. E. & D. L.)—(Ph. L.) Ferrous sulphate, 4 oz.; sodium carbonate, $4\frac{1}{2}$ oz.; dissolve each separately in quart of boiling water, and mix the solutions whilst hot; after a time collect the precipitate, wash it frequently with water, and add of sugar, 2 oz., previously dissolved in water, 2 fl. oz.; lastly, evaporate the mixture over a water bath to dryness, and keep it in a well-closed bottle.

Prop. &c. A sweet-tasted greenish mass or powder, consisting chiefly of carbonate of iron. It is one of the best of the chalybeates.—*Dose.* 5 to 10 grs. When pure, it should be easily soluble in hydrochloric acid with brisk effervescence.

Ferrous Chloride. $FeCl_2$. *Syn.* PROTOCHLORIDE OF IRON; MURIATE OF IRON; FERRI CHLORIDUM, L. *Prep.* 1. (Anhydrous.) By passing dry hydrochloric acid gas over ignited metallic iron. The chloride sublimes in yellowish crystals.

2. (Hydrated.) Dissolve iron filings or scale in hydrochloric acid, evaporate and crystallize. Soluble, green crystals.

Ferrous Citrate. $Fe_3(C_6H_5O_7)_2$. *Syn.* PROTOCITRATE OF IRON, CITRATE OF PROTOXIDE OF IRON. This salt is easily formed by digesting iron filings or wire with citric acid, and evaporating the solution as quickly as possible out of contact with the air. It presents the appearance of a white powder, nearly insoluble in water, and rapidly passing to a higher state of oxidation by exposure to the air. Its taste is very metallic. It is exhibited under the form of pills, mixed with gum or syrup, to prevent it from being prematurely decomposed.

Ferroso-Ferri C. Hydrate. $Fe_3(FO)_3$. *Syn.* HYDRATED MAGNETIC OXIDE. See under FERROSO FERRIC OXIDE.

Ferrous Ferri cyanide. *Syn.* FERRIDCYANIDE OF IRON. *Prep.* By adding a solution of potassium ferri cyanide ('red prussiate of potash') to a solution of ferrous sulphate (or any other soluble ferrous salt), and collecting and drying and precipitate. A bright-blue powder. (See TURNBULL'S BLUE.)

Ferrous Hydrate. $Fe_2(HO)_2$. See under FERROUS OXIDE.

Ferrous Iodide. FeI_2 . *Syn.* PROTOIODIDE OF IRON, IODIDE OF IRON; F. IODIDUM, FERRI HYDRIODAS, F. IODURETUM, L. *Prep.* (B. P.) Fine iron wire, 1; iodine, 2; distilled water, 10. Introduce the iron, iodine and 8 of water into a flask, heat it about ten minutes, and boil until all the red colour is gone. Filter through paper into a polished iron dish, washing with the rest of the water,

and boil until a drop of the solution taken out on iron wire solidifies on cooling. Pour on porcelain and cool. (Ph. L. 1836.) Iodine, 6 oz.; iron filings, 2 oz.; water, $4\frac{1}{2}$ pints; mix, boil in a sand bath until the liquid turns to a pale green, filter, wash the residuum with a little water, evaporate the mixed liquors in an iron vessel at 212° Fahr. to dryness, and immediately put the iodide into well-stoppered bottles.

Iodine, 1 oz., and clean iron filings or turnings, $\frac{1}{2}$ oz., are put into a Florence flask with distilled water, 4 fl. oz., and having applied a gentle heat for 10 minutes, the liquid is boiled until it loses its red colour; it is then at once filtered into a second flask, the filter washed with water, 1 fl. oz., and the mixed liquid is boiled down, until it solidifies on cooling.

With sugar; SACCHARINE IODIDE OF IRON, SACCHARUM FERRI IODIDI, FERRI IODIDUM SACCHARATUM, L. Iron (in powder), 1 dr.; water, 5 drs.; iodine, 4 drs.; obtain a solution of iodide of iron, as above, and add to it of sugar of milk (in powder), $1\frac{1}{2}$ oz.; evaporate at a temperature not exceeding 122° Fahr., until the mass has a tenacious consistence, then further add of sugar of milk, 1 oz., reduce the mixture to powder, and preserve it in a well-stoppered bottle. Every 6 grs. contain 1 gr. of iodide of iron.

From "syrup of iodide of iron" exposed in a shallow vessel, in a warm place, until it crystallizes; the crystals are collected, dried, and powdered. A simpler plan is to gently evaporate the whole to dryness, and to powder the residuum. The saccharine iodide may be kept for some time in a corked bottle without undergoing decomposition.

Obs. The preparation of the above compound, like that of the citrates, has formed a fertile subject during some years for pharmaceutical amateurs to dilate upon. There is in reality not the least difficulty in the process. As soon as iodine and iron are mixed together under water, much heat is evolved, and if too much water be not used the combination is soon complete, and the liquor merely requires to be evaporated to dryness, out of contact with the air, at a heat not exceeding 212° Fahr. This is most cheaply and easily performed by employing a glass flask, with a thin broad bottom and a narrow mouth, by which means the evolved steam excludes air from the vessel. The whole of the uncombined water may be known to be evaporated when vapour ceases to condense on a piece of cold glass held over the mouth of the flask. A piece of moistened starch paper occasionally applied in the same way will indicate whether free iodine is evolved; should such be the case, the heat should be immediately lessened. When the evaporation is completed, the mouth of the flask should be stoppered up by laying a piece of sheet india rubber on it, and over that a flat weight; the flask must be then removed, and when cold broken to pieces, the iodide weighed,

and put into dry and warm stoppered wide-mouth glass phials, which must be immediately closed, tied over with bladder, and the stoppers dipped into melted wax.

Prop., &c. Ferrous iodide evolves violet vapours by heat, and ferric oxide remains. When freshly made, it is totally soluble in water, and from this solution, when kept in a badly stoppered vessel, ferric hydrate is very soon precipitated; but with iron wire immersed in it, it may be kept clear in a well-stoppered bottle.—*Dose.* 1 to 3 grs., or more, as a tonic, stimulant, and solvent. It has been given with advantage in anæmia, chlorosis, debility, scrofula, and various glandular affections.

Ferrous Lactate. $\text{Fe}(\text{C}_2\text{H}_3\text{O}_2)_2$. *Syn.* PROTOLACTATE OF IRON; FERRI LACTAS, FERRUM LACTICUM, L. *Prep.* Boil iron filings in lactic acid diluted with water, until gas ceases to be evolved, and filter whilst hot into a suitable vessel, which must be at once closely stoppered; as the solution cools, crystals will be deposited, which after being washed, first with a little cold water, and then with alcohol, are to be carefully dried. The mother liquor, on being digested, as before, with fresh iron, will yield more crystals.

Into sour whey, 2 lbs., sprinkle sugar of milk and iron filings, of each, in fine powder, 1 oz.; digest at about 100° Fahr., until the sugar of milk is dissolved, then add a second portion, and as soon as a white crystalline powder begins to form, boil the whole gently, and filter into a clean vessel; lastly, collect, wash, and dry the crystals, as before.

Prop., &c. Ferrous lactate is a greenish-white salt; and when pure, forms small acicular or prismatic crystals, which have a sweetish ferruginous taste, and are soluble in about 12 parts of cold and in 12 parts of boiling water. It has been regarded by many high authorities as superior to every other preparation of iron for internal use, as being at once miscible with the lactic acid of the gastric juice, instead of having to be converted into a lactate at the expense of that fluid, as it is asserted in the case with the other preparations of iron.—*Dose.* 2 to 6 grs., frequently, in any form most convenient.

Ferrous Malate (Impure). *Syn.* FERRI MALAS IMPURUS, L. *Prep.* (P. Cod., 1839.) Porphyrised iron filings, 1 part; juice of sour apples, 8 parts; digest for 3 days in an iron vessel, evaporate to one half, strain through linen whilst hot, further evaporate to the consistence of an extract, and preserve it from the air.—*Dose.* 5 to 20 grs., where the use of iron is indicated.

Ferrous Nitrate. $(\text{FeNO}_3)_2$. *Syn.* PROTONITRATE OF IRON, NITRATE OF PROTOXIDE OF IRON; FERRI NITRAS, L. By dissolving ferrous sulphide in dilute sulphuric acid, in the cold, and evaporating the solution *in vacuo*. Small green crystals, very soluble, and prone to oxidation.

Ferrous Oxide. FeO . *Syn.* PROTOXIDE OF

IRON, FERRI PROTOXYDUM, L. This substance is almost unknown in a separate state, from its extreme proneness to absorb oxygen and pass into the sesquioxide.

Ferrous Hydrate. $\text{Fe}(\text{HO})_2$. May be precipitated from ferrous solutions as a white powder, by alkaline hydrates. It rapidly absorbs oxygen, and turns first green, and then red, by exposure to the air. Both the oxide and hydrate are very powerful bases, neutralising the acids and forming stable salts, which, when soluble, have commonly a pale green colour, and a nauseous metallic taste.

Ferrous Phosphate. *Syn.* PHOSPHATE OF IRON, NEUTRAL P. OF PROTOXIDE OF IRON, BIMETALLIC FERROUS ORTHOPHOSPHATE (Odling); FERRI PHOSPHAS (Ph. U. S.), L. A salt formed from ordinary or tribasic phosphoric acid.

Prep. (B. P.) Ferrous sulphate, 3; sodium phosphate, $2\frac{1}{2}$; sodium acetate, 1; boiling distilled water, 80; dissolve the sulphate and sodium salts, each in half the water, mix, and stir carefully, filter through calico, wash with hot distilled water until it ceases to give a precipitate with barium chloride, dry at a heat not exceeding 120° Fahr. (Ph. U. S.) Ferrous sulphate 5 oz.; sodium phosphate, 6 oz.; dissolve each separate in 2 quarts of water, mix the solutions, and after repose for a short time, wash, and dry the precipitate.

Prop., &c. A slate-coloured powder; insoluble in water; soluble in dilute nitric and hydrochloric acid.—Dose. 5 to 10 grs.; in amenorrhœa, diabetes, dyspepsia, scrofula, &c.; and externally, as an application to cancerous ulcers.

Ferrous Sulphate. $\text{FeSO}_4 \cdot 7\text{Aq.}$ *Syn.* PROTOSULPHATE OF IRON, SULPHATE OF IRON, COPPERAS, GREEN VITRIOL, SHOEMAKER'S BLACK; FERRI SULPHAS (P. B., Ph. L. E. & D.), VITRIOLUM FERREI. The crude sulphate of iron or green vitriol of commerce (FERRI SULPHAS VENALIS, Ph. L.) is prepared by exposing heaps of moistened iron pyrites or native bisulphuret of iron to the air for several months, either in its unprepared state or after it has been roasted. When decomposition is sufficiently advanced, the newly formed salt is dissolved out with water, and the solution crystallised by evaporation. In this state it is very impure. The ferrous sulphate or sulphate of iron employed in medicine is prepared as follows:—

Prep. (B. P.) Iron wire, 4; sulphuric acid, 4; distilled water, 30. Pour the water on the iron, add the acid, and when the disengagement of gas has nearly ceased, boil for ten minutes. Filter through paper. Allow to stand twenty-four hours, and collect the crystals. Sulphuric acid, 1 fl. oz.; water, 4 pints; mix, and add of commercial sulphate of iron, 4 lbs.; iron wire, 1 oz.; digest with heat and occasional agitation until the sulphate is dissolved, strain whilst hot, and set aside the liquor that crystals may form; evaporate the

mother-liquor for more crystals, and dry the whole.

Dissolve the transparent green crystals of the impure sulphate of iron in their own weight of water, acidulated with sulphuric acid, and re-crystallise.

The formula of the Ph. U. S. is similar.

(Dried; FERRI SULPHAS EXSICCATA, B. P.; FERRI SULPHAS EXSICCATUM—Ph. E., F. s. siccatum—Ph. D.) From ferrous sulphate, heated in a shallow porcelain or earthen vessel, not glazed with lead, till it becomes a greenish-gray mass, and then reduced to powder. The heat should be that of an oven, or not exceeding 400° Fahr. 5 parts of the crystallised sulphate lose very nearly 2 parts by drying.

(Granulated; FERRI SULPHAS GRANULATA, L.) (B. P.) A solution of iron wire, 4 oz., in sulphuric acid, 4 fl. oz., diluted with water, $1\frac{1}{2}$ pint, after being boiled for a few minutes, is filtered into a vessel containing rectified spirit, 8 fl. oz., and the whole stirred until cold, when the granular crystals are collected on a filter, washed with rectified spirit, 2 fl. oz., and dried, first, by pressure between bibulous paper, and next beneath a bell-glass over sulphuric acid, after which they are put into a stoppered bottle, to preserve them from the air.

Prop., &c. Ferrous sulphate forms pale bluish-green rhombic prisms, having an acid, styptic taste, and acid reaction; it dissolves in two parts of cold and less than one part of boiling water; at a dull-red heat it suffers decomposition; sp. gr. 1.82. It is perfectly soluble in water; a piece of iron put into the solution should not be covered with metallic copper. By exposure to the air it effloresces slightly, and is partly converted into a basic ferric sulphate.—Dose. $\frac{1}{2}$ to 4 grs., in pills or solution; externally, as an astringent or styptic. In the arts, as sulphate of iron (copperas), it is extensively used in dyeing, and for various other purposes. The dried sulphate (ferri sulphus exsiccatum) is chiefly used to make pills.

Crude sulphate of iron is frequently contaminated with the sulphates of copper, zinc, manganese, aluminium, magnesium, and calcium, which, with the exception of the first, are removed with difficulty. It also contains variable proportions of the neutral and basic ferric sulphates. The preparation obtained by direct solution of iron in dilute sulphuric acid should, therefore, be alone used in medicine.

In commerce, there are four varieties of crude sulphate of iron or copperas known,—greenish-blue, obtained from acid liquors,—pale green, from neutral liquors,—emerald green, from liquors containing ferric sulphate,—and ochry brown, which arises from age and exposure of the other varieties to the air. Even the first two of these contain traces of ferric sulphate, and hence give a bluish

precipitate with ferrocyanide of potassium; whereas the pure sulphate gives one which is at first nearly white.

Ferrous Sulphide. *FeS. Syn. SULPHURET OF IRON, SULPHIDE OF I., PROTOSULPHIDE OF I.; FERRI SULPHURETUM* (Ph. E. & D.), *L. Prep.* (Ph. E. & D.) Expose a bar of iron to a full white heat, and instantly apply a solid mass of sulphur to it, observing to let the melted product fall into water; afterwards separate the sulphide from the sulphur, dry, and preserve it in a closed vessel.

From sublimed sulphur, 4 parts; iron filings, 7 parts; mixed together and heated in a common fire, till the mixture begins to glow, and then removing the crucible from the heat, and covering it up, until the reaction is at an end, and the whole has become cold.

Hydrated; FERRI PROTOSULPHURETUM HYDRATUM, L. By adding a solution of ammonium sulphide or of potassium sulphide to a neutral solution of ferrous sulphate made with recently distilled or boiled water; the precipitate is collected on a filter, washed as quickly as possible with recently boiled water, squeezed in a linen cloth, and preserved in the pasty state, under water, as directed under ferric hydrate.

Prop., &c. The sulphide prepared in the dry way is a blackish brittle substance, attracted by the magnet. It is largely used in the laboratory as a source of sulphuretted hydrogen. The hydrated sulphide is a black, insoluble substance, rapidly decomposed by exposure to the air. Proposed by Mialhe as an antidote to the salts of arsenic, antimony, bismuth, lead, mercury, silver, and tin, and to arsenious acid; more especially to white arsenic and corrosive sublimate. A gargle containing a little hydrated sulphide of iron, will instantly remove the metallic taste caused by putting a little corrosive sublimate into the mouth. (Mialhe.) On contact with the latter substance, it is instantly converted into ferrous chloride and mercurous sulphide, two comparatively inert substances. It is administered in the same way as ferrous hydrate. When taken immediately after the ingestion of corrosive sublimate, it instantly renders it innocuous; but when the administration is delayed until 15 or 20 minutes after the poison has been swallowed, it is almost useless.

Ferrous Tartrate. *Syn. FERRI TARTRAS, FERRI PROTOTARTRAS, L. Prep.* 1. From iron filings, 2 parts; tartaric acid, 1 part; hot water, q. s.; digest together until reaction ceases, agitate the liquid, pour off the turbid solution, and collect, wash, and dry the powder, as quickly as possible, and keep it out of contact with the air.

Crystallised potassium tartrate, 132 parts; ferrous sulphate, 139 parts; dissolve each separately, mix the solutions, and collect the precipitate as before. A nearly insoluble powder; seldom used.

Dose. By dissolving the corresponding hy-

drates in a solution of tartaric acid, employing the former in slight excess, and evaporating, both the ferrous and ferric tartrate are easily obtained.

IRON ALUM. See ALUMS.

IRON CEMENT. See CEMENTS.

IRON FI'LINGS. *Syn. FERRI RAMENTA* (Ph. L. 1836), *FERRI LIMATURA* (Ph. E.), *FERRI SCOBS* (Ph. D.). The usual method of preparing iron filings for medical purposes has been already noticed; the only way, however, to obtain them pure, is to act on a piece of soft iron with a clean file. The Fr. Cod. orders them to be forcibly beaten in an iron mortar, and to be separated from oxide and dust by means of a fine sieve, and from the grosser parts by means of a coarse hair-sieve. — *Dose.* 10 to 30 grs., in sugar or honey, as a chalybeate; in larger doses it is an excellent vermifuge, especially for ascarides or the small thread-worm.

IRON LIQ'UOR. *Syn. PYROLIGNITE OF IRON, DYER'S ACETATE OF I., BLACK LIQUOR, TAR IRON L.; FERRI ACETAS VENALIS, L.* This article, so extensively used in dyeing, is a crude mixed acetate of the protoxide and sesquioxide of iron. It is usually prepared by one or other of the following methods:—

1. Old scraps of iron (hoops, worn-out tinplate, &c.) are left in a cask of pyroligneous acid, occasional agitation being had recourse to, until a sufficiently strong solution is obtained. By keeping the acid moderately warm in suitable vessels it will become saturated with the iron in a few days. With cold acid, on a large scale, forty days or more are required to complete the process.

2. A solution of pyrolignite or crude acetate of lime, is added to another of green copperas, as long as a precipitate is formed; after repose, the clear liquor is decanted.

IRON, REDUCED. *Syn. QUEVENNE IRON, FERRUM REDACTUM (B.P.), FERRI PULVIS, L.; FER REDUIT, F. Prep.* This preparation, which consists of metallic iron in a fine state of division mixed with a variable amount of magnetic oxide of iron, is made by passing perfectly dry hydrogen over peroxide of iron heated to redness in a gun-barrel.

Prop. A grayish-black powder, attracted by the magnet, and exhibiting metallic streaks when rubbed with firm pressure in a mortar. Rapidly absorbs oxygen, and must, therefore, be preserved from the air in well-stoppered bottles. It dissolves in hydrochloric acid with the evolution of hydrogen. 10 grains added to an aqueous solution of 50 grains of iodine and 50 grains of iodide of potassium, and digested with them in a small flask at a gentle heat, should leave not more than 5 grains undissolved, which should be entirely soluble in hydrochloric acid.

Uses. In medicine, it is chiefly given to restore the condition of the blood in all anæmic states of the system. There is no pulverulent state of iron so convenient as this for

children, as it has no taste, and only a very small dose is required.—*Dose.* 1 to 5 grains (children, $\frac{1}{4}$ to 1 grain), in powder, pill, or between bread and butter.

IRON WIRE. *Syn.* FERRUM IN FILA TRACTUM (Ph. L.), FERRI FILUM (Ph. E.), FERRI FILA (Ph. D.), L. This is the only form of metallic iron retained in the Ph. L. It is used to make preparations of iron.

ISCHURIA. In *pathology*, retention, stoppage, or suppression of the urine.

ISINGLASS. *Syn.* IORTHYOCOLLA, L. The finest kinds of isinglass are obtained from various species of the genus *Acipenser*, or sturgeon, that from the great sturgeon being perhaps the most esteemed. It is the air-bag, swimming bladder, or sound, dried without any other preparation than opening, folding, or twisting it. The picked or cut isinglass of the shops consists of the lumps of staple isinglass picked in shreds by women and children, or cut by machines.

Prop., &c. Good isinglass is the purest natural gelatin known. Its quality is determined by its whiteness, absence of the least fishy odour, and ready and almost entire solubility in boiling water; the solution forming a nearly white, scentless, semi-transparent, solid jelly, when cold. It is soluble in weak acids, and this solution is precipitated by alkalis. The aqueous solution is not precipitated by spirit of the common strengths. 1 part of good isinglass dissolved in 25 parts of hot water forms a rich, tremulous jelly. It is very commonly adulterated. See GELATIN.

ISOMERISM. In *chemistry*, identity of composition, with dissimilarity of properties. Isomeric compounds (isomerides) are such as contain the same elements in the same proportions, but which differ from each other in their chemical properties; thus, formate of ethyl and acetate of methyl are isomeric, having precisely the same ultimate composition, though differing in the arrangement of their elements.

ISOMORPHISM. In *chemistry*, the quality possessed by bodies differently composed of assuming the same crystalline form. Isomorphous substances are found to be closely allied in their chemical nature; and the fact of two bodies crystallizing in the same form has often led to the discovery of other points of similarity between them. The alums, for instance, no matter what their components, all crystallize in octahedra, and a crystal of potassium-alum, if transferred to a solution of chrome-alum, will continue to increase with perfect regularity from the deposition of the latter salt.

ISSUE. *Syn.* FONICULUS, L. In *surgery*, a small artificial ulcer formed on any part of the body by means of caustic or the lancet, and kept open by daily introducing an ISSUE PEA covered with some digestive or stimulating ointment; the whole being duly secured by an appropriate bandage.

ISSUE PEAS. *Syn.* PISÆ PRO FONTICULIS, L. Those of the shops are the immature fruit of the orange tree (ORANGE BERRIES). They are usually smoothed in a lathe. Issue peas are also 'turned' from orris root. The following compound issue peas are occasionally employed:—

1. Orris root (in powder) and Venice turpentine, of each, 1 part; turmeric, 2 parts; bees' wax, 3 parts; melted together and made into peas whilst warm.

2. Bees' wax, 3 parts; melt, add of Venice turpentine, 1 part; mix, and further add, of turmeric, 2 parts; orris root (in powder), 1 part; mix well, and form the mass into peas whilst warm. More irritating than the common pea.

3. (Dr. Gray.) Bees' wax, 12 parts; verdigris and white hellebore, of each, 4 parts; orris root, 3 parts; cantharides, 2 parts; Venice turpentine, q. s. Used to open issues instead of caustic, but their employment requires care.

ISSUE PLASTERS. See PLASTERS.

ITCH. *Syn.* YOUK†, SCOTCH FIDDLE†; PSORA, SCABIES, L.; GALE, Fr. In *pathology*, a cutaneous disease, caused by a minute insect lodging under the skin, and readily communicated by contact. There are four varieties of itch, distinguished by nosologists by the names—*scabies papuliformis*, or rank itch;—*scabies lymphatica*, or watery itch; *scabies purulenta*, or pocky itch; *scabies cachectica*, a species exhibiting appearances resembling each of the previous varieties. Our space will not permit more than a general notice of the common symptoms, and the mode of cure which is equally applicable to each species, and will not prove injurious to other skin diseases simulating the itch.

The common itch consists of an eruption of minute vesicles, principally between the fingers, bend of the wrist, &c., accompanied by intense itching of the parts, which is only aggravated by scratching. The usual treatment is repeated applications of sulphur-ointment (simple or compound), well rubbed in, once or twice a day, until a cure is effected; accompanying its use by the internal exhibition of a spoonful or more of flowers of sulphur, mixed with treacle or milk, night and morning. Where the use of sulphur-ointment is objectionable, a sulphur bath, or a lotion or bath of sulphurated potash, or of chloride of lime, may be employed instead. See BATH, LOTION (Itch), OINTMENT, PSORIASIS, &c.

IVORY. The osseous portion of the tusks and teeth of the male elephant, the hippopotamus, wild boar, &c. That of the narwhal or seahorse is the most esteemed, on account of its superior hardness, toughness, translucency, and whiteness. The dust or shavings (IVORY DUST, IVORY SHAVINGS) of the turner, form a beautiful size or jelly when boiled in water. ~~VEGETABLE IVORY is the hard albumen of the~~

seed of the *Phytelephas macrocarpa*, one of the Palm family.

Ivory may be dyed or stained by any of the ordinary methods employed for woollen, after being freed from dirt and grease; but more quickly as follows:—

1. **BLACK.** The ivory, well washed in an alkaline lye, is steeped in a weak neutral solution of nitrate of silver, and then exposed to the light, or dried and dipped into a weak solution of sulphide of ammonium.

2. **BLUE.** Steep it in a weak solution of sulphate of indigo which has been nearly neutralized with salt of tartar, or in a solution of soluble Prussian blue. A still better plan is to steep it in the dyer's green indigo-vat.

3. **BROWN.** As for black, but using a weaker solution of silver.

4. **GREEN.** Dissolve verdigris in vinegar, and steep the pieces therein for a short time, observing to use a glass or stoneware vessel; or, in a solution of verdigris, 2 parts; and sal ammoniac, 1 part, in soft water.

5. **PURPLE.** Steep it in a weak neutral solution of terchloride of gold, and then expose it to the light.

6. **RED.** Make an infusion of cochineal in liquor of ammonia, then immerse the pieces therein, having previously soaked them for a few minutes in water very slightly acidulated with aquafortis.

7. **YELLOW.** *a.* Steep the pieces for some hours in a solution of sugar of lead, then take them out, and when dry, immerse them in a solution of chromate of potassa.

b. Dissolve as much of the best orpiment in solution of ammonia as it will take up, then steep the pieces therein for some hours; lastly, take them out and dry them in a warm place, when they will turn yellow.

Ivory is etched or engraved by covering it with an etching ground or wax, and employing oil of vitriol as the etching fluid.

Ivory is rendered flexible by immersion in a solution of pure phosphoric acid (sp gr. 1.13,) until it loses, or partially loses, its opacity, when it is washed in clean cold soft water, and dried. In this state it is as flexible as leather, but gradually hardens by exposure to dry air. Immersion in hot water, however, restores its softness and pliancy. According to Dr. Ure, the necks of some descriptions of INFANTS' FEEDING BOTTLES are thus made.

Ivory is whitened or bleached by rubbing it with finely powdered pumice-stone and water, and exposing it to the sun, whilst still moist, under a glass shade, to prevent desiccation and the occurrence of fissures; observing to repeat the process until a proper effect is produced. Ivory may also be bleached by immersion for a short time in water holding a little sulphurous acid, chloride of lime, or chlorine, in solution; or by exposure in the moist state to the fumes of burning sulphur, largely diluted with air.

Ivory is wrought, turned, and fashioned, in a

similar manner and with similar tools to those used for bone and soft brass.

Obs. Bone for ornamental purposes is treated in a similar way to ivory, but less carefully, owing to its inferior value. The bones of living animals may be dyed by mixing madder with their food. The bones of young pigeons may thus be tinged of a rose colour in 24 hours, and of a deep scarlet in 3 or 4 days; but the bones of adult animals take fully a fortnight to acquire a rose colour. The bones nearest the heart become tinged the soonest. In the same way logwood and extract of logwood will tinge the bones of young pigeons purple. (Gibson.)

IVORY BLACK. See BLACK PIGMENTS.

JAG'GERY. *Syn.* PALM SUGAR. A coarse brown sugar made in India, by the evaporation of the juice of several species of palms. The following are the principal varieties of this product:—

1. **COCOA JAGGERY.** From the juice of the Cocoa-nut palm (*Cocos nucifera*).

2. **MALABAR JAGGERY.** From the juice of the Gummoot palm (*Saguerus saccherifer*).

3. **MYSORE JAGGERY.** From the juice of the wild Date-palm (*Phoenix sylvestris*); 17 galls. yield 46 lbs.

4. **PALMYRA JAGGERY.** From the juice of the Palmyra palm (*Borassus flabelliformis*); 6 pints yield 1 lb.

JALAP. *Syn.* JALAPÆ RADIX, JALAPA B. P. (Ph. L. & D.) CONVULVULI JALAPÆ RADIX (Ph. E.), L. The dried tubercles of the *Eragrostis purga*, *J. jalapa*—(Royle.) Jalap is a powerful stimulant and drastic purgative, producing copious liquid stools; but when judiciously administered, both safe and efficacious. It appears to be intermediate in its action between aloes and scammony.—*Dose.* 10 to 30 grs., in powder; in constipation, cerebral affections, dropsies, obstructed menstruation, worms, &c. Owing to its irritant properties, its use is contra-indicated in inflammatory affections of the alimentary canal, and after surgical operations connected with the abdomen and pelvis. It is usually administered in combination with sulphate of potassa or bitartrate of potassa and ginger; with mercurials, as the case may indicate. The powder is very generally adulterated.

Res'in of Jalap. *Syn.* RESINA JALAPÆ, L. *Prep.* 1. (Ph. E.) See EXTRACT OF JALAP.

2. (Nativelle.) Jalap root is digested in boiling water for 24 hours, and after being reduced to thin slices, more water is added, and the whole boiled for 10 minutes, with occasional agitation; the liquid is then expressed in a tincture press, and the boiling and pressing repeated a second and third time (these decoctions by evaporation yield AQUEOUS EXTRACT OF JALAP); the pressed root is next treated with rectified spirit, q. s., and boiled for 10 minutes, and then allowed to cool; the

tincture is then pressed out, and the boiling with fresh alcohol and expression is repeated twice; a little animal charcoal is added to the mixed tinctures, and, after thorough agitation, the latter are filtered; the liquid is now distilled until nothing passes over, the supernatant fluid is poured off the fluid resin, and the latter dried by spreading it over the surface of the capsule, and continuing the heat. The product is a friable and nearly colourless resin, which forms a white powder resembling starch. *Prod.* Fully 10% of pure resin.

3. (Planche.) Resinous extract of jalap is dissolved in rectified spirit, the tincture agitated with animal charcoal, and after filtration gently evaporated to dryness.

Pur. The jalap resin of commerce is generally adulterated with scammony, gum guaiacum or resin. When in a state of purity, it does not form an emulsion with milk, like scammony resin, but runs into a solid mass. It is insoluble in fixed oils and turpentine, whilst the common resins are freely soluble in those menstrua. Its alcoholic solution, dropped on a piece of absorbent white paper, and exposed to the action of nitrous gas, does not acquire a green or blue colour; if it does, guaiacum resin is present. 2% of this adulteration may be thus detected. (Gobley) It is insoluble in ether; but guaiacum resin, common resin, and some others, are so; the decanted ether should not become opalescent when mixed with water, and should evaporate without leaving any residuum. Powdered jalap resin placed in cold water does not dissolve, but forms a semi-fluid, transparent mass, as if it had been melted. Dissolved in a watch-glass with a little oil of vitriol, a rich crimson-coloured solution is obtained, from which, in a few hours, a brown viscid resin separates. These last two characteristics distinguish it from other resins.

Obs. Earthenware or well-tinned copper vessels must alone be used in the above processes, as contact with copper or iron turns the resin black, and this tinge can only be removed by redissolving the resin in alcohol, the addition of animal charcoal, and re-evaporation.

Jalap resin is an energetic cathartic.—*Dose.* 1 to 5 grs. See JALAPIN.

JALAP, Fæctitious Resin of. *Syn.* RESINÆ JALAPÆ FÆCTITIA, L. A substance frequently sold for jalap resin is made by fusing a mixture of pale yellow resin and scammony resin, and adding, when it has cooled a little, but still semi-fluid, a few drops of balsam of Peru or tolu; the mixture is then poured into small paper capsules or tin moulds. Its effects resemble those of jalap resin, but it inflames less. (Landerer.)

Jalap, Soap of. *Syn.* SAPO JALAPÆ, SAPO JALAPINUS, L. *Prep.* (Ph. Bor.) Resin of jalap and Castile soap, of each 1 part; rectified spirit, 2 parts, or q. s. to dissolve the ingredients softened by a gentle heat; subsequently evaporate the mixture by the heat of

a water bath until reduced to $4\frac{1}{2}$ oz., or it has acquired the consistence of a pill-mass.

Prop., &c. A grayish-brown mass, soluble in rectified spirit. Said to be milder in its action than the resin alone.—*Dose.* 5 to 15 oz.

JALAPIC ACID. *Syn.* ODOROUS PRINCIPLE OF JALAP—Pereira. *Prep.* Add an alcoholic solution of acetate of lead to a similar solution of jalap resin, collect the precipitate (jalapate of lead), and throw down the lead by means of sulphuretted hydrogen. (See ABSINTHIC ACID.) A brownish, soft, greasy substance, smelling strongly of jalap, soluble in alcohol and alkali, and slightly so in ether. Jalap resin contains about 13% of this substance.

JAL'APIN. $C_{34}H_{56}O_{16}$. *Syn.* JALAPINA. Jalap resin is commonly sold under this name, but pure jalapin is prepared by one or other of the following formulæ:—

Prep. 1. The liquid filtered from the jalapate of lead in preparing jalapic acid is a solution of acetate of jalapin, which, after any trace of lead is removed, by adding a few drops of dilute sulphuric acid, and filtration, yields the whole of its jalapin, as a precipitate, on the addition of 5 or 6 times its volume of water; this is collected, washed with a little cold distilled water, and dried by exposure to a current of warm dry air.

2. (Hume.) Coarsely powdered jalap is digested in strong acetic acid for 14 days, the tincture filtered, ammonia added in excess, and the whole agitated strongly; the mixture is then filtered, the deposit washed in cold water, redissolved in acetic acid, reprecipitated by ammonia, and again washed and dried.

3. (Kayser.) Pure jalap resin, in powder, is digested for some time in boiling ether, by which means the jalapic acid is removed, and pure jalapin remains undissolved.

Prop., &c. A transparent, colourless, scentless, insipid resin, very soluble in alcohol, but insoluble in ether. It is the active purgative principle of crude jalap resin.

JAMAICINE. *Syn.* JAMAICINA. A peculiar alkaloid obtained by Huftenschmidt from the bark of the Cabbage-tree (*Andira inermis*.)

Prep. The aqueous solution of cabbage-tree bark, treated with sulphuretted hydrogen and evaporated.

Prop. Yellow crystals soluble in water and, to a limited extent, in alcohol; fusible, and very bitter tasted. It forms salts with the acids, which, in small doses, produce restlessness and trembling; and in larger ones, purging. It is said to be vermifuge.

JAMES'S POWDER. See POWDERS.

JAMS. *Syn.* PRESERVES. Conserves of fruit with sugar, prepared by boiling. In the latter respect they differ from the conserves of the apothecary.

Prep. The pulped or bruised fruit is boiled along with $\frac{1}{2}$ to $\frac{2}{3}$ of its weight of loaf sugar,

until the mixture jellies, when a little is placed on a cold plate; the semi-fluid mass is then passed through a coarse hair sieve whilst hot, to remove the stones and skins of the fruit, and as soon as it has cooled a little is poured into pots or glasses. It is usual to tie these over, when cold, with paper which has been dipped in brandy. The pots must then be placed aside in a dry and rather cold situation.

The following fruits are those from which jams are commonly prepared:—Apricots, cherries (various), cranberries, currants (black, red, and white), gooseberries (ripe and green), mulberries, Orleans plums, raspberries, and strawberries. Red currants are commonly added to the last, to remove insipidity.

JAPAN'. See **VARNISH**, and *below*.

JAPAN'ING. The art of covering paper, wood, or metal, with a coating of hard, brilliant, and durable varnish. The varnishes or laquers employed for this purpose in Japan, China, and the Indian Archipelago, are resinous juices derived from various trees belonging to the natural order *Anacardiaceæ*, especially *Stagmaria verniciflua*, *Holigarna longifolia*, *Semecarpus Anacardium*, and species of *Rus* (Sumach). For use, they are purified by a defecation and straining, and are afterwards mixed with a little oil, and with colouring matter, as required. In this country varnishes of amber, asphaltum, or copal, or mixtures of them, pass under the names of 'JAPAN' and 'JAPAN VARNISH.'

Proc. The surface is coloured or painted with devices, &c., as desired, next covered with a highly transparent varnish (amber or copal), then dried at a high temperature (135° to 165° Fahr.), and, lastly, polished. Wood and paper are first sized, polished, and varnished. For plain surfaces asphaltum varnish or japan is used. See **VARNISHING**.

JAPONIC ACID. $C_{12}H_{10}O_5$. When catechu is exposed to the air in contact with caustic alkalis, black solutions (alkaline japonates) are formed; with carbonated alkalis, red solutions (alkaline rubates); the acid of the former may be separated. It is a black powder, insoluble in water, soluble in alkalis, and precipitated by acids. Boric acid forms red insoluble compounds with the earths and some other metallic oxides.

JARAVE. The Spanish name for **SARSAPARILLA BEER**. See **BEERS** (in *pharmacy*).

JASPER. *Syn.* **IASPIS**, *L.* A mineral of the quartz family, occurring in rocky masses. It takes various shades of red, yellow, brown, and green, and is occasionally banded, spotted, or variegated. It was formerly used as an amulet against hæmorrhages and fluxes. It is now extensively worked up into rings, seals, snuff-boxes, vases, &c., for which it is well calculated from its extreme hardness and susceptibility of receiving a fine polish.

JATROPHIC ACID. *Syn.* **CROTONIC ACID**, **LATROPHIC A.** A peculiar fatty acid disco-

vered by Pelletier and Caventon, and originally regarded by them as the cathartic principle of croton oil and croton seeds, but since shown by Redwood and Pereira to be nearly inert.

Prep. The oil is saponified by caustic potassa, and the resulting soap is decomposed by tartaric acid; the fatty matter which floats on the surface of the liquid is then skimmed off the aqueous portion, and the latter submitted to distillation; the liquid in the receiver is a solution of jatrophic acid.

Prop., &c. Volatile; very acid; has a nauseous odour; is solid at 23°, and vaporizes at 35° Fahr. It forms salts with the bases, none of which possess any practical importance.

JAUM'ANGE. *Prep.* From isinglass, 1 oz.; boiling water, 12 oz.; dissolve, add of any sweet white wine, $\frac{1}{2}$ pint; the yolks of 2 eggs beaten to a froth, and the grated yellow peel of 2 lemons; mix well, and heat the whole over the fire until sufficiently thickened, stirring all the time; lastly, serve it up, or pour it into moulds.

JAUN'DICE. *Syn.* **ICTERUS**, **MORBUS LUTEOLUS**, *L.* A disease characterised by a yellow colour of the eyes and skin, deep-coloured urine, and pale alvine evacuations. It appears to arise from a disordered action of the biliary organs. The treatment consists of the administration of saline aperients, and small doses of blue-pill, followed by tonics and diaphoretics. The action of these remedies should be promoted by the copious use of diluents (particularly saline water), and exertion in the open air, when possible. When there is much pain and vomiting, anodynes (or opium, morphia, &c.) may be administered. Jaundice is not in itself a dangerous disease, but it sometimes lays the patient open to attacks of others which are so.

JEL'LY. *Syn.* **GELATINA**, *L.* A term now very loosely applied to various substances which are liquid or semi-liquid whilst warm, and become gelatinous on cooling.

Jellies are coloured by the addition of the usual stains used by confectioners, and are rendered transparent by clarification with white of egg.

Al'mond Jelly. *Syn.* **GELATINA AMYGDALABUM**, *L.* *Prep.* From rich almond milk, $\frac{1}{2}$ pint; thick hartshorn jelly, $\frac{1}{2}$ pint; sugar, 2 oz.; with 2 or 3 bitter almonds and a little lemon peel, to flavour, heated together, strained, and moulded.

Ar'row-root Jelly. *Syn.* **GELATINA MARANTÆ**, *L.* From arrow-root, $1\frac{1}{2}$ oz., to water, 1 pint. Tous les mois jelly is made in the same way.

Bis'cuit Jelly. *Prep.* From white biscuit (crushed beneath the rolling-pin), 4 oz.; cold water, 2 quarts; soak for some hours, boil to one half, strain, evaporate to 1 pint, and add, of white sugar, $\frac{1}{2}$ lb., red wine, 4 oz., and cinnamon, 1 teaspoonful. In weakness of the stomach, and in dysentery and diarrhoea, and

in convalescence combined with rich beef gravy or soup.

Bread Jelly. *Syn.* PANADA; *GELATINA PANIS*, L. *Prep.* Cut a French roll into slices, toast them on each side, and boil in water, 1 quart, until the whole forms a jelly, adding more water if required; strain, and add sugar, milk, &c., to palate. It may be made with broth from which the fat has been skimmed, instead of water. *Used* as the last.

Broth Jelly. *Syn.* SOUP-JELLY. From broth or soup from which the fat has been skimmed, evaporated until it becomes gelatinous on cooling. A few shreds of isinglass are commonly added. See SOUP (Portable).

Calves' Feet Jelly. *Prep.* For each foot take of water, 3 pints, and boil to one half; cool, skim off the fat, and again boil for 2 or 3 minutes with the peel of a lemon and a little spice; remove it from the fire, strain through a jelly bag (see FILTRATION), add the juice of a lemon and a glass of wine, and when it has cooled a little put it into glasses or 'forms.'

Obs. If this jelly is required to be very transparent, it must be treated as follows:—After the fat is removed, it should be gently warmed, just enough to melt it, next well beaten with the white of an egg and the seasoning, and then brought to a boil for a minute or two, when it will be ready for straining, &c. The calves' feet should not be bought ready boiled, but only scalded. Cows' feet ('COW HEELS') make nearly as good jelly as that from calves' feet, and are much more economical.

Ceylon Moss Jelly. *Syn.* *GELATINA GRACILARIE*, L. *Prep.* (Dr. Sigmond.) Boil Ceylon moss (*Gracilaria lichenoides*), $\frac{3}{4}$ oz. in water, 1 quart, for 25 minutes, or till the liquid jellies on cooling; strain and flavour. Very nutritious; recommended in irritation of the mucous membranes and phthisis.

Cor'sican Moss Jelly. *Syn.* *GELATINA HELMINTHOCORTI*, D. *Prep.* (P. Cod.) Corsican moss (*Gracilaria Helminthocorton*), 1 oz.; water, q. s.; boil 1 hour, and strain 8 fl. oz.; to this add of isinglass (previously soaked in a little water), 1 dr.; refined sugar, 2 oz.; white wine, a wine-glassful. Vermifuge. See DECOCTION.

Fruit Jelly. Under this head we include those jellies made from the juices of fruits.

Prep. The strained juice mixed with $\frac{1}{2}$ to $\frac{3}{4}$ its weight of refined sugar, until it 'jellies' on cooling, observing to carefully remove the scum as it rises. The process should be conducted by a gentle heat, and it is preferable not to add the sugar until the juice is somewhat concentrated, as by lengthened boiling the quality of the sugar is injured.

Obs. Jellies are sold in pots or glasses, like JAMS. Both jams and fruit jellies are refrigerant and laxative; they are, however, mostly employed as relishes, especially during fevers and convalescences. The principal fruit jellies are:—APPLE, BARBERRY, CHERRY (from either

Cornelian or Kentish cherries), CURRANT (black, white, and red), ELDERBERRY, GOOSEBERRY, PLUM, QUINCE, RASPBERRY. See LEMON and ORANGE JELLY.

Gra'vy Jelly. By evaporating meat gravies.

Harts'horn Jelly. *Syn.* *GELATINA CORNU CERVI*, L. *Prep.* (P. Cod.) Hartshorn shavings, 8 oz.; wash it in water, then boil in clean water, 3 pints, till reduced to one half; strain, press, add of sugar, 4 oz., the juice of one lemon, and the white of an egg beaten up with a little cold water; mix well, clarify by heat, evaporate till it jellies on cooling, then add the peel of the lemon, and set it in a cool place. It may be flavoured with wine, spices, &c. Very nutritious.

Iceland Moss Jelly. *Syn.* *GELATINA LICHENIS*, L. *Prep.* (P. Cod.) Iceland moss, 2 oz.; soak for 1 or 2 days in cold water, then boil for 1 hour in water, q. s. to yield a strong solution; strain, decant the clear after repose, apply heat, and dissolve therein of isinglass, 1 dr.; evaporate the whole to a proper consistence, put it into pots, and set them in a cool place. Nutritious. Recommended in phthisis. The jelly of Iceland moss and cinchona (*GELATINA LICHENIS CUM CINCHONA*—P. Cod.) is made by adding to the above, syrup of cinchona, 6 fl. oz.

I'rish Moss Jelly. *Syn.* *GELATINA CHONDRI*, L. *Prep.* From Irish or cartageen moss. See DECOCTION.

I'singlass Jelly. *Syn.* CONFECTIONERS' JELLY; *GELATINA ICHTHYOCOLLE*, L. *Prep.* From isinglass dissolved in water by boiling, and evaporated till it 'jellies' on cooling, adding flavouring, as desired. $1\frac{1}{2}$ oz. of good isinglass makes fully a pint of very strong jelly. See BLANOMANGE, ISINGLASS, CALVES'-FEET JELLY, &c.

Lem'on Jelly. From isinglass, 2 oz.; water, 1 quart; boil, add of sugar, 1 lb., clarify, and when nearly cold, add the juice of 5 lemons, and the grated yellow rinds of 2 oranges and of 2 lemons; mix well, strain off the peel, and put it into glasses.

No'yeau Jelly. As PUNCH JELLY, but strongly flavoured with bitter almonds.

Orange Jelly. From orange juice, 1 pint; let it stand over the grated yellow rind of 3 or 4 of the oranges for a few hours, then strain, and add, of loaf sugar, $\frac{1}{2}$ lb., or more, isinglass, $\frac{3}{4}$ oz., dissolved in water, 1 pint; mix, and put it into glasses before it cools.

Punch Jelly. From isinglass, 2 oz.; sugar, $1\frac{1}{2}$ lb.; water, 1 pint; dissolve, add of lemon juice, $\frac{1}{2}$ pint; the peels of 2 lemons and of 2 oranges; rum and brandy, of each, $\frac{1}{4}$ pint; keep it in a covered vessel until cold, then liquefy it by a very gentle heat, strain, and pour it into moulds. A pleasant and deceptive way of swallowing alcohol.

Rice Jelly. *Syn.* CRÈME DE RIZ. From rice boiled in water, sweetened, and flavoured.

Sa'go Jelly. *Prep.* Soak sago in cold water for 1 hour, strain, and boil in fresh soft water

until it becomes transparent; then add wine, sugar, clear broth, milk, or spices, to flavour. 1 oz. of sugar makes a pint of good jelly.

Tapio'ca Jelly. As the last but using tapioca in lieu of sago.

JESUIT'S BARK. See CINCHONA.

JESUIT'S DROPS. See DROPS and TINCTURE.

JESUIT'S POWDER. Powdered cinchona bark.

JET. A variety of mineral bituminous carbon, very hard, and susceptible of a fine polish.

JEW'ELS. See DIAMOND, EMERALD, GEMS, &c.

JEW'ELRY. The gold in articles of jewelry, whether solid or plated, which are not intended to be exposed to very rough usage, is generally 'coloured,' as it is called in the trade. This is done as follows:—

1. (RED GOLD COLOUR.) The article, after being coated with the amalgam, is gently heated, and, whilst hot, is covered with gilder's wax; it is then 'flamed' over a wood fire, and strongly heated, during which time it is kept in a state of continual motion, to equalise the action of the fire on the surface. When all the composition has burned away, the piece is plunged into water, cleansed with the 'scratch-brush' and vinegar, and then washed and burnished. To bring up the beauty of the colour, the piece is sometimes washed with a strong solution of verdigris in vinegar, next gently heated, plunged whilst hot into water, and then washed, first in vinegar, or water soured with nitric acid, and then in pure water; it is, lastly, burnished, and again washed and dried.

2. (OR-MOLU COLOUR.) This is given by covering the parts with a mixture of powdered hematite, alum, common salt, and vinegar, and applying heat until the coating blackens, when the piece is plunged into cold water, rubbed with a brush dipped in vinegar, or in water strongly soured with nitric acid, again washed in pure water, and dried. During this process, the parts not to be dried in 'or-molu colour' should be carefully protected.

The frauds practised in reference to the 'finess' of the metal used in jewelry, is noticed under GOLD (Jeweller's). See also ASSAYING, DIAMOND, GEMS, GILDING LIQUOR, GILDING WAX, &c.

JEW'S PITCH. See ASPHALTUM.

JUICE (Spanish). See EXTRACT and LIQ'ORICE.

JU'JUBE. A fruit resembling a small plum, produced by various species of *Zizyphus*. Combined with sugar, it forms the JU'JUBE PASTE of the shops, when genuine; but that now almost always sold under the name is a mixture of gum and sugar, slightly coloured and flavoured.

JU'LEP. *Syn.* JULAP; JULEPUM, JULEPUS, JULAPIUM, L. A term usually regarded as synonymous with 'MIXTURE'; but according to the best authorities, implying a medicine which is used as a vehicle for other forms of

medicine. The word comes through the French, from a Persian expression, which signifies 'sweet drink.' A julep, according to Continental writers, is a drink of little activity, generally composed of distilled waters, infusions, and syrups, to which mucilages and acids are sometimes added; "but never powders or oily substances, which could interfere with its transparency." In England, the juleps of old pharmacy are now classed under 'MIXTURES.'

JU'NIPER BERRIES. *Syn.* JUNIPERI BACCÆ, J. COMMUNIS BACCÆ (Ph. E.), JUNIPERUS (Ph. L.), L. The fruit of the *Juniperus communis*, or common juniper tree. In the old Ph. L. & D. both the tops and berries (JUNIPERI FRUCTUS ET CACUMINA—Ph. L. 1836; JUNIPERUS—BACCÆ, CACUMINA—Ph. D. 1826) were ordered. The berries are stomachic and diuretic, and have been long employed in dropsics, either alone or combined with foxglove and squills. The tops (SUMMITATES) have been highly praised in scurvy and certain cutaneous affections.—*Dose* 1 to 2 drs., made into a conserve with sugar, or in the form of infusion or tea.

JUN'KET. *Syn.* DEVONSHIRE JUNKET, CURD JELLY. From warm milk put into a bowl, and then turned with a little rennet; some scalded cream and sugar are next added, with a sprinkling of cinnamon on the top, without breaking the curd. Much esteemed by holiday folk in the western counties, during the hot weather of summer. Sometimes, very strangely, a little brandy finds its way into these trifles.

KALEIDOSCOPE. *Syn.* FLOWER-GLASS. A pleasing philosophical toy invented by Sir David Brewster, which presents to the eye a series of symmetrical changing views. It is formed as follows:—Two slips of silvered glass, from 6 to 10 inches long, and from 1 to 1½ inch wide, and rather narrower at one end than the other, are joined together lengthwise, by one of their edges, by means of a piece of silk or cloth, glued on their back; they are then placed in a tube of tin or pasteboard, blackened inside, and a little longer than is necessary to contain them, and are fixed by means of small pieces of cork, with their faces at any angle to each other that is an even aliquot part of 4 right angles (as the ½, ⅓, ⅔, &c.). The other end of the tube is then closed with an opaque screen, or cover, through which a small eyehole is made in the centre; and the other end is fitted, first with a plate of common glass, and at the distance of about ⅓ of an inch, with a plain piece of slightly ground glass, parallel to the former; in the intermediate place or cell are placed the objects to form the images. These consist of coloured pieces of glass, glass beads, or any other coloured diaphanous bodies, sufficiently small to move freely in the cell, and to assume new positions when the tube is shaken or turned round. A tube so prepared presents an infinite number

of changing and symmetrical pictures, no one of which can be exactly reproduced. This toy is so easily constructed, is so very inexpensive, and at the same time so capable of affording an almost inexhaustible fund of amusement to the young, that we advise our juvenile friends to try their hands at its construction. Any common tube of tin or paste-board may be used, and strips of glass smoked on one side will answer for mirrors.

KALI. The name formerly applied to a species of *Salsola* employed for making **BABILLA**. It is sometimes used as a designation for the crude alkalies, and is the German synonym for 'potassa.'

Acidulated Kali. *Syn.* **LEMON AND KALI, LEMONIATED K.** A common preparation of the shops for making a pleasant effervescent draught. It is sometimes incorrectly styled 'citrate of potash.' *Prep.* 1. Carbonate of soda and tartaric acid, of each, 5 oz.; lump sugar, 1 lb.; all in the state of fine powder, and separately dried by a very gentle heat, after which they are mixed together, flavoured with essence of lemon, 1 dr., rubbed through a gauze sieve in a warm dry situation, put into bottles, and corked down immediately.

2. Finely powdered white sugar, 16 lbs.; tartaric acid, $4\frac{1}{2}$ lb.; carbonate of soda, 4 lbs.; essence of lemon, 1 oz.; as the last. Keeps well. A dessert-spoonful of either thrown into a glassful of water makes a pleasant effervescent draught.

KALIUM. [L.] Potassium.

KAL'YDOR. A cosmetic lotion; it resembles 'GOWLAND'S LOTION,' but is got up in a rather more pleasing style. See **LOTION**.

KA'OLIN. *Syn.* **CHINA CLAY, PORCELAIN C.** A fine white clay, derived from the decomposition of the felspar of granitic rocks. The potteries and porcelain works of this country are chiefly supplied with this substance from extensive tracts of it which occur near St. Austle, Cornwall. See **CLAY**.

KAP'NOMOR. *Syn.* **CAPNOMOR.** A colourless oil obtained from crude kreasote by distillation with potassa. It boils at 360° Fahr., has a peculiar odour, and is insoluble in water, but readily soluble in an alkaline solution of kreasote.

KATAL'YSIS. *Syn.* **CATALYSIS, CONTACT ACTION.** Terms applied to a class of chemical actions in which the decompositions, and the recombination of the elements of compound bodies, is apparently excited by the mere presence of, or contact with, other bodies, which do not themselves suffer such a change.

KELP. The alkaline ashes obtained by burning various species of sea-weed, formerly much used for the preparation of carbonate of soda. The weeds most valued for the purpose are the *Fucus vesiculosus*, *nodosus*, and *serratus*, and the *Laminari abulbosa* and *digitata*.

Of late years, the manufacture of kelp, like that of barilla, has been almost abandoned, except as a source of iodine. Mr. E. C. C.

Stanford, by carefully collecting and compressing the weed, and afterwards submitting it to dry distillation, doubles the yield of iodine and bromine, and obtains in addition various valuable hydrocarbons. See **BABILLA**, **IODINE**, **SODA**, &c.

KERMES. *Syn.* **KERMES-GRAINS, AL-KERMES; GRANUM TINCTORIUM, L.** The dried bodies of the female *Coccus Ilicis* of Linnaeus, a small insect of the order *Hemiptera*, which flourishes on the Ilex oak. It has been used as a red and scarlet dye-stuff ever since the time of Moses; but is now superseded in this country by cochineal, which gives colours of much greater brilliancy.

KERMES MINERAL. *Syn.* **KERMES MINERALE, K. MINERALIS, L.** An amorphous tersulphide of antimony, containing a small admixture of teroxide of antimony and sulphuride of potassium. *Prep.* 1. **IN THE HUMID WAY.**—*a.* (P. Cod.) Carbonate of soda (cryst.), 128 parts (say, 21 parts), is dissolved in water, 1280 parts (say 210 parts), contained in a cast-iron pan; tersulphide of antimony (in fine powder), 6 parts (say 1 part), is next added, and the whole boiled for an hour, with constant agitation with a wooden spatula; the boiling liquid is then filtered into a heated earthen pan containing a small quantity of very hot water, and the solution is allowed to cool as slowly as possible; the red powder which is deposited is collected on a cloth, on which it is well washed with cold water, and the superfluous water being removed by pressure, the powder is dried by a gentle heat, and is, lastly, passed through a fine silk-gauze sieve, and preserved from light and air.

b. (Wholesale.) From black sulphuride of antimony, 4 lb.; carbonate of potassa, 1 lb.; boil in water, 2 galls., for half an hour, filter, &c., as before. The undissolved portion of sesquisulphuret of antimony may be boiled again several times with fresh potassa and water, until the whole is dissolved. Inferior to the last.

c. (CLUZEL'S KERMES.) From tersulphide of antimony, 4 parts; crystallized carbonate of soda, 90 parts; water, 1000 parts; boil, &c., as in 1, *a.*, and dry the powder, folded up in paper, at a heat not exceeding 90° Fahr.

2. **IN THE DRY WAY.**—*a.* (P. Cod.) Carbonate of potassa, 100 parts; tersulphide of antimony, 50 parts; sulphur, 3 parts; mix, fuse in a Hessian crucible, pour the melted mass into an iron mortar, and when cold reduce it to powder; next boil it in water, 1000 parts, contained in an iron vessel, filter the solution, and otherwise proceed as before. *Product:* large, but of inferior quality.

b. (Fownes.) From tersulphide of antimony, 5 parts; carbonate of soda (dry), 3 parts; water, 80 parts; fuse, &c., as before. Nearly equal to 1, *a.*

c. (Berzelius.) Carbonate of potassa (pure), 3 parts; tersulphide of antimony, 8 parts; water, q. s. Resembles the last.

Prop., &c. An odourless, tasteless powder, insoluble in both water and alcohol, and, when pure and carefully prepared, entirely soluble in hydrosulphate of ammonia. As prepared by the formulæ 1, *a*, and 1, *c*, it is a very dark crimson powder, of a velvety smoothness; but that from the other formulæ has a brownish-red colour, more or less deep. The secret of preparing this compound of a fine and velvety quality, like that imported from the Continent, consists simply in filtering the solution whilst boiling hot, and allowing it to cool very slowly, by placing the vessel in an appropriate situation for that purpose. Another important point, according to Rose, is to employ sufficient alkali to keep the whole of the teroxide of antimony in solution as the liquid cools, instead of allowing a part of it to be deposited with the kermes. This is the reason of the superior quality and mildness of that prepared according to the directions of the French Codex. The liquor decanted from the 'kermes mineral' yields the golden sulphide of antimony on the addition of an acid, for which purpose the acetic is generally employed.

Dose. $\frac{1}{2}$ gr. to 3 or 4 grs., as a diaphoretic, cathartic, or emetic. It occupies in foreign practice the place of our James's Powder.

KETCH'UP. *Syn.* CATCHUP, CATSUP, KATCHUP. The juice of certain vegetables strongly salted and spiced, so as to be used as sauce; or a simple sauce made without the natural juice as a substitute for the true ketchup. The following are the principal varieties:—

Camp Ketchup. *Prep.* Take of good old beer, 2 quarts; white wine, 1 quart; anchovies, 4 oz.; mix, heat it to the boiling-point, remove it from the fire, and add of peeled shalots, 3 oz.; mace, nutmegs, ginger, and black pepper, of each, bruised, $\frac{1}{2}$ oz.; macerate for 14 days, with frequent agitation, then allow it to settle, and decant and bottle the clear portion.

Cu'mber Ketchup. *Prep.* From ripe cucumbers, in the same way as mushroom ketchup. Very luscious. Mixed with cream, or melted butter, it forms an excellent white sauce for fowls, &c.

Marine' Ketchup. *Prep.* Take of strong old beer, 1 gall.; anchovies, $1\frac{1}{2}$ lb.; peeled shalots (crushed), 1 lb.; bruised mace, mustard seed, and cloves, of each, $\frac{1}{2}$ oz.; bruised pepper and ginger, of each, $\frac{1}{4}$ oz.; mushroom ketchup and vinegar, of each, 1 quart; heat the mixture to the boiling-point, put it into a bottle, and macerate for 14 days, frequently shaking; then strain through flannel, and bottle it for use. Excellent with anything; like the last, it makes good white sauce, and keeps well.

Mush'room Ketchup. *Prep.* 1. Sprinkle mushroom flaps, gathered in September, with common salt, stir them occasionally for 2 or 3 days, then lightly squeeze out the juice, and add to each gallon, cloves and mustard seed, of each, bruised, $\frac{1}{2}$ oz.; allspice, black pepper, and ginger, of each, bruised, 1 oz.; gently heat to the boiling-point in a covered vessel, macerate

for 14 days, and decant or strain. Should it exhibit any indications of change in a few weeks, bring it again to the boiling-point, with a little more spice, and a table-spoonful more salt.

2. Take of mushroom juice, 2 galls.; pimento, 2 oz.; cloves, black pepper, mustard seed, and ginger, of each, bruised, 1 oz.; salt, 1 lb., (or to taste); shalots, 3 oz.; gently simmer for 1 hour in a covered vessel, cool, strain, and bottle.

3. Take of mushroom juice, 100 galls.; black pepper, 9 lb.; allspice, 7 lb.; ginger, 5 lb.; cloves, 1 lb. (all bruised); salt, q. s.; gently simmer in a covered tin boiler for 1 hour.

Oys'ter Ketchup. *Prep.* Pulp the oysters, and to each pint add, of sherry wine, or very strong old ale, 1 pint; salt, 1 oz.; mace, $\frac{1}{2}$ oz.; black pepper, 1 dr.; simmer very gently for 10 minutes, strain, cool, bottle, and to each bottle add a spoonful or two of brandy, and keep them in a cool situation. **COCKLE KETCHUP** and **MUSSEL KETCHUP** are made in the same way. *Used* to flavour sauces when the fish are out of season; excellent with rump steak, &c.

Pon'tac Ketchup. *Prep.* Take of the juice of elderberries and strong vinegar, of each, 1 pint; anchovies, $\frac{1}{2}$ lb.; shalots and spice, q. s. to flavour; boil for 5 minutes, cool, strain, and bottle. *Used* to make fish sauces.

Toma'to Ketchup. *Prep.* Prepared from tomatoes or love apples, like mushroom ketchup, except that a little very strong Chili vinegar is commonly added. An admirable relish for 'high' or rich flavoured viands.

Walnut Ketchup. *Prep.* 1. Take of the expressed juice of young walnuts, when tender, 1 gal.; boil 10 minutes, skim, add of anchovies, 2 lbs.; shalots, 1 lb.; cloves and mace, of each, 1 oz.; 1 clove of garlic, sliced; simmer in a covered vessel for 15 minutes, strain, cool, and bottle, adding a little fresh spice to each bottle, and salt, q. s. Will keep good in a cool place for 20 years.

2. Take of green walnut shells, 16 galls.; salt, 5 lbs.; mix and beat together for a week, press out the liquor, and to every gallon add, of allspice, 4 oz.; ginger, 3 oz.; pepper and cloves, of each, 2 oz.; all bruised; simmer for half an hour, and set aside in a closed vessel and in a cool situation until sufficiently clear.

3. Take of walnut juice, 1 gal.; vinegar, 1 quart; British anchovies (sprats), 3 or 4 lbs.; pimento, 3 oz.; ginger, $\frac{1}{2}$ oz.; long pepper, $\frac{1}{2}$ oz.; cloves, 1 oz.; shalots, 2 oz.; boil and bottle, as before.

4. From the juice of walnut shells, 30 galls.; salt, 1 bushel; allspice and shalots, of each, 6 lbs.; ginger, garlic, and horse-radish, of each, 3 lbs.; essence of anchovies, 3 galls.; as before.

Wine Ketchup. *Prep.* Take of mushroom or walnut ketchup, 1 quart; chopped anchovies, $\frac{1}{2}$ lb.; 20 shalots; scraped horse-radish,

2 oz.; spice, q. s.; simmer for 15 minutes, cool, and add of white and red wine, of each, 1 pint; macerate for 1 week, strain, and bottle.

General remarks. In preparing the above articles, vessels of glazed earthenware, or stoneware, or well-tinned copper pans, should alone be used to contain them whilst being boiled or heated, as salt and vegetable juices rapidly corrode copper, and render the ketchup poisonous. Nothing in the shape of copper, lead or pewter, should be allowed to touch them. Even a plated copper spoon left in a bottle of ketchup for some time will render its contents poisonous. Unpleasant and even dangerous fits of vomiting, colic, and diarrhoea, have resulted from the neglect of this precaution. See SAUCE, &c.

KIBES. The vulgar name for ulcerated chilblains.

KIDNEYS. *Syn.* RENES, L. (In anatomy.) The kidneys, as almost every one knows, are abdominal viscera which secrete the urine, and form the great channels by which the effete nitrogenous matter is removed from the blood. They are subject to various affections, both functional and organic, chronic and acute, of which some are imperfectly understood, and others only admit of alleviation, but not of being cured. See URINE and URINARY AFFECTIONS.

Kidneys. (In cookery.) Soyer recommends kidneys to be dressed by gently broiling them, having previously split them, "so as nearly to divide them, leaving the fat in the middle," and "run a skewer through them, that they may remain open." After being rubbed with a little butter, and seasoned with salt and pepper, "they may be served on toast, or with any sauce." "You may also egg and bread-crumbs them." "Five minutes suffice for a sheep or lamb's kidney of common size." (Soyer.) One or two lamb's kidneys, plainly broiled and served up with the gravy in them, eaten along with a little dry-toasted bread, form a most excellent and appropriate luncheon or dinner for a dyspeptic or convalescent.

KING'S CUP. *Prep.* Yellow peel of 1 lemon; lump sugar, 1½ oz.; cold water, 1 pint; infuse 8 or 10 hours, and strain. The addition of a teaspoonful of orange-flower water is a great improvement. *Used* as a diluent in cases where acid liquors are inadmissible. See LEMONADE.

KING'S EVIL. See SCROFULA.

KING'S YELLOW. See YELLOW PIGMENTS.

KINIC ACID. $\text{HC}_2\text{H}_3\text{O}_6$. *Syn.* QUINIC ACID, CINCHONIC ACID. A peculiar dibasic acid occurring in the cinchona barks, in which it exists associated with the alkaloids. *Prep.* It is readily obtained from kinate of lime, by the action of dilute sulphuric acid; the filtered solution evaporated to the consistence of a syrup, gradually deposits large crystals resembling those of tartaric acid.

Prop., &c. It is soluble in 2 parts of water, and in alcohol; and forms salts called kinates. Kinate of lime is obtained from an acidulated infusion of cinchona bark, by adding an excess of lime, filtering, evaporating to a syrup, and setting the liquid aside to crystallise. These crystals are purified by redissolving them, treating the solution with a little animal charcoal, and crystallising the salt as before. The liquid from which the bark-alkaloids have been precipitated by hydrate of lime affords an almost inexhaustible supply of this salt. See KINONE.

KINO. *Syn.* GUM KINO; KINO (B. P., Ph. L. E. & D.) The juice flowing from the incised bark of the *Pterocarpus Marsupium* or Indian, hardened in the sun.—*Dose.* 10 to 30 grs., in powder; as an astringent in chronic diarrhoea, &c.

Factitious Kino, met with in the shops, is made as follows:—Logwood, 48 lbs.; tormentil root, 16 lbs.; madder root, 12 lbs.; exhaust by coction with water, q. s.; to the liquor add of catechu, 16 lbs.; dissolve, strain, and evaporate to dryness. *Prod.* 24 lbs. Extract of mahogany is also commonly sold for kino.

KIRSCHWASSER (-väs ser) [Ger.]. *Syn.* KIRSCHENWASSER. A spirituous liquor distilled in Germany and Switzerland from bruised cherries. From the rude manner in which it is obtained, and from the distillation of the cherry-stones (which contain prussic acid) with the liquor, it has frequently a nauseous taste, and is frequently poisonous. When properly made and sweetened, it resembles noyau.

KISH. An artificial graphite occasionally produced in iron-smelting furnaces. It occurs in brilliant scales, and is said to possess peculiar efficacy in certain forms of anæmia and chlorosis.

KITCH'EN. The late Alexis Soyer set down as one of the crying faults of our countrymen, the employment of an apartment for the kitchen which is either too small or inconveniently situated, and which, in general, is not sufficiently provided with 'kitchen requisites.' "As a workman cannot work properly without the requisite tools, or the painter produce the proper shade without the necessary colours, in like manner does every person wishing to economise his food, and to cook it properly, require the proper furniture wherewith to do it." The neglect of these matters, which is so general, is, undoubtedly, a mischievous and deceptive economy.

KNOX'S POWDER. *Prep.* From common salt, 8 parts; chloride of lime, 8 parts; mixed together. An ounce of it dissolved in a tumblerful of water furnishes a solution which is similar to Labarraque's disinfecting fluid.

KECHLIN'S LIQUID. *Prep.* From copper filings, 96 grs.; liquor of ammonia, 2 fl. oz.; digested together until it turns of a full blue colour, and then mixed with hydrochloric acid,

5 fl. drs.; distilled water, 5 lbs.—*Dose*. 1 to 2 teaspoonfuls daily; in scrofula. It is poisonous in large doses.

KOOCHLA NUT. See *NUX VOMICA*.

KOU'MISS. A liquor prepared by the Calmucs, by fermenting mare's milk, previously kept until sour, and then skimmed. By distillation, it yields a spirit called rack, racky, or araka. 21 lbs. of fermented milk yield about $\frac{1}{2}$ pint of low wines, and this, by rectification, gives fully $\frac{1}{2}$ pint of strong alcohol.

KOUS'SO. *Syn.* CUSSO, KOSSO. This substance is the dried flowers of the *Brayera anthelmintica*, an Abyssinian tree which grows to the height of about 20 feet, and belongs to the natural order *Rosaceae*. It is one of the most effective remedies known for both varieties of tape-worm. The dose, for an adult, is 3 to 5 drs., in powder, mixed with about half a pint of warm water, and allowed to macerate for 15 or 20 minutes. The method prescribed for its successful administration is as follows:—The patient is to be prepared by a purgative or a lavement, and the use of a very slight diet the day before. The next morning, fasting, a little lemon juice is to be swallowed, or a portion of a lemon sucked, followed by the dose of kouso (both liquid and powder), at 3 or 4 draughts, at short intervals of each other, each of which is to be washed down with cold water acidulated with lemon juice. The action of the medicine is subsequently promoted by drinking weak tea without either milk or sugar, or water flavoured with lemon juice or toasted bread; and if it does not operate in the course of 3 or 4 hours, a dose of castor oil or a saline purgative is taken.

The flavour of kouso is rather disagreeable and nauseating. Its operation is speedy and effectual; but at the same time it is apt to produce, in large doses, great prostration of strength, and other severe symptoms, which unfit it for administration to the delicate of both sexes, or during pregnancy or affections of the lower viscera. Care should be taken not to purchase it in powder, as, owing to its high price, it is uniformly adulterated. The powdered kouso of the shops is, in general, nothing more than the root-bark of pomegranate, coloured and scented.

KREASOTE. *Syn.* CREASOTE, CREOSOTE, KEASOTE; CREASOTUM (B. P., Ph. L. & D.), CREAZOTUM (Ph. E.), L. A peculiar substance, discovered by Reichenbach, and so named on account of its powerful antiseptic property. It is a product of the dry distillation of organic bodies, and is the preservative principle of wood smoke and pyroligneous acid.

Prep. Kreasote is manufactured from wood-tar, in which it is sometimes contained to the amount of 20% to 35%, and from crude pyroligneous acid and pyroxilic oil.

1. (P. Cod.) Wood-tar is distilled in a wrought-iron retort until white vapours of paraffin appear; the heavy oily matter which forms the lower layer of the product is col-

lected, washed with water slightly acidulated with sulphuric acid, and then distilled in a glass retort, rejecting the first portions, which are chiefly eupion; the distillate is treated with a solution of potassa (sp. gr. 1.12), the mixed liquids being shaken strongly together; after it is settled, the layer of eupion which forms is removed from the surface, and the potash-solution of kreasote exposed to the air until it becomes black; it is then saturated with dilute sulphuric acid, the watery liquid rejected, and the remainder (consisting of crude kreasote) submitted to distillation in glass; the treatment by exposure, potassa, sulphuric acid, and distillation, is repeated three times or oftener, until the combination of kreasote and potassa ceases to become coloured by the action of the air; it is, lastly, saturated with concentrated phosphoric acid, and again distilled, rejecting the first portion that comes over.

2. (M. Simon.) A copper still, capable of containing 80 Berlin quarts, is filled to one third with the oil of wood-tar, and heat is applied; first, the more volatile matters pass over; these do not contain kreasote, and are, therefore, rejected; but when, by gradually increasing the temperature, there passes over a very acid liquid, which becomes turbid, and at the same time an oil separates from it when mixed with water, the product is collected, and the distillation continued until the operator notices a squirting in the still, when this part of the process is complete; the distilled product is then nearly saturated with potassa, and returned to the still, which, in the mean time, has been well cleaned out, and about half filled with water, and the distillation is recommenced; at first an oil comes over, which floats on water, and which consists chiefly of eupion, and is, therefore, rejected; as soon, however, as the oil begins to sink in the water which comes over with it, it is charged with kreasote, and is carefully collected; the distilling aqueous fluid being reintroduced, from time to time, into the still, and the distillation continued so long as any oil continues to come over with it; the heavy oily distillate is now agitated with liquor of potassa, sp. gr. 1.120; the portion which remains undissolved is eupion, and is skimmed off; the potassa-solution of kreasote still, however, contains a considerable quantity of eupion, the greater portion of which may be separated by dilution and distillation with an equal quantity, or with at least $\frac{1}{3}$ ths of its volume of water, fresh water being added from time to time, as long as any eupion comes over with the distilled liquor; when this has ceased to pass over, sulphuric acid is poured into the still in quantity exactly sufficient to saturate $\frac{1}{3}$ d only of the potassa formerly employed, and the distillation is again renewed; kreasote now distils over, the first portions of which, however, still contain eupion, after which pure kreasote follows; that is to say, "a kreasote which, when mixed with 6 or 8 times its quantity of a solution of pure

potassa, furnishes a mixture which, by the addition of any further quantity whatever of water, does not become turbid." The combination of kreasote remaining in the still is now mixed with sulphuric acid in slight excess, and the distillation renewed, the water coming over with it being from time to time returned into the still; and when no further oil passes over with the water, the process is complete. The kreasote thus obtained is redistilled with the water which has passed over with it, whilst the distilled water, as before, is allowed from time to time to run back into the still. The kreasote thus obtained is then colourless; but it contains a considerable quantity of water in solution, which is separated by distillation in a glass retort. The water distils first, and then kreasote, which, after cleaning the neck of the retort from the water, must be received in another dry receiver. If the kreasote assumes a red colour after being exposed for some time to the air, it must be re-distilled, and then it keeps very well. Korne found that tar prepared from turf furnishes much more kreasote than that from fir-wood, &c.

3. (Ure.) In saturating upon pyroligneous acid, if we dissolve effloresced sulphate of soda in it to saturation, at the temperature of 267° Fahr., the kreasote separates, and floats upon the surface; it is then decanted, and left in repose for some days, during which it deposits a fresh portion of salt and vinegar; it is next saturated whilst hot with carbonate of potassa, and distilled along with water; a pale yellow oily liquid passes over, which is rectified with phosphoric acid, &c., like the crude product of kreasote from tar.

Prop. Kreasote is a colourless, transparent liquid, heavier than water, of a peculiar unpleasant, penetrating odour, resembling that of smoked meat, and a very pungent and caustic taste; its vapour irritates the eyes; it boils at 400 Fahr., and is still fluid at —16° Fahr.; it produces on white filter paper greasy spots, which disappear if exposed to a heat of 212° Fahr.; dissolves in 80 parts of water, and mixes in all proportions with spirit of wine, the essential and fatty oils, acetic acid, naphtha, disulphide of carbon, ammonia, and potassa; it dissolves iodine, phosphorus, sulphur, resins, the alkaloids, indigo blue, several salts (especially the acetates and the chlorides of calcium and tin); reduces the nitrate and acetate of silver; is resinified by chlorine, and decomposed by the stronger acids. The aqueous solution is neutral, and precipitates solutions of gum and the white of eggs. It kindles with difficulty, and burns with a smoky flame. When quite pure, it is unaltered by exposure to the air. Sp. gr. 1.071, at 68° Fahr. A slip of deal dipped into it, and afterwards in hydrochloric acid, and then allowed to dry in the air, acquires a greenish-blue colour. It turns a ray of polarised light to the right, whereas carbolic acid does not affect polarisation.

Pur. The fluid commonly sold in the shops for kreasote, is a mixture of kreasote, picamar, and light oil of tar; in many cases it is little else than impure carbolic acid, with scarcely a trace of kreasote. Pure kreasote is perfectly soluble in both acetic acid and liquor of potassa; shaken with an equal volume of water in a narrow test-tube, not more than the 1-80th part disappears; otherwise it contains water, of which kreasote is able to assume 1-10th without becoming turbid.—If it can be dissolved completely in 80 parts by weight of water, at a medium temperature, it then forms a perfectly neutral liquid.—An oily residue floating on the surface betrays the presence of other foreign products (EUPION, KAPNOMOR, PICAMAR), which are obtained at the same time with the kreasote during the dry distillation of organic substances.

Kreasote is "devoid of colour, has a peculiar odour, and is soluble in acetic acid. When it is dropped on bibulous paper, and a boiling heat is applied for a short time, it entirely escapes, leaving no transparent stain." (Ph. L.) "Entirely and easily soluble in its own weight of acetic acid." (Ph. E.) Sp. gr. 1.046 (Ph. L.), 1.066 (Ph. E. & D.). The density and boiling-point of absolutely pure kreasote is given above. When prescribed in pills with oxide of silver, the mass will take fire unless the oxide be first mixed with liquorice or other powder. (Squire.)

Uses. Kreasote has been recommended in several diseases of the organs of digestion and respiration, in rheumatism, gout, torpid nervous fever, spasms, diabetes, tape-worm, &c.; but its use has not, in general, been attended with satisfactory results. It is given in the form of pills, emulsion, or an ethereal or spirituous solution. *Externally*, it has been employed in various chronic diseases of the skin, sores of different kinds, mortifications, scalds, burns, wounds (as a styptic), caries of the teeth, &c.; mostly in the form of an aqueous solution (1 to 80); or mixed with lard (5 drops to 1 dr.), as an ointment; dissolved in rectified spirit, it forms a useful and a popular remedy for toothache arising from decay or rottenness. In the *arts*, kreasote is extensively employed to preserve animal substances, either by washing it over them, or by immersing them in its aqueous solution. A few drops in a saucer, or on a piece of spongy paper, if placed in a larder, will effectually drive away insects; and make the meat keep several days longer than it otherwise would. A small quantity added to brine or vinegar is commonly employed to impart a smoky flavour to meat and fish, and its solution in acetic acid is used to give the flavour of whiskey to malt spirit. See CARBOLIC ACID.

KREATINE. $C_4H_7N_3O_5$. Aq. *Syn.* CREATINE. A crystallisable substance obtained from the juice of the muscular fibre of animals. It was first observed by Chevreul, but has recently been carefully studied by Liebig.

Prep. (Liebig.) Lean flesh is reduced to shreds, and then exhausted with successive portions of cold water, employing pressure; the mixed liquid is heated to coagulate the albumen and colouring matter of the blood, and is then strained through a cloth; pure baryta water is next added as long as a precipitate forms, the liquid is filtered, and the filtrate is gently evaporated to the consistence of a syrup; after repose for some days in a warm situation, crystals of kreatine are deposited; these are purified by redissolving them in water, agitating the solution with animal charcoal, and evaporating, &c., so that crystals may form.

Prop., &c. Brilliant, colourless, prismatic crystals; readily soluble in boiling water, sparingly so in cold water and in alcohol; the aqueous solution is neutral, bitter tasted, and soon putrefies.

KREATININE. $C_4H_7N_3O$. This substance exists in small quantities, both in the juice of flesh and in conjunction with kreatine in urine. It is also produced by the action of the stronger acids on kreatine. It forms colourless prismatic crystals, which are soluble in water, and the solution has a strongly alkaline reaction. It is a powerful organic base, and produces crystallisable salts with the acids.

KRENIC ACID. See CRENIC ACID.

KRYSTALINE. The name originally applied by Unverdorben to ANILINE.

KUSTITIEN'S METAL. *Prep.* Take of malleable iron, 3 parts; heat it to whiteness, and add of antimony, 1 part; Molucca tin, 72 parts; mix under charcoal, and cool. *Used* to coat iron and other metals with a surface of tin; it polishes without a blue tint, is hard, and has the advantage of being free from lead and arsenic.

KYANTZING. A method of preserving wood and cordage from decay, long known and practised, but patented by Mr. Kyan, a few years since. It consists in immersing the bodies in a solution of corrosive sublimate, 1 part, and water, 50 or 60 parts, either under strong pressure or the contrary, as the urgency of the case or the dimensions of the bodies operated on may require. See DRY ROT.

KY'ANOL. A substance obtained from coal-tar oil, and at first thought to be an independent principle, but since shown to be identical with ANILINE.

LABARBAQUE'S FLUID. See SOLUTION OF CHLORIDE OF SODA.

LAD'DANUM. *Syn.* LADANUM. An odorous, resinous substance found on the leaves and twigs of the *Cistus creticus*, a plant growing in the island of Candia and in Syria. It was formerly much used for making stimulating plasters. The following compound is often vended for it:—

Lad'danum, Factitious. *Prep.* From gum anime, resin, Venetian turpentine, and sand, of

each 6 parts; Spanish juice and gum arabic, of each (dissolved in a little water), 3 parts; Canada balsam, 2 parts; ivory black, 1 part; balsam of Peru, q. s. to give a faint odour.

LAB'ELS capable of resisting the action of OILS, SPIRITS, WATER, SYRUPS, and DILUTE ACIDS, may be obtained as follows:—Lay a coat of strained white of egg over the label (an ordinary paper one), and immediately put the vessel into the upper portion of a common steam-pan, or otherwise expose it to a gentle heat till the albumen coagulates and turns opaque, then take it out and dry it before the fire, or in an oven, at a white heat of about 212° Fahr.; the opaque white film will then become hard and transparent. The labels on bottles containing STRONG ACIDS or ALKALINE SOLUTIONS should be either etched upon the glass by means of hydrofluoric acid, or be written with incorrodible ink. See ETCHING and INK.

LAB'ORATORY. *Syn.* LABORATORIUM, L. A place fitted up for the performance of experimental or manufacturing operations in chemistry, pharmacy, and pyrotechny. For full information respecting the best mode of fitting up a chemical laboratory, the reader is referred to works specially devoted to chemical manipulation.¹ Almost any well-lighted spare room may be fitted up as a small laboratory at very little expense. The gas-furnaces and improved lamps introduced of later years have to a certain extent rendered chemists independent of brick furnaces. A strong working bench, fitted with drawers and cupboards, and having gas-pipes at intervals for attaching different kinds of jets, is an indispensable fixture. A close cupboard or closet, which is connected by a pipe with the chimney or the external air, is required to receive vessels emitting corrosive or evil-smelling vapours; the door of this closet should be of glass. A sink, with a copious supply of water, must be at hand, for washing apparatus. A glass, a stoneware barrel, with a tap of the same material, is required for holding distilled water. Shelves, supports for apparatus, and drawers, should be provided in abundance. The fine balances and other delicate instruments should be kept in a separate apartment. With regard to apparatus, we may state that the articles most frequently required in a laboratory are the gas or alcohol lamps; iron pans for sand bath and water bath; evaporating dishes; precipitating jars, funnels, and wash-bottles; retorts, flasks, and test-tubes; mortars and pestles; retort- and filtering-stands; rat-tail and triangular files, and glass rod and tubing.

The principal philosophical-instrument-makers sell chests or cabinets filled with apparatus and chemicals, under the name of 'PORTABLE LABORATORIES.' Those sold by Mr. J. J. Griffin and by Messrs. Jackson and

¹ The latest and best work is the "*Handbook of Chemical Manipulation*," by Greville Williams. Faraday's famous work on the same subject has long been out of print.

Townson are, perhaps, the most complete. They are well adapted for illustrating all the more valuable facts of chemical science, and performing all the ordinary operations of qualitative analysis.

LAC. *Syn.* **LACCA, L.** A resinous substance combined with much colouring matter, produced by the puncture of the female of a small insect, called the *Coccus lacca* or *ficus*, upon the young branches of several tropical trees, especially the *Ficus Indica*, *Ficus religiosa*, and *Croton lacciferum*. The crude resinous exudation constitutes the **STICK-LAC** of commerce. **SHELL-LAC** or **SHELLAC** is prepared by spreading the resin into thin plates after being melted and strained. **SEED-LAC** is the residue obtained after dissolving out most of the colouring matter contained in the resin.

Shell-lac is the kind most commonly employed in the arts. The palest is the best, and is known as 'orange lac.' The darker varieties—'liver-coloured,' 'ruby,' 'garnet,' &c.—respectively diminish in value in proportion to the depth of their colour.

Uses, &c. Lac was formerly much used in medicine; its action, if any, is probably that of a very mild diuretic. It is now chiefly used in **DENTIFRICES**, **VARNISHES**, **LACQUERS**, and **SEALING-WAX**.

Bleached Lac. *Syn.* **WHITE LAC; LACCA ALBA, L.** By dissolving lac in a boiling lye of pearlsh or caustic potassa, filtering and passing chlorine through the solution until all the lac is precipitated; this is collected, well washed and pulled in hot water, and, finally, twisted into sticks, and thrown into cold water to harden. *Used* to make pale varnishes and the more delicate coloured sealing-wax.

LAC DYE. *Syn.* **LAC, LAC-LAKE, INDIAN COCHINEAL.** A colouring substance used to dye scarlet, imported from India.

Prep. By dissolving out the colour of ground stick-lac by means of a weak alkaline solution, and then precipitating it along with alumina by adding a solution of alum.

Obs. To prepare the lac for dyeing, it is ground and mixed with diluted 'lac spirit,' and the whole allowed to stand for about a week. The 'cloth' is first mordanted with a mixture of tartar and 'lac spirit,' and afterwards kept near the boil for three quarters of an hour, in a bath formed by adding a proportion of the prepared lac dye to the mixture used for mordanting. Lac dye is only applicable to woollen and silk. The colours it yields are similar to those obtained from cochineal, but less brilliant.

LAC SPIRIT. See **TIN MORDANTS**.

LAC'QUEE. A solution of shell-lac in alcohol, tinged with saffron, annotta, aloes, or other colouring substances. It is applied to wood and metals to impart a golden colour. See **VARNISH**.

LACTALBUMEN. See **CASEIN**.

LACTATE, *Syn.* LACTAS, L. A salt of lactic acid. The lactates are characterised by

yielding an enormous quantity of perfectly pure carbonic oxide gas when heated with 5 or 6 parts of oil of vitriol. Most of these salts may be directly formed by dissolving the hydrate or carbonate of the metal in the dilute acid.

LACTA'TION. See **INFANCY, NURSING, &c.**

LACTIC ACID. $H_2C_6H_{10}O_6$. *Syn.* **ACID OF MILK; ACIDUM LACTICUM, L.** A sour, syrupy liquid, discovered by Scheele in whey. It is also found in some other animal fluids, and in several vegetable juices, especially in that of beet-root.

Prep. 1. Dissolve lactate of barium in water, precipitate the barium with dilute sulphuric acid, carefully avoiding excess, and gently evaporate to the consistence of a syrup, or until it acquires the density 1.215. Lactate of calcium may be used instead of lactate of barium, in which case a solution of oxalic acid must be employed as the precipitant. Pure. (See No. 5.)

2. Milk (skimmed or stale), 1 gal.; bicarbonate of sodium, $\frac{1}{2}$ lb.; dissolve, and expose the liquid to the air for some days, until it becomes sour, then saturate the excess of acid with some more bicarbonate of sodium, and again expose it to the air; repeat this as often as the liquid becomes sour; next heat the liquid to the boiling-point, filter, evaporate to dryness (or nearly), and exhaust the residuum with rectified spirit; filter the alcoholic solution, which contains lactate of sodium, add sulphuric acid as long as it causes a precipitate to form, again filter, and concentrate the clear liquid by evaporation.

3. (Boutron and Fremy.) Milk, 3 or 4 quarts; sugar of milk, 200 to 300 grs.; mix, and expose for 2 or 3 days in an open vessel at 70° to 80° Fahr., then saturate with bicarbonate of sodium, again expose at a moderate temperature, saturate with more bicarbonate of sodium, and repeat the process until the whole of the sugar of milk is decomposed; then coagulate the casein by heat, filter, evaporate, extract the acid lactate of sodium by alcohol of sp. gr. .810, and decompose it by the cautious addition of dilute sulphuric acid; again filter, distil off the alcohol, and evaporate as before.

4. (Scheele.) Evaporate sour whey to $\frac{1}{3}$ th of its bulk, saturate with slaked lime, filter, add 3 or 4 times the quantity of water, cautiously precipitate the lime with a solution of oxalic acid, filter, and gently evaporate to dryness in a warm bath; digest the residuum in strong rectified spirit, and again filter and evaporate.

5. (Wackenroder.) Sugar of lead, 25 parts; finely powdered chalk, 20 parts; skimmed milk, 100 parts; water, 200 parts; digested together at about 75° Fahr. In six weeks the chalk will be dissolved; the whole is then heated, but not to boiling; the cheese is strained off, pressed, and the decanted liquid is

clarified by albumen and evaporated, to let the lactate of calcium crystallise; the salt is recrystallised and decomposed, either by sulphuric acid or by the exact quantity of oxalic acid. This is, perhaps, the most effective mode of preparing lactic acid.

6. (Wholesale.)—*a.* Good raw cane-sugar, 7 lbs., is dissolved in milk (skimmed or stale), 2 galls., and cheese (in a moist or putrescent state), $\frac{1}{2}$ lb., and chalk, 4 lbs., previously rubbed to a cream with water, $1\frac{1}{2}$ gal., is then added; the mixture is next exposed in a loosely covered jar, at a temperature of 80° to 86° Fahr., with occasional stirring, for 2 or 3 weeks, or until the whole is converted into a semi-solid mass of crystals of lactate of calcium; this is purified either by draining off and expressing the liquid portion, dissolving the residue in water, and evaporating the solution for crystals; or the whole is put into a stoneware vessel and heated to the boiling-point, by which the casein is coagulated, and the lactate of calcium is dissolved; the solution, filtered whilst hot, furnishes the salt in crystals on cooling; these crystals are subsequently dissolved in water, and the filtered solution decomposed by oxalic acid, as before.

b. From cane-sugar, 4 parts; moist cheese, 1 part; chalk, 3 parts; water, 20 parts; as the last.

Obs. Lactic acid prepared by any of the usual formulæ may be rendered quite pure by dilution with water, saturation with baryta, evaporation, crystallisation, re-solution in water, and the careful addition of dilute sulphuric acid, as in No. 1; the liquid is, lastly, again filtered and evaporated. Another plan is to convert the acid into lactate of zinc, by the addition of commercial zinc-white, and to redissolve the new salt in water, and then decompose the solution with a stream of sulphuretted hydrogen. In all cases the evaporation should be conducted at a very gentle heat, and, when possible, finished over sulphuric acid, or *in vacuo*. For particular purposes, this last product may be dissolved in ether, filtered, and the ether removed by a very gentle heat. Care must also be taken to remove the solid lactate of calcium at the proper period from the fermenting liquid, as otherwise it will gradually redissolve and disappear, and on examination the liquid will be found to consist chiefly of a solution of butyrate of calcium.

Prop. The product of the above formulæ is a solution of lactic acid. It may be concentrated *in vacuo* over a surface of oil of vitriol until it appears as a syrupy liquid of sp. gr. 1.215; soluble in water, alcohol, and ether; exhibiting the usual acid properties, and forming salts with the metals, called LACTATES. Heated in a retort to 266° Fahr., a small portion distils over, and the residuum on cooling concretes into a yellowish, solid, fusible mass, very bitter, and nearly insoluble in water. This is lactic acid, which has lost half (1 equiv.)

of its basic water. By long boiling in water, this substance is reconverted into lactic acid. Heated to 480° Fahr., it suffers decomposition, lactide (the anhydrous, concrete, or sublimed lactic acid of former writers) and other products being formed. This new substance may be purified by pressure between bibulous paper and solution in boiling alcohol from which it separates in dazzling white crystals on cooling. By solution in hot water and evaporation to a syrup, it furnishes common lactic acid.

Uses. Lactic acid has been given in dyspepsia, goat, phosphatic urinary deposits, &c. From its being one of the natural constituents of the gastric juice, and from its power of dissolving a considerable quantity of phosphate of calcium, it appears very probable that it may prove beneficial in the above complaints. *Dose.* 1 to 5 grs.; in the form of lozenges, or solution in sweetened water.

LACTIC FERMENTATION. The peculiar change by which saccharine matter is converted into lactic acid. Nitrogenous substances which in an advanced state of putrefactive change act as alcohol-ferments often possess, at certain periods of their decay, the property of inducing an acid fermentation in sugar, by which that substance is changed into lactic acid. Thus, the nitrogenized matter of malt, when suffered to putrefy in water for a few days only, acquires the power of acidifying the sugar which accompanies it; whilst in a more advanced state of decomposition it converts, under similar circumstances, the sugar into alcohol. The gluten of grain behaves in the same manner. Wheat flour, made into a paste with water, and left for four or five days in a warm situation, becomes a true lactic acid ferment; but if left a day or two longer, it changes its character, and then acts like common yeast, occasioning the ordinary pany or vinous fermentation. Moist animal membranes, in a slightly decaying condition, often act energetically in developing lactic acid. The rennet employed in the manufacture of cheese furnishes a well-known example of this class of substances.

In preparing lactic acid from milk, the acid formed, after a time, coagulates and renders insoluble the casein, and the production of the acid ceases. By carefully neutralizing the free acid by carbonate of sodium, the casein becomes soluble, and, resuming its activity, changes a fresh quantity of sugar into lactic acid, which may be also neutralized, and by a sufficient number of repetitions of this process all the sugar of milk present may, in time, be acidified. This is the rationale of the common process by which lactic acid is obtained. Cane-sugar (probably by previously becoming grape-sugar) and the sugar of milk both yield lactic acid; the latter, however, most readily, the grape-sugar having a strong tendency towards the alcoholic fermentation. If the lactic fermentation be allowed to pro-

ceed too far, the second stage of the process of transmutation commences, hydrogen gas and carbonic acid gas are evolved, and the butyric fermentation, by which oily acids are formed, is established.

LACTIDE. See LACTIC ACID.

LACTIN. See SUGAR OF MILK.

LACTOMETER. *Syn.* GALACTOMETER. An instrument for ascertaining the quality of milk. The best way of testing milk is to place it in a long graduated tube or lactometer, and to allow it to remain until all the cream has separated, then to decant off the clear whey, and to take its specific gravity; the result of the two operations, when compared with the known quantity of cream and the density of the whey of an average sample of milk, gives the value of the sample tested.

A little instrument called a 'milk tester' is sold in London at a low price. It is essentially a hydrometer which sinks to a given mark on the stem in pure water, and floats at another mark at the opposite end of the scale in pure milk. The intermediate space indicates the quantity of water (if any) employed to adulterate the article. As the sp. gr. of pure milk varies, the indications of the 'tester' cannot be depended on.

LACTUCA. (B.P.) *Syn.* LETTUCE. The leaves and flowering tops of the wild indigenous plant *Lactuca Virosa*. They are sedative, narcotic, and powerfully diuretic; also mildly laxative and diaphoretic. Given in dropsy and visceral obstructions. See LETTUCE, EXTRACT OF.

LACTOSE. See SUGAR OF MILK.

LACTUCARIUM. *Syn.* LETTUCE OPIUM, *THRIDACE*; LACTUCARIUM (Ph. E. & D.). The inspissated milky juice of the *Lactuca sativa* (common garden lettuce), or the *Lactuca virosa* (strong scented wild lettuce), obtained, by incision, from the flowering stems, and dried in the air. The latter species yields by far the greater quantity. M. Arnaud, of Nancy, adopts the following method of procuring this substance, which appears to be the most productive and simple of any yet published:—Before the development of the lateral branches, the stems of twelve plants are cut, one after another, a little below the commencement of these branches; returning to the first one, a milky exudation is found on the cut portion, and on that which remains fixed in the earth; this milky exudation is adroitly collected with the end of the finger (or with a bone knife), which is afterwards scraped on the edge of a small glass; the same operation is performed on twelve other heads, and so on; on the third day it is repeated on every portion of the plant remaining in the ground, a thin slice being first cut off the top; this is done every day until the root is reached. As soon as the lactucarium is collected, it coagulates; the harvest of each day is divided into small pieces, which are placed on plates, very near each other, but without touching, and

allowed to dry for two days, after which they are set aside in a bottle. In this way 15 or 20 times the ordinary product is obtained.

Prop., &c. Lactucarium is anodyne, hypnotic, antispasmodic, and sedative, allaying pain and diminishing the force of the circulation. It has been recommended in cases in which opium is inadmissible, and has been administered with advantage in chronic rheumatism, cholice, diarrhoea, asthma, and troublesome cough of phthisis, the irritability and watchfulness in febrile disorders, &c.—*Dose.* 2 to 5 grs.; made into pills, lozenges, or tincture.

LACTUCIN. *Syn.* LACTUCINUM, L. This is the active principle of lactucarium, and is found in the juice of several species of lettuce.

Prep. Exhaust lactucarium with hot rectified spirit, agitate the tincture with a little animal charcoal, filter, add a little milk of lime, and evaporate to dryness; digest the residuum in hot rectified spirit, filter, and evaporate by a gentle heat, so that crystals may form.

Prop., &c. A nearly colourless, odourless, fusible, neutral, bitter substance; sparingly soluble in cold water and in ether; but freely soluble in alcohol. It possesses feeble basic properties. Good lactucarium contains fully 20% of this substance.

LADANUM. See LABDANUM.

LAENNEC'S CONTRA-STIMULANT. See DRAUGHT.

LAKE. *Syn.* LACCA, L. Animal or vegetable colouring matter, precipitated in combination with oxide of tin or alumina; usually the latter. The term was formerly restricted to red preparations of this kind, but is now indiscriminately applied to all compounds of alumina and colouring matter. The term 'LAKE,' when unqualified by an adjective, is, however, understood to apply exclusively to that prepared from cochineal.

Prep. Lakes are made—1. By adding a solution of alum, either alone or partly saturated with carbonate of potassa, to a filtered infusion or decoction of the colouring substance, and after agitation precipitating the mixture with a solution of carbonate of potash.—2. By precipitating a decoction or infusion of the colouring substance made with a weak alkaline lye, by adding a solution of alum.—3. By agitating recently precipitated alumina with a solution of the colouring matter, prepared as before, until the liquid is nearly decoloured, or the alumina acquires a sufficiently dark tint. The first method is usually employed for acidulous solutions of colouring matter, or for those whose tint is injured by alkalies; the second, for those that are brightened, or at least uninjured, by alkalies; the third, for those colouring matters that have a great affinity for gelatinous alumina, and readily combine with it by mere agitation. By attention to these general rules, lakes may be prepared from almost all animal and vegetable colouring substances that yield their colour to

water, many of which will be found to possess great beauty and permanence. The precise process adapted to each particular substance may be easily ascertained by taking a few drops of its infusion or decoction, and observing the effects of alkalis and acids on the colour. The quantity of alum or of alumina employed should be nearly sufficient to decolour the dye liquor; and the quantity of carbonate of potassa should be so proportioned to the alum as to exactly precipitate the alumina without leaving free or carbonated alkali in the liquid. The first portion of the precipitate has the deepest colour, and the shade gradually becomes paler as the operation proceeds. A beautiful 'tone' of violet, red, and even purple, may be communicated to the colouring matter of cochineal by the addition of perchloride of tin; the addition of arseniate of potassa (neutral arsenical salt) in like manner gives shades which may be sought for in vain with alum or alumina. After the lake is precipitated, it must be carefully collected, washed with cold distilled water, or the purest rain water, until it ceases to give out colour, and then carefully dried in the shade. In this state it forms a soft velvety powder. That of the shops is generally made up into conical or pyramidal drops (drop lake), which is done by dropping the moist lake through a small funnel on a clean board or slab, and drying it by a gentle heat as before. A very little clear gum water is commonly added to the paste, to give the drops consistence when dry.

Blue Lake. *Syn.* LACCA CŒRULEA, L. Prepared from some of the blue-coloured flowers; fugitive. The name is also applied to lump archil (laccacœrulea), to moist alumina coloured with indigo, and to mixed solutions of pearlsh and prussiate of potash, precipitated with another solution of sulphate of iron and alum. These are permanent and beautiful, but are seldom used, in consequence of indigo and Prussian blue supplying all that is wanted in this class of colours.

Brazil-wood Lake. *Syn.* DROP LAKE; LACCA IN GLOBULIS, L. *Prep.* 1. Take of ground Brazil-wood, 1 lb.; water, 4 galls.; digest for 24 hours, then boil for 30 or 40 minutes, and add of alum 1½ lb.; dissolved in a little water; mix, decant, strain, and add of solution of tin, ½ lb.; again mix well and filter; to the clear liquid add, cautiously, a solution of salt of tartar or carbonate of soda, as long as a deep-coloured precipitate forms, carefully avoiding excess; collect, wash, dry, &c., as directed above.

Obs. The product is deep red. By collecting the precipitate in separate portions, lakes varying in richness and depth of colour may be obtained. The first portion of the precipitated lake has the brightest colour. An excess of alkali turns it on the violet, and the addition of cream of tartar, on the brownish-red. The tint turns more on the violet red when the solution of tin is omitted. Some persons use less, others more, alum.

2. Add washed and recently precipitated alumina to a strong and filtered decoction of Brazil wood. Inferior to the last.

Carminated Lake. *Syn.* COCHINEAL LAKE, FLORENCE L., FLORENTINE L., PARIS L., VIENNA L.; LACCA FLORENTINA, L. *Prep.* 1. The residuum of the cochineal left in making carmine is boiled with repeated portions of water, until it is exhausted of colour; the resulting liquor is mixed with that decanted off the carmine, and at once filtered; some recently precipitated alumina is then added, and the whole gently heated, and well agitated for a short time; as soon as the alumina has absorbed sufficient colour, the mixture is allowed to settle, after which the clear portion is decanted, the lake collected on a filter, washed, and dried, as before. The decanted liquor, if still coloured, is now treated with fresh alumina until exhausted, and thus a lake of a second quality is obtained. Very fine.

2. To the coloured liquor obtained from the carmine and cochineal as above, a solution of alum is added, the filtered liquor precipitated with a solution of carbonate of potassa, and the lake collected and treated as before. Scarcely so good as the last.

Obs. Some makers mix a little solution of tin with the coloured liquor before adding the alum or alumina; this brightens the colour. The above lake is a good glazing colour with oil, but has little body. It may be made directly from a decoction of cochineal. (See below.)

Lake, Cochineal. *Prep.* 1. Cochineal (in coarse powder), 1 oz.; water and rectified spirit, of each, 2½ oz.; digest for a week, filter, and precipitate the tincture with a few drops of solution of tin added every two hours, until the whole of the colouring matter is thrown down; lastly, wash the precipitate in distilled water, and dry it. Very fine.

2. Digest powdered cochineal in ammonia water for a week, dilute the solution with a little water, and add the liquid to a solution of alum, as long as a precipitate falls, which is the lake. Equal to the last.

3. Coarsely powdered cochineal, 1 lb.; water, 2 galls.; boil 1 hour, decant, strain, add a solution of salt of tartar, 1 lb., and precipitate with a solution of alum. By adding the alum first, and precipitating the lake with the alkali, the colour will be slightly varied. All the above are sold as CARMINATED or FLORENCE LAKE, to which they are often superior.

Lake, Green. Made by mixing blue and yellow lake together. Seldom kept in the shops, being generally prepared extemporaneously by the artist on his palette.

Lake, Lac. *Prep.* Boil fresh stick-lac in a solution of carbonate of soda, filter the solution, precipitate with a solution of alum, and proceed as before. A fine red.

Lake, Li'chen. See ORCEIN.

Lake, Mad'ier. *Syn.* LACCA RUBLE, L. CO-

LUMBINA, L. *Prep.* 1. (Sir H. C. Inglefield.) Take of Dutch grappe or crop madder, 2 oz.; tie it in a cloth, beat it well in a pint of water in a stone mortar, and repeat the process with fresh water (about 5 pints) until it ceases to yield colour; next boil the mixed liquor in an earthen vessel, pour it into a large basin, and add of alum 1 oz., previously dissolved in boiling water, 1 pint; stir well, and while stirring, pour in gradually of a strong solution of carbonate of potassa ('oil of tartar'), 1½ oz.; let the whole stand until cold, then pour off the supernatant yellow liquor, drain, agitate the residue with boiling water, 1 quart (in separate portions), decant, drain, and dry. *Product.* ½ oz. The Society of Arts voted their gold medal to the author of the above formula.

2. Add a little solution of acetate of lead to a decoction of madder, to throw down the brown colouring matter, filter, add a solution of tin or alum, precipitate with a solution of carbonate of soda or of potassa, and otherwise proceed as before.

3. (Ure.) Ground madder, 2 lbs.; water, 1 gal.; macerate with agitation for 10 minutes, strain off the water, and press the remainder quite dry; repeat the process a second and a third time; then add to the mixed liquors, alum, ½ lb., dissolved in water, 3 quarts; and heat in a water bath for 3 or 4 hours, adding water as it evaporates; next filter, first through flannel, and, when sufficiently cold, through paper; then add a solution of carbonate of potassa as long as a precipitate falls, which must be washed until the water comes off colourless, and, lastly, dried. If the alkali be added in 3 successive doses, 3 different lakes will be obtained, successively diminishing in beauty. See **MADDER**, **MADDER RED**, &c.

Orange Lac. *Prep.* Take of the best Spanish annotta, 4 oz.; pearlsh, ½ lb.; water, 1 gal.; boil for half an hour, strain, precipitate with alum, 1 lb., dissolved in water, 1 gal., observing not to add the latter solution when it ceases to produce an effervescence or a precipitate; strain, and dry the sediment in small squares, lozenges, or drops. The addition of some solution of tin turns this lake on the **LEMON YELLOW**; acids redden it. See **YELLOW LAKE**.

Lake, Red. *Prep.* Take of pearlsh, 1 lb.; clean shreds of scarlet cloth, 3½ lbs.; water, 5 galls.; boil till the cloth is decoloured, filter the decoction, and precipitate with a solution of alum, as before. See the **LAKES** noticed above (**Brazil-wood**, **Carminated**, **Cochineal**, and **Madder**).

Lake, Yellow. *Prep.* 1. Boil French berries, quercitron bark, or turmeric, 1 lb., and salt of tartar, 1 oz., in water, 1 gal., until reduced to one half, then strain the decoction, and precipitate with a solution of alum.

2. Boil 1 lb. of the dye-stuff with alum, ½ lb.; water, 1 gal., as before, and precipitate

the decoction with a solution of carbonate of potash. See **LAKE**, **ORANGE** (*above*).

LAMB in its general qualities closely resembles mutton, of which, indeed, it is merely a younger and more delicate kind. It is well adapted as an occasional article of food for the convalescent and dyspeptic; but it is unequal for frequent use, more especially for the healthy and robust, to the flesh of the adult animal.

LAMBS, DISEASE OF. Among other diseases, these animals are particularly prone to one affecting the lungs in consequence of the existence of parasites (*Strongylus bronchialis*) in the air-passages. See **PARASITES**.

LAMP. A contrivance for producing artificial light or heat by the combustion of inflammable liquids. The term 'lamp' is also applied to a portable gas-burner (**GAS-LAMP**), and to a tubular candle-holder, which, by the aid of a simple mechanical device, keeps the flame at one height (**CANDLE-LAMP**).

OIL LAMPS were employed for illumination among the nations of antiquity, at the earliest period of which any record exists. The Assyrian, Greek, and Roman lamps preserved in our museums are generally noble specimens of art-workmanship. Though elegant in form, and rich in external embellishment, the ancient lamp was simply a vessel to contain the oil, with a short depression or spout on the one side, in which the wick is laid. Lamps of this rude construction are still in common use in many countries.

No important improvement in the principle and construction of lamps as a source of light occurred until a comparatively recent date; the smoke, dirt, and disagreeable odour of the common lamp having previously led to its disuse among the superior classes in favour of candles. At length, in 1789, M. Argand made a revolution in illumination by the invention and introduction of the well-known lamp which bears his name. In the **ARGAND LAMP** a hollow tubular wick of woven cotton replaces the solid bundle of fibres, and is so arranged that air passes through it into the interior of the flame. Over the burner is placed a cylindrical glass chimney, open at the bottom, and surrounding the flame at a short distance from it, by which another current of air is made to act on the exterior portion of the flame. In this way a due supply of oxygen is secured, and sufficient heat generated for the perfect combustion of the gaseous products of the oil, and the smoke and soot which escape from the ordinary lamp are converted into a brilliant and smokeless flame.

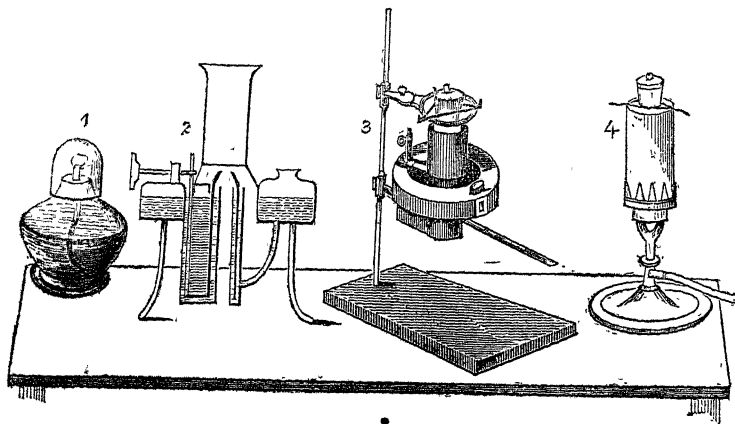

The earliest table-lamps constructed on Argand's principle had one serious defect—the oil vessels had to be placed almost on a level with the burners, in a position which caused them to cast objectionable shadows. This defect was almost entirely removed by making the oil vessel in the form of a flattish ring, connected by slender tubes with the

burner. The more elegant contrivances, known as the **MODERATOR LAMP** and **CARCEL LAMP**, which are now so much used for burning colza and similar oils, cast no shadow. In these the oil, instead of being sucked up by the wick, or descending to it by the force of gravity, is driven up by mechanical means from the oil-reservoir contained in the foot or pedestal. A spiral spring, acting upon a piston, elevates the oil in the 'moderator,' while a little pump worked by clockwork does the same duty in the 'Carcel.' The burner and wick in each are formed on Argand's principle.

For burning the hydrocarbon oils distilled from coal and petroleum, lamps of very simple construction are used. These oils, in consequence of their diffusive character, rise to a

considerable height up a wick, and therefore do not require mechanical lamps. The wicks of **HYDRO-CARBON LAMPS** are usually flat, but sometimes circular. To cause perfect combustion, a strong draught of air is created by placing over the flame a tall glass chimney, usually much contracted above the flame. A metallic cap, with an orifice the shape of the flame, is placed over the burner, its use being to deflect the currents of air upon the flame. The reservoirs of hydro-carbon lamps ought always to be constructed of some bad conductor of heat, as glass or porcelain.

For chemical operations, many forms of lamp are used. The ordinary glass **SPIRIT-LAMP**, fitted with a ground-glass cap, is quite indispensable for minor experiments. (See *engr. 1.*)

Stoneware wick-holders are preferable to those of brass, which become greatly heated, and endanger the splitting of the glass. "An effective spirit-lamp may at any time be constructed out of a vial having a glass tube passing through the cork, a cover being formed from a test-tube inverted over the wick, and fitting with moderate tightness on the superior extremity of the cork," (Greville Williams.) Alcohol or wood spirit is the fuel used.

The **ARGAND LAMP**, when intended as a source of heat for chemical purposes, is so modified as to adapt it to burn either oil, spirit of wine, or wood-spirit, and the combustion is greatly aided by the chimney, which in this case is made of copper. (See *engr. 2* and *3.*) The lamp itself is also made of metal, and furnished with ground caps to the wick-holder and aperture by which the spirit is introduced, in order to prevent loss of spirit by evaporation when the lamp is not in use. When in use this aperture must always be left open, otherwise an accident is sure to happen, as the heat expands the air in the lamp, and the spirit is forcibly expelled.

In those situations in which coal-gas is

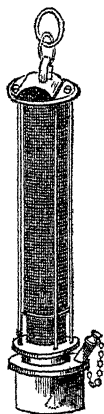

cheap, it may be used with great economy and advantage as a source of heat in most chemical operations. Retorts, flasks, capsules, and other vessels, can be thus exposed to an easily regulated and constant temperature for many successive hours. Small platinum crucibles may be ignited to redness by placing them over the flame on a little wire triangle. Of the various gas-lamps now used in the laboratory, the first and most simple consists of a common Argand gas-burner fixed on a heavy and low foot, and connected with a flexible gas-tube of caoutchouc or other material. (See *engr. 4.*) With this arrangement it is possible to obtain any degree of heat, from that of the smallest blue flame, to that which is sufficient to raise a moderately large platinum crucible to dull redness. When gas mixed with a certain proportion of air is burnt, a pale blue flame, free from smoke, and possessing great heating power, is obtained. A lamp for burning the mixture may easily be made by fitting a close cover of fine wire gauze over the top of the chimney of the last-mentioned contrivance. The gas is turned on, and after a few minutes ignited above the wire gauze. The ingenious and useful burners of

Bunsen and Griffin are so constructed that gas and air mixed in any proportions, or gas alone, may be burnt at pleasure. See ILLUMINATION, FUEL, FURNACE, GAS, LABORATORY, &c.

Flameless Lamp. *Syn.* GLOW LAMP. A coil of fine platinum wire is slipped over the wick of a spirit lamp, the greater part being raised above the cotton; the lamp is supplied with ether or alcohol, lighted for a moment, and then blown out. The coil continues to glow in the mixed atmosphere of air and combustible vapour, until the liquid in the lamp is exhausted.

Monochromatic Lamp. A lamp fed with a mixture of a solution of common salt and spirit of wine. It gives a yellow light, and makes every object illuminated by it appear either yellow or black. The human features are changed in a remarkable degree; the countenance appearing truly ghastly and unearthly.

Safety Lamp. *Syn.* MINER'S LAMP, DAVY, GEORDY. The safety lamp of Sir H. Davy and George Stephenson are similar in principle, and were independently invented about the same time. That of Sir H. Davy consists of a common oil lamp, surmounted with a cylinder of wire gauze, the apertures of which

are not greater than the $\frac{1}{16}$ th of an inch square, and the wire of which it is made of the $\frac{1}{16}$ th to the $\frac{1}{8}$ th of an inch in diameter. (See *engr.*) The fire-damp (carbonetted hydrogen) along with air passes through the meshes into the interior of the gauze cylinder. Here it ignites, but the flame which is produced by its combustion cannot explode a mixture of fire-damp and air by which the lamp may be surrounded. The flame is prevented from passing to the exterior of the gauze by the cooling action of the metal of which it is constructed. When this lamp is taken in to an explosive atmosphere, although the fire-damp may burn within

the cage with such energy as sometimes to heat the metallic tissue to dull redness, the flame is not communicated to the mixture on the outside. These appearances are so remarkable, that the lamp becomes an admirable indicator of the state of the air in different parts of the mine, and if its admonitions are attended to, gives the miner time to withdraw before an explosion takes place.

Telescope Lamp. This ingenious contrivance, invented by Messrs. Murray and Heath, is intended for microscopic illumination. It consists of three brass tubes sliding one within the other, the oil vessel being contained in the inner tube. The height of the lamp is regulated to the greatest nicety by simply turning one tube in the other, interior spiral guides

preventing all chance of slipping. The great advantages of this arrangement is absence of the stand and bar usually employed for raising and lowering the lamp, which enables it to be used on all sides, and to be brought much closer to the microscope than other lamps. See *Engr.*, p. 680.

LAMP BLACK. See BLACK PIGMENTS.

LAMP'REY. *Syn.* GREAT LAMP'REY, SEAL.

This fish is the *Petromyzon marinus* of Linnæus. It generally quits the sea in the spring, for the purpose of spawning, and remains in our rivers for a few months. Its flesh is soft and glutinous, and though esteemed a delicacy, is extremely difficult of digestion, if not otherwise unwholesome. Potted lampreys are usually so highly seasoned, as to become a dangerous article of food. Henry I is said to have lost his life from the effects of a surfeit of lampreys.

LANTHA'NIUM. La. A rare metal, discovered by Mosander, associated with oxide of cerium. Oxide of lanthanum is a pale salmon-coloured powder, unaffected by ignition in open vessels. See CERIUM.

LA'PIS. [L.] A stone. The term was much employed by the old chemists, and is still commonly applied to several preparations used in medicine.

Lapis Cans'ticus. See POTASSA.

Lapis Divi'nus. *Syn.* DIVINE STONE; LAPIS OPHTHALMICUS, L.; PIERRE DIVINE, Fr. *Prep.* 1. (Beer.) Verdigris, nitre, and alum, equal parts, melted together.

2. (P. Cod.) Alum, nitre, and blue vitriol, of each 3 oz.; camphor, 1 dr.; as last.

3. (Woolfuss.) Blue vitriol, nitre, alum, and camphor, equal parts, melted together, adding the camphor last. Astringent and detergent. 1 oz., dissolved in water, 1 pint, formed a once celebrated lotion. 1 dr. in water, 1 pint, is still used as a collyrium.

Lapis Inferna'lis. See NITRATE OF SILVER.

Lapis Lazuli. See ULTRAMARINE.

Lapis Lydius. *Syn.* LYDIAN STONE. A siliceous slate, used as a touchstone by jewellers.

Lapis Medicamento'sus. *Syn.* MEDICINAL STONE; LAPIS MIRABILIS, L. *Prep.* (Ph. L. 1746.) Alum, litharge, and Amnian bole, of each, 6 oz.; colcothar of green vitriol, 3 oz.; vinegar, 4 fl. oz.; mix, and evaporate to dryness. Formerly used to make an astringent and detergent lotion:—1 oz. to water, 1 pint. Once a popular application to ulcers, and in other cases; now disused.

Lapis Vulgarari'us. Very similar to LAPIS DIVINUS.

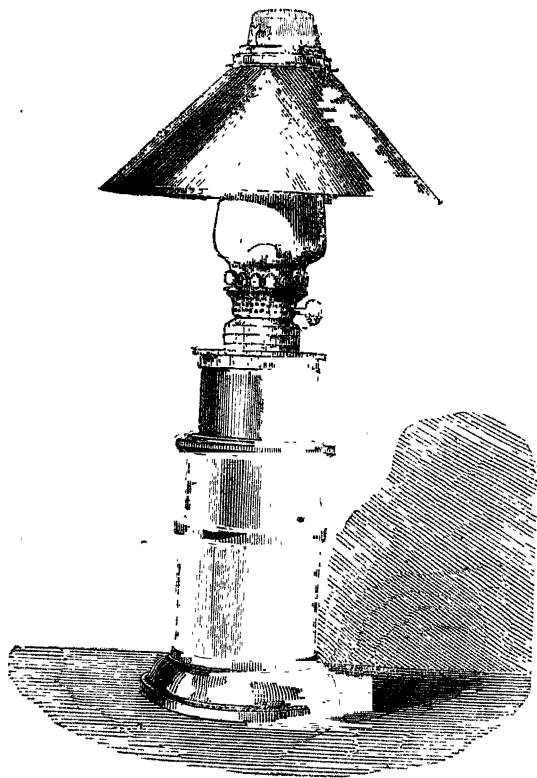

LARD. *Syn.* HOG'S LARD, AXUNGIE; ADIPS (Ph. L.), AXUNGIA (Ph. E.); A. SULLUS (Ph. D.), A. PORCI, A. PREPARATUS, (B.P.), L. The fat of the pig (*Sus scrofa*—Linn.) melted by a gentle heat, and strained through flannel or a hair sieve. The fat about the loins yields the whitest and hardest lard. "That which has been cured with chloride of sodium is not to be employed." (Ph. L.) "It is not to be used without being first carefully washed with

water." (Ph. L. 1866.) *Used*, chiefly, to make ointments, and in cookery. See ADEFS.

LARDING. By many this is regarded as belonging to the higher style of cookery only, and too troublesome and extravagant to be adapted to the kitchens of the middle classes and the poor. This, we are assured, is not the case. "On the contrary, "it is an economical process, and will make lean meat go much farther than without it." The process of larding is a follows:—"Get what is called a larding needle, that is, a piece of steel from 6 to 9 inches long, pointed at one end, and

having four slits at the other to hold a small strip of bacon when put between them. It will, perhaps, cost tenpence. Cut the bacon into pieces 2 or 3 inches long, and $\frac{1}{4}$ to $\frac{1}{2}$ an inch square; put each one after the other in the pin, insert it in the meat, and leave only about half an inch out; using 8 pieces to each pound." (Soyer.)

LARK. The *Alauda arvensis* (SKYLARK) and the *Alauda cristata* (FIELD-LARK), with several other species of the same genus, form a light and nutritious article of food, by many esteemed a delicacy. The last, according to

Galen and Dioscorides, eaten either roasted or boiled, 'helps the colic.' The heart, applied to the thigh, was also regarded to possess the same virtue.

LAUDANUM. This name is now understood to denote, exclusively, the common tincture of opium of the Pharmacopœia; but formerly the term was applied to several preparations of opium differing greatly from each other, both in their strength and mode of preparation. (See *below*.)

Laudanum, Dutchman's. From the flowers of bull's hoof or Dutchman's laudanum (*Passiflora mercuria*—Linn.) infused in rum. Nar-

cotic. *Used* as a substitute for tincture of opium in the West Indies.

Laudanum, Ford's. This is merely the common tincture of opium aromatized with a little cloves and cinnamon.

Laudanum, Houlton's. *Prep.* From opium 2½ oz.; distilled vinegar, 1½ pint; digested together for a week, the filtered tincture gently evaporated nearly to dryness, and then redissolved in weak spirit (1 of rectified spirit to 7 of water), 1 quart.—*Dose* 10 to 60 drops.

Laudanum, Neumann's. A fermented infusion of opium evaporated to the consistence of honey.

Laudanum, Quince. *Syn.* EXTRACTUM OPII CYDONIATUM, LAUDANUM CYDONIATUM, L. *Prep.* 1. Extract of opium made with quince juice; a few drops of the oils of cinnamon, cloves, and mace, being added before the mass cools. Now seldom used.

2. LAUDANUM LIQUID-QUINCE; LAUDANUM LIQUIDUM CYDONIATUM, L. L. C. PARATUM FERMENTATIONE, L.) A fermented infusion of opium prepared with quince juice, aromatized with cloves, cinnamon, aloes wood, and yellow sandal wood, and evaporated so as to possess about twice the strength of the ordinary tincture. Now obsolete.

Laudanum, Rousseau's. Wine of opium prepared by fermentation. See WINE.

Laudanum, Smith's Concentrated. Resembles Battley's LIQUOR OPII SEDATIVUS, but possesses about 6 times its strength.

Laudanum, Swediaur's. *Prep.* From extract of opium, 2 parts, dissolved in a mixture of alcohol, 1 part, distilled water, 8 parts. Every 5 drops contain 1 gr. of opium.

Laudanum, Sydenham's Liquid. *Syn.* LAUDANUM LIQUIDUM SYDENHAMII, L. Similar to WINE OF OPIUM—Ph. L., but rather stronger, and aromatized with a little cloves and cinnamon. Wine of opium is now always sold for it.

Laudanum, Tartarized. *Syn.* LAUDANUM LIQUIDUM TARTARIZATUM, L. A tincture of opium prepared with spirit alkalinized with salt of tartar, and flavoured with aromatics. Obsolete.

LAUGHING GAS. See NITROUS OXIDE.

LAUREL. See CHERRY LAUREL, SWEET BAY, OIL, &c.

LA'VA. The matter thrown out by volcanoes. The beautiful ornamental vases, jugs, and other objects sold under the name, are a superior sort of unglazed coloured porcelain.

LAVEMENT. See ENEMA.

LAVENDER. The flowers or flowering tops of *Lavandula vera* or common garden lavender. An essential oil, spirit, and tincture, prepared from it, are official in the Pharmacopœias.

Lavender, Red. See TINCTURE.

Lavender, Smith's British. *Prep.* From English oil of lavender, 2 oz.; essence of ambergris, 1 oz.; eau de Cologne, 1 pint; rectified spirit, 1 quart. Very fragrant. See WATER (Lavender.)

LAXATIVES. *Syn.* LENITIVES; LAXATIVA, LAXANTIA, LENITIVA, L. Mild purgatives or cathartics. The principal of these are—almond oil, cassia pulp, castor oil, confection of senna, cream of tartar, figs, grapes, honey, phosphate of soda, prunes, salad oil, tamarinds, &c..

LAYERS. Among gardeners, a mode of propagating plants, by laying down the shoots of young twigs, and covering a portion of them with the soil, without detaching them from the parent plant. To facilitate the rooting of such layers, the part beneath the soil is fractured by twisting or bruising it, or it is partly cut through with a sharp knife, immediately under a bud. When the layer has

taken root, it is divided from the parent stem, and transplanted or potted. In this way with a little care, nearly all plants may be multiplied.

LEAD. Pb. Eq. 207. *Syn.* PLUMBUM. This metal, like gold, silver, and iron, appears to have been known in the most remote ages of antiquity. The ore from which it is almost exclusively extracted, as being the only one found in abundance, is the native sulphide or sulphuret of lead, called by mineralogists galena.

Prep. On the large scale lead is obtained by roasting galena in a reverberatory furnace, and smelting the residue along with coal and lime. The lead thus obtained generally contains small quantities of both silver and gold, which it often pays to extract, by a method termed 'Pattinson's process.' This process is founded on the circumstance that when melted, lead containing silver is allowed to cool. The lead crystallises out first, leaving an alloy of lead and silver still fused. By removing the crystals of lead, as formed, until about four fifths are removed; the residue is an alloy of lead and silver much richer than the original. Repeated several times, this yields a rich alloy of silver and lead that is expelled and the silver obtained.

Pure lead for chemical purposes may be obtained as follows, although the lead of commerce is nearly pure:

By reducing nitrate of lead with charcoal.

By heating the oxide left by igniting pure acetate of lead with black flux.

Prop., &c. The general properties of lead are too well known to require notice here. The sp. gr. of that of commerce is about 11.35; but in a state of absolute purity its greatest density is 11.45. It melts at about 600° Fahr., and when very slowly cooled, crystallises in octahedrons. At a white heat it boils, and is volatilised. When exposed to moist air, it soon becomes covered with a gray film. It is scarcely acted on by hydrochloric or sulphuric acids, although, after some time, both coat it with a film of chloride or sulphate. It is rapidly acted on by nitric acid, with formation of the nitrate. Pure water, put into a leaden vessel, and exposed to the air, soon corrodes it, and dissolves the newly formed oxide; but river and spring water have little action upon lead, provided there is no free carbonic acid present, the carbonates and sulphates in such waters destroying their solvent powers. It has been found that a very small amount of phosphate of sodium or of iodide of potassium, dissolved in distilled water prevents its corrosive action on this metal. The lead in contact with such water gradually becomes covered with a superficial film of an insoluble salt of lead, which adheres tenaciously, and prevents further change. From this it appears that ordinary water ('hard water'), which abounds in mineral salts, may be more or less safely kept in leaden cisterns; but distilled water and rain water, and all other varieties that contain scarcely any saline matter, speedily

corrode, and dissolve a portion of lead, when kept in vessels of that metal. When, however, leaden cisterns have iron or zinc fastenings or braces, a galvanic action is set up, the preservative power of saline matter ceases, and the water speedily becomes contaminated with lead, and unfit for consumption as a beverage. Water containing carbonic anhydride also acts on lead; and this is the reason why the water of some springs (although loaded with saline matter), when kept in leaden cisterns, or raised by leaden pumps, possesses unwholesome properties.

Free carbonic acid is evolved during the fermentation or decay of vegetable matter, and hence the absolute necessity of preventing the leaves of trees falling into water-cisterns formed of lead. The 'eau de rose' and the 'eau d'orange' of commerce, which are pure distilled water holding in solution small quantities of essential oil, and are imported in leaden canisters, always contain a small quantity of lead, and deposit a sediment, which is not the case when they are kept in glass or incorrodible vessels.

Lead and all its preparations are highly poisonous; and whether imbibed in almost infinitesimal quantities with our daily beverages and food, or swallowed in larger and appreciable doses, is productive of the most disastrous consequences, the real cause being unfortunately seldom suspected.

With the acids lead or its oxides form salts, usually white in colour, and in the majority nearly insoluble in water, but readily soluble in acids.

Tests. The oxides and salts of lead, mixed with a little carbonate of soda, and exposed on a charcoal support to the reducing flame of the blowpipe, readily yield a soft and ductile globule of metallic lead, and the charcoal, at the same time, becomes covered with a yellowish incrustation of oxide of lead. Both metallic lead and its oxides are soluble in nitric acid, furnishing a solution which may be examined with ease.

Selection of lead salts may be recognised by the following reactions:—Sulphuretted hydrogen, hydrosulphide of ammonium, and the alkaline sulphides, give black precipitates, insoluble in the cold dilute acids, alkalies, alkaline sulphides, and cyanide of potassium. Potassium and sodium hydrates give a white precipitate, soluble in excess. Ammonia (except with the acetate) gives a white precipitate, insoluble in excess. The carbonates of potassium, sodium, and ammonium, give a white precipitate, insoluble in excess. Dilute sulphuric acid (in excess), and solutions of the sulphates give a white precipitate, sparingly soluble in dilute acids, but soluble in a hot boiling solution of potassium carbonate. Chromate and bichromate of potassium give yellow precipitates insoluble in dilute nitric acid, and soluble in solution of potassium hydrate. Iodide of potassium gives a yellow precipitate,

soluble in great excess by heat, and separating in small, brilliant, golden-yellow scales, as the liquid cools. A piece of polished zinc precipitates metallic lead in an arborescent form, hence called the lead tree. To prepare for these tests, a solid supposed to contain lead should be digested in nitric acid, when the solution, evaporated to dryness and redissolved in water, may be tested as above.

Estim. This has been already referred to under previous heads. The ores of lead (galena) may be digested in nitric acid, when the solution may be treated with sulphuric acid, and the lead estimated from the weight of the precipitated sulphate. This is called an assay in the wet way. The method adopted by practical mineralogists is an assay in the dry way, and is conducted as follows:—A small but powerful air-furnace, charged with coke, is brought to as high a temperature as possible, and a conical wrought-iron crucible plunged into the midst of it; as soon as the crucible has attained a dull-red heat, 1000 grs. of the galena, reduced to powder, are thrown into it, and stirred gently with a long piece of stiff iron wire flattened at the one end, in order to expose as large a surface of the powdered ore to the air as possible, observing now and then to withdraw the wire, to prevent it becoming red-hot, in which case some of the ore would permanently adhere to it, and be reduced before the intended time; the roasting is completed in 3 or 4 minutes, and any portion of the ore adhering to the stirrer being detached by a knife, and returned into the crucible, the latter is covered up, and allowed to attain a full cherry-red heat, when about 2 or 3 spoonfuls of reducing flux are added, and the whole brought to a full white heat; in 12 to 15 minutes, the portion of metal and scoria adhering to the sides of the crucible are scraped down into the melted mass with a small stick of moist green wood, after which the crucible is again covered, and the heat urged for 2 or 3 minutes longer, so as to keep the mass in a perfectly liquid state during the whole time; the crucible is then removed from the fire with the crucible-tongs, and adroitly tilted so as to discharge its contents into a small ingot-mould of brass, observing to rake the scoria from the surface to the sides of the crucible, so as to allow the molten lead to be poured out without it; the scoria is then reheated in the crucible with about $\frac{1}{2}$ spoonful of flux, and after being cleansed with a piece of green wood, as before, is at once poured into a second mould, which is instantly inverted; the little button of lead thus obtained is added to the lead in the other mould, and the whole is accurately weighed. The weight, divided by 10, gives the percentage of lead (including silver, if present) in the ore examined.

One half of the lead thus obtained is put into a dry cupel of bone ash, and placed in the cupelling furnace, and treated as described in

the article on assaying; the metallic button left on the cupel is then detached and weighed. The weight, divided by 5, gives the per-centage of pure silver.

Obs. The flux commonly employed in the above assay is composed of red argol, 6 parts; nitre, 4 parts; borax, 2 parts; fluor spar, 1 part; well pulverised and thoroughly mixed together. When the ore is very refractory, about a spoonful of carbonate of potassium should be added for each 1000 grains of ore, in which case the roasting may be dispensed with. The quantity of silver in argentiferous galena varies from $\frac{1}{1000}$ to $\frac{1}{2}$ part of the whole. Whenever this ore contains above 2 parts of silver in the 1000, it is found to be profitable to extract the latter. Indeed, by Pattison's process it is found that as small a proportion as 1 in 8000 can be extracted with profit.

Uses. The uses of lead in the arts are well known. It enters into the composition of many important alloys (pewter, type-metal, shot-metal, solder, &c.), it furnishes us with several valuable pigments (chrome yellow, &c.), and it is extensively used in dyeing. Some of its preparations are employed in medicine.

Ant., &c. Administer an emetic of sulphate of zinc or sulphate of copper, and, if necessary, tickle the fauces with the finger or a feather, to induce vomiting. Should this not succeed, the stomach-pump may be had recourse to. Epsom or Glauber's salts, or alum, dissolved in water, or water acidulated with sulphuric acid, followed by tea, water gruel, or barley water, are the proper antidotes, and should be taken as soon after the poison has been swallowed as possible. In poisoning by white lead, Dr. Alfred Taylor recommends the administration of a mixture of sulphate of magnesium and vinegar, as preferable to the sulphate alone. When the symptoms are those of painter's colic, the treatment recommended under that head should be adopted. In paralysis arising from lead, small doses of strychnine, brucine, and their preparations, may be cautiously administered. A symptom of poisoning by lead is the formation of a narrow leaden blue line, from $\frac{1}{16}$ th to $\frac{1}{4}$ th of an inch wide, bordering the edges of the gums, attached to the neck of two or more teeth of either jaw. (Dr. Burton.) This decoloration may often be detected or rendered more conspicuous by rinsing the mouth out with water holding a little sulphuretted hydrogen or hydrosulphide of ammonium in solution. Chevallier and Rayer recommend the use of sulphurous or hepatic mineral waters, or of artificial solutions of sulphuretted hydrogen or alkaline sulphides in water, both in cases of acute and chronic poisoning by lead; but the practical success of this plan does not appear to have been in proportion to theoretical anticipations. The hydrated sulphides of iron are said by their advocates to be infallible, if taken sufficiently early.

Lead, Acetate of. $\text{Pb}(\text{C}_2\text{H}_3\text{O}_2)_2$. *Syn.* PLUMBI ACETATE, SUGAR OF LEAD, PLUMBI

ACETAS. (B. P.) *Prep.* Litharge (in fine powder) 24; acetic acid, 40; distilled water, 20; mix the acetic acid and the water, add the litharge, and dissolve with the aid of a gentle heat, filter, evaporate until a pellicle forms and crystallise. Drain and dry the crystal.

Acetic acid (sp. gr. 1.0843), 23 parts, is gently heated in a copper boiler rendered electro-negative by means of a large flat piece of lead soldered within it, and litharge (pure, and in fine powder), 13 parts, is sprinkled in; the heat is then continued, with constant stirring, until the acid is saturated, when the mother-waters of a former process, if any, are added, and the whole is heated to the boiling-point, and allowed to settle until cold; the clear portion is now decanted, and evaporated in a similar vessel until the liquor has the sp. gr. 1.266 or 1.267, when it is run into salt-glazed stoneware vessels (the edges of which have been well smeared with candle grease), and allowed to crystallise. The product is 38 to 38½ parts of crystallised sugar of lead. It is found to be advantageous to preserve a very slight excess of acid during the boiling and crystallisation, to prevent the formation of any basic acetate, the presence of which impedes the formation of regular crystals.

From litharge, 112 lb.; acetic acid (sp. gr. 1.057), 128 lb. *Prop.* 180 to 184 lb.

Prop. Pure acetate of lead forms colourless, transparent, prismatic crystals, slightly efflorescent in dry air; it is soluble in 8 parts of alcohol and in 1½ part of cold water; the aqueous solution has a sweet astringent taste, and feebly reddens litmus, but turns turmeric and the juice of violets green; when gently heated, it melts in its water of crystallisation; by continuing the heat, the whole of the water is expelled, and the dry acetate obtained; at a higher temperature the salt suffers decomposition, and acetic acid, acetone, &c., is given off. Commercial acetate of lead is in general a confused crystalline mass, somewhat resembling broken lump-sugar. It is powerfully astringent and poisonous.

When pure it is completely soluble in distilled water acidulated with acetic acid forming a transparent colourless solution, "38 grains dissolved in water require for complete precipitation, 200 grains measures of the volumetric solution of oxalic acid." (B. P.)

Uses, &c. Acetate of lead is extensively employed in dyeing and calico-printing. In medicine, it is used as an astringent, styptic, and hæmostatic; in pulmonary, uterine, and intestinal hæmorrhage, colliquative diarrhœa, phthisical sweats, &c. It is usually combined with morphia or opium, and with acetic acid to prevent it passing into the state of the poisonous carbonate in the stomach.—*Dose.* ½ gr. to 2 grs. (Collier); 1 to 2 grs. to 8 or 10 grs, twice or thrice a day (Pereira); 3 grs. to 10 grs., every 6 or 8 hours (A. T. Thomson). *Externally*, as a collyrium, 10 grs. to water, 8 fl. oz. (A. T. Thomson); as a lotion, 20 grs. (A. T.

Thomson), 1 dr. (Collicr), to water, 8 or 10 fl. oz.; as an injection, 40 grs. to rose water, $\frac{1}{2}$ pint. The lotion is cooling and sodative, and is commonly used in excoriations, local inflammations, &c.

Basic Acetates. There are several of these salts, but only one is of importance.

Tribasic Lead Acetate, or Double Plumbic Acetate, and Dioxide. $\text{Pb}(\text{C}_2\text{H}_3\text{O}_2)_2 \cdot 2 \text{PbO}$. *Syn.* SUBACETATE OF LEAD; BASIC LEAD CITRATE; GOULARD'S ACETATE OF LEAD; PLUMBI SUBACETAS (B. P.) *Prep.* Litharge, 7; acetate of lead, 10; and distilled water, 40; are boiled half-an-hour, and evaporated down, and allowed to crystallise out of contact with air.

Used under the form of "Plumbi subacetas liquor" v. (B. P.)

Lead, Arse'niate of. $\text{Pb}_3(\text{AsO}_4)_2$. *Syn.* ARSE-NATE OF L.; PLUMBI ARSENIAS, L. *Prep.* Gradually add a solution of acetate of lead to another of arseniate of sodium. A white, insoluble powder. Proposed as an external application in certain forms of cancer.

Lead, Bro'mide of. PbBr_2 . *Syn.* PLUMBI BROMIDUM, L. *Prep.* By precipitating a solution of neutral acetate or nitrate of lead with a solution of bromide of potassium. A white, crystalline powder, sparingly soluble in water. It fuses by heat into a red liquid, which turns yellow when cold. It has been used in the same cases as iodide of lead.

Lead, Car'bonate of. PbCO_3 . *Syn.* PLUMBI CARBONAS, L. *Prep.* By precipitating a cold solution of either acetate or nitrate of lead with a solution of an alkaline carbonate, observing to well wash the precipitate and dry it in the shade. This preparation is seldom employed, the commercial carbonate (WHITE LEAD) being substituted for it. See WHITE PIGMENTS.

Lead, Chloride of. PbCl_2 . *Syn.* CHLORIDE LEAD; PLUMBI CHLORIDUM (Ph. L. 1836). *Prep.* (Ph. L. 1836.) Dissolve acetate of lead, 19 oz., in boiling water, 3 pints; next dissolve chloride of sodium, 6 oz., in boiling water, 1 pint; mix the two solutions, and when cold, wash and dry the precipitate. A white, crystalline powder.

Dissolve finely powdered litharge in boiling dilute hydrochloric acid, and set aside the filtered solution to cool. Brilliant colourless needles.

Prop. Soluble in 135 parts of cold and in 22 parts of boiling water; it melts when heated, and solidifies on cooling, forming a horn-like substance (horn lead; plumbi corneum).

Uses, &c. In the Ph. L. 1836 chloride of lead was ordered to be employed in the preparation of 'hydrochlorate of morphia.' Mr. Tuson highly recommends it in cancerous affections, to allay pain and restrain morbid action, either in the form of a lotion or ointment.

Various mixtures of lead chlorides and oxide are employed as a white pigment under the name of 'Pattison's white.' It is prepared by rapidly mixing a boiling solution of lead chloride with an equal volume of lime water. Another similar compound is called 'patent yellow' or 'Turner's yellow.'

Lead, Chromate of. PbCrO_4 . *Syn.* LEMON YELLOW, LEIPZIG YELLOW, PARIS YELLOW *Prep.* By adding a filtered solution of acetate or nitrate of lead to a like solution of chromate of potassium, as long as a precipitate forms, which is collected, washed with water, and dried. For information respecting the manufacture of this substance on the large scale, as a colouring substance (chrome yellow), see YELLOW PIGMENTS.

Lead, Dichromate of. *Syn.* CHROME ORANGE, CHROME RED. $\text{PbCrO}_4 \cdot \text{PbO}$. *Prep.* By adding to a solution of nitrate or acetate of lead a solution of chromate of potassium, to which an equivalent of potassa has been added. This compound, is of a splendid scarlet colour. See RED PIGMENTS.

Lead, Cy'anide of. PbCy_2 . *Syn.* PLUMBI CYANIDUM, L. *Prep.* By adding hydrocyanic acid to a solution of acetate of lead, as long as a precipitate forms, which, after being washed with distilled water, is dried by a very gentle heat, and preserved from the light and air. Sometimes used as a source of medicinal hydrocyanic acid.

Lead, Iodide of. PbI_2 . *Syn.* LEAD IODIDE; PLUMBI IODIDUM, (B. P., Ph. L. E. D.) *Prep.* (B. P.) Nitrate of lead, 4; iodide of potassium, 4; distilled water, a sufficiency. Dissolve with the aid of heat the nitrate of lead in 30 of water, and the iodide of potassium in 10 of water, mix, collect the precipitate, wash, and dry at a gentle heat.

Prop., &c. A rich yellow-coloured powder, soluble in acetic acid, alcohol, and boiling water; when heated, it fuses and volatilizes in yellow vapour, but with a higher degree of heat, violet vapours of iodine are evolved, leaving a residuum (lead) which is wholly soluble in nitric acid.—*Dose.* $\frac{1}{4}$ gr. to 4 grs. or more, made into a pill; as a deobstruent and resolvent, in enlargements of the cervical, axillary, and mesenteric glands, and in scrofulous affections and scirrhus tumours.

Lead, Nitrate of. $\text{Pb}(\text{NO}_3)_2$. *Syn.* PLUMBI NITRAS, L. (B. P., Ph. E. D.)

Prep. (Ph. D.) Litharge (in fine powder), 1 oz.; pure nitric acid, 2 fl. oz., diluted with water, $\frac{1}{2}$ pint; mix, apply a sand-heat, and evaporate to dryness, occasionally stirring; boil the residuum in water, 2 $\frac{1}{2}$ pints; filter, acidulate with a few drops of nitric acid, evaporate to a pellicle, and set the liquid aside to cool; lastly, dry the deposited crystals on bibulous paper, and preserve them in a well-closed bottle.

(Commercial). By dissolving while lead in dilute nitric acid, and crystallising.

Uses, &c. This salt is extensively used in calico printing, and in the preparation of the iodide and other salts of lead. It was formerly much esteemed in asthmas, hæmorrhages, and epilepsy. It is now often used in an external application in cancer, ulcers, wounds, and various cutaneous affections. It is the basis of Liebert's celebrated 'cosmé-

tique infallible,' and of Ledoyen's 'disinfecting fluid.' A very weak solution is an excellent application to chapped nipples, lips, hands, &c.—*Dose*. $\frac{1}{2}$ to 1 gr.; in the form of pill or solution, washed down with a table-spoonful of water very slightly acidulated with nitric acid.

Lead, Nitro-saccharate of. *Syn.* PLUMBI NITROSACCHARAS, L. *Prep.* (Dr. S. E. Hoskins.) Nitric acid, 1 part; water, 19 parts; mix; in this dilute acid saccharate of lead (in fine powder) is to be dissolved, and set aside that crystals may form, which are to be dried by pressure between the folds of bibulous paper. A weak solution of the salt, acidulated with saccharic acid, has been employed by Dr. Hoskins as a solvent for phosphatic calculi, with apparent success.

Lead, Oxide of. PbO. *Syn.* MONOXIDE OF LEAD, PROTOXIDE OF LEAD, YELLOW OXIDE OF LEAD, PLUMBI OXYDUM (B. P.) *Prep.* This substance is obtained perfectly pure by expelling the acid from nitrate of lead, by exposing it to heat in a platinum crucible; or, still better, by adding ammonia to a cold solution of nitrate of lead until the liquid becomes faintly alkaline, washing the precipitate with cold water, drying it, and heating it to moderate redness for 1 hour.

Prep., &c. Pure protoxide of lead has a lemon-yellow colour, and is the best of all the salts of lead. It is very heavy, slightly soluble in water, and freely so in acids, particularly when in the hydrated state; the aqueous solution has an alkaline reaction; at a red heat it melts, and assumes a semi-crystalline form on cooling; in the melted state it rapidly attacks and dissolves siliceous matter, with which it unites to form glass (flint glass); when heated along with organic substances of any kind, it is easily reduced to the metallic state.

On the commercial scale, this oxide is prepared by heating the gray film or dross that forms on the surface of melted lead when freely exposed to the air. When the process is arrested, as soon as the oxide acquires a uniform yellow colour, it is called massicot; when the heat is still further increased, until it fuses or partially vitrifies, it forms litharge of which there are several varieties. See LITHARGE, MASSICOT.

Lead, Red Oxide of. *Syn.* RED LEAD, MINIMUM. *Prep.* This is prepared by exposing unfused protoxide of lead to the air for a long time, at a dull red heat. It is a very heavy powder, of a fine red colour, decomposed by a strong heat into protoxide of lead, and oxygen gas, which is evolved. Somewhat uncertain in its composition, but is generally of the composition Pb_3O_4 or $PbO_2 \cdot 2PbO$. See RED PIGMENT.

Lead, Dioxide. PbO₂. *Syn.* BINTOXIDE OF LEAD, PEROXIDE OF LEAD, PUCE OXIDE OF LEAD. *Prep.* By digesting red oxide of lead in dilute nitric acid; or by infusing a mixture of protoxide of lead and chlorate of potassium

at a heat a little below redness, and washing the powdered mass in water; or by transmitting a current of chlorine gas through a solution of neutral acetate of lead. This oxide gives up half its oxygen at a red heat; acids also decompose it. Its chief use is in chemical analysis, to separate sulphurous acid from certain gaseous mixtures, which it converts into sulphuric acid, which it at the same time absorbs, forming sulphate of lead. It has recently been employed as an oxidizing agent in the manufacture of the ANILINE DYES.

Lead, Pyrolignite of. Sugar of lead made with rough pyroligneous acid. Used in dyeing, chiefly for the preparation of acetate of alumina.

Lead, Saccharate of. *Syn.* PLUMBI SACCHARAS, L. *Prep.* (Dr. S. E. Hoskins.) Nitric acid, 2 parts; water, 10 parts; mix in a porcelain capsule, add of sugar, 1 part; and apply heat until reaction ceases; then dilute the liquid with distilled water, neutralize it with powdered chalk, filter, and add to the filtrate a solution of acetate of lead, as long as a precipitate (saccharate of lead) forms; lastly, collect the precipitate on a filter, wash and dry it. Used to make nitro-saccharate of lead, and as a source of saccharic acid.

Lead, Sulphate of. PbSO₄. *Syn.* PLUMBI SULPHAS, L. This salt occurs native in transparent octahedra (lead vitriol), and is obtained in large quantities as a by-product in the preparation of acetate of aluminum for dyeing.

Prep. By adding dilute sulphuric acid to a solution of a soluble salt of lead. It is very sparingly soluble in water and in dilute sulphuric acid, soluble in strong hydrochloric acid and bitartrate of ammonium.

Lead, Sulphide of. PbS. *Syn.* PLUMBI SULPHIDE. This occurs abundantly in nature in the form of GALENA.

Prep. By fusing metallic lead with sulphur or by passing sulphuretted hydrogen through a solution of a salt of lead.

Lead, Tartrate of. *Syn.* PLUMBI TANNAS, L. *Prep.* Precipitate a solution of acetate of lead with an infusion of galls, and wash and dry the precipitate. Astringent, sedative, and hæmostatic.—*Dose*. 1 gr. and upwards, made into a pill. It has been highly recommended in the form of ointment and cataplasms, in bed-sores, chronic ulcers of the feet, white swellings, &c.

Lead, Tartrate of. *Syn.* PLUMBI TARTRAS, L. *Prep.* By precipitating acetate of lead, by tartrate of ammonium, washing and drying.

LEAD, GRANULATED. *Prep.* By melting new lead, and pouring it in a small stream, from an iron ladle with a hole drilled in its bottom, into a pail of water. Used to make solutions and alloys.

LEAD, RED. See RED PIGMENTS.

LEAD, WHITE. See WHITE PIGMENT.

LEAD DUST. *Syn.* PULVIS PLUMBI, PLUMBUM DIVISUM, L. *Prep.* By melting new lead, adding bruised charcoal, mixing by violent agitation, which must be continued until the

metal "sets," and then pounding and washing away the charcoal. Used by potters.

LEAD PYROPHORUS. See PYROPHORUS.

LEATHER. *Syn.* CORIUM, CORIUS, L. Leather is the skin of animals which has been prepared by one or other of several processes adopted for the purpose, having the common object of preventing its spontaneous destruction by putrefaction, besides other objects, which are more or less peculiar to each variety of this useful substance.

Leather is only prepared on the large scale, and primarily either by the process of 'TANNING' or 'TAWING,' in the manner briefly described under these heads.

CURRIED LEATHER is leather which has been tanned, and sold to the currier, who, after soaking it in water, and rubbing it to soften it, pares it even with a broad, sharp knife, rubs it with a piece of polished stone or wood, and, whilst still wet, besmears it with oil or grease (**DUBBING**), which gradually penetrates the leather as the moisture evaporates. It next undergoes the operation of 'waxing,' which consists of first rubbing it on the flesh side with a mixture of oil and lamp black; it is then 'black-sized' with a brush or sponge, and, when dry, is lastly 'tallowed' with a proper cloth, and 'slicked' upon the flesh side with a broad and polished lump of glass. Leather curried on the hair or grain side, termed 'black on the grain,' is blackened by wetting it with iron liquor, and rubbing it with an iron 'slicker' before applying the oil or grease. The grain is finally raised by the 'pommel' or 'graining board' passed over it in various directions.

Leather is dyed or stained by the application, with an ordinary brush, of any of the strong liquid dyes, in the cold or only gently heated, to the surface of the skin previously stretched on a board. The surface, when dry, is commonly finished off with white of egg and the pommel or smoothing stick. Bookbinders generally employ copperas water as a black stain or sprinkle; a solution of indigo as a blue one; and a solution of salt of tartar or common soda, as a brown one.

Leather, before being japanned or varnished, as in the preparation of what is called 'ENAMELLED' and 'PATENT LEATHER,' is carefully freed from grease by the application of absorbent substances or hard pressure between rollers, and the surface is nicely shaved, smoothed, and polished by appropriate tools, the varnish is then applied to the grain side for the former, and the flesh side of the skin for the latter, which is previously stretched out tight on a board to receive it. The whole is, lastly, submitted to a gentle stove-heat to harden the varnish; and the process is repeated, if necessary.

Uses, &c. These are well known, and are all but universal. The leather manufacture of Great Britain is equal in importance and utility to any other department of our industry, and

inferior in point of value and extent only to those of cotton, wool, and iron. "If we look abroad on the instruments of husbandry, on the implements used in most of the mechanic trades, on the structure of; a multitude of engines and machines; or if we contemplate at home the necessary parts of our clothing—breeches, shoes, boots, gloves—or the furniture of our houses, the books on our shelves, the harness of our horses, or even the substance of our carriages; what do we see but instances of human industry exerted upon leather? What an aptitude has this single material in a variety of circumstances for the relief of our necessities, and supplying conveniences in every state and stage of life? Without it, or even without it in the plenty we have it, to what difficulties should we be exposed?" (Dr. Campbell.) Leather is a kind of natural felt, but of much closer and firmer texture than that of artificial origin. "The thinner and softer kinds of leather are sometimes used as body-clothing; but its special and proper purpose is the manufacture of coverings for the feet, to protect them from cold and water." (Eras. Wilson.) See JAPANING, VARNISH, &c.

LEAVEN. Dough which has become sour or run into a state of incipient putrefaction. When a small quantity of it is added to recent dough, it excites fermentation, but is apt to produce a disagreeable taste and odour in the bread. It is now superseded by yeast. Both these substances are used in the same way.

LEAVES (Medicated). *Syn.* FOLIA MEDICATA, L. On the Continent several preparations of this kind are in use. In many cases the leaves of tobacco deprived of nicotine, by soaking them in water, are dried, and then moistened or steeped in a tincture or infusion of the medicinal substance. In this way belladonna, camphor, and henbane, are often administered. Cruveillier recommends opiated belladonna leaves for smoking in troublesome coughs, phthisis, spasmodic asthmas, &c., to be prepared as follows:—Belladonna leaves, 1 oz., are steeped in an infusion of opium, 10 grs., in water, 1 fl. oz. (or less), and are then carefully dried in the shade. "**MUSTARD LEAVES** (Riggollet's) consist of mustard moistened with water, spread on paper, and dried." (Squire.) See CIGARS (in *pharmacy*), and VEGETABLE SUBSTANCES.

LECANORIC ACID. See ORSELLINIC ACID.

LEECH. *Syn.* HIRUDO (B. P., Ph. L. & D.), L. The official leech of the Pharmacopoeias is the *Sanguisuga medicinalis* (*Hirudo medicinalis*—Cuv.), familiarly known as the 'old English' or 'speckled leech.' It is also occasionally called the 'Hamburg gray' or 'Russian leech,' from being imported from those parts. Its characteristics are—Back, greenish or olive-green, sometimes almost black or intense brown, with 6 rusty-red or yellowish longitudinal stripes, which are mostly spotted with black.—Belly, dirty yellow or

light olive-green, spotted more or less with black. The spots are very variable in size and number; in some cases few, in others so numerous as to form the prevailing tint of the belly. This variety, which is the most valuable of the commercial leeches, is chiefly imported from Hamburg.

Another variety of leech, the *Sanguisuga officinalis*, familiarly known as the 'Hamburg' or 'French green leech,' are imported from Bordeaux, Lisbon, and Hamburg. Its characteristics are—Back, brownish olive-green, with 6 reddish or rusty-yellow longitudinal bands.—Belly, light dirty pea-green, or yellowish-green, free from spots, but exhibiting two lateral stripes. This leech is vastly inferior to the preceding variety, and some of those imported from France and Portugal are absolutely useless, from their indisposition to bite, arising from the fraud practised by the collectors and dealers, of gorging them with blood to improve their appearance before sending them to market. The above are the species of leech commonly employed in medicine in this country, but many others are noticed by writers on the subject.

Leeches are best preserved in water obtained from a pond, and occasionally changed; when kept in spring water, they soon die. The introduction of a hand to which an ill-flavoured medicine or odour adheres into the water in which they are kept, is often sufficient to poison them. The application of saline matter to the skin of leeches, even in very small quantities, immediately occasions the expulsion of the contents of the stomach; hence a few grains of common salt are frequently sprinkled over them, to make them disgorge the blood which they have swallowed. The frequent changing of the water in which leeches are kept is injudicious. Once a month in winter, and once a week in summer, is deemed sufficiently often by the large dealers, unless the water becomes discoloured or bloody, when it should be changed every day, or every other day. When clean pond water cannot be obtained, clean rain water that has been well exposed to the air should alone be employed. Mr. J. R. Kenworthy recommends placing in the water a few balls of irregular lumps of pure clay, about 2½ inches in diameter; a method which we can recommend as both simple and successful. The plan adopted by M. Fée is as follows:—Place 7 inches of a mixture of moss, turf, and charcoal, in a marble or stone trough, over which sprinkle some small pebbles. At one end of the trough, and about half way up, place a thin shelf of stone or marble, pierced with small holes, on which put first some moss, or portions of marsh horse-tail (*Equisetum palustre*), and on this a layer of pebbles to keep it down; then pour in water sufficiently high just to moisten the moss and pebbles, put in the leeches, and tie over the mouth of the trough with a cloth. Another plan consists in keep-

ing the leeches in a glass tank, or aquarium, provided with a pebbly bottom and a few healthy aquatic plants.

Propag. According to Dr. Wagner, an annual feast on living blood is necessary to render leeches able to grow and propagate. These conditions can only be fulfilled by restoring to the breeding cisterns those which have been already employed. All artificial methods of feeding them, by bladders or sponges of blood, have been found to fail. He recommends the employment of two tanks, with the bottom formed of loam, clay, or turf, surrounded by an inner border of a similar substance, and an outer one of sand—the one for leeches fit for medical use—and the other for breeding, or for such leeches as have been applied. No leeches are to be taken from the breeding tank until a year has elapsed after their having been applied and fed with human blood; and their removal to the first tank should take place in September or October, as by this time the breeding season is over. By this plan all leeches that have been applied are to be carefully restored to the breeding tank, without making them disgorge the blood they have swallowed.

LEECH'ING. This consists in the application of leeches to any vascular part of the body, for the purpose of withdrawing blood from it, and thus allaying local inflammation, distension of vessels, &c. Leeches are most conveniently applied by means of a common pill-box or a wine-glass. The part should be previously washed perfectly clean, and if covered with hair should be closely shaved. Sometimes leeches are indisposed to bite; in such cases, allowing them to crawl over a piece of dry linen or calico, rolling them in porter, moistening the part with a little milk, or sweetened milk, or drawing a little blood, by a slight puncture or scratch, will usually make them bite freely. To stop the bleeding from leech-bites, various plans are adopted, among which the application of nitrate of silver or creasote, or gentle pressure for some hours with the finger, are the most successful. Of late years a piece of matico leaf or soldier's herb, applied in the same manner as a piece of lint, has been commonly adopted to stop the bleeding of leech-bites.

LEEK. *Syn. PORRUM, L. The Allium porrum* (Linn.). Its general properties are intermediate between those of the onion and garlic. The juice is said to be powerfully diuretic, and capable of dissolving phosphatic calculi.

LEGUMIN. Vegetable casein. It is found most abundantly in the seeds of leguminous (podded) plants, *e. g.*, beans, peas, &c.

LEM'ON. *Syn. LIMO, L.* The fruit of the *Citrus limonum* or lemon tree. The juice, peel, and essential oil, are official. See *Oil*, and *below*.

LEM'ON AC'ID. See CITRIC ACID.

LEM'ON FLA'VOUR. See ESSENCE OF LEMON.

LEM'ON JUICE. *Syn. LIMONIS SUCCUS*

than an ordinary pea, and is of the shape of a double convex lens. Several varieties are cultivated on the Continent of Europe and in many parts of Asia, where they are largely consumed as human food. Lentils are more nourishing than any other description of pulse, but are reputed difficult of digestion, apt to disorder the bowels, and injurious to the eyes. Several alimentary preparations, sold at high prices as cures for dyspepsia, constipation, &c., contain lentil flour as the principal ingredient. See *ERVALENTA* and *REVALENTA*.

LETH'ARGY. *Syn.* *LETHARGUS*, L. A heavy, unnatural sleep, sometimes bordering upon apoplexy, with scarcely any intervals of waking, from which the patient is with difficulty aroused, and into which he again sinks as soon as the excitement is withdrawn. It frequently arises from plethora, in which case depletion is indicated; or from the suppression of some usual discharge or secretion, which it should then be our business to re-establish. It also often arises from over mental fatigue and nervous debility, when relaxation from business, the use of a liberal diet, and ammoniacal stimulants and antispasmodics, are found useful. When depending on a determination of blood to the head, cupping may be had recourse to, and all sources of excitement avoided. In all cases the bowels should be moved as soon as possible by means of mild purgatives.

LETUCE. *Syn.* *LACTUCA*, L. The early leaves or head of the *Lactuca sativa*, or garden lettuce, forms a common and wholesome salad. They are reputed as slightly anodyne, laxative, hypnotic, and antaphrodisaic, and have been recommended to be eaten at supper by those troubled by watchfulness, and in whom there exists no tendency to apoplexy. The leaves and flowering tops of *L. virosa* are, official in the L. P.; the "flowering herb" (*LACTUCA*) in the Ph. L.; the "insipissated juice," in the Ph. E.; and the "insipissated juice and leaves," in the Ph. D. The "insipissated juice" of *Lactuca virosa*, or strong-scented wild lettuce, is also official in the Ph. E.; and both the "leaves and insipissated juice" of the same variety are ordered in the Ph. D. The last species is more powerful than the cultivated lettuce. See *EXTRACT* and *LACTUCARIUM*.

LEUCORRHE'Æ. *Syn.* *WHITES*; *CATARRHUS VAGINÆ*, *FLUOR ALBUS*, L. The symptoms of this disease are well known to most adult females. The common causes are debility, a poor diet, excessive use of hot tea, profuse menstruation or purgation, late hours, immoderate indulgence of the passions, frequent miscarriages, protracted or difficult labours, or local relaxation. Occasionally it is symptomatic of other affections. The treatment must be directed to the restoration of the general health, and imparting tonicity to the parts affected. Tepid or sea bathing, or shower baths; bark, chalybeates, and other tonics; with local affusions of cold water, and mild astringent injections, as those of black tea

or oak bark, are generally found successful in ordinary cases.

LEVANT' NUT. See *COCCULUS INDICUS*.

LEVIGA'TION. *Syn.* *LEVIGATIO*, L. The process of reducing substances to fine powder, by making them into a paste with water, and grinding the mass upon a hard smooth stone or slab, with a conical piece of stone having a flat, smooth, under surface, called a 'muller.' Levigation is resorted to in the preparation of paints on the small scale, and in the elutriation of powders. The term is also, sometimes, incorrectly applied to the lengthened trituration of a substance in a marble or wedge-wood-ware mortar.

LEVORACE'MIC ACID. See *RACEMIC ACID*.

LEY'DEN JAR. *Syn.* *LEYDEN PHIAL*, *ELECTRICAL JAR*. An instrument for the accumulation of the electric fluid. Its simplest form is that of a wide-mouthed jar of rather thin glass, coated on both sides with tin-foil, except on the upper portion, which is left uncoated, and having a cover of baked wood, through which passes a brass wire, terminating in a metallic knob, and communicating with the inner coating. To charge the jar, the outer coating is connected with the earth, and the knob put in contact with the conductor of an electrical machine. The inner and outer surfaces of the glass thus become respectively positive and negative, and the particles of the glass become strongly polarised. On making connection between the two coatings with a conducting substance, discharge takes place by a bright spark and a loud snap; and if any part of the body be interposed in the circuit, a shock is felt.

• **LIBAVIUS'S LIQUOR.** See *TRIN* (*Bichloride*).

LIC'HEN. In pathology, a dry papulous or pimply eruption of the skin, terminating in scurfy exfoliations. "Lichen exhibits great variety in its outward characters in different individuals; in one, the pimples are brightly red; in another, of debilitated constitution, they are bluish and livid; in a third, they are developed around the base of hairs; in a fourth, they appear as circular groups, and increase by their circumference, while they fade in the centre, forming so many rings of various size; in a fifth, a modification of the preceding, they have the appearance of flexuous bands; while in a sixth, they are remarkable for producing intensity of suffering, or unusual disorganization of the skin. They are all occasioned by constitutional disturbance, sometimes referable to the digestive, and sometimes to the nervous system. In some instances, however, they depend upon a local cause. I have had a crop of lichenous pimples on the backs of my hands from rowing in hot weather; and in hot climates that annoying disorder called prickly heat is a lichen." (*Eras. Wilson*.) The treatment of this affection is noticed under *ERUPTIONS* (*Papular*).

LICHENS. *Syn.* LICHENS.—Juss., LICHEN-
ALES—Lind., L. In botany, these are cryptogam-
ous plants, which appear under the form of
thin, flat crusts, covering rocks and the barks
of trees. Some of them, like Iceland moss
(*Cetraria Islandica*), are esculent and medi-
cinal, and employed either as medicine or food;
and others, when exposed in a moistened state
to the action of ammonia, yield purple or blue
colouring principles, which, like indigo, do
not pre-exist in the plant. Thus, the *Rocella*
tinctoria, the *Variolaria orcina*, the *Lecanora*
tartarea, &c., when ground to a paste with
water, mixed with putrid urine or solution of
carbonate of ammonia, and left for some time
freely exposed to the air, furnish the archil,
litmus, and cudbear of commerce, very similar
substances, differing chiefly in the details of
their preparation. From these the colouring
matter is easily extracted by water or very
dilute solution of ammonia. See ARCHIL, CUD-
BEAR, and LITMUS.

LIGATURE. In surgery, a small waxed
piece of cord or string formed of silk or thread,
employed for the purpose of tying arteries,
veins, and other parts, to prevent hæmorrhage,
or to cause their extirpation. To be safe and
useful, they should be round, smooth, and suf-
ficiently strong to permit of being tied with se-
curity without incurring the danger of break-
ing or slipping. There are many cases re-
corded in which emigrants, soldiers, and
travellers, have lost their lives, from the
simple inability of those around them to apply
a ligature.

LIGHT. *Syn.* LUMEN, LUX, L. Light
acts as a vivifying or vital stimulus on organ-
ised beings; just as privation of light, or
darkness, disposes to inactivity and sleep. "In
maladies characterised by imperfect nutrition
and sanguinification, as scrofula, rickets, and
anæmia, and in weakly subjects with oedema-
tous (dropsical) limbs, &c., free exposure to
solar light is sometimes attended with very
happy results. Open and elevated situations
probably owe part of their healthy qualities to
their position with regard to it." On the
contrary, "in diseases of the eye, attended
with local vascular or nervous excitement, in
inflammatory conditions of the brain, in fever,
and in mental irritation, whether attended or
not with vascular excitement, the stimulus of
light proves injurious, and, in such cases, dark-
ness of the chamber should be enjoined. After
parturition, severe wounds, and surgical oper-
ations, and in all inflammatory conditions,
exclusion of strong light contributes to the
well-doing of the patient." (Pereira.)

LIG'NIN. $C_6H_{10}O_5$. *Syn.* CELLULOSE. This
is woody fibre deprived of all foreign matter.
It forms about 95% of baked wood, and
constitutes the woody portion of all vegetable
substances. Fine linen and cotton are almost
entirely composed of lignin, the associated
vegetable principles having been removed
by the treatment the fibres have been sub-

jected to during the process of their manu-
facture.

Pure lignin is tasteless, inodorous, insoluble
in water and alcohol, and absolutely innutri-
tious; dilute acids and alkaline solutions
scarcely affect it, even when hot; oil of vitriol
converts it into dextrin or grape sugar, ac-
cording to the mode of treatment. When
concentrated sulphuric acid is added very gra-
dually to about half its weight of lint, linen
rag, or any similar substance shredded small,
and contained in a glass vessel, with constant
trituration, the fibres gradually swell up and
disappear, without the disengagement of any
gas, and a tenacious mucilage is formed, which
is entirely soluble in water. If, after a few
hours, the mixture be diluted with water, the
acid neutralized by the addition of chalk, and,
after filtration, any excess of lime thrown
down by the cautious addition of a solution of
oxalic acid, the liquid yields, after a second
filtration, and the addition of alcohol in con-
siderable excess, a gummy mass, which pos-
sesses all the characters of pure dextrin. If,
instead of at once saturating the diluted acid
solution with chalk, we boil it for 4 or 5 hours,
the dextrin is entirely converted into grape
sugar, which, by the addition of chalk and
filtration, as before, and evaporation by a
gentle heat to the consistence of a syrup, will,
after repose for a few days, furnish a concrete
mass of crystallised sugar. By strong pressure
between folds of porous paper or linen, redis-
solving it in water, agitation with animal char-
coal, and recrystallisation, brilliant colourless
crystals of grape sugar may be obtained.
Hemp, linen, or cotton, thus treated, yield
fully their own weight of gum, and $1\frac{1}{2}$ of their
weight of grape sugar. During the above
transformation, the sulphuric acid is converted
into sulpholignic acid, and may be procured in
a separate state. A solution of oxide of copper
in ammonia, or solution of basic carbonate of
copper in strong ammonia, dissolves cotton,
which may then be precipitated by acids in
colourless flakes.

LIG'NITE. *Syn.* BROWN COAL. Wood
and other matter more or less mineralised and
converted into coal. The lignites are gener-
ally dark brown, and of obvious woody struc-
ture. They are distinguished from true coals
by burning with little flame and much smoke.
Those of Germany are largely used as a source
of paraffin and burning oils.

LIG'NUM VITÆ. See GUAIACUM WOOD.

LIME. CaO . *Syn.* OXIDE OF CALCIUM;
CHAUX, Fr.; KALK, Ger. Lime, when pure, and
as a chemical and medical reagent, will be found
treated of under CALCIUM (Oxide of). It is
prepared on the large scale for commerce by
calcining chalk, marble or limestone, in kilns,
and is called quicklime, caustic lime, burnt
lime, stone lime, &c. The lime kilns are usually
of the form of an inverted cone, and are packed
with alternate layers of limestone and fuel,
and the burnt lime raked out from the bottom.

The lime thus obtained is a pale yellow powder, combining eagerly with water, and crumbling to a light white powder, "slaked lime," with the evolution of much heat. Lime which slakes well is termed "fat lime," while if it slakes badly is termed "poor lime."

Lime, Salts of. See under CALCIUM.

Lime, Pyrolignite of. An impure acetate of calcium used for making mordants in dyeing and calico printing, as a substitute for the more expensive acetate of lead.

Lime, Chloride of. *Syn.* BLEACHING POWDER, CHLORINATED LIME, HYPOCHLORIDE OF CALCIUM.

A compound of hypochloride, chloride, and hydrate of lime in varying proportions, and most extensively used for bleaching, thousands of tons being made near Newcastle alone every year.

Prep. Hydrate of calcium is thinly spread out in a proper vessel and exposed to an atmosphere of chlorine gas until it is saturated. Now included in the *Materia Medica*.

Hydrate of calcium, or slaked lime (fresh), 20 parts, common salt, 1 part, are mixed together, and the powder placed in long earthenware vessels into which chlorine is passed until the mixture begins to grow damp, or until one part of it, dissolved in 130 parts of water, is capable of decolouring $4\frac{1}{2}$ parts of sulphate of indigo, when the whole is transferred to dry bottles.

(Wholesale.) The chlorine is generated from the usual materials mixed in leaden vessels, heated by steam, and the gas, after passing through water, is conveyed by a leaden tube into an apartment built of siliceous sandstone, and arranged with shelves or trays, containing dry fresh slaked lime, placed one above another, about an inch asunder. The process, to produce a first-class article, is continued for 4 or 5 days. During this time the lime is occasionally agitated by means of iron rakes, the handles of which pass through boxes of lime placed in the walls of the chamber, which thus act as valves.

Prop., &c. Chloride of lime is a pale yellowish, white powder, generally more or less damp, and evolving a chlorine-like odour of hypochloric acid. Soluble in about 20 parts of water, and decomposed by acids with the evolution of chlorine and a little oxygen. Good chloride of lime should contain from 32% to 36% of chlorine, of which, however, but 25% to 30% can be easily liberated by an acid.

Estim. See CHLOROMETRY.

Uses. Chloride of lime is employed in medicine as an antiseptic and disinfectant. An ointment of chloride of lime has been used in 'scrofula,' and a lotion or bath, moderately dilute, is one of the cleanest and readiest ways of removing the 'itch,' and several other skin diseases. It is also in great use as a disinfectant, and may be used either in substance or solution. A small quantity of the powder spread on a flat dish or plate, and placed on the chimney-piece, and a like quantity in an

opposite part of the room, will continue to evolve sufficient chlorine or hypochlorous acid to disinfect the air of an apartment for several days. The evolution of chlorine is promoted by occasionally renewing the exposed surface, by stirring it with a piece of stick, and, after it becomes scentless, by the addition of a little acid, as strong vinegar, or hydrochloric acid, or oil of vitriol, largely diluted with water. Of late, however, it has been partly superseded by the antiseptics, carbolic acid, &c. The most extensive consumption of chloride of lime is, however, for bleaching textile fabrics. When employed for this purpose, the goods are first immersed in a dilute solution of this compound, and then transferred to a vat containing dilute sulphuric acid. The chlorine thus disengaged in contact with the cloth, causes the destruction of the colouring matter. This process is generally repeated several times, it being unsafe to use strong solutions. White patterns may thus be imprinted upon coloured cloth; the figures being stamped with tartaric acid thickened with gum water, the stuff is immersed in the chloride bath, when the parts to which the acid has been applied remain unaltered, while the printed portions are bleached white.

Concluding remarks.—Chloride of lime is now scarcely ever made on the small scale, as it can be purchased of the large manufacturer of better quality and cheaper than it could possibly be made by the druggist. The only secret in the manufacture of good bleaching powder is maintaining the temperature of the ingredients rather low.

LIME. The fruit of *Citrus limetta*. It resembles the lemon, but is smaller and has a smoother skin. It is imported into Great Britain in a preserved state for use as a dessert. Its juice is also largely imported for the preparation of CITRIC ACID, and for the prevention of scurvy on board ship (see *below*).

LIME JUICE. *Syn.* LEMON JUICE. The juice of the fruits of various species of *Citrus*, principally LIMES, is known in commerce under these names. It is very variable as to quality, which depends upon the method of extraction, the quality of the fruit, and the honesty of the shipper.

We have examined the juice expressed from limes sent from the West Indies, from Jamaica, and from South Africa, with the following results:

	W. Indies.	Jamaica.	S. Africa.
Specific gravity of juice . .	1041.80	1044.18	1044.90
Per cent. of citric acid . .	7.96	8.66	8.50
Per cent. of ash . .	0.321	0.401	0.364

The yield from limes is very small, and the freshly expressed juice contains a large amount of pulp. This, however, on standing a few weeks, separates, and a clear sherry-coloured liquid is obtained.

A concentrated lime or lemon juice is used by calico printers. It is a "dark, treakly looking fluid, marking from 48° to 54° Twaddell," and contains about 30 per cent. of pure citric acid.

Adult. See LEMON JUICE.

Estim. Lime juice is only valuable on account of the citric acid it contains. If of good quality, 100 grs. will neutralise from 70 to 76 grs. of pure crystallised carbonate of soda. "For commercial purposes, each grain of carbonate of soda neutralised may represent a half grain of crystallised citric acid (equal to .38 gr. of dry acid), and the value of the lime juice be calculated in proportion." (O'Neill.) As commercial lime juice contains variable proportions of vegetable extractive matter, the indications of the hydrometer cannot be depended upon. See ACIDIMETRY, CITRIC ACID, &c.

LIME/STONE. A general term applied to a great variety of rocks in which carbonate of lime is the principal constituent.

Estim. The value of chalk, limestone, marble, &c., for hydraulic mortars and cements, may be determined as follows:

A given weight (say 100 grs.) of the sample is reduced to powder and digested in hydrochloric acid diluted with about an equal weight of water, with frequent agitation for an hour or longer; the mixture is then diluted with thrice its volume of water, thrown upon a filter, and the undissolved portion washed, dried, ignited, and weighed. This weight indicates the per-centage of clay and silica or sand; and the loss that of the lime or calcium oxide, magnesium oxide, and ferric oxide, present in the substance examined. In most cases these results will be sufficient to show the quality of the limestone for the purpose of making mortar or cement.

The filtrate and the washings are mixed together, and ammonia is added in excess; the bulky, reddish-brown precipitate is collected, washed, dried, ignited, and weighed. This gives the per-centage of ferric oxide.

The filtrate, &c., from last is then treated with oxalate of ammonium, and the quantity of lime determined in the manner described under the head of CALCIUM.

The liquid filtered from the precipitate in last is boiled for some time with carbonate of potassium until ammoniacal fumes are no longer evolved; the precipitate is then collected on a filter, washed with hot water, dried, and strongly ignited for 3 or 4 hours, and, lastly, weighed. This gives the per-centage of magnesium.

LINCTUS. [L., Eng.] *Syn.* LOCH, LOHOCH, LINCTURE, LAMBATIV; LOOCH, Fr. A medicine of the consistence of honey, intended to be licked off a spoon. This form of medicine is well adapted to females and children, but is not much used in England at the present time. Those employed in modern pharmacy and prescribing are included under the

heads CONFECTION, CONSERVE, or ELECTUARY. —The dose, when it is not otherwise stated, is a teaspoonful occasionally.

Linctus, Caca'o. *Syn.* LINCTUS CACAO, L.; CREME DE TRONCHIN, Fr. *Prep.* From cocoa-butter, 2 oz.; white sugar (in powder), syrup of capillaire, and syrup of tolu, of each, 1 oz.; mix. Demulcent and pectoral; in coughs, sore throats, hoarseness, &c.

Linctus, Common. *Prep.* From oil of almonds and syrup of tolu, of each, 1 oz.; powdered white sugar, 2 drs. As the last.

Linctus, Cough. *Syn.* PECTORAL LINCTUS; LINCTUS PECTORALIS, L. *Prep.* 1. (Dr. Latham.) Compound ipecacuanha powder (Dover's powder), $\frac{1}{2}$ dr.; compound tragacanth powder, 2 drs.; syrup of tolu, confection of hips, and simple oxymel, of each, 1 oz.—*Dose.* 1 teaspoonful, 3 or 4 times a day. "This linctus has been extensively used, as a remedy for coughs, in the West-end of London, having been found to be a safe and generally efficacious remedy." (Redwood.) The preceding as well as the following are also useful preparations.

Linctus, Demulcent. *Syn.* LINCTUS DEMULCENS, L.; LOOCH DE TRONCHIN, Fr. *Prep.* From oil of almonds, syrup of capillaire, manna, and cassia pulp, of each, 2 oz.; powdered gum tragacanth, 20 grs.; orange-flower water, 2 fl. oz. As the last. The above is the quantity for two days, which is as long as it will keep.

Linctus, Emollient. *Syn.* OILY EMULSION; LOHOCH OLEOSUM, EMULSIO OLEOSA, L.; LOOCH HUILEUX, Fr. *Prep.* (P. Cod.) Oil of almonds, powdered gum, and orange-flower water, of each, 4 drs.; syrup of marshmallow, 1 oz.; water, 3 fl. oz. or q. s.; for an emulsion. In troublesome coughs.

Linctus, Expect'rant. *Syn.* LINCTUS EXPECTORANS, LOHOCH E., L. *Prep.* 1. Oxymel of squills, confection of hips, syrup of marshmallow, and mucilage of gum arabic (thick), equal parts. Demulcent and expectorant.

2. (Dr. Copland.) Oil of almonds and syrup of lemons, of each, 1 fl. oz.; powdered ipecacuanha, 6 grs.; confection of hips, 1 oz.; compound powder of tragacanth, 3 drs.

3. (Zanetti.) Kermes mineral, 4 grs.; manna, 6 oz.; oil of almonds, syrup of squills, and syrup of senega, of each, 2 drs. Laxative, demulcent, and expectorant. The above are useful in hoarseness, tickling coughs, sore throats, &c.

Linctus, Pectoral. *Syn.* FOX LUNGS; LINCTUS PECTORALIS, LOHOCH È PULMONÈ VULPIUM, L. *Prep.* From spermaceti and Spanish juice, of each, 8 oz.; water, q. s. to soften the liquorice; make a thin electuary, and add of honey, 3 lbs.; oil of aniseed, 1 oz.; mix well. A popular and excellent demulcent in coughs. It formerly contained the herb 'fox lungs,' but spermaceti is now substituted for that article.

Linctus, Turpentine. *Syn.* LINCTUS STIMULANS, L. TEREBINTHINE, LOHOCH ANTHEL-

MINTICUM, L. *Prep.* (Recamier.) Oil of turpentine, 2 drs.; honey of roses, 3 oz.; mix. — *Dose.* A teaspoonful, night and morning, followed by a draught of any weak liquid; in worms, more especially tape-worm.

Linctus, White. *Syn.* **LINCTUS ALBUS**, **MISTURA ALBA**, **LOCHOC ALBUM**, L.; **LOCH BLANC**, Fr. *Prep.* (P. Cod.) Jordan almonds, $4\frac{1}{2}$ drs.; bitter almonds, $\frac{1}{2}$ dr.; blanch them by steeping them in hot water and removing the skins; add of white sugar, $\frac{1}{2}$ oz.; gum tragacanth, 20 grs.; beat to a smooth paste, and further add, of oil of almonds and orange-flower water, of each, 4 drs.; pure water 4 fl. oz. A pleasant demulcent in tickling coughs.

LINEN. *Syn.* **LINTEUM**, L. Linen is a textile fabric made of the liber-fibres of the *Linum usitatissimum*, or common flax, a plant which from time immemorial has been cultivated for this purpose. It is remarkable for the smoothness and softness of its texture, and is hence highly esteemed in temperate climates as an elegant and agreeable article of clothing to be worn next the skin. Its fibres are better conductors of heat, more porous, and more attractive of moisture, than those of cotton, which render it less adapted for body linen in cold weather, as well as in hot weather and hot climates, than calico. The latter, however, lacks the luxurious softness and freshness of linen, whilst the peculiar twisted and jagged character of its fibres render it apt to excite irritation in extremely delicate skins. The common prejudice in favour of old linen and flax lint for dressing wounds is thus shown to have reason on its side, and, like many other vulgar prejudices, to be supported by the investigations of science.

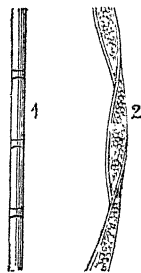

Identif. Linen fabrics are commonly sophisticated with cotton, which is a much less costly and a more easily wrought material. Various plans have been proposed to detect this fraud, many of which are too complicated and difficult for practical purposes. The following commend themselves for their simplicity and ease of application:—

1. A small strip (a square inch, for instance) of the suspected cloth is immersed for 2 or 3 minutes in a boiling mixture of about equal parts of hydrate of potassium and water, contained in a vessel of silver, porcelain, or hard glass; after which it is taken out and pressed between the folds of white blotting paper or porous calico. By separating 8 or 10 threads in each direction, their colour may be readily seen. The deep yellow threads are **LINEN**, the white or pale yellow ones are **COTTON**.

2. A small strip of the cloth, after having been repeatedly washed with rain water, boiled in the water, and dried, is immersed for 1 to 2 minutes in sulphuric acid; it is then withdrawn, carefully pressed under water with the fingers, washed, immersed for a few seconds in ammonia, solution of carbonate of potassium, or solution of carbonate of sodium,

again washed with water, and dried between filtering paper. By this treatment the cotton fibres are dissolved, while the linen fibres are merely rendered thinner and more translucent, according to the duration of the experiment; after a short immersion, the cotton fibres appear transparent, while the linen fibres remain white and opaque.

3. (By the **MICROSCOPE**.) The indications afforded by both the previous tests, although quite visible to the naked eye, are rendered still more palpable by the use of a magnifying glass of small power, as the common pocket lens. Under a good microscope the presence of cotton in a linen tissue is very perceptible. The fibres of cotton present a distinctly flat and shrivelled appearance, not unlike that of a narrow, twisted ribbon, with only occasional joints; whilst those of flax are round, straight, and jointed. The fibres of cotton, after being exposed to the action of strong alkaline lyes, untwist themselves, contract in length, and assume a rounded form, but still continue distinct in appearance from the fibres of linen. The engraving represents a fibre of linen (1) and a fibre of cotton (2), as they appear when magnified 155 diameters. The difference between the two may be perceived, although less distinctly, through a good Stanhope or Codrington lens, provided the object be well illuminated.

Dyeing. Linen and cotton, from the similarity of their behaviour with dye-stuffs, are treated in nearly the same manner. The affinity of their fibres for colouring matter is very much weaker than that of the fibres of silk and woollen. On this account they are dyed with greater difficulty than those substances, and the colours so imparted are, in general, less brilliant and permanent under similar conditions. Linen shows less disposition to take dyes than cotton. The yarn or cloth, after being scoured and bleached in the usual manner, requires to have an additional tendency given to it, by chemical means, to condense and retain the materials of the dye-bath in its pores. This is effected by steeping the goods in solutions (mordants) which have at once an affinity for both the fibres of the cloth and the colouring matter. A similar process is employed in dyeing most other substances; but with cotton and linen, attention to this point is essential to the permanency of the dye. These matters are more fully explained under the heads **DYEING** and **MORDANT**.

The domestic management of linen may here receive a few moments' attention. Fruit stains, iron-moulds, and other spots on linen,

may, in general, be removed by applying to the part, previously washed clean, a weak solution of chlorine, chloride of lime, spirits of salts, oxalic acid, or salts of lemons, in warm water, and frequently by merely using a little lemon juice. When the stain is removed, the part should be thoroughly rinsed in clear warm water (without soap) and dried. Recent iron-moulds or ink spots on starched linen, as the front of a shirt, may be conveniently removed by allowing a drop or two of melted tallow from a common candle to fall upon them before sending the articles to the laundress. The oxide of iron combines with the grease, and the two are washed out together. If the spot is not entirely removed the first time, the process should be repeated. Linen that has acquired a yellow or bad colour by careless washing, may be restored to its former whiteness by working it well in water to which some strained solution of chloride of lime has been added, observing to well rinse it in clean water, both before and after the immersion in the bleaching liquor. The attempt to bleach unwashed linen should be avoided, as also using the liquor too strong, as in that case the linen will be rendered rotten.

LING. The *Gadus molua* (Linn.), an inferior species of the cod-fish tribe, common in the Northern seas, and used as a coarse article of food by the poor.

LINIMENT. *Syn.* LINIMENTUM, L. A semifluid ointment, or soapy application to painful joints, swellings, burns, &c. The term is also occasionally extended to various spirituous and stimulating external applications. A medicine of a thinner consistence, but similarly employed, is called an 'EMBROCATION.' These terms are, however, frequently confounded together, and misapplied. Liniments are generally administered by friction with the hand or fingers, or with some substance (as a piece of flannel) capable of producing a certain amount of irritation of the skin. Sometimes a piece of linen rag dipped in them is simply laid on the part. In most cases in which liniments are found beneficial, the advantage obtained from them is attributable rather to the friction or local irritation than to any medicinal power in the preparation itself. The greater number of cerates and ointments may be converted into liniments by simply reducing their consistence with almond or olive oil, or oil of turpentine.

Liniment, Acid. *Syn.* LINIMENTUM ACIDUM, L. ACIDI SULPHURICI, L. *Prep.* 1. (Sir B. Brodie.) Salad oil, 3 oz.; oil of vitriol, 1 dr.; mix, then add of oil of turpentine, 1 oz., and agitate the whole well together. As a counter-irritant, in rheumatism, stiff joints, &c. It closely resembles the 'GUESTONIAN EMBROCATION.'

2. (Hosp. F.) Olive oil, 3 oz.; oil of turpentine, 2 oz.; sulphuric acid, 1 fl. dr. An excellent alterative, stimulant, discutient, and counter-irritant, in chronic rheumatism, stiff

joints, indolent tumours, and various chronic diseases of the skin.

Linimentum Aconitii. (B. P.) Aconite root, in powder, 20; camphor, 1; rectified spirit, to percolate, 30. Moisten the root for 3 days, then pack in a percolator, and pour sufficient rectified spirit upon it to produce with the camphor 20.

Strength, 1 in 1. Applied with a camel-hair pencil, alone or mixed in equal proportions, with a soap liniment or compound camphor liniment, and rubbed on the part. 7 parts of this, and 1 part of chloroformum belladonna, and sprinkled thinly on impermeable piline, is the best application for neuralgia or lumbago.

Liniment of Am'ber-oil. *Syn.* LINIMENTUM SUCCINI, L. *Prep.* 1. From olive oil, 3 parts; oils of amber and cloves, of each, 1 part. Resembles 'ROCHE'S EMBROCATION.'

2. (Opiated; LINIMENTUM SUCCINI OPIATUM, L.) From rectified oil of amber and tincture of opium, of each, 2 fl. oz.; lard, 1 oz. Anodyne, antispasmodic, and stimulant. A once popular remedy in cramp, stiff joints, &c.

Liniment of Ammo'nia. *Syn.* AMMONIACAL LINIMENT, VOLATILE L., OIL AND HAERTSHORN; LINIMENTUM AMMONIÆ (B. P., Ph. L. E. & D.), L. *Prep.* 1. (B. P.) Solution of ammonia, 1; olive oil, 3; mix.

2. (Ph. L. & E.) Liquor of ammonia (sp. gr. '960), 1 fl. oz.; olive oil, 2 fl. oz.; shake them together until they are mixed.

3. (Ph. D.) To the last add of olive oil, 1 fl. oz. Stimulant and rubefacient. Used in rheumatism, lumbago, neuralgia, sore throat, spasms, bruises, &c. When the skin is irritable, more oil should be added, or it should be diluted with a little water.

4. (Camphorated; LINIMENTUM AMMONIÆ CAMPHORATUM, EMBROCATIO AMM. CAMPHORATA, L.)—*a.* (Hosp. F.) Olive oil, 3 oz.; camphor, $\frac{1}{2}$ oz.; dissolve by a gentle heat, and when cold, add of liquor of ammonia, 1 fl. oz.

b. Soap liniment, 2 oz.; olive oil and liquor of ammonia, of each, 2 drs. As the last; more especially for sprains, bruises, chilblains, &c.

5. (Compound; DR. GRANVILLE'S COUNTER-IRRITANT OR ANTIDYNOUS LOTION; LINIMENTUM AMMONIÆ COMPOSITUM, L.—Ph. E.)—*a.* (STRONGER.) From liquor of ammonia (sp. gr. '880), 5 fl. oz.; tincture of camphor, 2 fl. oz.; spirit of rosemary, 1 fl. oz.; mix. It should be kept in a well-stoppered bottle and in a cool situation.

b. (WEAKER.) Solution of ammonia ('880), 5 fl. oz.; tincture of camphor, 3 fl. oz.; spirit of rosemary, 2 fl. oz.

Obs. The above formulæ are nearly identical with the original ones of Dr. Granville; the principal difference being in his ordering liquor of ammonia of the sp. gr. '872, instead of '880. They are counter-irritant, rubefacient,

vesicant, and cauterising, according to the mode and length of their application. The milder lotion is sufficiently powerful to produce considerable rubefaction and irritation in from 1 to 5 or 6 minutes; vesication, in 8 or 10 minutes; and cauterisation, in 4 or 5 minutes longer. For the latter purpose, the stronger lotion is generally employed. According to Dr. Granville, these lotions are prompt and powerful remedies in rheumatism, lumbago, cramp, neuralgia, sprains, swollen and painful joints, headache, sore throat, and numerous other affections in which the use of a powerful counter-irritant has been recommended. They are ordered to be applied by means of a piece of linen, 6 or 7 times folded, or a piece of thick, coarse flannel wetted with the lotion, the whole being covered with a thick towel, and firmly pressed against the part with the hand. The stronger lotion is only intended to be employed in apoplexy, and to produce cauterisation. See COUNTER-IRRITANTS.

6. (From SESQUICARBONATE OF AMMONIA;—*LINIMENTUM AMMONIÆ SESQUICARBONATIS*—Ph. L.) Solution of sesquicarbonate of ammonia, 1 fl. oz.; olive oil, 3 fl. oz.; shake them together until mixed. This preparation resembles ordinary liniment of ammonia in its general properties, but it is much less active, owing to the alkali being carbonated. It is the 'oil and hartshorn' and the 'volatile liniment' of the shops.

Liniment, Anodyne. See LINIMENTS OF BELLADONNA, MORPHIA, OPIUM, SOAP, &c.

Liniment, Antispasmodic. *Syn.* *LINIMENTUM ANTISPASMODICUM*, L. *CAJÉPUTI COMPOSITUM*, L. *Prep.* (Hufeland.) Oils of cajeput and mint, of each, 1 part; tincture of opium, 3 parts; compound camphor liniment, 24 parts. Anodyne, stimulant, and rubefacient.

Liniment, Arcens's. Compound elemi ointment.

Liniment of Belladonna. *Syn.* *LINIMENTUM BELLADONNÆ*, B. P. L. *Prep.* 1. (B. P.) Prepared the same as *LINIMENTUM ACONITII*. A fluid ounce is equal to a solid ounce. Prescribed with equal parts of soap liniment, or compound camphor liniment, and is an excellent topical application for neuralgic pain.

2. Extract of belladonna, 1 dr.; oil of almonds, 2 oz.; lime water, 4 fl. oz.; In eczema, and some other cutaneous affections, to allay irritation, &c. (Cutan. Hosp.) Extract of belladonna, 4 drs.; glycerine, 1 oz.; soap liniment, 6 oz. As the last.

4. (Guy's Hosp.) Extract of belladonna, 1 oz.; soap liniment, 8 fl. oz.

5. (Phœbus.) Extract of belladonna, 40 grs.; rectified ether, 1 dr.; cherry-laurel water, 2 fl. oz. As a friction to the abdomen in lead colic.

Obs. The above are reputed excellent stimulants, anodynes, antispasmodics, and resolvents, in various diseases, as rheumatism,

neuralgia, painful affections of the skin and joints, tumours, &c. &c.

Linimentum Calceis. (B. P.) Solution of lime, 1; olive oil, 1; mix. (The best liniment for burns and scalds.)

Liniment of Cajeput Oil. *Syn.* *LINIMENTUM OLEI CAJÉPUTI*, L. *Prep.* 1. (Dr. Copland.) Compound camphor liniment and soap liniment, of each, 1½ fl. oz.; oil of cajeput, 1 fl. oz.

2. (Dr. Williams.) Oil of cajeput, ½ fl. dr.; castor oil, 1 fl. dr.; olive oil, 4½ fl. drs. A warm, antispasmodic, diffusible stimulant and rubefacient; in spasmodic asthma, colic, chronic rheumatism, spasms, chest affections, &c. See *ANTISPASMODIC L. (above)*.

Liniment of Camphor. *Syn.* *CAMPHORATED OIL*, *CAMPHOR EMBROCATION*; *LINIMENTUM CAMPHORÆ* (B. P., Ph. L. E. & D.), *OLEUM CAMPHORATUM*, L. *Prep.* 1. (B. P.) Camphor, 1; olive oil 4; dissolve.

2. (Ph. L. & E.) Camphor, 1 oz.; olive oil, 4 fl. oz.; gently heat the oil, add the camphor (cut small), and agitate until dissolved: The Dublin College orders only ½ the above camphor. Stimulant, anodyne, and resolvent; in sprains, bruises, rheumatic pains, glandular enlargements, &c.

3. (Compound; *LINIMENTUM CAMPHORÆ COMPOSITUM*—B. P., Ph. L. & D.)—a. (B. P.) Camphor, 5; English oil of lavender, 4; strong solution of ammonia, 10; rectified spirit, 20. Dissolve the oil and camphor in the spirit and gradually add the ammonia.

b. (Ph. L.) Camphor 2½ oz.; oil of lavender, 1 fl. dr.; rectified spirit, 17 fl. oz.; dissolve, then add of stronger liquor of ammonia, 3 fl. oz., and shake them together until they are mixed.

c. (Ph. L. 1836.) Liquor of ammonia, 7½ fl. oz.; spirit of lavender, 1 pint; distil off 1 pint, and dissolve in it camphor, 2½ oz. The formula of the Ph. D. 1826 was nearly similar.

d. (Wholesale.) Camphor (clean), 21 oz.; English oil of lavender, 3½ oz.; liquor of ammonia, 2¾ lbs.; rectified spirit, 7 pints; mix, close the vessel, and agitate occasionally, until the camphor is dissolved. Powerfully stimulant and rubefacient. It closely resembles, and is now almost universally sold for, Ward's 'Essence for the Headache.'

Liniment of Cantharides. *Syn.* *LINIMENT OF SPANISH FLIES*; *LINIMENTUM LYTTE*, L. *CANTHARIDIS* (Ph. D. & U. S.), L. *Prep.* 1. (Dr. Collier.) Tincture of cantharides and soap liniment, equal parts.

2. (Ph. D.) Cantharides (in fine powder), 3 oz.; olive oil, 12 fl. oz.; digest for 3 hours over a waterbath, and strain through flannel, with expression.

3. (Ph. U. S.) Spanish flies, 1 oz.; oil of turpentine, .8 fl. oz.; proceed as last. The above are irritant and rubefacient; but should be used cautiously, lest they produce strangury.

Liniment of Chloride of Lime. *Syn.* *Li-*

NIMENTUM CALCIS CHLORINATE, L. Prep. 1. Chloride of lime, 1 dr.; water (added gradually), 3 fl. oz.; triturate together in a glass mortar for 10 minutes, pour off the liquid portion, and add of oil of almonds, 2 fl. oz.

2. (Kopp.) Solution of chloride of lime (ordinary), 1 part; olive oil, 2 parts.

3. (Waller.) Chloride of lime (in fine powder), 1 part; soft soap, 2 parts; soft water, q. s. to make a liniment.

Obs. The above are cleanly and excellent applications in itch, scald head, herpes, lepra, foul ulcers, &c.

Liniment of Chloroform. *Syn.* **LINIMENTUM CHLOROFORMI, B. P. Prep.** 1. (B. P.) Chloroform, 1; liniment of camphor, 1; mix. The oil in the camphor liniment prevents the evaporation of the chloroform. Stimulating on application to a tender skin.

2. Chloroform 1 fl. dr.; almond oil, 7 fl. drs.; mix in a phial, and agitate until the two unite.

3. (Tuson.) Chloroform, 1 fl. dr.; soap liniment, 2 fl. oz.; as the last. Used as an application in neuralgic pains, rheumatism, &c.

Liniment of Cod-liver Oil. *Syn.* **LINIMENTUM OLEI MORRUE, L. o. JACORIS ASELLI, L. Prep.** (Dr. Brach.) Cod-liver oil, 2 fl. oz.; liquor of ammonia, 1 fl. oz.; mix. Resolvent, dispersive; applied to glandular tumours, scrofulous enlargements, &c.

Liniment of Croton Oil. *Syn.* **LINIMENTUM CROTONIS (B. P., Ph. D.), L. OLEI CROTONIS, L. o. TIGILLI, L. Prep.** 1. (B. P.) Croton oil, 1; oil of cajeput, 3½; rectified spirit, 3½; mix.

2. (Ph. D.) Croton oil, 1 fl. oz.; oil of turpentine, 7 fl. oz.; mix by agitation.

3. (J. Allen.) Croton oil and liquor of potassa, of each, 1 fl. dr.; agitate until mixed, then add of rose water, 2 fl. oz.

4. (Pereira.) Croton oil, 1 part; olive oil, 5 parts.

Obs. The above are used as counter-irritants; in rheumatism, neuralgia, bronchial and pulmonary affections, &c. When rubbed on the skin, redness and a pustular eruption ensue, and in general the bowels are acted on.

Liniment, Diuretic. *Syn.* **LINIMENTUM DIURETICUM, L. Prep.** 1. (Dr. Calini.) Squills (in fine powder), 1 dr.; gastric juice of a calf, 2 oz.; mix.

2. (Dr. Christison.) Soap liniment, tincture of foxglove, and tincture of squills, equal parts. In dropsies; rubbed over the abdomen or loins twice or thrice a day.

Liniment, Emollient. *Syn.* **LINIMENTUM ALBUM, L. EMOLLIENTS, L. Prep.** From camphor, 1 dr.; Peruvian balsam, ½ dr.; oil of almonds, 1 fl. oz.; dissolve by heat, add of glycerin, ½ fl. oz., agitate well, and, when cold, further add of oil of nutmeg, 15 drops. Excellent for chopped hands, lips, nipples, &c.

Liniment of Garlic. *Syn.* **LINIMENTUM ALLII, L. Prep.** From juice of garlic, 2 parts;

olive oil, 3 parts; mix. In whooping-cough, infantile convulsions, &c.

Liniment of Ginger. *Syn.* **LINIMENTUM ZINGIBERIS, L. Prep.** (Dr. Turnbull.) Ginger, 1 part; rectified spirit, 2 parts; make a tincture or essence. For short-sightedness. A few drops are occasionally rubbed on the forehead for 8 or 10 minutes at a time. How this tincture came to be called a liniment we are at a loss to determine.

Liniment, Hungarian. *Syn.* **LINIMENTUM HUNGARICUM, L. Prep.** (Soubeiran.) Powdered cantharides and sliced garlic, of each, 1 dr.; camphor, bruised mustard seed, and black pepper, of each, 4 drs.; strong vinegar, 6 fl. oz.; rectified spirit, 12 fl. oz.; macerate a week, and filter. An excellent rubefacient and counter-irritant.

Liniment of Hydrochloric Acid. *Syn.* **LINIMENTUM MURIATICUM, L. ACIDI MURIATICI, L. A. HYDROCHLORICI, L. Prep.** 1. (Hosp. F.) Olive oil, 2 oz.; white wax, 2 drs.; dissolve by a gentle heat, add of balsam of Peru, 1 dr.; hydrochloric acid, 2 drs.; mix well. An excellent application to chilblains before they break.

2. (W. Cooley.) Olive oil, ½ pint; white spermaceti (pure) and camphor, of each, ½ oz.; mix with heat, add of hydrochloric acid, ½ fl. oz., and proceed as before. Equal to the last, and cheaper. This was extensively employed among the seamen of the Royal Navy by Mr. Cooley with uniform success.

Liniment of Iodide of Potassium. *Syn.* **LINIMENTUM IODURETUM GELATINOSUM, L. GELÉE POUR LE GOÎTRE, Fr. Prep.** (Foy.) Iodide of potassium, 4 drs.; proof spirit, 2 oz.; dissolve, and add the liquid to a solution of curd soap, 6 drs., in proof spirit, 2 oz., both being at the time gently warm; lastly, aromatise with rose or neroli, pour it into wide-mouthed bottles, and keep them closely corked. In goitre, &c.

Linimentum Potassii Iodidi cum Sapone. (B. P.) Hard soap, in powder, 1½; iodide of potassium, 1½; glycerin, 1; oil of lemon, ½; water, 1. Dissolve the soap in 7 of water, by heat of a water bath; dissolve the iodide of potassium in the remainder of the water, and mix by trituration the two solutions, and when cold add the oil of lemon, and mix thoroughly.

Liniment of Iodine. *Syn.* **LINIMENTUM IODI (B. P.); IODURETTED LINIMENT; LINIMENTUM IODINII, L. IODURETUM, L. Prep.** 1. (B. P.) Iodine, 5; iodide of potassium, 2; camphor, 1; rectified spirit, 40; dissolve.

2. (Cutan. Hosp.) Compound tincture of iodine and laudanum, equal parts.

3. (Dr. Copland.) Soap liniment, 1 oz.; iodine, 8 to 10 grs.

4. (Guibourt.) Iodide of potassium, 1 dr.; water, 1 fl. dr.; dissolve, and add it to white soap (in shavings) and oil of almonds, of each, 10 drs., previously melted together. Some perfume may be added. In scrofula, glandular enlargements, rheumatism, &c.

Liniment of Lead. *Syn.* LINIMENTUM PLUMBI, L. *Prep.* (Gaozey.) Acetate of lead, 40 grs.; soft water, 12 fl. oz.; olive oil, 6 oz.; mix, and agitate well. Astringent and refrigerant. Useful in excoriations, especially when accompanied with inflammation.

Liniment of Lime. *Syn.* LINIMENT FOR BURNS, CARRON OIL; LINIMENTUM CALCIS (Ph. L. E. & D.), L. AQUE CALCIS, OLEUM LINICUM CALCIS, L. *Prep.* 1. From olive oil (linseed oil—Ph. E.) and lime water, equal parts, shaken together until they are mixed. Very useful in burns and scalds.

2. (Compound; LINIMENTUM CALCIS COMPOSITUM, L.)—*a.* (Camphorated—W. Cooley.) Camphor liniment and lime water, equal parts.

b. (Opiated—W. Cooley.) Lime water and camphor liniment, of each, 1 oz.; extract of opium, 5 grs.; mix. Both are used as anodynes to allay pain and irritation in severe burns, chilblains, &c., for which purpose they are excellent. All the above liniments with lime water should be used as soon as possible after being prepared, as the ingredients separate by keeping.

Liniment of Mercury. *Syn.* MERCURIAL LINIMENT; LINIMENTUM HYDRARGYRI (B. P., Ph. L.), LIN. H. COMPOSITUM (Ph. L. 1836), L. *Prep.* 1. (B. P.) Ointment of mercury, 1; solution of ammonia, 1; liniment of camphor, 1. Melt the ointment in the liniment, add the ammonia, and shake them together.

2. (Ph. L.) Camphor, 1 oz.; spirit of wine, 1 fl. dr.; sprinkle the latter on the former, powder, add of lard and mercurial ointment (stronger), of each, 4 oz.; rub them well together, then gradually add of liquor of ammonia, 4 fl. oz.; and mix well. Stimulant and discutient. It resembles mercurial ointment in its effects; but though milder in its operation, it more quickly produces salivation.

Liniment of Morphia. *Syn.* LINIMENTUM MORPHIÆ, L. *Prep.* (W. Cooley.) Pure morphia, 3 grs.; put it into a warm mortar, add very gradually, of oil of almonds (warm), 1 fl. oz., and triturate until the morphia is dissolved, then add of camphor liniment, 1 oz. An excellent topical anodyne and antispasmodic, which often allays pain* when other means have failed.

Liniment of Mustard. *Syn.* LINIMENTUM SINAPIS, L. *Prep.* 1. Flour of mustard (best), 1 oz.; water, tepid, 2 fl. oz.; mix, and add of glycerin, liquor of ammonia, and olive oil, of each, 1 fl. oz.

2. (Béral.) Carbonate of ammonia (in fine powder), 1 part; camphor (in powder), 2 parts; oil of lavender, 4 parts; tincture of mustard, 6 parts; mix, dissolve by agitation, add of simple liniment (warm), 56 parts, and again agitate until the whole is perfectly incorporated.

3. Black mustard seed (ground in a pepper-mill or otherwise well bruised), $\frac{1}{2}$ lb.; oil of turpentine, 1 pint; digest, express the liquid, filter, and dissolve in it camphor, $\frac{1}{2}$ lb. Stimu-

lant and rubefacient. A popular and useful remedy in rheumatic pains, lumbago, colic, chilblains, &c. The last is a close imitation of Whitehead's 'Essence of Mustard.'¹

4. (LIN. OLEI VOLATILIS SINAPIS.)—*a.* From volatile oil of black mustard seed, $\frac{1}{2}$ dr.; oil of almonds, 1 fl. oz. As a rubefacient.

b. From volatile oil, 1 part; alcohol (sp. gr. .815), 1 to 2 parts. As a vesicant.

Liniment of Mustard (Compound). LINIMENTUM SINAPIS COMPOSITUM (B. P.). Oil of mustard, 1 dr.; ethereal extract of mezereon, 40 grs.; camphor, 2 drs.; castor oil, 5 drs.; rectified spirit, 32 drs.; dissolve.

Liniment of Nitrate of Mercury. *Syn.* CITRINE LINIMENT; LINIMENTUM HYDRARGYRI NITRATIS, L. *Prep.* (Sir H. Halford.) Ointment of nitrate of mercury and olive oil, equal parts, triturated together in a glass mortar, or mixed by a gentle heat. This liniment is stimulant, discutient, and alterative, and in its general properties resembles the ointment of the same name. For most purposes the quantity of oil should be at least doubled.

Liniment of Nux Vomica. *Syn.* LINIMENTUM NUCIS VOMICÆ, L. *Prep.* (Magendie.) Tincture of nux vomica, 1 fl. oz.; liquor of ammonia, 2 fl. drs.; mix. As a stimulating application to paralysed limbs. The addition of $\frac{1}{2}$ fl. dr. each of glycerin and salad oil renders it an excellent application in chronic rheumatism and neuralgia.

Liniment of Opium. *Syn.* ANODYNE LINIMENT; LINIMENTUM OPII (B. P., Ph. L. & E.), L. OPII or L. ANODYNUM (Ph. D.), L. SAPONIS CUM OPIO, L. *Prep.* 1. (B. P.) Tincture of opium, 1; liniment of soap, 1; mix.

2. Tincture of opium, 2 fl. oz.; soap liniment, 6 fl. oz.; mix.

3. (Ph. E.) Castile soap, 6 oz.; opium, 1½ oz.; rectified spirit, 1 quart; digest for three days, then filter, add of camphor, 3 oz., oil of rosemary, 6 fl. drs., and agitate briskly.

4. (Ph. D.) Soap liniment and tincture of opium, equal parts.

5. (Wholesale.) Soft soap, 1½ lb.; powdered opium and camphor, of each $\frac{1}{4}$ lb.; rectified spirit, 1 gall.; digest a week.

Obs. This preparation is an excellent anodyne in local pains, rheumatism, neuralgia, sprains, &c.

Liniment of Phosphorus. *Syn.* LINIMENTUM PHOSPHORATUM, L. *Prep.* (Augustin.) Phosphorus, 6 grs.; camphor, 12 grs.; oil of almonds, 1 oz.; dissolve by heat; when cold, decant the clear portion, and add of strongest liquor of ammonia, 10 drops. A useful friction in gout, chronic rheumatism, certain obstinate cutaneous affections, &c.

Simple Liniment. *Syn.* LINIMENTUM SIMPLEX (Ph. E.), L. *Prep.* (Ph. E.) White wax, 1 oz.; olive oil, 4 fl. oz.; melt together, and stir the mixture until it is cold. Emollient; resembles spermaceti ointment in all except its consistence.

¹ See page 462.

Liniment of Soap. *Syn.* OPODELDOC, CAMPHORATED TINCTURE OF SOAP, BALSAM OF S.; LINIMENTUM SAPONIS (B. P., Ph. L. E. & D.), L. SAPONACEUM, TINCTURA SAPONIS CAMPHORATA, BALSAMUM SAPONIS, L. *Prep.* 1. (B. P.) Hard soap (cut small), $2\frac{1}{2}$ oz.; camphor, $1\frac{1}{4}$ oz.; English oil of rosemary, 3 drs.; rectified spirit, 18 oz.; distilled water, 2 oz.; mix the water and spirit, add the other ingredients, digest at a temperature not exceeding 70° Fahr., agitating occasionally for seven days, and filter.

2. (Ph. L.) Castile soap (cut small), $2\frac{1}{2}$ oz.; camphor (small), 10 drs.; spirit of rosemary, 18 fl. oz.; water, 2 fl. oz.; digest with frequent agitation until the solid substances are dissolved.

3. (Ph. E.) Castile soap, 5 oz.; camphor, $2\frac{1}{2}$ oz.; oil of rosemary, 6 fl. drs.; rectified spirit, 1 quart.

4. (Ph. D.) Castile soap (in powder), 2 oz.; camphor, 1 oz.; proof spirit, 16 fl. oz.

5. (LINIMENT SAVONNEAU—P. Cod.) Tincture of soap (P. Cod.) and rectified spirit ('863 or 41 o. p.), of each, 8 parts; olive oil, 1 part.

Obs. This article, prepared according to the directions of the Pharmacopœia, from 'soap made of olive oil and soda' (Castile soap), is apt to gelatinise in cold weather, and to deposit crystals of elaidate and stearate of lime. This may be avoided, when expense is not an objection, by first well drying the soap, employing a spirit of at least 85%, and keeping the preparation in well-closed bottles. A cheaper and better plan is to substitute the 'soft soap' of the Ph. L. ('soap made with olive oil and potassa') for the Castile soap ordered by the College. The soft soap of commerce imparts to the liniment an unpleasant smell. The following formula, one of those commonly adopted by the wholesale druggists, produces a very good article, though much weaker than that of the Pharmacopœia.

6. (Wholesale.) Camphor (cut small), $1\frac{1}{2}$ lb.; soft soap, 7 lbs.; oil of rosemary, 3 fl. oz.; rectified spirit of wine and water, of each, 3½ galls.; digest with occasional agitation for a week, and filter. This is the 'opodeldoc' or 'soap liniment' of the shops.

Uses. Soap liniment is stimulant, discutient, and lubricating, and is a popular remedy in rheumatism, local pains, swellings, bruises, sprains, &c.

7. (With Opium.) See LINIMENT OF OPIUM.

8. (Sulphuretted; LINIMENTUM SAPONIS SULPHURETUM, L. SULPHURO - SAPONACEUM—Jadelot, L.) Sulphuret of potassium, 3 oz.; soap, 12 oz.; water, q. s.; melt together, and add, of olive oil, 12 oz.; oil of origanum, 1 fl. dr.; mix well. An excellent remedy for the itch, and some allied skin diseases.

Liniment of Sulphide of Carbon. *Syn.* LINIMENTUM CARBONIS SULPHURETI, L. *Prep.* 1. From bisulphide of carbon, 1 dr.; camphorated oil, 1 oz.; mix.

2. (Lampadius.) Camphor, 2 drs.; bisulphuret of carbon, 4 fl. drs.; dissolve, and add of rectified spirit, 1 fl. oz. In rheumatism, gouty nodes, &c.

Liniment of Sulphuric Acid. See ACID LINIMENT.

Liniment, Tripharm'ic. *Syn.* LINIMENTUM TRIPHARMICUM (Ph. L. 1746), L. *Prep.* Take of lead plaster and olive oil, of each, 4 oz.; melt, add of strong vinegar, 1 fl. oz., and stir until cold. Cooling and desiccative; in excoriations, burns, &c.

Liniment of Turpentine. *Syn.* KENTISH'S LINIMENT; LINIMENTUM TEREBINTHINÆ (B. P., Ph. L. & D.); L. TEREBINTHINATUM (Ph. E.), L. *Prep.* 1. (B. P.) Oil of turpentine, 16; camphor, 1; soft soap, 2; dissolve the camphor in the turpentine, then add the soap, and rub till thoroughly mixed.

2. (Ph. L.) Soft soap, 2 oz.; camphor, 1 oz.; oil of turpentine, 10 fl. oz.; shake them together until mixed. Stimulant; in lumbago, cholera, colic, &c.

3. (Ph. L. 1824.) Resin cerate, 6 oz.; oil of turpentine, 4 fl. oz.; mix. An excellent application to burns.

4. (Ph. E.) Resin ointment, 4 oz.; camphor, 4 drs.; dissolve by a gentle heat, and stir in oil of turpentine, 5 fl. oz.

5. (Ph. D.) Oil of turpentine, 5 fl. oz.; resin ointment, 8 oz.; mix by a gentle heat. This forms Dr. Kentish's celebrated application to burns and scalds. The parts are first bathed with warm oil of turpentine or brandy, and then covered with pledgets of lint, smeared with the liniment.

6. (Compound—*a.* LINIMENTUM TEREBINTHINÆ ACETICUM.) Oil of turpentine, 1; acetic acid, 1; liniment of camphor, 1; mix.

b. (LINIMENTUM TEREBINTHINÆ COMPOSITUM, L.) (Acetic; ST. JOHN LONG'S LINIMENT; LINIMENTUM TEREBINTHINÆ ACETICUM, L.) Oil of turpentine, 3 oz.; rose water, $2\frac{1}{2}$ fl. oz.; acetic acid, 5 drs.; oil of lemons, 2 fl. oz.; yolk of egg, 1; make an emulsion. As a counter-irritant in phthisis.

c. (Ammoniated—Debreyne.) Lard, 3 oz.; melt, and add, of oil of turpentine and olive oil, of each, 1 oz.; when cold, further add of camphorated spirit, 4 fl. drs.; liquor of ammonia, 1 fl. dr. In sciatica, lumbago, &c.

d. (Opiated—Recamier.) Oil of turpentine, 1 fl. oz.; oil of chamomile, 2 fl. oz.; tincture of opium, 1 fl. dr. In neuralgia, &c.

e. (Sulphuric—Ph. Castr. Ruthena.) Oil of turpentine, 2 oz.; olive oil, 5 oz.; mix, and add of dilute sulphuric acid, $1\frac{1}{2}$ dr. See ACID LINIMENT.

Liniment of Veratrine. *Syn.* LINIMENTUM VERATRINÆ, L. *Prep.* (Brande.) Veratrine, 8 grs.; alcohol, $\frac{1}{2}$ fl. oz.; dissolve, and add of soap liniment, $\frac{1}{2}$ fl. oz. In neuralgic and rheumatic pains, gout, &c.

Liniment of Verdigris. *Syn.* OXYMEL OF VERDIGRIS; LINIMENTUM ARBUTINIS (Ph. L.),

OXYMEL ÆRUGINIS (Ph. L. 1738), **OXYMEL CUPRI SUBACETATIS** (Ph. D. 1826), L. *Prep.* (Ph. L.) Verdigris (in powder), 1 oz.; vinegar, 7 fl. oz.; dissolve, filter through linen, add of honey, 14 oz., and evaporate to a proper consistence.

Obs. This preparation is wrongly named a 'liniment.' The College, after 'beating about the bush' for nearly a century, found a right name for it in 1788; but, as in many other cases, soon abandoned it for another less appropriate.

Oxymel of verdigris is stimulant, detergent, and escharotic. It is applied to indolent ulcers, especially of the throat, by means of a camel-hair pencil; and, diluted with water, it is used as a gargle. Care must be taken to avoid swallowing it, as it occasions vomiting and excessive purging.

Liniment, Vermifuge. *Syn.* **LINIMENTUM ANTHELMINTICUM**, L. **VERMIFUGUM**, L. *Prep.* Castor oil, 1 oz.; essential oils of wormwood and tansy, of each, $\frac{1}{2}$ oz.; Dr. Peschier's ethereal tincture of pennyroyal buds, 20 drops; mix. Employed in frictions on the abdomen in cases of worms in children. Its activity may be still further increased by the addition of a little garlic juice. ('Journ. de Méd.') An excellent medicine.

Liniment, Ware's. *Prep.* From camphor liniment, 1 oz.; solution of carbonate of potassa, 1 dr. In amaurosis.

Liniment, White's. The old name for spermæti ointment.

Liniment, Wilkinson's. *Prep.* (Phœbus.) Prepared chalk, 20 grs.; sulphur, lard, and tar, of each, $\frac{1}{2}$ oz.; mix, and add of Boyle's fuming liquor, 10 or 15 drops. In certain chronic skin diseases, neuralgia, &c.

LINSEED. *Syn.* **FLAX SEED**; **LINI SEMINA**, L. The seed of *Linum usitatissimum* (Linn.), or common flax. (Ph. L.) Oily, emollient, demulcent, and nutritive. Ground to powder (linseed meal; farina lini), it is used for poultices. The cake left after expressing the oil (linseed cake; lini placenta) is used for feeding cattle. Under the form of tea or infusion, it is used as a diluent, and to allay irritation in bronchial, urinary, and other like affections. See **INFUSION**, **LINEN**, &c.

LINT. *Syn.* **LINTEUM**, L. White linen-cloth, scraped by hand or machinery, so as to render it soft and woolly. The hand-made lint is now little used; it was prepared from pieces of old linen-cloth. The machine-made lint is prepared from a fabric woven on purpose. A lint made from cotton (cotton-lint) is now largely manufactured; it is much inferior to the true lint, being a bad conductor of heat. Lint is used for dressing ulcers, either alone or smeared with some suitable ointment or cerate.

Medicated Lint. *Syn.* **LINTEUM MEDICATUM**, L. **NIGRUM**, L. **INFERNALE**, L. *Prep.* 1. Nitrate of silver, 20 to 30 grs.; distilled water, 1 fl. oz.; dissolve, saturate dry lint, $\frac{1}{2}$

oz., with the solution, and expose it in a saucer or capsule to the light and air, until it has become black and dry.

2. From nitrate of silver and nitrate of copper, of each, $\frac{1}{2}$ dr.; lint, 1 oz.; water, 1 $\frac{1}{2}$ fl. oz.; as the last. Used to dress old and indolent ulcers.

LIP SALVE. See **SALVE**.

LIQUATION. The process of sweating out by heat the more fusible metals of an alloy. Metallurgists avail themselves of this method in assaying and refining the precious metals, and procuring antimony and some other metals from their ores.

LIQUEFACIENTS. *Syn.* **RESOLVENTS**; **LIQUEFACIENTIA**, **RESOLVENTIA**, L. In pharmacy, substances or agents which promote secretion and exhalation, soften and loosen textures, and promote the absorption or removal of enlargements, indurations, &c. To this class belong the alkalies, antimony, bromine, chlorine, iodine, mercury, sulphur, &c., and their preparations.

LIQUEFACTION. The assumption of the liquid form. It is usually applied to the conversion of a solid into the liquid state, which may arise from increase of temperature (fusion), absorption of water from the atmosphere (deliquescence), or the action of a body already fluid (solution).

Liquefaction of Gases. Under the combined influence of pressure and cold, nearly all the gases may be liquefied. The first experiments in this direction were made by Faraday, who succeeded in reducing to the liquid condition 8 bodies which had hitherto been regarded as permanent gases, namely, ammonia, carbonic anhydride, chlorine, cyanogen, hydrochloric acid, nitrous oxide, sulphuretted hydrogen, and sulphurous anhydride. His method of proceeding was very simple; the materials were sealed up in a strong, narrow, glass tube, bent so as to form an obtuse angle, together with a little 'pressure gauge,' consisting of a slender tube closed at one end, and having within it, near the open extremity, a globule of mercury. The gas, being disengaged by the application of heat or otherwise, accumulated in the tube, and by its own pressure brought about liquefaction. The force required for this purpose was judged of by the diminution of volume of the air in the pressure gauge. By employing powerful condensing syringes, and an extremely low temperature, Faraday has since succeeded in liquefying olefiant gas, hydriodic and hydrobromic acids, phosphuretted hydrogen, and the gaseous fluorides of silicon and boron. Oxygen, hydrogen, nitrogen, nitric oxide, carbonic oxide, and coal gas, refused to liquefy at the temperature of -166° Fahr., while subjected to pressures varying in different cases from 27 to 58 atmospheres. Since then an even greater degree of cold has been obtained from liquefied nitric oxide and ether.

CARBONIC ANHYDRIDE is liquefied on the

large scale by condensing it in strong vessels of gun-metal or boiler-plate. It requires a pressure of between 27 and 28 atmospheres at 32° Fahr. (Adams.) The liquefied acid is colourless and limpid, lighter than water, and four times more expandable than air; it mixes in all proportions with ether, alcohol, naphtha, oil of turpentine, and sulphuret of carbon; and is insoluble in water and fat oils. When a jet of liquid carbonic anhydride is allowed to issue into the air from a narrow aperture, such an intense degree of cold is produced by the evaporation of a part, that the remainder freezes to a solid (solid carbonic anhydride), and falls in a shower of snow. This substance, which may be collected, affords a means of producing extreme cold. Mixed with a little ether, and poured upon a mass of mercury, the latter is almost instantly frozen. The temperature of this mixture in the air was found to be —106° Fahr.; when the same mixture was placed beneath the receiver of an air-pump, and exhaustion rapidly performed, the temperature sank to —166°. This degree of cold was employed in Faraday's last experiments on the liquefaction of gases.

LIQUEUR. [Fr.] *Syn.* CORDIAL. A stimulating beverage, formed of weak spirit, aromatised and sweetened. The manufacture of liqueurs constitutes the trade of the 'compounder,' 'rectifier,' or 'liquoriste.'

The materials employed in the preparation of liqueurs or cordials are rain or distilled water, white sugar, clean flavourless spirit, and flavouring ingredients. To these may be added the substances employed as 'finings,' when artificial clarification is had recourse to.

The utensils and apparatus required in the business are those ordinarily found in the wine and spirit cellar; together with a copper still, furnished with a pewter head and a pewter worm or condenser, when the method 'by distillation' is pursued. A barrel, hogshead, or rum puncheon, sawn in two, or simply 'unheaded,' as the case may demand, forms an excellent vessel for the solution of the sugar; and 2 or 3 fluted funnels, with some good white flannel, will occasionally be found useful for filtering the aromatic essences used for flavouring. Great care is taken to ensure the whole of the utensils, &c., being perfectly clean and 'sweet,' and well 'seasoned,' in order that they may neither stain nor flavour the substances placed in contact with them.

In the preparation or compounding of liqueurs, one of the first objects which engages the operator's attention is the production of an alcoholic solution of the aromatic principles which are to give them their peculiar aroma and flavour. This is done, either by simple solution or maceration, as in the manufacture of tinctures and medicated spirits, or by maceration and subsequent distillation. The products, in this country, are called ESSENCES or SPIRITS, and by the French INFUSIONS,

and are added to the solution of sugar (SYRUP or CAPILLAIRE) or to the dulcified spirit, in the proportions required. Grain or molasses spirit is the kind usually employed for this purpose in England. As before observed, it should be of the best quality; as, if this is not the case, the raw flavour of the spirit is perceptible in the liquor. Rectified spirit of wine is generally very free from flavour, and when reduced to a proper strength with clear soft water, forms a spirit admirably adapted for the preparation of cordial liqueurs. Spirit weaker than about 45 o. p., which has been freed from its own essential oil, by careful rectification, is known in trade under the title of 'pure,' 'flavourless,' 'plain,' or 'silent spirit.' Before macerating the ingredients, if they possess the solid form, they are coarsely pounded, bruised, sliced, or ground, as the peculiar character of the substance may indicate. This is not done until shortly before submitting them to the action of the menstruum; as, after they are bruised they rapidly lose their aromatic properties by exposure to the air. When it is intended to keep them for any time in the divided state, they should be preserved in well-corked bottles or jars. The practice of drying the ingredients before pounding them, frequently adopted by ignorant and lazy workmen, for the sake of lessening the labour, is, of course, even more destructive to their most valuable qualities than mere exposure to the air. The length of time the ingredients should be digested in the spirit should never be less than 5 or 6 days, but a longer period is preferable when distillation is not employed. In either case the time may be advantageously extended to 10 days or a fortnight, and frequent agitation should be had recourse to during the whole period. When essential oils are employed to convey the flavour, they are first dissolved in a little of the strongest rectified spirit of wine, in the manner explained under ESSENCE; and when added to the spirit, they are mixed up with the whole mass as rapidly and as perfectly as possible. In managing the still, the fire is proportioned to the ponderosity of the oil or flavouring substance, and the receiver is changed before the fumes come over; as these are unfitted to be mixed with the cordial. In many cases the addition of a few pounds of common salt to the liquor in the still facilitates the process and improves the product. Ingredients which are not volatile are, of course, always added after distillation. The stronger spirit is reduced to the desired strength by means of either clear soft water or the clarified syrup used for sweetening. The sugar employed should be of the finest quality, and is preferably made into capillaire or syrup before adding it to the aromatised spirit; and not until this last has been rendered perfectly 'fine' or transparent, by filtration or clarification, as the case may demand. Some spirits or infusions, as those

of aniseed, caraway, &c., more particularly require this treatment, which is best performed by running them through a clean wine bag, made of rather fine cloth, having previously mixed them with a spoonful or two of magnesia; but in all cases clarification by simple repose should be preferred. Under proper management, liqueurs or cordials prepared of good materials will be found perfectly 'clear' or 'bright' as soon as made, or will become so after being allowed a few days for defecation; but in the hands of the inexperienced operator, and when the spirit employed is insufficient in strength or quantity, it often happens that they turn out 'foul' or 'milky.' When this is the case, the liquid may be 'fined down' with the whites of 12 to 20 eggs per hogshead; or a little alum, either alone or followed by a little carbonate of sodium or potassium, both dissolved in water, may be added, in the manner described under FININGS.

An excellent and easy way of manufacturing cordial liquors, especially when it is inconvenient to keep a large stock on hand, is by simply 'aromatising' and 'colouring,' as circumstances or business may demand, spirit 60 or 64 u. p., kept ready sweetened for the purpose. To do this to the best advantage, two descriptions of sweetened spirit should be provided, containing respectively 1 lb. and 3 lbs. of sugar to the gallon. From these, spirit of any intermediate sweetness may be made, which may be flavoured with any essential oil dissolved in alcohol, or any aromatised spirit or 'infusion' (see *below*), prepared either by digestion or distillation. As a general rule, the concentrated essences, made by dissolving 1 oz. of the essential oil in 1 pint of the strongest rectified spirit of wine, will be found admirably adapted for this purpose. These essences, which should be kept in well-corked bottles, are employed by dropping them cautiously into the sweetened spirit until the desired flavour is produced. During this operation, the liquor should be frequently and violently shaken to produce complete admixture. If by any accident the essence is added in too large a quantity, the resulting 'miliness' or excess of flavour may be removed, by the addition of a little more spirit, or by clarification. In this way the majority of the liqueurs in common use may be produced extemporaneously, of nearly equal quality to those prepared by distillation. For those which are coloured, simple digestion of the ingredients is almost universally adopted. The "process by distillation" should, however, be always employed to impart the flavour and aroma of volatile aromatics to the spirit, when expense, labour, and time, are of less importance than the production of a superior article.

The French liquoristes are famed for the preparation of cordials of superior quality, cream-like smoothness, and delicate flavour. Their success chiefly arises from the employment of very pure spirit and sugar (the former in a

larger proportion than that adopted by the English compounder), and in the judicious application of the flavouring ingredients. The French liquoristes distinguish their cordials as 'eaux' and 'extraits' (waters, extracts), or liqueurs which, though sweetened, are entirely devoid of viscosity; and 'baumes,' 'crèmes,' and 'huiles' (balms, creams, oils), which contain sufficient sugar to impart to them a syrupy consistence. The greatest possible attention is given to the preparation of the aromatised or flavouring essences, in France called 'infusions.' These are generally made by macerating the aromatic ingredients in spirit at about 2 to 4 u. p. (sp. gr. .922 to .925), placed in well-corked glass carboys, or stoneware jars or bottles. The maceration is continued, with occasional agitation, for 3, 4, or even 5 weeks, when the aromatised spirit is either distilled or filtered; generally the former. The outer peel of cedrats, lemons, oranges, limettes, bergamottes, &c., is alone used by our Continental neighbours, and is obtained either by carefully peeling the fruit with a knife, or by 'oleo-saccharum,' by rubbing it off with a lump of hard white sugar. Aromatic seeds and woods are bruised by pounding before being submitted to infusion. The substances employed in France to colour liqueurs are, for—blue, soluble Prussian blue, sulphate of indigo (nearly neutralised with chalk), and the juice of blue flowers and berries;—amber, fawn, and brandy colour, burnt sugar or spirit colouring;—green, spinach or parsley leaves (digested in spirit), and mixtures of blue and yellow;—red, powdered cochineal or brazil wood, either alone or mixed with a little alum;—violet, blue violet petals, litmus, or extract of logwood;—purple, the same as violet, only deeper;—yellow, an aqueous infusion of safflower or French berries, and the tinctures of saffron and turmeric.

A frequent cause of failure in the manufacture of liqueurs and cordials is the addition of too much flavouring matter. Persons unaccustomed to the use of strong aromatic essences and essential oils, seldom sufficiently estimate their power, and, consequently, are very apt to add too much of them, by which the liqueur is rendered not only disagreeably high flavoured, but, from the excess of oil present, also 'milky,' or 'foul,' either at once, or, what is nearly as bad, on the addition of water. This source of annoyance, arising entirely from bad manipulation, frequently discourages the tyro, and cuts short his career as a manufacturer. From the viscosity of cordials, they are less readily 'fined down' than unsweetened liquor, and often give much trouble to clumsy and inexperienced operators. The most certain way to prevent disappointment in this respect is to use too little rather than too much flavouring; for if the quantity proves insufficient, it is readily 'brought up' at any time, but the contrary is not effected without some trouble and delay.

A careful attention to the previous remarks will render this branch of the rectifier's art far more perfect and easy of performance than it is at present, and will, in most cases, produce at once a satisfactory article, 'fine, sweet, and pleasant.'

The cordials of respectable British 'compounders' contain fully 3 lbs. of white lump sugar per gallon, and are of the strength of 60 to 64 u. p. The baumes, crèmes, and huiles imported from the Continent are richer both in spirit and sugar than ours, and to this may be referred much of their superiority. Mere sweetened or cordialised spirits (eaux, of the Fr.) contain only from 1 to 1½ lb. of sugar per gallon.

The purity of liqueurs is determined in the manner noticed under BRANDY, WINE, &c.

The following list embraces nearly all the cordials and liqueurs, both native and imported, met with in trade in this country:—

Absinthe. *Syn.* EXTRAIT D'ABSINTHE DE SUISSE; SWISS EXTRACT OF WORMWOOD. *Prep.* From the tops of *Absinthum majus*, 4 lbs.; tops of *Absinthum minus*, 2 lbs.; angelica root, calamus aromaticus, Chinese aniseed, and leaves of dittany of Crete, of each, 15 grs.; brandy or spirit at 12 u. p., 4 galls.; macerate for 10 days, then add water, 1 gall.; distil 4 galls. by a gentle heat, and dissolve in the distilled spirit, of crushed white sugar, 2 lbs. Tonic and stomachic.

Alkermes. This liqueur is highly esteemed in some parts of the South of Europe.

Prep. 1. Bay leaves and mace, of each 1 lb.; nutmegs and cinnamon, of each 2 oz.; cloves, 1 oz. (all bruised); cognac brandy, 3½ galls.; macerate for 3 weeks, frequently shaking, then distil over 3 galls., and add, of clarified spirit of kermes, 18 lbs.; orange-flower water, 1 pint; mix well, and bottle. This is the original formula for the 'alkermes de Santa Maria Novella,' which is much valued.

2. Spice, as last; British brandy, 4 galls.; water, 1 gall.; macerate as before, and draw over 4 galls., to which add, of capillaire, 2 galls., and sweet spirit of nitre, ½ pint. Cassia is often used for cinnamon. Inferior to the last.

Aniseed Cordial. *Prep.* 1. From aniseed, 2 oz. (or essential oil, 1½ dr.), and sugar, 3 lbs. per gallon. It should not be weaker than about 45 u. p., as at lower strengths it is impossible to produce a full-flavoured article without its being milky, or liable to become so.

2. (ANISETTE DE BORDEAUX.)—*a.* (Foreign.) Aniseed, 4 oz.; coriander and sweet fennel seeds, of each, 1 oz. (bruised); rectified spirit, ½ gall.; water, 3 quarts; macerate for 5 or 6 days, then draw over 7 pints, and add of lump sugar, 2½ lbs.

6. (English.) Oil of aniseed, 15 drops; oils of cassia and caraway, of each, 6 drops; rub them with a little sugar, and then dissolve it in spirit (45 u. p.), 3 quarts, by well shaking them together; filter, if necessary, and dis-

solve in the clear liquor sugar, 1½ lb. See PEPPERMINT (*below*).

Balm of Moluc'ca. *Prep.* From mace, 1 dr.; cloves, ½ oz.; clean spirit (22 u. p.), 1 gall.; infuse for a week in a well-corked carboy or jar, frequently shaking, colour with burnt sugar, q. s., and to the clear tincture add of lump sugar, 4½ lbs., dissolved in pure soft water, ½ gall. On the Continent this takes the place of the 'cloves' of the English retailer.

Bit'ters. These have generally from 1 to 1½ lb. of sugar per gallon.¹

Car'away Cordial. *Prep.* Generally from the essential oil, with only 2½ lbs. of sugar per gall. 1 fl. dr. of the oil is commonly reckoned equal to ¼ lb. of the seed. The addition of a very little oil of cassia, and about half as much of essence of lemon or of orange, improves it. See BRANDY (Caraway).

Ce'drat Cordial. *Prep.* From essence (oil) of cedrat, ¼ oz.; pure spirit (at proof), 1 gall.; dissolve, add of water, 3 pints, agitate well; distil 3 quarts, and add an equal measure of clarified syrup. A delicious liqueur. See CRÈME and EAU (*below*).

Cin'namon Cordial. *Prep.* This is seldom made with cinnamon, owing to its high price, but with either the essential oil or bark of cassia, with about 2 lbs. of sugar to the gall. It is preferred coloured, and therefore may be very well prepared by simple digestion. The addition of 5 or 6 drops, each, of essence of lemon and orange peel, with about a spoonful of essence of cardamoms per gall., improves it. 1 oz. of oil of cassia is considered equal to 8 lbs. of the buds or bark. 1 fl. dr. of the oil is enough for 2½ galls. It is coloured with burnt sugar.

Cit'ron Cordial. *Prep.* From the oil or peel, with 3 lbs. of sugar per gall., as above. (See *below*.)

Citronelle. *Syn.* EAU DE BARBADES. *Prep.* 1. From fresh orange peel, 2 oz.; fresh lemon peel, 4 oz.; cloves, ½ dr.; corianders and cinnamon, of each, 1 dr.; proof spirit, 4 pints; digest for 10 days, then add of water, 1 quart, and distil ½ gall.; to the distilled essence add of white sugar, 2 lbs., dissolved in water, 1 quart.

2. Essence of orange, ½ dr.; essence of lemon, 1 dr.; oil of cloves, and cassia, of each, 10 drops; oil of coriander, 20 drops; spirit (58 o. p.), 5 pints; agitate until dissolved, then add of distilled or clear soft water, 3 pints; well mix, and filter it through blotting paper, if necessary; lastly, add of sugar (dissolved), q. s.

Clairet. *Syn.* ROSSALIS DES SIX GRAINES. *Prep.* From aniseed, fennel seed, coriander seed, caraway seed, dill seed, and seeds of the candy-carrot (*Athamantia cretensis*—Linn.), of each (bruised), 1 oz.; proof spirit, ½ gall.; digest for 1 week, strain, and add of loaf sugar, 1 lb., dissolved in water, q. s.

¹ See article, BITTERS.

Cloves. *Syn.* CLOVE CORDIAL. *Prep.* From bruised cloves, 1 oz., or essential oil, 1 fl. dr., to every 3 galls. of proof spirit. If distilled, some common salt should be added, and it should be drawn over with a pretty quick fire. It requires fully 3 lbs. of sugar per gall, and is generally coloured with poppy flowers or burnt sugar. The addition of 1 dr. of bruised pimento, or 5 drops of the oil for every oz. of cloves, improves this cordial. See BALM OF MOUTUCA (*above*).

Coriander Cordial. *Prep.* From corianders, as the last. A few sliced oranges improve it.

Crème d'Anis. As ANISEED CORDIAL, only richer.

Crème des Barbades. As CITRONELLE, adding some of the juice of the oranges, and an additional lb. of sugar per gall.

Crème de Cacao. *Prep.* Infuse roasted caracca cacao nuts (cut small), 1 lb., and vanilla, $\frac{1}{2}$ oz., in brandy, 1 gall, for 8 days; strain, and add of thick syrup, 3 quarts.

Crème de Cedrat. *Syn.* HUILE DE CEDRAT. *Prep.* From spirit of citron, 1 pint; spirit of cedrat, 1 quart; proof spirit, 3 quarts; white sugar, 16 lbs., dissolved in pure soft water, 2 galls.

Crème de Macarons. *Prep.* 1. From cloves, cinnamon, and mace, of each (bruised), 1 dr.; bitter almonds (blanched and beaten to a paste), 7 oz.; spirit (17 u. p.), 1 gall.; digest a week, filter, and add of white sugar, 6 lbs., dissolved in pure water, 2 quarts.

2. Clean spirit (at 24 u. p., sp. gr. .945), 2 galls.; bitter almonds, $\frac{3}{4}$ lb.; cloves, cinnamon, and mace, of each, in coarse powder, $1\frac{1}{2}$ dr.; infuse for 10 days, filter, and add of white sugar, 8 lbs., dissolved in pure water, 1 gall.; lastly, give the liqueur a violet tint with infusion or tincture of litmus and cochineal. An agreeable, nutty-flavoured cordial, but, from containing so much bitter almonds, should be only drank in small quantities at a time. The English use only one half the above quantity of almonds.

Crème de Naphe. *Prep.* From sweetened spirit (60 u. p.) containing $3\frac{1}{2}$ lbs. of sugar per gall., 7 quarts; orange-flower water (foreign), 1 quart. Delicious.

Crème de Noyeau. See NOYEAU.

Crème d'Orange. *Prep.* From oranges (sliced), 3 dozen; rectified spirit, 2 galls.; digest for 14 days; add of lump sugar, 28 lbs. (previously dissolved in water, $4\frac{1}{2}$ galls.); tincture of saffron, $1\frac{1}{2}$ fl. oz.; and orange-flower water, 2 quarts.

Crème de Portugal. Flavoured with lemon, to which a little oil of bitter almonds is added.

Curacao. *Prep.* From sweetened spirit (at 56 u. p.), containing $3\frac{1}{2}$ lbs. of sugar per gall., flavoured with a tincture made by digesting the 'oleo-saccharum' prepared from Seville oranges, 9 in number; cinnamon, 1 dr.; and mace, $\frac{3}{4}$ dr., in rectified spirit, 1 pint. It is coloured by digesting in it for a week or 10 days Brazil-wood (in powder), 1 oz., and after-

wards mellowing the colour with burnt sugar, q. s.

Delight of the Mandarins. From spirit (22 u. p.), 1 gull.; pure soft water, $\frac{1}{2}$ gall.; white sugar (crushed small), $4\frac{1}{2}$ lbs.; Chinese aniseed and ambrette or musk seed, of each (bruised), $\frac{1}{2}$ oz.; safflower, $\frac{1}{2}$ oz.; digested together in a carboy or stone bottle capable of holding double, and agitated well every day for a fortnight.

Eau de Cedrat. *Syn.* CEDRAT WATER. As CRÈME DE CEDRAT, but using less sugar.

Eau de Chasseurs. See PEPPERMINT (*below*).

Eau de Vie d'Acadaye. *Syn.* EAU DE VIE D'ANIS; ANISEED LIQUEUR BRANDY. *Prep.* From brandy or proof spirit, 1 gall.; sugar, $\frac{3}{4}$ lb.; dissolved in aniseed water, 1 pint.

Gold Cordial. *Prep.* From angelica root (sliced), 1 lb.; raisins, $\frac{1}{2}$ lb.; coriander seeds, 2 oz.; caraway seeds and cassia, of each, $1\frac{1}{2}$ oz.; cloves, $\frac{1}{2}$ oz.; figs and sliced liquorice root, of each, 4 oz.; proof spirit, 3 galls.; water, 1 gall.; digest 2 days, and distil 3 gallons by a gnetic heat; to this add of sugar, 9 lb., dissolved in rose water and clean soft water, of each, 1 quart; lastly, colour the liquid by steeping in it of hay saffron, $1\frac{1}{4}$ oz. This cordial was once held in much esteem. It derives its name from a small quantity of gold leaf being formerly added to it.

Huile d'Anis. See CRÈME D'ANIS (*above*).

Huile de Vanille. Flavoured with essence or tincture of vanilla. It is kept in a decanter, and used to flavour liqueurs, &c.

Huile de Venus. *Prep.* From the flowers of the wild carrot, $2\frac{1}{2}$ oz., and sugar, 3 lbs. to the gal. It is generally coloured by infusing a little powdered cochineal in it.

Jargonelle. *Syn.* JARGONELLE CORDIAL. Flavoured with essence of jargonelle pear (acetate of amy). Pine-apple cordial and liqueurs from some other fruits are also prepared from the new fruit essences. See ESSENCE.

Lemon Cordial. *Prep.* Digest fresh and dried lemon peel, of each 2 oz., and fresh orange peel, 1 oz., in proof spirit, 1 gal., for a week; strain with expression, add of clear soft water, q. s. to reduce it to the desired strength, and lump sugar, 3 lbs. to the gallon. The addition of a little orange-flower or rose water improves it.

Liquodilla. Flavoured with oranges and lemons, of each, sliced, 3 in number; with sugar, $2\frac{1}{2}$ lbs. per gal.

Lovage Cordial. *Prep.* From the fresh roots of lovage, 1 oz. to the gallon. A fourth of this quantity of the fresh roots of celery and sweet fennel are also commonly added. In some parts a little fresh valerian root and oil of savine are added before distillation. It is much valued by the lower classes in some of the provinces for its stomachic and emmenagogue qualities.

Oil of Cedrat. See CRÈME DE CEDRAT (*above*).

O'range Cordial. Like LEMON CORDIAL or

CREME D'ORANGE, from fresh orange peel, $\frac{1}{2}$ lb. to the gallon.

Parfait Amour. *Syn.* PERFECT LOVE. *Prep.* Flavoured with the yellow rind of 4 lemons, and a teaspoonful of essence of vanilla to the gallon, with sugar, 8 lbs., and powdered cochineal, q. s. to colour.

Peppermint. *Syn.* PEPPERMINT CORDIAL, SPORTSMAN'S C., X. MINT; EAU DE CHASSEURS, Fr. This well-known compound is in greater demand in every part of the kingdom than all the other cordials put together.

Prep. 1. From peppermint water and gin or plain spirit (22 u. p.), of each, 1 pint; lump sugar, $\frac{3}{4}$ lb.

2. (Wholesale.) English oil of peppermint, 5 oz., is added to rectified spirit of wine, 3 pints, and the mixture is agitated well together for some time in a corked bottle capable of holding 4 pints or more; it is then emptied into a cask having a capacity of upwards of 100 galls., and perfectly white and flavourless proof spirit, 36 galls., is poured in, and the whole well agitated for 10 minutes; a solution of the best double refined lump sugar, $2\frac{3}{4}$ cwt., in about 35 galls. of pure filtered rain water, is then added, and the contents of the cask well 'rummaged up,' in the usual manner, for at least 15 minutes; sufficient clear rain water to make up the whole quantity to exactly 100 gallons, and holding in solution alum, 5 oz., is next added, and the whole is again well agitated for at least a quarter of an hour, after which the cask is bunged down, and allowed to repose for a fortnight before it is 'broached' for sale.

Obs. The last formula produces a beautiful article, provided the ingredients are of good quality. Care on this point is particularly necessary in reference to the essential oil, which should only be purchased of some known respectable dealer. The sugar should be sufficiently pure to dissolve in a wine-glassful of clear soft water without injuring its transparency, and the cask should be a fresh-emptied gin pipe, or one properly prepared for gin, as, if it gives colour, it will spoil the cordial. When these particulars are attended to, the product is a bright transparent liquor as soon as made, and does not require fining. Should there be the slightest opacity, the addition of 2 oz. of salt of tartar, dissolved in a quart of hot water, will have the effect of "clearing it down" in the course of a few days. The product is 100 galls. of cordial at 64 u. p.

Pimento. *Syn.* PIMENTO CORDIAL, PIMENTO DRAM. Rather strongly flavoured with allspice or pimento. It has obtained a great repute in the West Indies in diarrhoea, cholera, and bowel complaints generally.

Raspberry Cordial. *Prep.* From raspberry brandy, capillaire, and water, equal parts. A similar article is prepared by flavouring sweetened spirit with the new 'raspberry essence.'

Rat'fia. The numerous liqueurs bearing this name are noticed in another part of this volume. See RATIFIA.

Shrub. See the article SHRUB in another part of this work.

Sighs of Love. *Prep.* 1. From proof spirit flavoured with otto of roses and capillaire, equal parts.

2. From sugar, 6 lbs.; pure soft water q. s. to produce a gallon of syrup, to which add, of eau de rose, 1 pint; proof spirit, 7 pints. It is stained of a pale pink by powdered cochineal. A very pleasant cordial. A drop or two (not more) of essence of ambergris or vanilla improves it.

Tears of the Widow of Malabar. *Prep.* As BALM OF MOLUCCA, but employing cloves (bruised), $\frac{1}{2}$ oz., mace (shredded), 1 dr., and a teaspoonful of essence of vanilla for flavouring. Some add of orange-flower water, $\frac{1}{2}$ pint. It is slightly coloured with burnt sugar.

Tent. From plain spirit (22 u. p.) and port wine, of each, 1 quart; sherry and soft water, of each, 1 pint; orange-flower water and lemon juice, of each, $\frac{1}{2}$ pint; essence of ambergris, 2 drops (not more); sugar, 2 lbs. See WINE.

Us'quebanch. See the article USQUEBAUGH in another part of this work.

LIQUEUR DE LA MOTTE. [Fr.] See DROPS (Golden) and TINCTURE.

LIQUEUR DORÉE. [Fr.] *Prep.* Take of cinnamon, bitter orange peel, and Peruvian bark, of each, $\frac{1}{2}$ oz.; hay saffron, $\frac{1}{2}$ oz.; brandy and Malaga wine, of each 3 quarts; digest for a week, strain, and add of lump sugar, 2 lbs. Tonic, stomachic, and stimulant; chiefly used as an agreeable alcoholic dram.

LIQUEUR DE PRESSAVIN. [Fr.] *Prep.* From oxide of mercury (freshly precipitated) and cream of tartar, of each, 1 oz.; hot water, 1 quart; dissolve and filter. For use, 2 spoonfuls of this liquor are added to 1 quart of water.—*Dose.* A wine-glassful 3 or 4 times a day, avoiding the use of common salt. This is simply a solution of potassio-tartrate of mercury, and may be taken in the usual cases in which mercury is administered.

LIQUODIL'LA. See LIQUEUR.

LIQUID-AMBAR. *Syn.* COPALM BALSAM. A fluid balsamic juice obtained from the *Liquidambar styraciflua*, an American tree. It closely resembles LIQUID STORAX in its properties, and may be applied to the same purposes. See STYRAX.

LIQUOR. *Syn.* LIQUOR, L.; LIQUEUR, Fr. This term is given in the London Pharmacopœia to those aqueous solutions commonly, though improperly, called 'WATERS'; ammonia liquor potassæ, &c. It is now more correctly applied to the 'WATERS' of the British Pharmacopœia. See SOLUTION.

The term 'liquor' has also, of late years, been applied to certain concentrated preparations, most of which would be more correctly

termed 'FLUID EXTRACTS,' as they merely differ from good extracts in their consistence, and from ordinary extracts in containing less starchy matter, albumen, and gum. There is also usually a little spirit added to them, to prevent decomposition. Liquors of this kind may be prepared of the finest quality, by the same processes that are required for the preparation of good soluble extracts; observing to stop the evaporation as soon as the consistence of treacle is acquired, and when cold, to add 1-4th or 1-5th part of their weight (after evaporation) in rectified spirit. The addition of 3 or 4 drops of the oils of cloves and mustard seed, dissolved in the spirit, will secure them from any risk of 'moulding' or fermenting; in fact, with this addition many of them will keep well without spirit, provided they are evaporated sufficiently, and kept in a cool place. The liquors, which are merely concentrated infusions or decoctions, and which, in their consistence, do not even approximate to extracts, may be made in the manner directed under those heads.

Much confusion would be prevented if the terms 'concentrated decoction,' 'concentrated infusion,' &c., were adopted for those vegetable preparations possessing 8 times the usual strength; 'liquors' for those of a higher strength, but still sufficiently liquid to be treated as such in dispensing, &c.; and 'fluid extracts,' for those possessing considerable consistence, and approaching the common extracts in their degree of concentration and mode of preparation. See DECOCTION, INFUSION, ESSENCE, EXTRACT, SOLUTION, &c.

* * * The following formulæ present some illustrations of the preparation of this class of medicines.

Liquor, Anodyne. See SPIRIT OF ETHER.

Liquor, Antinephritic. *Syn.* LIQUOR ANTINEPHRITICUS, L. *Prep.* (Adams.) Poppy heads, 6 oz.; water, 1½ pint; boil to one third, strain with pressure, and add of nitrate of potassa, 1 oz.—*Dose.* 1 to 2 teaspoonfuls night and morning; in gravel and painful affections of the kidneys and bladder.

Liquor, Antipodagric (Begnins). *Syn.* HOFFMANN'S GOUT LIQUID; LIQUOR ANTIPODAGRICUS HOFFMANNII, L. *Prep.* From Boyle's fuming liquor, 1 part; spirit of wine, 3 parts. *Sudorific.*—*Dose.* 20 to 30 drops; or externally, in gout, and other painful affections, either alone or combined with camphor. See AMMONIA (Perhydrosulphate).

Liquor, Antipsoric. *Syn.* LIQUOR ANTIPSORICUS, LOTIO A., L. *Prep.* (Van Mons.) Sulphuret of sodium, 1½ dr.; hydrochlorate of ammonia, 75 grs.; dissolve each separately in water, ½ pint, mix the solutions, and filter. In itch, and other moist skin diseases.

Liquor, Bleaching. See SOLUTION OF CHLORIDE OF LIME.

Liquor, Boyle's Fu'ming. The perhydrosulphate of ammonia.

Liquor of Calum'ba. *Syn.* LIQUOR CA-

LUMBE, L. Same as CONCENTRATED INFUSION OF CALUMBA.

Liquor of Cam'phor. See ESSENCE.

Liquor of Chire'tta. Same as CONCENTRATED INFUSION OF CHIRETTA.

Liquor of Cincho'na. *Syn.* LIQUOR OF BARK, CONCENTRATED INFUSION OF BARK, INSPISSATUM I. OF B.; INFUSUM CINCHONÆ SPISSATUM (Ph. L.), L. *Prep.* 1. (Ph. L.) Yellow cinchona bark (bruised), 3 lbs., is macerated in distilled water, 6 pints, at two successive operations, as directed under EXTRACT OF CINCHONA—Ph. L.; the mixed infusions are evaporated by the heat of a water bath to one fourth, and placed aside to settle; the clear portion is decanted, the remainder strained, and the mixed liquid again evaporated until its sp. gr. reaches 1.200; to this, when cold, rectified spirit is dropped in, by degrees, "so that 3 fl. drs. may be added to each fl. oz. of the liquor;" lastly, allow it to repose for 20 days, that the dregs may subside.

Obs. It is not at all clear whether the College means 3 fl. drs. of spirit to be added to each fl. oz. of the liquid before its addition, or that it is to be added so that each fl. oz. of the product shall contain that quantity. We presume the former. 1 fl. dr. of this preparation is said to represent fully 4 fl. oz. of the INFUSION OF CINCHONA—Ph. L.; but it is obvious that it must be liable to great variations in strength. "In a general way, 1 fl. dr. may be considered equal to 3 fl. oz. of the infusion." (Pereira.) As commonly met with, this preparation is nearly destitute of the cinchona alkaloids.

2. Yellow cinchona bark, bruised, 56 lbs., and water holding in solution sulphuric acid, 1½ lb., are macerated together, with occasional agitation, in a covered earthen vessel, for 48 hours, after which the liquid is expressed, and the residuum or marc is treated with fresh water; the mixed strained liquid is then evaporated as rapidly as possible in earthenware, to exactly 6 lbs.; to this, rectified spirit, 1½ lb., is added, and the whole is set aside for a week or 10 days; the clear portion is, lastly, decanted and preserved in well-closed bottles. The product is very rich in quinine. It is 96 times as strong as the DECOCTION OF CINCHONA—Ph. L., and 12 times as strong as the above preparation of the Ph. L. This preparation resembles the 'LIQUOR CINCHONÆ' sold by certain houses in the trade, at 24s. per lb., wholesale.

3. Exhaust the bark as above, by maceration in 3 successive waters without acid, filter, evaporate the mixed liquors to 7 lbs., and proceed as before. Inferior to the last, and less rich in the cinchona alkaloids. Very thick; scarcely liquid.

4. FROM PALE BARK :—(LIQUOR CINCHONÆ PALLIDÆ; INFUSUM CINCHONÆ SPISSATUM—Ph. L.) From pale bark, as the last. See INFUSION OF CINCHONA.

Disinfecting-Liquor. See SOLUTION (Chlo-

rides of Lime, Soda, and Zinc), and DISINFECTING COMPOUNDS.

Liquor of Ergot. *Syn.* ESSENCE OF ERGOT OF RYE, CONCENTRATED INFUSION OF E.; ESSENTIA SECALIS CORNUTI, LIQUOR ERGOTÆ, INFUSUM ERGOTÆ CONCENTRATUM, L. *Prep.* Recent ergot of rye (reduced to coarse powder by pounding, or preferably by grinding it in a pepper-mill), 1½ lb., and boiling distilled water, 4 lbs., are digested together in a closed vessel, with frequent agitation, until cold, and then put into a wide-mouthed bottle, along with rectified spirit, 2 lbs.; the whole is then allowed to macerate for a week, after which the liquor is expressed and filtered. *Obs.* 4 fl. drs. of this essence are equal to 1 dr. of ergot in substance. It is 8 times the strength of the INFUSION (as usually prepared according to the formula of Pereira and others), and 2½ times the strength of the TINCTURE OF ERGOT of the London Apothecaries' Hall. This is the only ESSENCE or LIQUOR OF ERGOT known in the wholesale trade.

Liquor of Flints. See SOLUTION.

Libavius's Liquor. Bichloride of tin.

Liquor of Mat'ico. *Syn.* CONCENTRATED INFUSION OF MATICO; LIQUOR MATICONIS, INFUSUM MATICONIS CONCENTRATUM, L. *Prep.* From matico leaves, 1 lb.; rectified spirit, ½ pint; distilled water, 32 fl. oz.; digest 10 days, express, and filter. 1 fl. dr. added to 7 fl. drs. of water is equal to 1 fl. oz. of the common INFUSION.

Liquor of Myrrh. *Syn.* SOLUTION OF MYRRH; LIQUOR MYRRHÆ, LOCO LIQUAMINIS MYRRHÆ, L. *Prep.* (Ph. Bor.) Extract of myrrh (Ph. Bor.), 1 oz.; distilled water, 5 fl. oz.; mix thoroughly, decant, and strain. It should be of a brownish-yellow colour, and turbid. —*Dose.* ½ to 1 fl. dr.

Liquor of Opium. *Syn.* LIQUOR OPII, L. O. CONCENTRATUS, L. OPIATUS, L. See BLACK DROP.¹

1. (Messrs. Smith.) Opium, 4 oz., is made into an extract, and 'denarcotized' by ether; it is then dissolved in alcohol, filtered, evaporated nearly to dryness, and redissolved in water, q. s. to furnish 12 oz. of solution; to this is added, of rectified spirit, 2½ oz., with water, q. s. to make the whole up to 16 oz.—*Dose.* 3 to 12 drops.

2. (Acetic; LIQUOR OPII ACETICUS, L.) See LAUDANUM (Houlton's).

3. (Citric; LIQUOR OPII CITRICUS, L.)—*a.* Powdered opium, 1½ oz.; lemon juice, 1½ pint; evaporate to one half, cool, add of rectified spirit, 5 fl. oz., and the next day decant or filter; same strength as 'LAUDANUM.'

6. (LIQUOR MORPHÆ CITRATIS—Dr. Porter.) Opium, 4 oz.; citric acid, 2 oz.; triturate, and add of boiling water, 15 fl. oz.; digest with agitation for 24 hours, and filter. This last has above three times the strength of LAUDANUM.¹ It is sadly misnamed.

4. (Hydrochloric; SOLUTION OF MURIATE OF

¹ Under Drops, page 415.

OPIUM; LIQUOR OPII HYDROCHLORICUS, L.—Dr. Nichol.) Powdered opium, 1½ oz.; distilled water, 1 pint; hydrochloric acid, 1½ fl. oz.; digest a fortnight, and strain with expression. Same strength as 'LAUDANUM.' According to Dr. Nichol, this is preferable to every other preparation of opium.

5. (Sedative; BATTLE'S SEDATIVE SOLUTION OF OPIUM; LIQUOR OPII SEDATIVUS, L.)—*a.* Hard aqueous extract of opium (bruised), 3 oz., is boiled in water, 1½ pint, until dissolved; to the solution, when cold, rectified spirit, 6 oz., is added, together with water, q. s. to make the whole measure exactly 1 quart; the liquor is, lastly, filtered.

6. From hard extract of opium, 22 oz.; boiling water, 13 pints; rectified spirit, 3 pints; as the last.

c. From extract of opium—Ph. L., 4½ oz.; water, 1 quart; boil till reduced to 34 fl. oz.; cool, filter, and add of rectified spirit, 5 fl. oz., and water, q. s. to make up exactly 1 quart.

Obs. The first two formulae, which vary only in their quantities, are identical with that employed by Mr. Battley. As hard extract of opium is not always at hand, we have introduced a formula in which the ordinary extract is ordered. It gives a precisely similar product to the others, provided the cold aqueous decoction is filtered before adding the spirit. Battley's LIQUOR OPII SEDATIVUS is an excellent preparation, less exciting than opium or laudanum.—*Dose.* 10 to 30 drops. Dr. Christison states that 20 drops of Battley's solution are equal to 30 drops of the common tincture.

Liquor of Rhu'barb. *Syn.* LIQUOR RHEI, INFUSUM RHEI CONCENTRATUM, L. *Prep.* 1. Rhu'barb (well bruised), 6½ oz.; water, q. s.; rectified spirit, ½ pint; proceed as for INFUSION OF CALUMBA (conc.); to produce a quart. 8 times the usual strength.

2. See INFUSION OF RHUBARB (Concentrated).

3. See EXTRACT OF RHUBARB (Fluid).

Liquor of Sarsaparilla. *Syn.* FLUID EXTRACT OF SARSAPARILLA; LIQUOR SARZÆ, ESSENTIA SARSAPARILLÆ, L. *Prep.* Either the simple of the compound liquor or sarsaparilla may be made from the corresponding decoction, or, preferably, the infusion prepared with water at 125° Fahr., by carefully evaporating it until sufficiently concentrated, and then straining it through flannel, and adding a little spirit. Jamaica sarsaparilla should be alone employed, as the other varieties, especially the Honduras, not only possess less medicinal virtue, and yield less extract, but are very liable to ferment and get mouldy, unless an undue proportion of spirit is added to them. See EXTRACT OF SARSAPARILLA (Fluid).

Liquor of Sen'na. *Syn.* LIQUOR SENNÆ, L. Both the FLUID EXTRACT and the CONCENTRATED INFUSION OF SENNA are called by this name, but more generally the former. The following are additional formulae:—

1. (Duncan.) Senna, 15 lbs.; boiling water, 5 galls.; proceed by the method of displacement, evaporate the product to 10 lbs., add of molasses, 6 lbs. (previously concentrated over a water bath until it begins to congeal on cooling), dissolve, and further add of rectified spirit, $1\frac{1}{2}$ pint, together with water, q. s. to make the whole measure exactly 12 pints. Every fl. oz. represents 1 oz. of senna.

2. (Dr. Tweedy.) As the last, but using tincture of ginger (prepared with rectified spirit), $1\frac{1}{2}$ pint, instead of the spirit there ordered.

Liquor of Soap. *Syn.* LIQUOR SAPONIS, L. See TINCTURE.

Styptic Liquor. *Syn.* LIQUOR STEPTICUS, L. *Prep.* (Ph. Slevico-Holsat. 1831.) Alum and sulphate of copper, of each, $1\frac{1}{2}$ oz.; sulphuric acid, 1 oz.; water, 1 lb.; dissolve, and filter.

Liquor of Taraxacum. *Syn.* FLUID EXTRACT OF DANDELION; EXTRACTUM TARAXACI FLUIDUM, LIQUOR TARAXACI, L. *Prep.* 1. Dandelion roots, (dried), 28 lbs., are rinsed in clean cold water, to remove dirt, and then sliced small, and macerated in enough cold water, to cover them, for 24 hours; the liquid is next pressed out, and after the fecula has subsided, the clear portion is decanted, and heated to 180° or 190° Fahr., to coagulate the albumen; the liquid is then filtered while hot, and evaporated by steam, or preferably by a current of warm air, until it is reduced to $22\frac{1}{2}$ lbs.; to this, rectified spirit, 6 lbs., is added, and after thorough agitation, the vessel is set aside for a week or a fortnight, after which the clear portion is gently poured from the sediment and preserved in well-closed bottles in a cool place. A very fine article. It represents an equal weight of the root.

2. The expressed juice of dandelion is heated to near the boiling-point, strained, and evaporated, as the last, to a proper consistence; $\frac{1}{4}$ th or $\frac{1}{3}$ th of rectified spirit is then added, and the liquid is otherwise treated as before. Very odorous and pale coloured.

3. Dried root (coarsely powdered), 1 lb.; water, $1\frac{1}{4}$ pint; rectified spirit, $\frac{1}{2}$ pint; digest a week, express the liquor, pass it through a hair sieve into a bottle, and in 10 days decant the clear portion.

4. (Ph. Bor.) Extract of dandelion, 3 parts; water, 1 part (or q. s.); triturated together.

5. (W. Procter.) Fresh root, 2 lbs., is sliced and reduced to a pulp, and macerated with $\frac{1}{4}$ th of its bulk of rectified spirit for 24 hours; it is then subjected to strong pressure, the marc is treated with water containing a little spirit, 1 pint, and the liquid is again expressed; the mixed product is evaporated to 12 fl. oz., and when cold, rectified spirit, 4 fl. oz., is added, and the whole filtered.

Obs. Liquor of taraxacum has a very large. The dose is 1 to 2 fl. drs. See Ex-

Liquor of Valerian. See EXTRACT OF VALERIAN (Fluid).

Liquor of Vanilla. *Syn.* FLUID EXTRACT OF VANILLA; LIQUOR VANILLE, EXTRACTUM V. FLUIDUM, L. *Prep.* 1. Vanilla (sliced), 1 lb.; rectified spirit, 3 pints; prepare a tincture either by displacement or maceration, and reduce it, by distillation at the lowest possible temperature, to $1\frac{1}{2}$ lb.; put this into a strong bottle whilst hot, add of white sugar candy (in powder), $\frac{1}{2}$ lb., cork down, and agitate the whole until it is nearly cold. Very fine. Used chiefly for its odour and flavour. It represents half its weight of vanilla.

2. (W. Procter.) Vanilla (cut into thin transverse slices), 1 oz.; sugar, 3 oz.; triturate, until reduced to fine powder, put it into a strong pint bottle, along with syrup, $\frac{1}{2}$ pint; water, 2 oz.; tie down the cork, and set the bottle for half an hour in boiling water; cool, strain, and treat the residue in a like manner with a mixture of water, 6 fl. oz., and rectified spirit, 1 fl. oz.; lastly, mix the two products. Greatly inferior to the last.

LIQUORICE. *Syn.* STICK LIQUORICE; LIQUORITIA, GLYCYRRHIZA RADIX (B. P.), GLYCYRRHIZA RADIX, GLYCYRRHIZA (Ph. L. & D.), G. GLABRA (Ph. E.), L. "The root or underground stem of the *Glycyrrhiza glabra*, fresh and dried, cultivated in Britain." "The recent and the dried root of *Glycyrrhiza glabra*," or common liquorice. "The fresh root is to be kept buried in dried sand for use." (Ph. L.) It has a sweetish taste, and is slightly aperient, expectorant, and diuretic. It is a popular demulcent and pectoral. Its extract and solution are much used as a domestic remedy for cough. As a masticatory, it allays thirst and irritation. Its extract is the common LIQUORICE, SPANISH LIQUORICE, or SPANISH JUICE, of the shops. See EXTRACT, &c.

LIST. The border or selvaie torn off a piece of cloth. It is used by the French polishers and law stationers to form their rubbers, and for numerous other purposes.

LITHARGE. *Syn.* SEMI-VITRIFIED OXIDE OF LEAD; PLUMBI OXYDUM (Ph. L.), PLUMBI OXYDUM SEMI-VITREUM (Ph. D.), LITHARGYRUM (Ph. E.), L. The litharge of commerce is semi-vitrified protoxide of lead, obtained chiefly by scraping off the drops that form on the surface of melted lead exposed to a current of air (dross of lead; plumbum ustum), and heating it to a full red, to melt out any undecomposed metal. The fused oxide, in cooling, forms a yellow or reddish semi-crystalline mass, which readily separates into scales; these, when ground, constitute the 'powdered litharge' of the shops. Litharge is also prepared by exposing red lead to a heat less than that necessary to fuse it, and 'English' thick; is obtained as a secondary product by fusion, from argentiferous lead ore, CINCHONÆ often called 'silver stone.' ZISSATUM—

Par. "Entirely, or almost entire last. See in dilute nitric acid. This soly-

SOLUTION (Chlo-

ened by sulphuretted hydrogen. Potassa throws down a white precipitate, which is redissolved by adding the same in excess. If sulphate of soda be added to 100 grs. of this oxide dissolved in nitric acid, 135 grs. of sulphate of lead is precipitated." (Ph. L.) "50 grs. dissolve entirely, and without effervescence, in 1½ fl. oz. of pyroligneous acid, and the solution precipitated by 53 grs. of phosphate of soda remains precipitable by more of the test." (Ph. E.) The solution in both acetic and nitric acid should be colourless. It is of great importance to the pharmacist to obtain pure litharge, as the slightest impurity will often colour and spoil his lead plaster (EMP. PLUMBI, and solution of diacetate of lead (LIQ. PLUMBI DIACETATIS)).

Uses. Litharge is employed in pharmacy, to make plasters and several other preparations of lead; by painters as a 'drier' for oils; and for various other purposes in the arts.

Obs. The litharge of commerce is distinguished by its colour as LITHARGE OF GOLD (LITHARGYRUM AURI, L. AURUM, L. CHERYSITIS), which is dark coloured and impure, and LITHARGE OF SILVER (SILVER STONE; LITHARGYRUM ARGENTI, L. ARGENTUM, L. ARGYRITIS), which is purer, and paler coloured. The dark colour of the former is generally said to be owing to the presence of red lead. Foreign litharge generally contains copper and iron; and, not unfrequently, a little silver and silica. These are readily detected by the usual tests. In grinding litharge, about 1 lb. of olive oil is usually added to each 1 cwt., to prevent dust. The best solvents of litharge are nitric acid and acetic acid. As it slowly absorbs the carbonic acid of the air, it generally effervesces slightly when treated with acids, and this effervescence is stronger in proportion to its age. See LEAD.

LITHIUM. Li. The metallic base of LITHIA, first obtained by Sir H. Davy by exposing hydrate of lithium in contact with mercury to galvanic action, and decomposing the resulting amalgam by distillation. It is now obtained by fusing pure chloride of lithium in a small, thick, porcelain crucible, and decomposing it while in a fused state by a current of electricity. It is a white metal, like sodium, very oxidizable, fusing at 356°, and having a sp. gr. of '59. It is the lightest metal known. It belongs to the 'alkaline group,' of which potassium, sodium, cesium, and rubidium, are the other members.

Lithium forms salts analogous to those of sodium, but usually somewhat less soluble. (They can be distinguished from those of potassium and sodium by the phosphate and carbonate.) (Being only sparingly soluble in water, rate, and those of barium, strontium, and calcium, forming crystallisable and soluble salts.) (The last hasulphuric acid and oxalic acid,—and

LAUDANUM of magnesium, by the solution of 4. (Hydrot exhibiting an alkaline reaction.

1. tinum, they tinge the flame of

the blowpipe carmined red. The salts of lithium may generally be formed by dissolving the hydrate or carbonate in dilute acids.

Lithium, Carbonate of. Li_2CO_3 . *Syn.* CARBONATE OF LITHIA; LITHIÆ CARBONAS (B. P.). *Prep.* To an aqueous solution of sulphate of lithium, add a strong solution of carbonate of ammonium, collect the precipitate, drain, and press, wash with a little rectified spirit, and dry. By dissolving it in boiling water, and slowly evaporating the solution, crystals may be obtained.

Prop., &c. It resembles carbonate of magnesium in appearance; is soluble in about 100 parts of cold water, and in considerably less of boiling water, and is insoluble in alcohol. The tests for its purity given in the B. P. are—in giving no precipitate with oxalate of calcium or lime water, and leaving, when 10 grains are neutralised with sulphuric acid and ignited, 14·86 grains of dry sulphate. It has been proposed by M. Lipowitz, Dr. Garrod, and others, as a solvent for uric acid calculi. According to Biswanger, 1 part of carbonate of lithia in 120 parts of water takes up, at blood-heat, nearly 4 parts of uric acid. Mr. Alexander Ure recommends a dilute solution of this substance as an injection in lithic calculus, as it is a better solvent of uric acid than either borax or the alkaline carbonates. "Of all the various menstrua hitherto recommended, none appear to promise more favourably than the carbonate of lithia." "If by means of injections" (of this solution) "we can reduce a stone at the rate of a grain or more an hour, we shall not merely diminish the bulk of the calculus, but further loosen its cohesion, disintegrate it, so to speak, causing it to crumble down, and be washed away in the stream of urine." (Mr. A. Ure).—*Dose.* 2 to 5 grs., twice or thrice a day; as an injection, 1 gr. to water, 1 fl. oz.

Lithium, Citrate of. $\text{Li}_3\text{C}_6\text{H}_5\text{O}_7$. *Syn.* LITHIÆ CITRAS (B. P.). A white deliquescent amorphous powder, made by acting on 50 grains of lithium carbonate with 100 of citric acid, and is readily soluble in 2½ parts of water.

Test., &c. 20 grains burnt at a low red heat until white leave 10·6 grains of carbonate of lithium. Its medical properties are similar to those of the carbonate.—*Dose.* 5 to 16 grains, largely diluted.

Lithium, Oxide of. Li_2O . *Syn.* LITHIA. An alkaline earth found in petalite, &c., and in small quantities in most mineral waters.

Prep. Petalite (a silicate of aluminum and lithium) in powder mixed with twice its weight of fluor spar is heated with strong sulphuric acid as long as acid vapours are given off. The residue is treated with ammonia, boiled, and filtered, evaporated to dryness, and heated to redness. The residue consists of sulphate of lithium, from which the oxide is obtained by decomposing it with acetate of barium, filtering and heating after having evaporated the solution to dryness.

This yields the so-called oxide, which is in reality the hydrate, LiHO , and is a white, non-volatile, soluble, caustic solid. The true oxide is a white powder decomposed by water forming the hydrate, and obtainable by igniting the metal in oxygen.

Lithia, Effervescing Solution of. *Syn.* LIQUOR LITHIE EFFERVESCENS. *Comp.* Water charged with carbonic acid and holding in solution carbonate of lithium.—10 fl. oz. contain 5 grains of the carbonate.—*Props.* Colourless liquid, possessing powerful diuretic properties.—*Use.* Antilithic, for dissolving calculi of uric acid.—*Dose.* 5 to 10 fl. oz.

LITHOGRAPHY. The art of tracing letters, figures, and other designs, on stone, and transferring them to paper by impression. Our notice of this beautiful and useful art must necessarily be brief.

There are two methods of lithography in general use. In the one, a drawing is made on the stone with a lithographic crayon, or with lithographic ink; in the other method, the design is made on lithographic paper, which, on being moistened and passed through the press, leaves its design on the surface of the stone, reversed. In either method, water acidulated with nitrous acid, oil of vitriol, or hydrochloric acid, is poured over the stone, and this, by removing the alkali from the chalk or ink, leaves the design on it in a permanent form, at the same time that it 'etches' away a portion of the lights, and renders the surface more absorbent of water.

The process of lithographic printing is as follows:—Water is thrown over the stone, the roller charged with printing ink is passed over the surface, the paper is applied, and a copy is obtained by the action of the lithographic press. The same process must be had recourse to for each copy. The nature of the stone is such that it retains with great tenacity the resinous and oily substances contained in the ink or crayon employed to form the design, and also absorbs water freely; this, combined with the peculiar affinity between resinous and oily substances, and their mutual power of repelling water, occasions the ink on the printing roller to adhere to the design, and to leave untouched the lights.

The stones are prepared for lithography by polishing in the ordinary way; the style of work for which they are intended determining the degree of labour bestowed upon them. For crayon drawings, the surface should have a fine grain, but the finish of the stone must depend upon the desired softness of the intended drawing; for writing or drawing on in ink, the surface must receive a higher polish, and must be finished off with pumice-stone and water.

The best lithographic stones are obtained from Solenhofen, near Munich, and from Papenheim, on the banks of the Danube. The white lias which lies immediately under the blue, near Bath, also yields good lithographic

stones, and furnishes the principal portion of those employed in this country. See CRAYONS, INK, and PAPER.

LITHOTRYP'TICS. *Syn.* LITHOTRYPTICS; LITHONTRYPTICA, L. Under this head are intended numerous substances (LITHICS; LITHICA, L.) used to prevent the formation of urinary calculi, or to dissolve them when already formed. Those employed with the former intention are more correctly termed ANTILITHICS (ANTILITHICA, L.), and those with the latter, LITHONTRYPTICS, or LYTHONLYTICS (LITHONTRYPTICA, LITHONTLYTICA, L.).

The following are the principal substances included under this head by pharmacological writers:—Alkalies and their carbonates, benzoic acid, borax, carbonate of lithia, effervescing solution of lithia, carbonic acid, cinna-mic acid, diluents (generally), diuretics (generally), juniper, malic acid, Malvern waters, mineral acids, nitrosaccharate of lead, opium, phosphate of soda, phosphoric acid, poppies, turpentine, ura ursi, vegetable acids, vegetable astringents, vegetable bitters, Vichy waters, wall pellitory, water (pure).

LIT'MUS. *Syn.* TURNSOLE; LACMUS, LACCA CÆRULEA, L. MUSIVA, L. MUSCI, L. A blue substance prepared by the united influence of water, air, ammonia, and either potassa or soda, from *Rocella tinctoria*, *Lecanora tartarea*, or any of the other tinctorial lichens capable of yielding archil, by a process essentially similar to that adopted for the latter substance, except that chalk is generally used to form the paste, which is moulded into cakes and dried.

Pur., &c. "Soluble in both water and alcohol. Its blue colour is reddened by acids, and is restored by the addition of alkalies." (Ph. L. 1836.) It is extensively used by the dyer as a red and crimson colouring matter, and by the chemist as a test for acids. See ARCHIL, CUDBEAR, &c.

LIVE-LONG. Digestive candy. See CANDYING.

LIVER. *Syn.* HEPAR, L. A large abdominal viscus, the exclusive duty of which, until recently, was stated by physiologists to be to secrete bile; but the secretion of sugar for combustion in the lungs or capillaries is now said to be one of its chief duties. The liver is subject to several diseases, both functional and organic, among which inflammation (hepatitis) holds the most prominent place. The acute form of this disease is ushered in with pain in the region of the liver, with sickness, costiveness, and a strong, hard, and frequent pulse, with great pain about the clavicle and shoulders. There is cough, oppressed breathing, and often vomiting of bilious matter. The urine is scanty, and of a saffron-yellow colour, and the skin and eyes are also tinged yellow. The treatment consists chiefly in purging with salines accompanied with mercurials, the use of antimonials, and a blister applied over the region of the liver. Bitter tonics, as calumba, cascarrilla, and gentian,

may afterwards be had recourse to; and if the patient resides in a hot climate a change to a temperate one should be made, if possible. Chronic hepatitis requires similar treatment, but of a less active character. The more usual causes of diseases of the liver, besides those common to the other viscera, are residence in a hot climate, and the excessive use of highly seasoned food and alcoholic liquors.

Liv'er. *Syn.* **HEPAR, L.** In *chemistry and pharmacy*, a term formerly applied to numerous substances, on account of their colour; as liver of antimony (**HEPAR ANTIMONII**), liver of sulphur (**HEPAR SULPHURIS**), &c.

LIXIVIA'TION. The process of dissolving out or extracting the saline matter of bodies, more especially of ashes, the residua of distillations, &c., by means of ablation or digestion in water. The solution so obtained is called a 'LYE,' 'LEY,' or 'LIXIVIUM,' and the salts resulting from the evaporation of such solutions 'LIXIVIAL SALTS.'

LLAMA. *Syn.* **GUANACO; LAMA, L.** A genus of animals of the family *Bovidae* and tribe *Camelina*. The llama is confined to South America, and may be regarded as the representative of the camel in the New World. The most important species are *Lama vicugna* (the VICUNA) and *L. Guanacus* (the GUANACO). The wool of llamas is woven into stuffs for *ponchos*, and made into cords, sacks, &c. See **ALPACA**.

LOAD/STONE. *Syn.* **LODESTONE, MAGNESIAN STONE, MAGNETIC IRONSTONE.** Native magnetic oxide of iron (Fe_2O_3). It is often found massive, frequently crystallised, and occasionally in beds of considerable thickness. Its colour varies from reddish-black to deep gray. Native magnets from Arabia, China, and Bengal, are commonly of a reddish colour, and are powerfully attractive. Those found in Germany and England have the colour of unwrought iron; those from Macedonia are more black and dull.

LOAM. A native mixture of clay, sand, and oxide of iron, with more or less chalk. Loamy soils are of this description. They are called heavy or light, according to the proportion of clay; and sandy, calcareous, or gravelly, just as sand, gravel, or chalk, form a characteristic portion of them.

LOBELIA. *Syn.* **INDIAN TOBACCO; LOBELIA (B. P., Ph. L. E. & D.), L.** "The flowering herb of *Lobelia inflata*" (B. P., Ph. L.), or bladder-podded lobelia. The herb has an unpleasant odour, and an acrid, burning, nauseous taste, somewhat resembling that of tobacco. In small doses (1 to 3 grs.), it is expectorant and diaphoretic; in larger doses (5 to 15 grs.), nauseant and emetic; and in excessive doses, poisonous. According to Dr. Pereira, its principal value is that of an anti-spasmodic. It has been highly recommended by Dr. Elliotson in spasmodic asthma. He commences with small doses, and gradually increases them, unless headache or nausea occurs. Others give a full dose at or before the com-

mencement of the fit. It has been also tried in croup, whooping-cough, and other diseases of the respiratory organs, with variable effect.

Lobelia is the panacea of Dr. Coffin, the author of the pretended system of medicine irreverently called 'Coffinism.'

LOBELIC ACID. The acid existing in decoction of lobelia. It closely resembles gallic acid. It reddens litmus, and is precipitated by several metallic salts.

LOBELINE. *Syn.* **LOBELINA, L.** A light yellowish-brown oily substance, found by Calhoun of Philadelphia in *Lobelia inflata*. It is volatile, soluble in alcohol, ether, and water; and in oil of turpentine, oil of almonds, and some other fixed oils; with the acids it forms crystallisable salts, which are soluble. It may be obtained from the seeds by the action of alcohol acidulated with acetic acid, evaporating, treating with magnesia and then with ether, and again evaporating. 1 oz. of the seeds furnishes 2 grs. When perfectly pure, 1 gr. will kill a large dog.

LOB/STERS. See **SHELL FISH**.

LOCK/SOY. Rice boiled to a paste and drawn into threads. Used to thicken soups. It is imported from China.

LOG/WOOD. *Syn.* **CAMPEACHY WOOD; HÆMATOXYLUM (Ph. L. E. & D.), HÆMATOXYLI LIGNUM (B. P.), LIGNUM CAMPECHENSE, L. CAMPECHIANTUM, L.** The heart-wood of *Hæmatoxylon Campechianum*, a native of the coast of Campeachy, but now common in the West Indies and India. It is a valuable astringent, and its decoction, extract, and infusion, are useful remedies in chronic diarrhoea and dysentery, and in hæmorrhages, &c. The extract is an efficient substitute for catechu and kino.

Logwood is extensively employed in dyeing and calico printing, for the production of reds, violets, purples, blacks, drabs, &c. It readily yields its colour both to spirit and boiling water. The colouring matter requires a large quantity of water to dissolve it, but when dissolved can be concentrated to any degree by boiling down. The infusion is of a fine red, turning on the purple or violet; acids turn it on the yellow, and alkalies deepen it. To stuffs mordanted with alum, it gives various shades of violet and purple, according to the proportions of the materials. By using solution of tin as the mordant, various shades of red, lilac, and violet, may be obtained. The addition of a little Brazil wood is commonly made to brighten the red. With a mordant of sulphate or acetate of iron, it dyes black; and with the addition of a little sulphate of copper, grays of various shades. Silk is, however, chiefly employed, in conjunction with gall-nuts, for blacks, to which it imparts a lustre and velvety appearance. Silk is usually turned through the cold decoction, but for wool the decoction is used either hot or boiling. Logwood is one of the cheapest and most easily managed of the dye stuffs. It

is also used to make ink. See HEMATOXYLIN, INK, &c.

LO'HOCH. See LINCTUS.

LORICA. A species of lute applied as a coating to chemical vessels before exposing them to the fire. Its application is called **LORICATION.** See LUTE.

LOTION. *Syn.* LOTIO, L. An external application, or wash, consisting of water holding in solution medicinal substances. Lotions may be prepared of any soluble medicaments that are capable of exerting their action by contact with the skin. Writers on pharmacology have arranged them in classes, as sedative, anodyne, stimulant, &c., according to their effects. Sedative and refrigerant lotions are commonly employed to allay inflammation;—anodyne and narcotic lotions, to relieve pain;—stimulant lotions, to induce the maturation of tumours, &c.;—detergent lotions, to clean foul ulcers;—repellent and resolvent lotions, to discuss tumours, remove eruptions, &c.;—counter-irritant lotions, to excite a secondary morbid action, with the intention of relieving one already existing. Lotions are usually applied by wetting a piece of linen with them and keeping it on the part affected; or, in slight cases, by moistening the part with the fingers previously dipped into them. Lotions are more agreeable if made with rose water, but are not thereby rendered more efficacious. In all cases, distilled water, or filtered soft water, is alone admissible as the solvent.

As lotions are, in general, mere extemporaneous or magistral preparations, it will, of course, be only necessary here to give the formulæ for a few of those which are the most useful or the most frequently employed. These will serve as examples from which others may be prepared. As a general rule, the medium dose of any substance dissolved in a fluid ounce of distilled water, forms a lotion of the proper strength, under all ordinary circumstances; or, what is the same thing, the medium dose in grains, taken in scruples, is sufficient for a pint of such a lotion. Thus, the dose of sulphate of zinc is 1 to 3 grs.,

therefore— $\frac{1+3}{2} = 2$ grs., which is the proportion of sulphate of zinc, to be taken for 1 fl. oz. of water, or 40 grs. for 1 pint. Again, the dose of bichloride of mercury is $\frac{1}{2}$ to $\frac{3}{4}$ gr.;

therefore— $\frac{\frac{1}{2} + \frac{3}{4}}{2} = \frac{5}{8}$ gr.; or nearly $\frac{1}{2}$ gr. per fl. oz., and 8½ grs. per pint. In this method extreme or unusual doses, as, for instance, those of sulphate of zinc, as an emetic, in poisoning, &c., are not taken into the calculation. In all cases in which lotions are intended for extremely susceptible parts, it is proper to dilute them with an equal bulk of water. When intended for eye-waters (**COLLYRIA**), they should be diluted with at least 3 to 4 times their bulk of water. See EMBROCATION, LINIMENT, &c.

Lotion of Ac'etate of Ammo'nia. *Syn.* LOTIO AMMONIÆ ACETATIS, L. *Prep.* 1. Solution of acetate of ammonia, 1 part; water, 2 parts.

2. (Hosp. F.) Solution of acetate of ammonia, rectified spirit, and water, equal parts. Discutient and refrigerant. In ordinary inflammations.

Lotion of Ac'etate of Lead. *Syn.* LOTIO PLUMBI ACETATIS, L. *Prep.* 1. (Collier) Acetate of lead, 1 dr.; distilled water, 8 fl. oz. Sometimes a little vinegar is added. In excoriations, burns, sprains, contusions, &c. See SOLUTION OF DIACETATE OF LEAD.

2. Acetate of lead, 2 grs.; distilled water, 1 oz. (Ophthalmic Hospital.)

Lotion of Ac'etate of Zinc. *Syn.* LOTIO ZINCI ACETATIS, L. *Prep.* 1. (Béral.) Acetate of zinc, 1½ dr.; water, 1 pint. Astringent; similar to lotion of sulphate of zinc.

2. Acetate of zinc, 1 to 2 grs.; water, 1 oz. An astringent collyrium in ophthalmia, and as injection in gonorrhœa after the acute stage has passed. Neither tincture nor wine of opium gives a precipitate with this lotion.

Lotion, Acetic. *Syn.* LOTIO ACETI, L. *Prep.* 1. Vinegar, 1 part; water, 2 or 3 parts. For bruises, contusions, &c., and as a general refrigerant application to sound parts.

2. Vinegar, 1 fl. oz.; cold water, $\frac{1}{2}$ pint; as a wash in chronic ophthalmia, &c.

Lotion, Acid. See LOTIONS OF ACETIC, NITRIC, AND PHOSPHORIC ACID, &c.

Lotion of Acon'itine. *Syn.* LOTIO ACONITINÆ, L. *Prep.* (Turnbull.) Aconitine, 8 grs.; rectified spirit, 2 fl. oz. In neuralgia; applied by means of a small piece of sponge mounted at the end of a stick. It must never be employed when the skin is broken or abraded; and it would be wise, in most cases, to dilute it with double its volume of proof spirit.

Lotion, Al'kaline. *Syn.* LOTIO ALKALINA, L. POTASSÆ CARBONATIS, L. *Prep.* (P. Cod.) From salt of tartar, 1 oz.; water, 1 pint. Stimulant and detergent. Diluted with an equal bulk of water, it forms an excellent cosmetic wash to remove scurf from the hair. Sometimes it is made with almond milk instead of water.

Lotion of Al'um. *Syn.* LOTIO ALUMINIS, L. *Prep.* From alum, 1½ dr.; distilled or rose water, 1 pint. Astringent. For sore gums, nipples, excoriations, &c.

Lotion, Ammoni'acal. *Syn.* LOTIO AMMONIÆ, L. AMMONIACALIS, L. *Prep.* 1. Liquor of ammonia, 3 fl. drs.; cold water, 5 fl. oz. As a stimulant to indolent ulcers, and in certain skin diseases.

2. (Swediaur.) Liquor of ammonia, spirit of thyme, and spirit of camphor, equal parts. In headaches; applied to the forehead and temples, and in other cases, as a counter-irritant. In most cases it should be used diluted.

3. (Opiated—Dr. Kirkland.) Sal volatile, 3½ fl. oz.; tincture of opium, $\frac{1}{2}$ fl. oz.; water,

4 fl. oz. Anodyne, stimulant, and resolvent.

Lotion, Antiphlogistic. *Syn.* LOTIO ANTIPHLOGISTICA, L. *Prep.* 1. (Copland.) Solution of diacetate of lead, 3 fl. drs.; solution of acetate of ammonia, 2 fl. oz.; distilled water, 1 pint. Refrigerant, sedative, and repellent. Used to allay inflammation, &c.

2. (A. T. Thomson.) Opium, 2 drs.; distilled vinegar, $\frac{1}{2}$ pint. Anodyne and refrigerant; in swelled joints, &c.

Lotion of Arnica. *Syn.* LOTIO ARNICÆ, L. *Prep.* 1. Tincture of arnica, 1 fl. dr.; rose water, 2 $\frac{1}{2}$ fl. oz. In contusions, bruises, extravasations, &c.

2. (Niemann.) Arnica flowers, $\frac{1}{2}$ oz.; hot vinegar, 3 fl. oz.; boiling water, 5 fl. oz.; infuse until cold, and strain. In acute hydrocephalus; or with water, q. s. to measure a pint, as a common lotion.

Lotion, Arsenical. *Syn.* LOTIO ARSENICALIS, L. *ACIDI ARSENIOSI*, L. *Prep.* 1. Arsenious acid, 5 grs.; water, 1 pint. In psoriasis, &c.

2. (Compound—M. le Febre.) Arsenious acid, 8 grs.; boiling water, 16 fl. oz.; dissolve, and add, of extract of hemlock, 1 oz.; solution of diacetate of lead, 3 fl. oz.; tincture of opium, 1 fl. dr. Every morning, in cancer.

Astringent Lotion. *Syn.* LOTIO ASTRINGENS, L. See LOTIONS OF ALUM, SULPHATE OF ZINC, &c.

Lotion, Barlow's. *Prep.* From sulphuret of potassium (in powder), 3 drs.; soap (sliced), $\frac{1}{2}$ dr.; lime water, 7 $\frac{1}{2}$ fl. oz.; proof spirit, 2 fl. oz.; dissolve. In itch, ringworm, &c.

Lotion, Bateman's. *Prep.* From bichloride of mercury, 2 grs.; compound spirit of lavender, 1 fl. oz.; dissolve, and add of distilled water, 4 fl. oz. In obstinate cutaneous eruptions, more especially those of a papular character.

Lotion of Belladonna. *Syn.* LOTIO BELLADONNÆ, L. *Prep.* (Graefe.) Extract of belladonna, $\frac{1}{2}$ dr.; dilute solution of diacetate of lead, $\frac{1}{2}$ pint. Applied to tumours and glandular enlargements.

Lotion of Benzoin. LOTIO BENZOINI. Tincture of benzoin, 1; rose water, 40. A nice lotion to protect the face from the heat of the sun.

Lotion of Bichloride of Mercury. *Syn.* LOTIO HYDRARGYRI BICHLORIDI, L. *H. CHLORIDI CORROSIVI*, L. *Prep.* 1. Corrosive sublimate, 5 to 10 grs.; distilled water, 1 pint. The addition of 5 or 6 grs. of hydrochlorate of ammonia, or as many drops of hydrochloric acid, increases the solvent action of the water, and renders the preparation less liable to change. Some persons dissolve the sublimate in 1 or 2 fl. drs. of rectified spirit before adding it to the water; but this is unnecessary. In obstinate eruptions, glandular swelling, obstinate sores, &c.; also as an injection.

2. (Good.) Corrosive sublimate, 1 dr.; sal ammoniac, 2 drs.; nitre, 4 drs.; water, 6 fl.

oz.; dissolve. In itch, &c. For use, it should be diluted with about 3 times its bulk of water.

3. (LOTIO HYDRARGYRI AMYGDALINA—St. B. Hosp.) Blanched bitter almonds, 1 oz.; water, 1 pint; make an emulsion, and add of bichloride of mercury (dissolved in a little rectified spirit), 10 grs. This resembles GOWLAND'S LOTION, and may be used for it.

Lotion of Bismuth. LOTIO BISMUTHI. Nitrate of bismuth, 6 grs.; corrosive-sublimate, $\frac{1}{2}$ gr.; spirits of camphor, 1 $\frac{1}{2}$ minim; water, 1 oz. A soothing lotion in chronic skin affections.

Lotion, Black. See MERCURIAL LOTION.

Lotion of Bo'rax. *Syn.* LOTIO BORACIS, L. BORACICA, L. *Prep.* 1. (Dr. Abercrombie.) Borax, 2 $\frac{1}{2}$ drs.; distilled vinegar, $\frac{1}{2}$ pint. In ringworm.

2. (Copland.) Borax (in powder), 1 dr.; rose water and orange-flower water, of each, 3 fl. oz.; dissolve. A fragrant and effective application to sore gums, sore nipples, excoriations, &c.

3. (Dr. Johnson.) Borax, 2 drs.; precipitated chalk, 1 oz.; rose water and rectified spirit, of each, 3 oz. For sore nipples.

4. (Dr. Meigs.) Borax, $\frac{1}{2}$ oz.; sulphate of morphia, 6 grs.; rose water, 8 fl. oz. To allay itching and irritation, especially pruritus vulvæ.

5. Borax, 1; rose water, 24. Cosmetic.

Lotion, Bromine. *Syn.* LOTIO BROMINII, L. *Prep.* (Dr. Glover.) Bromine, 1 dr.; water, 1 pint. As an application to scrofulous ulcers.

Lotion for Burns. See LINIMENT.

Lotion, Camphorated. See EVAPORATING LOTION.

Lotion of Cap'sicum. *Syn.* LOTIO CAPSICI, L. *Prep.* (Griffith.) Tinctures of capsicum and camphor, of each, 4 fl. oz.; liquor of ammonia, 2 fl. oz. A powerful rubefacient and counter-irritant.

Lotion of Carbonate of So'da. *Syn.* LOTIO SODÆ CARBONATIS, L. *Prep.* From carbonate of soda, $\frac{1}{2}$ oz.; water, 1 pint. To allay itching and irritation. See ALKALINE LOTION.

Lotion of Cherry Laurel. *Syn.* LOTIO LAURO-CERASI, L. *Prep.* 1. Cherry-laurel water (distilled), 1 $\frac{1}{2}$ fl. oz.; distilled water, $\frac{1}{2}$ pint. Anodyne; useful to allay irritation, &c. Some persons with delicate skin employ it as a wash after shaving.

2. Cherry-laurel water (distilled), 4 oz.; rectified spirit and ether, of each, 1 fl. oz.; extract of belladonna, 2 drs.; agitate well together in the cold. An excellent application in neuralgia, painful tumours, &c.

Lotion for Chilblains. See CHILBLAIN, LINIMENT, &c.

Lotion of Chlo'rate of Soda. *Syn.* LOTIO SODÆ CHLORATIS, L. *Prep.* (Darling.) Chlorate of soda, 5 drs.; water, $\frac{1}{2}$ pint. In pruritus, &c.

Lotion of Chlo'ride of Ammonium. LOTIO

AMMONII CHLORIDI. Chloride of ammonium, 1 oz.; rectified spirit, 1 oz.; water, 10 oz. To this vinegar is sometimes added. *Used* as a dressing for bruises. See also **LOTION OF HYDROCHLORATE OF AMMONIA.**

Lotion of Chloride of Lead. *Syn.* **LOTIO PLUMBI CHLORIDI, L. Prep.** (Tuson.) Chloride of lead, 1 dr.; hot distilled water, 1 pint; dissolve. In cancerous ulcerations, painful neuralgic tumours, &c.

Lotion of Chloride of Tin. *Syn.* **LOTIO STANNI CHLORIDI, L. Prep.** (Nauche.) Chloride of tin, 1 gr.; distilled water, 2 to 3 fl. oz. In cancerous ulcerations.

Lotion of Chloride of Zinc. *Syn.* **LOTIO ZINCI CHLORIDI, L. Prep.** 1. Chloride of zinc, 10 grs. (or solution, $\frac{1}{2}$ fl. dr.); water, 1 pint. As a disinfectant and preventive lotion.

2. (Voght.) Chloride of zinc, 8 grs.; extract of aloes, 40 grs.; distilled water, 4 fl. oz. In atonic and foul ulcers.

Lotion, Chlorinated. *Syn.* **LOTIO CHLORINATA, L. Prep.** 1. (**LOTIO CALCIS CHLORINATAE**)—a. From chloride of lime, 3 drs.; water, 1 pint; agitate together for some time, and strain through muslin.

b. (Derheims.) Chloride of lime, 1 oz.; water, 1 quart; triturate and filter.

2. (**LOTIO SOBÆ CHLORINATÆ**.) From chloride of soda, as the last. They are both excellent washes for foul ulcers, the itch, &c.; and, when diluted, for the teeth, to sweeten the breath, remove the smell of tobacco smoke, to prevent infection, and for various purposes. When intended for application to very tender or abraded surfaces, they must be largely diluted with water.

Lotion of Chloroform. *Syn.* **LOTIO CHLOROFORMI, L. Prep.** Chloroform (pure), $1\frac{1}{2}$ fl. oz.; rectified spirit and cold distilled water, of each, $\frac{1}{2}$ pint. Anodyne. A piece of oiled silk should be laid over the rag to prevent evaporation. The lotion made with water, as commonly prescribed, is inert.

Lotion for Corns. See **CORN.**

Lotion of Creasote. *Syn.* **LOTIO CREASOTI, L. Prep.** 1. Creasote, 2 fl. drs.; liquor of potassa, 3 fl. drs.; water, $\frac{1}{2}$ pint.

2. Creasote, 3 fl. drs.; vinegar and water, of each, $\frac{1}{2}$ pint. In burns, itch, phagedenic ulcerations, ringworm, chancre, &c.

Lotion of Cy'anide of Potassium. *Syn.* **LOTIO POTASSI CYANIDI, L. Prep.** 1. (Caze-nave.) Cyanide of potassium, 10 grs.; emulsion of bitter almonds, 6 fl. oz. In chronic eruptions and other cases attended with much itching or irritation.

2. (Foy.) Cyanide of potassium, 8 grs.; distilled water, 1 fl. oz. In neuralgia, acute rheumatism, &c.; applied by means of compresses of linen. Both the above are poisonous if swallowed.

Lotion of Delphinine. *Syn.* **LOTIO DELPHININÆ, EMBBOCATIO D., L. Prep.** (Dr. Turnbull.) Delphinine, 20 to 60 grs.; rectified spirit, 2 fl. oz. *Used* as **LOTION OF VERATRIA.**

Lotion of Diac'etate of Lead. *Syn.* **GOULARD'S LOTION; LOTIO PLUMBI DIACETATIS, L.** The dilute liquor of diacetate of lead (**LIQ. PLUMBI DIACETATIS DILUTUS—Ph. L.**), See **SOLUTION.** Also Solution of subacetate of lead (B.P.), 3 minims, with 7 minims to 1 oz. water.

Lotion, Evap'rating. *Syn.* **LOTIO EVAPORANS, L. VAPORANS, L. SPIRITUS DILUTI, L. Prep.** 1. (Copland.) Sulphuric ether, rectified spirit, and solution of acetate of ammonia, of each, $1\frac{1}{2}$ fl. oz.; rose water, $3\frac{1}{2}$ fl. oz.

2. (Guy's Hosp.) Rectified spirit, 1 part; water, 5 parts.

3. (Erasmus Wilson.) Rectified spirit, 1 part; water, 4 to 6 parts.

4. (**CAMPHORATED—Ware.**) Camphor, $\frac{1}{2}$ dr.; elder flowers, $\frac{1}{2}$ oz.; rectified spirit, 4 oz.; digest 24 hours, and strain.

Obs. The above are soothing and refrigerant, if allowed to evaporate by free exposure; stimulant, if the evaporation is prevented by covering the part with the hand, or a piece of oiled silk. They are useful applications in nervous headaches, restlessness, itching and irritability of the skin, &c. "A little rose water added to the simple water makes an agreeable addition, and sometimes camphor water (julep), or a little Goulard's extract, may be deemed advantageous, when a greater degree of calming effect is required." (Eras. Wilson.) Eau de Cologne, diluted with an equal quantity of water, is often used as an evaporating lotion.

Lotion of Gall-nuts. *Syn.* **LOTIO GALLÆ, L. Prep.** From gall-nuts (bruised), $\frac{1}{2}$ oz.; boiling water, 1 pint; infuse until cold, and strain. Astringent. An excellent application to sore nipples, or to strengthen them before suckling; spirit of wine, 3 fl. oz., may be advantageously added to the cold infusion, and a like portion of water omitted. See **DECOCTION.**

Lotion of Glycerin. *Syn.* **LOTIO GLYCERINI, L. GLYCERINÆ, L. Prep.** 1. Glycerin, 1 oz.; water, 1 pint. To allay itching, and remove dryness, &c., in various skin diseases; also in chaps of the nipples, lips, and hands. For the latter purpose the addition of 2 to 3 drs. of borax is recommended by some writers.

2. Glycerin, 1 oz.; thick mucilage, 2 oz.; lime water, 7 oz. In burns, scalds, chaps, excoriations, &c.

3. (Startin.) Glycerin, 1 oz.; extract of belladonna, 1 dr.; soap liniment, 3 oz.; triturate together. In bruises, sprains, and swelled joints; gouty, neuralgic, and rheumatic pains, &c.

4. (Startin.) Trisnitrate of bismuth, $\frac{1}{2}$ dr.; tincture of foxglove and dilute nitric acid, of each, 1 fl. dr.; glycerin, 4 drs.; rose water, $8\frac{1}{2}$ fl. oz. To allay the itching in prurigo, and some other skin diseases.

Obs. Various lotions may be prepared by dissolving active medicinal substances in glycerin.

Lotion, Goulard's. See LOTION OF DIACETATE OF LEAD.

Lotion, Gout. *Syn.* LOTIO ANTARTHERITICA, L. *Prep.* 1. Glycerin, 1 oz.; extract of belladonna, 3 drs.; veratrine, 10 grs., dissolved in rectified spirit, 2 fl. oz.; mix, and further add of water, 17 fl. oz. It is poisonous if swallowed.

2. ('SCUDAMORE'S G. L.') From camphor mixture, 9 fl. oz.; rectified spirit, 3 fl. oz. The above are applied on rags or compresses, or are poured on the surface of poultices.

Lotion, Gowland's. This celebrated nostrum is prepared as follows:—Take of Jordan almonds, 1 oz.; bitter almonds, $\frac{1}{2}$ oz.; blanch them, and make an emulsion in soft water, 1 pint; to this add of bichloride of mercury, 15 grs., previously dissolved in rectified spirit, 2 fl. drs., together with enough water to make the whole measure 1 pint, and put it into bottles.

Obs. This preparation is chiefly used as a cosmetic to improve the complexion; and also as a wash for obstinate eruptions and minor glandular swellings and indurations. As a beautifier of the complexion, it is employed by simply wetting the skin with it, either by means of the corner of a napkin or the fingers dipped into it, after which it is gently wiped off with a dry cloth. Dr. Paris represents this nostrum to contain $\frac{1}{2}$ dr. of corrosive sublimate in every pint, which is not the case.

Lotion, Granville's Counter-irritant. See LINIMENT OF AMMONIA (Compound).

Lotion, Hemlock. *Syn.* LOTII CONII, L. *Prep.* (Mid. Hosp.) Extract of hemlock, 3 drs.; opium, 1 dr.; boiling water, 1 pint; digest until cold, and strain. Anodyne and resolvent; in glandular enlargements, painful ulcers, cancer, indurations, rheumatism, neuralgia, &c.

Lotion, Hooping Cough. (Struve's). LOTIO ANTIPERTUSSICA, L. *Prep.* (Paris.) Potassio-tartrate of antimony, 1 dr.; tincture of cantharides, 1 oz.; water, 2 oz. This is a powerful counter-irritant, and should be used with caution, as it is apt to induce a troublesome eruption on the parts to which it is frequently applied.

Lotion of Hydrochlorate of Ammonia. *Syn.* LOTIO AMMONIÆ HYDROCHLORATIS, L. *Prep.* 1. (WEAKER.) From sal ammoniac, 1 to 4 drs.; water, 1 pint. As a wash in itch, ulcers, tender feet, swelled joints, &c.

2. (STRONGER.) From sal ammoniac, 1 to 2 oz.; water, 1 pint. In contusions, chronic tumours, extravasations, chilblains, &c., when the skin is not broken. Both are stimulant and resolvent or discutient. Vinegar is often substituted for the whole or part of the water, and sometimes a fifth or sixth part of rectified spirit is added. See also LOTION OF CHLORIDE OF AMMONIUM.

Lotion, Hydrochloric. *Syn.* LOTIO ACIDI HYDROCHLORICI, L. *Prep.* 1. Hydrochloric acid, 1 fl. oz.; water, 1 pint. In lepra, and several other skin diseases.

2. (Foy.) Hydrochloric acid, 1 part; water, 16 parts. In chilblains, when the skin is unbroken.

Lotion, Hydrocyanic. *Syn.* LOTIO HYDROCYANICI, L. ACIDI HYDROCYANICI, L. *Prep.* 1. (Magendie.) Medicinal hydrocyanic acid, 1 to 2 fl. drs.; lettuce water, 1 pint. In hepatic affections.

2. (Sneider.) Medicinal acid, $1\frac{1}{2}$ fl. dr.; rectified spirit and water, of each, 6 fl. oz.

3. (A. T. Thomson.) Medicinal acid and rectified spirit, of each, 2 fl. drs.; acetate of lead, 16 grs.; distilled water, $7\frac{1}{2}$ fl. oz. In impetigo, &c.

Obs. Lotions of prussic acid are employed to allay pain and irritation in various chronic skin diseases, especially the scaly and itchy eruptions; and in cancer, &c., with variable success. See HYDROCYANIC ACID.

Lotion of Hyposulphite of Soda. *Syn.* LOTIO SODÆ HYPOSULPHITIS, L. *Prep.* (Startin.) Hyposulphite of soda and alum, of each, $1\frac{1}{2}$ dr.; eau de Cologne, $\frac{1}{2}$ fl. oz.; rose water, $7\frac{1}{2}$ fl. oz. In the advanced stages of acne.

Lotion of Iodide of Arsenic and Mercur. *Syn.* LOTIO ARSENICI ET HYDRARGYRI HYDRIODATIS, L. *Prep.* From Donovan's solution, 1 part; water, 9 parts. In lepra, psoriasis, and other scaly skin diseases. See SOLUTION.

Lotion of Iodide of Potassium. *Syn.* LOTIO POTASSII IODIDI, L. *Prep.* 1. From iodide of potassium, 1 to 2 drs.; water, 1 pint. In the usual cases in which ioduretted preparations are employed.

2. (Dr. O. Ward.) Iodide of potassium, 1 dr.; water, $\frac{3}{4}$ pint. In itch. (See below.)

Lotion of Iodide of Zinc. *Syn.* LOTIO ZINCI IODIDI, L. *Prep.* (Ross.) Iodine, $1\frac{1}{2}$ dr.; zinc filings, 1 dr.; water, 8 fl. oz.; digest with heat until the liquid becomes coloured, then filter. In enlarged tonsils.

Lotion of Iodine. *Syn.* LOTIO IODINII, L. *Prep.* From iodine, 2 grs.; rectified spirit, 1 fl. dr.; dissolve, well agitate the solution with distilled water, 1 pint, and filter. An excellent wash for scrofulous ulcers, and in chronic ophthalmia, cutaneous scrofula, and several chronic skin diseases, particularly in highly sensitive habits.

Lotion, Compound, of Iodine. *Syn.* LOTIO IODI COMP., L. *Prep.* 1. Iodide of potassium, 80 grs.; iodine, 60 grs.; water, 1 oz.

2. (Cazenave.) Iodide of potassium and iodide of sulphur, of each, 1 dr.; water, 1 pint. In itch; either alone or diluted with an equal bulk of water.

3. (Dauvergne.) Iodine, 3 drs.; iodide of potassium, 6 drs.; water, 3 fl. oz.; dissolve, and label the bottle No. 1. Sulphuret of potassium, 4 oz.; water, 8 fl. oz.; dissolve. For use, a teaspoonful of No. 1, and a table-spoonful of No. 2, are to be added to about a pint of water. In itch, and several other skin diseases.

4. (Lugol.) Iodine, 1 to 2 grs.; iodide of potassium, 3 to 6 grs.; water, 1 pint. In scro-

fulous ophthalmia, fistulas, &c.; and as a wash in numerous skin diseases.

5. (Righini.) Chloride of lime, 4 drs.; water, 2½ fl. oz.; triturate together, filter into a stoppered bottle, and add of tincture of iodine, 1 dr. With a pint of water, it forms an effective application in itch.

6. (Soubeiran.) Iodide of potassium, 1 oz.; iodine, ½ oz.; water, 6 oz.; dissolve. *Used* as iodine paint; also as a caustic to touch the surfaces of scrofulous ulcers, and the eyelids in scrofulous ophthalmia.

7. Iodide of potassium, ½ dr.; iodine, 16 grs.; water, 1 pint. This is the common and best form of iodine lotion, but for certain purposes it is used much stronger. (See *above*.)

Lotion of Iron with Conium. LOTIO FERRI CUM CONIO. Sulphate of iron, 8 grs.; extract of conium, 8 grs.; water, 1 oz.

Lotion, Itch. *Syn.* LOTIO ANTIPSORICA, L. *Prep.* (Cazenave.) Sulphuret of potassium, 1 dr.; soft soap, 2 drs.; water, 8 fl. oz.; dissolve. An excellent remedy for the itch. It leaves little smell behind, and does not soil the linen. (See *above*.)

Lotion, Kirkland's. See LOTION OF MYRRH.

Lotion of Lemon Juice. *Syn.* LOTIO SUCCI LIMONIS, L. *Prep.* From the freshly expressed juice of lemon, diluted with 4 or 5 times its bulk of water. To render it more agreeable, rose water may be employed, or a few drops of eau de Cologne added. It is cooling and detergent, and forms an excellent application to foul ulcers, and to allay the itching in numerous cutaneous affections.

Lotion of Lime Wa'ter. *Syn.* LOTIO CALCIS SPIRITUOSA, L. *Prep.* (Ph. Chirur.) Rectified spirit, 4 oz.; lime water, 8 fl. oz. See EVAPORATING LOTION (*above*).

Lotion, Mammillary. *Syn.* LOTIO BALSAMI PERUVIANI COMPOSITA, L. *Prep.* (Iverg.) Balsam of Peru, 1 dr.; yolk of 1 egg; make an emulsion, and add of spirit of wild thyme, 3 fl. oz. For sore nipples; to be followed, whilst still wet, by a 'dusting' with a powder composed of Peruvian bark, 1 dr.; gum arabic, 2 drs.

Lotion, Mercu'rial. *Prep.* 1. (BLACK WASH, BLACK LOTION, MILD PHAGEDENIC L.; LOTIO NIGRA (B.P.), L. HYDRARGYRI CINEREA, L. H. NIGRA, L. H. CHLORIDI CUM CALCE, L. MERCURIALIS N., AQUA PHAGEDENICA MITIS, L.) —a. (B.P.) From calomel, 3 grs.; lime water, 1 oz.; well shaken together.

b. (Mid. Hosp.) To the last add of thick mucilage, 1 fl. oz.

c. (Guy's Hospital.) From calomel, 1 dr., to lime water, 8 fl. oz.

Obs. Black wash is a favourite application to all kinds of syphilitic and scrofulous sores. The bottle should be well shaken before the lotion is applied.

2. YELLOW WASH, Y. LOTION, PHAGEDENIC L.; LOTIO FLAVA, L. PHAGEDENICA, AQUA P., LOTIO HYDRARGYRI FLAVA, L. H. BICHLORIDI

CUM CALCE, L.)—a. (B.P.) Corrosive sublimate, 18 grs.; lime water, 10 oz.; well shaken together.

b. (St. B. Hosp.) Corrosive sublimate, 20 grs.; lime water, 6 fl. oz. *Used* as the last, but it is stronger and more active, from containing a little undecomposed bichloride.

Lotion of Myrrh. *Syn.* KIRKLAND'S LOTION; LOTIO MYRRHÆ, L. *Prep.* 1. (Dr. Kirkland.) Tincture of myrrh and lime water, equal parts. In scorbutic ulcers and gums.

2. (Compound; LOTIO MYRRHÆ COMPOSITA, L.—Ph. Chirur.) Honey of roses and tincture of myrrh, of each, 2 fl. drs.; lime water, 2½ fl. oz. As No. 1; also used as a dentifrice.

Lotion of Ni'trate of Bi'smuth. *Syn.* LOTIO BISMUTHI NITRATIS, L. *Prep.* (Cutan. Hosp.) Subnitrate or trisnitrate of bismuth, ½ dr.; corrosive sublimate, 12 grs.; spirit of camphor, ½ fl. dr.; water, 1 pint. In itch, and some other eruptions.

Lotion of Nitrate of Sil'ver. *Syn.* LOTIO ARGENTI NITRATIS, L. *Prep.* 1. Nitrate of silver, 15 grs.; nitric acid, 10 drops; distilled water, ½ pint. As a wash for indolent ulcers, sore legs, &c.

2. (Jackson.) Nitrate of silver, 10 grs.; water, 1 fl. oz. For bed-sores; applied, at first, twice or thrice a day.

3. (Schneider.) Nitrate of silver, ½ dr.; nitric acid, 10 drops; water, 1½ fl. oz. In chilblains, soft corns, &c.

Lotion of Nitrate of Silver (Strong.) LOTIO ARGENTI NITRATIS FORTIS. Nitrate of silver, 60 grs.; distilled water, 1 oz.

Lotion, Etherial, of Nitrate of Sil'ver. LOTIO ARGENTI NITRATIS ÆTHEREA. Nitrate of silver, 20 grs.; distilled water, 1 dr.; spirit of nitrous ether, 1 oz.

Lotion of Ni'tre. *Syn.* LOTIO POTASSE NITRATIS, L. *Prep.* 1. Nitre, 3 drs.; vinegar, ½ pint; water, ½ pint.

2. Nitre, 2 drs.; sal ammoniac, 1 dr.; vinegar and water, of each, ½ pint. In sprains, contusions, extravasations, tender feet, chilblains, &c. Diluted with an equal bulk of water, it is a popular application to 'black eyes.'

Lotion of Ni'tric Acid. *Syn.* LOTIO ACIDI, L. ACIDI NITRICI, L. *Prep.* 1. (Collier.) Nitric acid, ½ fl. oz.; water, 1 pint. In lepra, and other scaly skin diseases.

2. (Phebus.) Nitric acid, 1 fl. dr.; laudanum, 1½ fl. dr.; rose water, ½ pint. For venereal ulcers.

Lotion of Nitromuriatic Acid. *Syn.* LOTION OF AQUA REGIA. *Prep.* (Copland.) Nitromuriatic acid, 1½ dr.; water, 1 pint. In gangrene and mortification.

Lotion of Nux Vom'ica. *Syn.* LOTIO NUCIS VOMICÆ, L. *Prep.* 1. Alcoholic extract of nux vomica, 10 grs.; rectified spirit and water, of each, 2½ fl. oz. In amaurosis.

2. (Radins.) Alcoholic extract of nux vomica, 8 grs.; liquor of ammonia (stronger),

$\frac{1}{2}$ fl. oz.; rectified spirit, 2 fl. oz. In paralysed limbs.

Lotion of Opium. *Syn.* LOTIO OPII, L. OPATA, L. *Prep.* 1. (Christison.) Opium, 40 grs.; water, $\frac{1}{2}$ pint; infuse, add to the filtered liquid a solution of sugar of lead, 40 grs., in water, $\frac{1}{2}$ pint, and filter.

2. (St. B. Hosp.) Opium, $1\frac{1}{2}$ dr.; boiling water, 1 pint; triturate and strain. Anodyne; the first is also refrigerant and discutient.

Lotion of Ox'ide of Zinc. *Syn.* LOTIO ZINCI OXYDI, L. *Prep.* 1. (Augustin.) Oxide of zinc, 1 dr.; elder-flower water, $1\frac{1}{2}$ fl. oz. In pustular erysipelas.

2. (Hosp. F.) Oxide of zinc, $\frac{1}{2}$ dr.; mucilage, 2 fl. drs.; water, 6 fl. drs. As an astringent and desiccant, in scrofulous eruptions, excoriations, moist chaps, &c.

Lotion, Phagedenic. See MERCURIAL LOTION (*above*).

Lotion of Phosphoric Acid. *Syn.* LOTIO ACIDI PHOSPHORICI, L. *Prep.* (Pereira.) Dilute phosphoric acid (Ph. L.), 1 fl. oz.; water, $\frac{1}{2}$ pint. In caries and fistula.

Lotion of Potas'sa. See LOTIO POTASSÆ, L. *Prep.* From liquor of potassa, 1 fl. oz.; water, 1 pint. Detergent; in scorbutic eruptions, and foul ulcers, and to prevent infection.

Lotion of Potas'sio-tar'trate of Antimony. *Syn.* LOTIO ANTIMONIALIS, L. ANTIMONII POTASSIO-TARTRATIS, L. RUBEFACIENS, L. *Prep.* 1. Tartar emetic, 1 dr.; tincture of camphor, 2 fl. drs.; water, 1 pint. As a local stimulant. Diluted with twice or thrice its weight of water, it is employed as a collyrium in chronic ophthalmia, and in specks on the cornea.

2. (Sir Wm. Blizard.) Tartar emetic, 20 grs.; boiling water, 1 fl. oz. Used to cleanse foul ulcers, to repress fungous growths and warts, and in ring-worm, &c.

3. (Pereira.) Tartar emetic, 1 dr.; boiling water, $1\frac{1}{2}$ fl. oz.; dissolve. Employed as a local irritant instead of the ointment. All the above are rubefacient and counter-irritant. See ANTIMONY.

Lotion of Quin'ine. *Syn.* LOTIO QUINÆ, EMBROCATIO Q., L. *Prep.* From disulphate of quinine, 1 dr.; rectified spirit, 5 fl. oz. Applied over the spine in intermittents.

Lotion, Saponaceous. *Syn.* LOTIO SAPONIS, L. SAPONACEA (Ph. L. 1746), L. *Prep.* From liquor of carbonate of potassa, $\frac{1}{2}$ oz.; olive oil, 4 oz.; rose water, 12 oz.; agitate together. Emollient; chiefly as a cosmetic.

Lotion, Saviard's. *Prep.* (Foy.) Caustic potassa, 1 dr.; camphor, 20 grs.; sugar, 1 oz.; water, 1 pint. As a wash for indolent ulcers.

Lotion, Struve's. See HOOPING COUGH LOTION.

Lotion of Sul'phate of Cop'per. *Syn.* LOTIO CUPRI SULPHATIS, L. *Prep.* 1. Blue vitriol, 1 dr.; camphor julep, 1 pint. For phagedenic ulcers, and in itch, &c.

2. (Dr. Graves.) Sulphate of copper, 10

grs.; water, 1 fl. oz. In chilblains, ring-worm &c.

3. (Lloyd.) Sulphate of copper, 1 oz.; water, 1 pint. In itch; either alone or diluted.

Lotion of Sul'phate of Iron. *Syn.* LOTIO FERRI SULPHATIS. Sulphate of iron, 2 grs.; water, 1 oz.

Lotion of Sul'phate of Zinc. *Syn.* LOTIO ZINCI SULPHATIS, L. *Prep.* 1. Sulphate of zinc, $\frac{1}{2}$ dr.; water, 1 pint. Astringent; in some chronic skin diseases, as a wash for loose, flabby granulations, and for ulcers that discharge profusely, &c.

2. (Collier.) Sulphate of zinc, 2 drs.; water, 1 pint. As a counter-irritant in pains of the joints, periosteum, old sprains, &c.

Lotion of Tar. *Syn.* LOTIO PICIS LIQUIDÆ, L. *Prep.* (Saunders.) Quicklime, 6 oz.; water, $2\frac{1}{2}$ pints; slake, add of tar, 4 oz., and boil to one half. This liquid may be advantageously employed in various chronic skin diseases, especially those affecting the heads of children. See INFUSION OF TAR, &c.

Lotion of Valer'ian. *Syn.* LOTIO VALERIANÆ, EMBROCATIO ANTIHYSTERICA, E. EMMENAGOGA, L. *Prep.* From tincture of valerian and proof spirit, equal parts. In hysteria, suppressions, &c.

Lotion of Vera'trine. *Syn.* LOTIO VERATRINÆ, L. *Prep.* (Dr. Turnbull.) Veratrine, 20 to 60 grs.; rectified spirit, 2 oz. In gout, rheumatism, &c. It is extremely poisonous, and must only be used where the skin is sound, and then with great caution.

Lotion of Ver'digris. *Syn.* LOTIO VERUGINIS, L. CUPRI CITRATIS, L. *Prep.* From verdigris, 3 drs.; vinegar, $\frac{1}{2}$ pint; water, $\frac{1}{2}$ pint. As a wash for indolent scrofulous and venereal ulcers.

Lotion of Vin'egar. See ACETIC LOTION (*above*).

Lotion, Yel'low. See MERCURIAL LOTION (*above*).

LOZENGE. *Syn.* TROCHE; TROCHISCUS, TABELLA, L.; TABLETTE, Fr. A small cake, often medicated, consisting principally of powdered sugar, made into a mass with some glutinous liquid, without the aid of heat, and dried. The form given to lozenges (TROCHES; TABELLÆ, TROCHISCI, TABLETTES) is generally that of a small round tablet or flattened cylinder; but originally they were exclusively made in the shape of a lozenge or rhomb, from which circumstance their familiar name is derived. LOZENGES are distinguished from DROPS or PASTILLES by the non-employment of heat in their preparation; and from PASTES, by the latter being formed of vegetable juice or pulp, and having a softer consistence.

In the preparation of lozenges the dry ingredients, separately reduced to a very fine powder, are first perfectly mixed together, and then beaten into a stiff paste with the glutinous liquid employed to give them form; the mass is next rolled out to a desired thickness,

and cut into pieces of the proper shape by means of a small cylinder or punch of steel or tin-plate, called a 'lozenge-cutter.' The newly formed lozenges are lastly dried by placing them on an inverted sieve or frame covered with paper in a dry, warm, and airy situation, and are frequently turned until they become hard and brittle, due care being taken to preserve them from dust and dirt. To prevent the mass adhering to the fingers and utensils during the process of manufacture, a little finely powdered starch, or a very little olive oil, scented with the same aromatic as that contained in the lozenges, may be used. Mucilage of gum arabic or of gum tragacanth, thin isinglass size, or the strained white of egg, are the substances usually employed to make the pulverulent materials adhere together. A strained decoction of Irish moss is now frequently used for the same purpose, for inferior qualities. The larger the proportion of gum which enters into the composition of lozenges, the slower they dissolve in the mouth; hence powdered gum is frequently added to the other materials to increase their quality in this respect, as well as to give additional solidity to those which, like chalk, for instance, are of a peculiarly dry or crumbly nature. Starch and potato flour are often added to lozenge-masses in lieu of a portion of the sugar, and even plaster of Paris is not unfrequently employed to give them weight; frauds which are readily detected in the manner noticed under GUM and SUGAR.

As a general rule, MEDICATED LOZENGES should weigh from 8 to 10 grs. each, and a medium dose of their active ingredient should be distributed through the bulk of 6 to 8 of them, in which case 3 to 5 of them may be safely taken as a dose, or sucked during the lapse of 3 or 4 hours. This will be useful in the preparation of those for which no established proportions are given. In 'sending out' compounds of this class containing active medicaments, as morphia or opium, the retailer as well as the manufacturer should be careful that the quantity contained in each lozenge is plainly marked on the label.

In lozenges intended for MOUTH COSMETICS, or to perfume the breath, ambergris is generally regarded as the most appropriate perfume; but hard smokers frequently prefer cloves and cinnamon, and some ladies give the preference to roses, orange flowers, and orris or violets.

Lozenges are coloured with the same stains as are used for liqueurs and sweetmeats.

Lozenges, as well as all other similar articles of confectionery, should be preserved in well-closed glass bottles, or jars, or in tin canisters, so as to be perfectly excluded from the air and damp.

Lozenges, Absorbent. *TRACHISCI ANTACIDI, L.* *Prep.* 1. Take of precipitated chalk, $\frac{1}{2}$ lb.; gum arabic, 2 oz.; double refined white sugar, 14 oz.; all in impalpable powder; oil of nut-

meg, $\frac{1}{2}$ fl. dr.; pass the mixture through a fine sieve, beat it up with mucilage, q. s., roll the mass into a thin sheet, and cut it into lozenges; lastly, dry them by exposing them on a sheet of white paper to the air, out of contact with dust.

2. As the last, but substituting heavy carbonate of magnesia, $1\frac{1}{2}$ oz., for an equal weight of chalk. In diarrhoea, heartburn, acidity, &c. See CHALK LOZENGES, MAGNESIA L., SODA L., &c.

Lozenges, Aca'cia. See GUM LOZENGES.

Lozenges, Acid'ulated. *Syn.* ACIDULATED LEMON LOZENGES, TARTARIC ACID L.; TROCHISCI ACIDI TARTARICI (Ph. E.), L. *Prep.* From tartaric acid, 2 drs.; oil of lemon, 10 drops; white sugar, 8 oz.; mucilage, q. s. to make a lozenge-mass. The same ingredients mixed with heat form ACIDULATED or ACID DROPS. Both are useful in coughs, hoarseness, sore throats, &c. See CAYENNE LOZENGES, CITRIC ACID L., ROSE L., &c.

Lozenges, Al'kaline. See SODA LOZENGES, VICHY L., &c.

Lozenges, Al'um. *Syn.* TROCHISCI ALUMINIS, L. Each lozenge contains $1\frac{1}{2}$ gr. of alum. As an astringent. See ASTRINGENT LOZENGES.

Lozenges, An'iseed. *Syn.* TROCHISCI ANISI, L. *Prep.* From oil of aniseed, $1\frac{1}{2}$ fl. dr.; finest white sugar, 1 lb.; mucilage, q. s. Carminative and stomachic. In colic, griping, &c.; and as a pectoral.

Lozenges, Anthelmin'tic. See WORM LOZENGES.

Lozenges, Antimonial. *Syn.* TROCHISCI ANTIMONIALES, MORSUM STIBI KUNKELII, L.; TABLETTES DE KUNKEL, Fr. *Prep.* (P. Cod.) Levigated sulphuret of antimony and cardamom seeds, of each, 1 oz.; almonds (blanched), 2 oz.; cinnamon, $\frac{1}{2}$ oz.; sugar, 13 oz.; mucilage of tragacanth, q. s.; to be divided into 15-gr. lozenges. As an alterative.

Lozenges, Ape'rient. *Syn.* TROCHISCI APERIENTES, L. Each lozenge contains 1 gr. each of calomel and scammony, and 2 grs. of jalap; or, instead of the last, $\frac{1}{2}$ gr. of jalapine. 2 to 3 for a dose.

Lozenges, Astringent. *Syn.* TROCHISCI ASTRINGENTES, L. Each lozenge contains $1\frac{1}{2}$ gr. of alum and 2 grs. of catechu. In spitting of blood, relaxed uvula, sore throat, &c. See ALUM LOZENGES.

Lozenges, Bark. *Syn.* TROCHISCI CINCHONAE, L. *Prep.* (P. Cod.) Cinchona, 2 oz.; cinnamon, 2 drs.; white sugar, 14 oz.; mucilage of gum tragacanth, q. s.; mix, and divide into 16-gr. lozenges. Tonic.

Lozenges, Bath. *Syn.* DAWSON'S LOZENGES. From extract of liquorice and gum arabic, of each, $1\frac{1}{2}$ oz.; sugar, 17 oz. It is both rolled into lozenges and formed into pipes. Demulcent; in tickling coughs, &c.

Lozenges, Bicarbonate of Soda. TROCHISCI SODAE BICARBONATIS. Bicarbonate of soda, in powder, 3600 grs. ($8\frac{1}{2}$ oz.); refined sugar, 25

oz.; gum acacia, in powder, 1 oz.; mucilage, 2 oz.; distilled water, 1 oz.; mix, and form in 720 lozenges. Each lozenge contains 5 grs. of bicarbonate of soda.—*Dose.* 1 to 6 lozenges.

Lozenges, Bis'muth. *Syn.* TROCHISCI BIS-MUTHI, L. *Prep.* 1. (B. P.) Subnitrate of bismuth, 346 grs.; carbonate of magnesia, 4 oz.; precipitated chalk, 6 oz.; sugar, 29 oz.; gum acacia, 1 oz.; mucilage, 2 oz.; rose water, a sufficiency; make 720 lozenges. Each lozenge contains 2 grains of subnitrate of bismuth.—*Dose.* 1 to 6 lozenges.

2. (Trousseau.) Each lozenge contains 1 gr. of subnitrate of bismuth. Tonic and antispasmodic; in chronic dyspepsia, gastrodynia, nausea, cramp of the stomach, &c.

Lozenges, Black Currant. TROCHISCI RIBIS NIGRI, L. *Prep.* From inspissated juice of black currants and sugar, of each, in powder, 1 lb.; tartaric acid, $\frac{1}{2}$ oz.; mucilage, q. s. In hoarseness, &c.

Lozenges, Bo'rax. *Syn.* TROCHISCI BORACIS, L. Each lozenge contains 3 grs. of borax. One occasionally in aphthous sore mouth, sore throat, &c.

Lozenges, Bromide of Ammonium. Each lozenge contains 2 grs. of bromide of ammonium.—*Dose.* 1 to 3 lozenges.

Lozenges, Burnt Sponge. *Syn.* TROCHISCI SPONGIÆ, T. s. USEÆ, L. *Prep.* (P. Cod.) Burnt sponge, 4 oz.; sugar, 12 oz.; mucilage of tragacanth, q. s.; divide into 12-gr. lozenges. In scrofula, glandular enlargements, &c.

Lozenges, Caca'o. *Syn.* TROCHISCI BUTYRI CACAO, L. Each lozenge contains 1-3rd of its weight of pure cacao butter. In habitual constipation; and in phthisis, scrofula, &c., instead of cod-liver oil; taken *ad libitum*. They are usually scented with roses.

Lozenges, Caffeine. *Syn.* TROCHISCI CAFFEINÆ, L. Each lozenge contains $\frac{1}{4}$ gr. of caffeine and $\frac{1}{2}$ gr. of citric acid. In hemicrania, hypochondriasis, &c.

Lozenges, Cal'omel. *Syn.* WORM LOZENGES; TROCHISCI CALOMELANOS, T. HYDRARGYRI CHLORIDI, L. *Prep.* (P. Cod.) Each lozenge contains 1 gr. of calomel. Alterative, &c. They afford a simple way of introducing mercury into the system. During their use, salt food and acid liquors should be avoided. When given for worms, they should be followed, in a few hours, by a purge.

Lozenges, Cam'phor. *Syn.* TROCHISCI CAMPHORÆ, L. Each lozenge contains $\frac{3}{4}$ gr. of (finely powdered) camphor. They must be kept in a well-corked bottle.

Lozenges, Car'bonate of Lime. See CHALK LOZENGES.

Lozenges, Cat'echu. *Syn.* CACHOU LOZENGES; TROCHISCI CATECHU (B. P.), T. DE TERRA JAPONICA, L.; TABLETTES DE CACHOU, Fr. *Prep.* 1. (Ph. E. 1744.) Catechu, 2 oz.; tragacanth, $\frac{1}{2}$ oz.; white sugar, 12 oz.; rose water, q. s.

2. (P. Cod.) Extract of catechu, 4 oz.; sugar, 16 oz.; mucilage of gum tragacanth, q. s.; for 10-gr. lozenges.

3. (TRO. CATECHU ET MAGNESIÆ—P. Cod.) Magnesia, 2 oz.; powdered catechu, 1 oz.; sugar, 13 oz.; mucilage of gum tragacanth (made with cinnamon water), q. s. to mix.

4. (PERFUMED.) See CACHOU AROMATISÉ and PASTILS.

5. (B. P.) Pale catechu, in powder, 720 grs.; refined sugar, in powder, 25 oz.; gum arabic, in powder, 1 oz.; mucilage, 2 oz.; distilled water, a sufficiency; divide into 720 lozenges. Each lozenge contains 1 gr. of catechu.—*Dose.* 1 to 3 lozenges.

Obs. All the above are taken in diarrhœa, in relaxation of the uvula, in irritation of the larynx, and as cosmetics to fasten the teeth, and disguise a fetid breath. The one containing magnesia (No. 3) is also sucked in dyspepsia, acidity, and heartburn.

Lozenges, Cayenne'. *Syn.* TROCHISCI CAPSICI, L. Flavoured with essence or tincture of capsicum or cayenne, with a very concentrated Chili vinegar, or a little pure soluble cayenne pepper.

2. (ACIDULATED.) To each lb., add of tartaric acid, $\frac{1}{2}$ oz. Both are used in dyspepsia, and to promote digestion and create an appetite. They have also been recommended in temporary deafness arising from exposure to cold. They are generally tinged of a light pink or red colour.

Lozenges, Chalk. *Syn.* HEARTBURN LOZENGES; TROCHISCI CRETÆ (Ph. E.), T. CARDIALGICI, TABLETTES CARDIALGICÆ, L. *Prep.* (Ph. E.) Prepared chalk, 4 oz.; gum arabic, 1 oz.; nutmeg, 1 dr.; white sugar, 6 oz.; rose or orange-flower water, q. s. Antacid and absorbent. 3 or 4 sucked *ad libitum*; in heartburn, dyspepsia, diarrhœa, acidity of the stomach and bowels, &c.

Lozenges, Char'coal. *Syn.* TROCHISCI CARBONIS, L. *Prep.* 1. (P. Cod.) Prepared charcoal, 4 oz.; white sugar, 12 oz.; mucilage, q. s. to mix. In diarrhœa, cholera, dyspepsia, &c.

2. (TRO. CARBONAS CUM CHOCOLATÂ—M. Chevallier.) Charcoal and white sugar, of each, 1 oz.; chocolate, 3 oz.; mucilage of gum tragacanth, q. s. to mix. Nutritious; used as the last.

Lozenges, Ching's Worm. *Prep.* 1. (YELLOW.) From saffron, $\frac{1}{2}$ oz.; boiling water, 1 pint; infuse, strain, add of calomel, 1 lb.; powdered white sugar, 28 lbs.; mix well, make a mass with mucilage of tragacanth, and divide it into 7000 lozenges. Each lozenge contains 1 gr. of calomel.

2. (BROWN.) From calomel, 7 oz.; resinous extract of jalap, 3 $\frac{1}{2}$ lbs.; white sugar, 10 lbs.; mucilage of tragacanth, q. s.; mix, and divide into 6125 lozenges. Each lozenge contains $\frac{1}{2}$ gr. of calomel and 3 $\frac{1}{2}$ grs. of resinous extract of jalap. 1 to 6 of the yellow lozenges over night, as a vermifuge, followed by an equal

number of the brown ones the next morning fasting.

Lozenges, Chlo'rate of Potassa. *Syn.* TROCHISCI POTASSÆ CHLORATIS, L. *Prep.* 1. Each lozenge contains $1\frac{1}{2}$ gr. of chlorate of potassa. In phthisis, sore throat, &c. 6 to 12 a day.

2. (B. 1P) Chlorate of potash, in powder, 3600 grs. ($8\frac{1}{2}$ oz.); refined sugar, in powder, 25 oz.; gum acacia, in powder, 1 oz.; mucilage, 2 oz. distilled water, 1 oz., or a sufficiency; mix the powders, and add the mucilage and water to form a proper mass; divide in 720 lozenges. Each lozenge contains 5 grs. of chlorate of potash.—*Dose.* 1 to 6 lozenges.

Lozenges, Chloride of Ammonium. Each lozenge contains 2 to 3 grs. of chloride of ammonium. *Used* in bronchitis.—*Dose.* 2 to 4 lozenges.

Lozenges, Chlo'ride of Gold. 1. (TROCHISCI AURI CHLORIDI, L.) Each lozenge contains $\frac{1}{16}$ gr. of neutral chloride of gold. 2 to 4 daily; in scrofula, cancer, &c.

2. (With soda; TROCHISCI AURI ET SODII CHLORIDI, T. SODII AURO-CHLORIDI, L.—*Chrestien.*) Each lozenge contains $\frac{1}{16}$ th gr. of soda-chloride of gold. Two daily; as the last.

Lozenges, Chloride of Lime. *Syn.* TROCHISCI CALCIS CHLORIDI, T. C. CHLORINATÆ, L. Each lozenge contains $\frac{1}{4}$ gr. of dry chloride of lime. They are frequently tinged with a little carmine. *Used* to sweeten the breath, and whiten the teeth. They do not keep well.

Lozenges, Choc'olate. *Syn.* TROCHISCI CHOCOLATÆ, L. From vanilla chocolate pressed into sheets, and cut into pieces whilst hot.

Lozenges, Cinch'na. *Syn.* TROCHISCI CINCHONÆ EXTRACTI, L. Each lozenge contains $1\frac{1}{2}$ gr. of dry extract of bark. A little cinnamon or nutmeg is often added. See BARK LOZENGES.

Lozenges, Cin'namon. *Syn.* TROCHISCI CINNAMOMI, L. From cinnamon (in fine powder), 1 oz., or the essential oil, 1 fl. dr., to each lb. of sugar. Carminative and stomachic. CASSIA LOZENGES are made in the same way, and are frequently substituted for them.

Lozenges, Cit'rate of Iron. *Syn.* TROCHISCI FERRI CITRATIS, L. Each lozenge contains $1\frac{1}{2}$ gr. of ammonio-citrate of iron. As a mild chalybeate tonic. They are sometimes made with equal parts of sugar and vanilla chocolate.

Lozenges, Citrate of Magnesia. *Syn.* TROCHISCI MAGNESIÆ CITRATIS, L. Each 15-gr. lozenge contains 5 grs. of pure citrate of magnesia. Laxative.

Lozenges, Cit'ric Acid. *Syn.* TROCHISCI ACIDI CITRICI, L. *Prep.* (P. Cod.) Citric acid, 3 drs.; sugar, 16 oz.; essence of lemon, 16 drops; mucilage of tragacanth, q. s.; mix, and divide into 12-gr. lozenges. In coughs, hoarseness, &c.

Lozenges, Clove. *Syn.* TROCHISCI CARYOPHILLI, L. From cloves (powdered along with sugar), 2 oz., or essential oil, 1 fl. dr., to each lb. of sugar. They are frequently coloured. Carminative and stomachic; also used as a restorative after fatigue, added to chocolate to improve its flavour, and sucked to sweeten the breath.

Lozenges, Cough. *Syn.* PECTORAL LOZENGES, PULMONIC L.; TROCHISCI ANTICATARRHALES, L. *Prep.* 1. (Black-currant lozenge-mass, 1 lb.; ipecacuanha (in very fine powder, 2 drs. For 12-gr. lozenges.

2. To the last add of powdered opium and camphor, $1\frac{1}{2}$ dr.

3. To either No. 1 or 2 add of oil of aniseed, $1\frac{1}{2}$ fl. dr.

4. (TABLETTES DE TRONCHIN.) From powdered gum arabic, 8 oz.; oil of aniseed, 16 drops; extract of opium, 12 grs.; kermes mineral, 1 dr.; pure extract of liquorice, 2 oz.; white sugar, 32 oz.; water, q. s.; mix, and divide into 10-gr. lozenges.

5. (TABLETTES DE VANDAMME.) From benzoic acid, 1 dr.;orris powder, 2 drs.; gum arabic (powdered), 1 oz.; starch, 2 oz.; sugar, 16 oz.; water, q. s.; mix and divide into 15-gr. lozenges.

6. Each lozenge contains $\frac{1}{2}$ gr. of lactucarium, $\frac{1}{2}$ gr. of powdered ipecacuanha, and $\frac{1}{16}$ gr. of powdered squills, together with $\frac{1}{3}$ rd of their weight of pure extract of liquorice.

Obs. To render the above serviceable in coughs, hoarseness, &c., the bowels should be kept gently open with some mild aperient, and a light diet adopted, with abstinence from stimulating liquors. See EMETINE LOZENGES, IPECACUANHA L., &c.

Lozenges, Cro'ton Oil. *Syn.* TROCHISCI CROTONIS, L. *Prep.* (Soubeiran.) Croton oil, 5 drops; powdered starch, 40 grs.; white sugar, 1 dr.; chocolate, 2 drs.; divide into 30 lozenges; 5 or 6 generally prove cathartic.

Lozenges, Cu'bebine. *Syn.* TROCHISCI CUBEBINI, L. *Prep.* (Ph. Hamb.) Copaiba and extract of cubebs, of each, 6 oz.; yolks of 3 eggs; mix, add of powdered marshmallow root, 6 oz.; make it into pipes of 12 grs. each, and roll them in sugar. In gleet, &c., and in affections of the mucous membranes of the throat and fauces. Lablonye orders them to be made of sugar, and flavoured with oil of pepper-mint.

Lozenges, Cu'bebs. *Syn.* TROCHISCI CUBEBSÆ, L. *Prep.* (Spitta.) Cubebs, 2 drs.; balsam of tolu, 6 grs.; mix, and add of extract of liquorice, 1 oz.; syrup of tolu, 1 dr.; powdered gum, q. s.; divide into 10-gr. lozenges. One of these, allowed to melt gradually in the mouth, is said to alleviate the obstruction in the nose, in coryza.

Lozenges, D'Arcet's. See VICHY LOZENGES.

Lozenges, Digestive. See RHUBARB LOZENGES, GINGER L., DIGESTIVE CANDY, &c.

of poppies, 2 oz.; powdered tragacanth, 4 oz.; sugar, 10 oz.; rose water, q. s. to form a lozenge mass.

Lozenges, Em'etine. *Syn.* TROCHISCI EMETINÆ, L. *Prep.* (Magendie.)—1. From impure or coloured emetine, 32 grs. (or pure emetine, 8 grs.); white sugar, 2 oz.; mucilage, q. s. to mix; divide into 64 lozenges. Emetic. —*Dose.* 1 for a child, and 4 for an adult. They are generally tinged of a pink colour with carmine.

2. From impure or coloured emetine, 32 grs. (or pure emetine, 8 grs.); sugar, 4 oz.; mucilage, q. s.; divide into 256 lozenges. Pectoral. 1 every hour, or oftener, for an adult. The last are intended to take the place of ipecacuanha lozenges, but are rather stronger.

Lozenges, Escharotic. *Syn.* TROCHISCI ESCHAROTICI, L. *Prep.* (P. Cod.) Corrosive sublimate, 2 drs.; starch, 4 drs.; mucilage of tragacanth, q. s.; mix, and divide into 3-gr. oat-shaped granules. For external use only. See CAUSTIC (Zinc).

Lozenges, Ferrocyanide of Iron. *Syn.* TROCHISCI FERRI FERROCYANIDI, T. CÆRULEI, L. Each lozenge contains $1\frac{1}{2}$ gr. of pure Prussian blue. Alterative, febrifuge, and tonic; in epilepsy, intermittents, diseases of the ganglionic system, &c.

Lozenges, Fruit. *Prep.* From juice of black currants (boiled to the consistence of an extract), 1 lb.; juice of red currants (similarly treated), $\frac{1}{2}$ lb.; powdered gum tragacanth, $\frac{1}{4}$ lb.; sugar, 3 lbs.; raspberry syrup, q. s.; pear essence, a few drops. Resemble black currant lozenges, but are more agreeable.

Lozenges, Garana. See PAULLINIA LOZENGES.

Lozenges, Gin'ger. *Syn.* TROCHISCI ZINGIBERIS, L. *Prep.* From the best unbleached Jamaica ginger and gum arabic, of each, in very fine powder, $1\frac{1}{2}$ oz.; double refined lump sugar, 1 lb.; rose water (tinged with saffron), q. s. A still finer quality may be made by using an equivalent proportion of essence of ginger, instead of the powder. Inferior qualities are prepared with coarser sugar, to which some starch is often added. Ginger lozenges are carminative and stomachic, and are useful in flatulency, loss of appetite, dyspepsia, &c.

Lozenges, Gold. *Syn.* TROCHISCI AURI, L. Each lozenge contains $\frac{1}{16}$ gr. of pulverulent gold.

Lozenges, Gum. *Syn.* TROCHISCI ACACIÆ (Ph. E.), T. GUMMI ARABICI, T. COMMOSI, L. *Prep.* 1. (Ph. E.) Gum arabic, 4 oz.; tarch, 1 oz.; white sugar, 12 oz.; (all in very fine powder); rose water, q. s.

2. (P. Cod.) Gum arabic, 1 lb.; sugar, 3 lbs.; orange-flower water, 2 fl. oz.

3. (Transparent) From the same materials, but employing a gentle heat. Demulcent; used to allay tickling coughs.

Lozenges, Gum Tragacanth. *Syn.* TROCHISCI TRAGACANTHÆ, T. GUMMI T., L. *Prep.* (Ph. E. 1744.) Compound powder of tragacanth, 3 oz.; sugar, 12 oz.; rose water, 4 fl. oz. Re-

semble the last, but are more durable in the mouth.

Lozenges, Heart'burn. See CHALK LOZENGES, &c.

Lozenges, Iceland Moss. *Syn.* TROCHISCI LICHENIS, L. (P. Cod.) Contain half their weight of dried and powdered lichen jelly. Resemble gum lozenges.

Lozenges, Indian Hemp. *Syn.* TROCHISCI CANNABIS, T. C. INDIOT, L. (Ebriard.) Each lozenge contains $\frac{1}{12}$ gr. of extract of Indian hemp.

Lozenges, I'odide of Iron. *Syn.* TROCHISCI FERRI IODIDI, L. Each lozenge contains $\frac{1}{2}$ gr. of dry iodide of iron. 12 to 20 daily; in amenorrhœa, chlorosis, scrofulous debility, &c. They are generally flavoured with a little nutmeg or cinnamon.

Lozenges, Iodide of Potassium. *Syn.* TROCHISCI POTASSII IODIDI, L. Each lozenge contains 1 gr. of iodide of potassium, flavoured with nutmeg or cinnamon. 10 to 15 daily; in scrofula, indurations, &c. One of the best ways of taking iodide of potassium.

Lozenges, Ipecacuan'ha. *Syn.* TROCHISCI IPECACUANHÆ, L. *Prep.* 1. (P. Cod., Hamb. do., and Ph. U. S.) Each lozenge contains $\frac{1}{4}$ gr. of ipecacuanha.

2. (TRO. IPECAC. CUM CAMPHORÆ.) Each lozenge contains $\frac{1}{2}$ gr. of camphor, and $\frac{1}{4}$ gr. of ipecacuanha.

3. (TRO. IPECAC. CUM CHOCOLATÆ—P. Cod.) Each lozenge contains 1 gr. of ipecacuanha, and 12 grs. of chocolate *à la vanille*. The above are pectoral and expectorant, and are very useful in tickling and chronic coughs, hoarseness, &c.

Lozenges, Ipecacuanha and Morphia. *Syn.* TROCHISCI IPECACUANHÆ ET MORPHIÆ (B.P.) Each lozenge contains $\frac{1}{12}$ gr. ipecacuanha and $\frac{3}{16}$ gr. hydrochlorate morphia.—*Dose.* 1 to 6 lozenges. See MORPHIA AND IPECACUANHA LOZENGES.

Lozenges, I'ron. *Syn.* TROCHISCI FERRI, T. CHALYBEATI, L. 1. Each lozenge contains 1 gr. of Quevenne's iron. See LOZENGES, REDUCED IRON, p 724.

2. (TRO. FERRI CARBONATIS.) Each lozenge contains $1\frac{1}{2}$ gr. of saccharine carbonate of iron. They are both mild and excellent chalybeates. See STEEL LOZENGES.

Lozenges, Ju'jube. See JUJUBE PASTE.

Lozenges, Ker'mes Mineral. *Syn.* TROCHISCI KERMETIS, L. *Prep.* 1. (P. Cod.) Each lozenge contains $\frac{1}{2}$ gr. of kermes mineral, and about $\frac{3}{4}$ gr. of gum, made up with sugar and orange-flower water. Diaphoretic and expectorant.

2. (Compound.) As the last, but with the addition of $\frac{1}{2}$ gr. of opium, $\frac{1}{4}$ gr. of squills, and $\frac{1}{2}$ gr. of ipecacuanha. Anodyne and expectorant; both are very useful in catarrhs.

Lozenges, Lactate of Iron. *Syn.* TROCHISCI FERRI LACTATIS, L. *Prep.* (Cap.) Each lozenge contains 1 gr. of lactate of iron. Tonic. Useful in debility, accompanied with a diseased state of the organs of digestion.

Lozenges, Lactic Acid. *Syn.* TROCHISCI ACIDI LACTICI, L. Each lozenge contains 1 gr. of lactic acid to about 12 grs. of sugar. They are best flavoured with vanilla or nutmeg. In dyspepsia, &c., especially in gouty subjects. Those prepared by Magendie's formula contain a larger proportion of acid, but are much too sour for frequent use.

Lozenges, Lactucarium. *Syn.* TROCHISCI LACTUCARII, L. *Prep.* (Ph. E.) Prepared with lactucarium in the same manner as the opium lozenges, Ph. E. Each of these lozenges contains from $\frac{1}{4}$ to $\frac{1}{2}$ gr. of lactucarium. Anodyne and demulcent. *Used* to allay tickling coughs, &c.

Lozenges, Lavender. *Syn.* TROCHISCI LAVANDULÆ, L. From $\frac{3}{4}$ fl. dr. of Mitcham oil of lavender to each lb. of sugar, and tinged red with liquid lake or carmine; or violet, with litmus or indigo. *Used* chiefly to scent the breath. Those of the shops are generally deficient in odour.

Lozenges, Lemon. *Syn.* TROCHISCI LIMONIS, T. LIMONUM, L. *Prep.* 1. From 1 fl. dr. of oil of lemon to each 1 lb. of double refined white sugar.

2. (Acidulated.) See CITRIC and TARTARIC ACID LOZENGES.

Obs. Lemon lozenges and drops are agreeable sweetmeats, and those that are acidulated are often very useful to promote expectoration in coughs, &c. The last are also made into drops as well as lozenges, when they form the 'ACIDULATED LEMON DROPS' of the shops. Those that are made of citric acid are by far the most wholesome. Both lemon lozenges and drops are generally coloured with infusion of saffron or turmeric.

Lozenges, Lettuce. *Syn.* TROCHISCI LACTUCÆ, L. *Prep.* From extract of lettuce, extract of liquorice, gum, and sugar, equal parts. Anodyne and demulcent; in obstinate cough without expectoration. See LACTUCARIUM LOZENGES.

Lozenges, Li'chen. See ICELAND MOSS LOZENGES.

Lozenges, Liquorice. *Syn.* BLACK LOZENGES; TROCHISCI GLYCYRRHIZÆ, T. G. GLABRÆ, T. BECHICI NIGRI, L. *Prep.* (1. Ph. E.) Extract of liquorice and gum acacia, of each, 6 oz.; white sugar, 12 oz.; dissolve in water, q. s.; evaporate to a paste, and form into lozenges, pectoral and demulcent. *Used* to allay tickling coughs and remove hoarseness.

2. (With OPIUM.) See OPIUM LOZENGES.

Lozenges, Magnesia. *Syn.* HEARTBURN LOZENGES; TROCHISCI MAGNESIÆ (Ph. E.), L. *Prep.* 1. (Ph. E.) Carbonate of magnesia, 6 oz.; powdered white sugar, 3 oz.; oil of nutmeg, 20 drops; mucilage of tragacanth, q. s. to mix.

2. (Ph. U. S.) Calcined magnesia, 4 oz.; sugar, 12 oz.; nutmeg, 1 dr.; mucilage of tragacanth, q. s.; for 10-gr. lozenges.

(Wholesale.) Calcined magnesia, 3 oz.; powdered gum tragacanth, 1 oz.; double refined

lump sugar, $\frac{3}{4}$ lb.; rose or orange-flower water, q. s. to make a lozenge mass.

Obs. Magnesia lozenges are very useful in heartburn, acidity, and indigestion. The confectioners generally omit the nutmeg, and make their mucilage with either rose or orange-flower water, or else add the dry gum to the mass, and then mix up the powders with one or other of these liquids. It is also an improvement to use calcined magnesia, which is about twice as strong as the carbonate, and consequently less need be employed.

Lozenges, Manna. *Syn.* TROCHISCI MANNÆ, L. *Prep.* (Van Mons.) Powdered tragacanth, 1 dr.; white sugar, 12 oz.; manna, 3 oz.; orange-flower water, q. s. to mix. Demulcent, and in large numbers slightly laxative.

Lozenges, Marsh-Mallow. *Syn.* TROCHISCI ALTHÆÆ, L.; TABLETTES DE GUIMAUVE, Fr. *Prep.* (P. Cod.) Marsh-mallow root (decorated and finely powdered), 2 oz.; sugar, 14 oz.; mucilage of tragacanth (made with orange-flower water), q. s. Demulcent and expectorant. *Used* to allay the irritation in cough, &c. The preparations of marsh-mallow have always been highly esteemed as pectorals by the vulgar.

Lozenges, Min'ium. *Syn.* TROCHISCI MINII (Ph. E. 1744), L. *Prep.* From red lead, 1 dr.; corrosive sublimate, 2 drs.; crum of bread, 1 oz.; rose water, q. s.; to be made up into oat-like grains. For external use only.

Lozenges, Morphia. *Syn.* TROCHISCI MORPHIÆ (B. P., Ph. E.), T. M. HYDROCHLORATIS, L. *Prep.* 1. (Ph. E.) Hydrochlorate of morphia, 20 grs.; tincture of tolu, $\frac{1}{2}$ fl. oz.; powdered white sugar, 25 oz.; dissolve the hydrochlorate in a little warm water, mix it with the tincture and the sugar, make a mass with mucilage of gum tragacanth, q. s., and divide it into 15-gr. lozenges. Each lozenge contains about $\frac{1}{10}$ gr. of hydrochlorate of morphia. *Used* as opium lozenges, but are pleasanter. The morphia lozenges of the shops generally contain $\frac{1}{12}$ gr. of hydrochlorate of morphia. (Pereira.)

2. (With IPEACUANHA; TROCHISCI MORPHIÆ ET IPEACUANHÆ—Ph. E.) As the last, adding of ipecacuanha, 1 dr. Each lozenge contains about $\frac{1}{10}$ gr. of hydrochlorate of morphia, and $\frac{1}{12}$ gr. of ipecacuanha. Anodyne and expectorant; in tickling coughs, &c., and to allay pain.

3. Hydrochlorate of morphia, 20 grs.; tincture of tolu, $\frac{1}{2}$ oz.; refined sugar, in powder, 24 oz.; gum arabic, in powder, 1 oz.; mucilage, 2 oz., or a sufficiency; boiling distilled water, $\frac{1}{2}$ oz. Divide the mass into 720 lozenges. Each lozenge contains $\frac{1}{36}$ gr. of hydrochlorate of morphia.—*Dose.* 1 or 2 occasionally, for cough.

Lozenges, Morphia and Ipecacuanha. *Syn.* TROCHISCI MORPHIÆ ET IPEACUANHÆ (B. P.) Hydrochlorate of morphia, 20 grs.; ipecacuanha, in fine powder, 60 grs.; tincture of tolu, $\frac{1}{2}$ oz.; refined sugar, in powder, 24 oz.; gum arabic, in powder, 1 oz.; mucilage, 2 ozs., or a

sufficiency; distilled water, $\frac{1}{2}$ oz.; divide the mass into 720 lozenges. Each lozenge contains $\frac{1}{16}$ grs. of hydrochlorate of morphia and $\frac{1}{16}$ gr. of ipecacuanha.—*Dose*. 1 or 2 occasionally, for cough.

Lozenges, Nitre. *Syn.* TROCHISCI NITRICI, L. *Prep.* 1. (Ph. E. 1783.) Nitre, 3 oz.; white sugar, 9 oz.; mucilage of tragacanth, q. s. to mix. Diuretic; but chiefly sucked, without swallowing, to remove incipient sore throat.

2. (Camphorated; TROCHISCI NITRI CAMPHORATI, L.—Chaussier. Each lozenge contains $\frac{1}{2}$ gr. of opium, $\frac{1}{2}$ gr. of camphor, and 1 gr. of nitre. In hoarseness, sore throat, &c.

Lozenges, Nutmeg. *Syn.* TROCHISCI MYRISTICÆ, L. From oil of nutmeg, 1 fl. dr., to each lb. of sugar, and coloured with infusion of saffron. Carminative and stomachic; in colic, &c.

Lozenges, Opium. *Syn.* ANODYNE LOZENGES; TROCHISCI OPII (Ph. E.), T. GLYCYRRHIZÆ CUM OPIO, L. *Prep.* 1. (B. P., Ph. E.) Opium (strained), 2 drs.; tincture of tolu, $\frac{1}{2}$ oz.; triturate together, add of powdered sugar, 6 oz.; extract of liquorice (soft) and powdered gum acacia, of each, 5 oz.; mix, and divide into 10-gr. lozenges. Each lozenge contains $\frac{1}{10}$ to $\frac{1}{8}$ gr. of opium. *Used* to allay tickling cough and irritation of the fauces, and as an anodyne and hypnotic.

2. (Ph. U. S.) Opium (in fine powder), 2 drs.; extract of liquorice, gum arabic, and sugar, of each, 5 oz.; oil of aniseed, $\frac{1}{2}$ fl. dr.; water, q. s.; divide into 6-gr. lozenges. Each lozenge contains $\frac{1}{16}$ gr. of opium. As the last.

3. Extract of opium, 72 grs.; tincture of tolu, $\frac{1}{2}$ oz.; refined sugar (in powder), 2 oz.; extract of liquorice, 6 oz.; distilled water, a sufficiency. Divide the mass into 720 lozenges. Each lozenge contains $\frac{1}{16}$ gr. of extract of opium.—*Dose*. 1 to 2 lozenges.

Lozenges, Orange. *Syn.* TROCHISCI AURANTII, L. From oil of orange, $1\frac{1}{2}$ fl. dr. to each lb. of sugar, and infusion of saffron for colouring. By adding nitric or tartaric acid, 3 drs., 'ACIDULATED ORANGE LOZENGES' will be formed.

Lozenges, Orange-flower. *Syn.* TROCHISCI AURANTII FLORUM, L. *Prep.* (P. Cod.) Powdered sugar, 1 lb.; neroli, 1 dr.; orange-flower water, q. s.; make it into drops (pastilli); or, omit the water, and make it into lozenges with mucilage of tragacanth made with orange-flower water. Delightfully fragrant.

Lozenges, Or'ris-root. *Syn.* TROCHISCI IRI-Dis, L. *Prep.* From orris-root (in very fine powder), 1 oz.; sugar, 1 lb.; mucilage of tragacanth, q. s. to mix. *Used* to perfume the breath.

Lozenges, Ox'late of Potassa. *Syn.* TROCHISCI POTASSÆ OXALATIS, T. P. SUPER-OXALATIS, L. As ACIDULATED LOZENGES, but using quadroxalate of potassa (salt of sorrel) instead of tartaric acid. (See below.)

Lozenges, Oxalic Acid. *Syn.* TROCHISCI

ACIDI OXALICI, L. As ACIDULATED LOZENGES, but using oxalic acid instead of tartaric acid. The last two are refrigerant, but their use is objectionable, especially for patients who labour under the oxalic diathesis. In large quantities they are poisonous.

Lozenges, Paregoric. *Syn.* TROCHISCI PAREGORICI, L. Medicated with 2 fl. oz. of paregoric, and 2 drs. of tartaric acid, to each lb. of sugar, and tinged of a pink colour with lake or cochineal. As a pectoral in catarrhs, &c.

Lozenges, Paullin'ia. *Syn.* TROCHISCI PAULLINÆ, T. GUARANÆ, L. *Prep.* (Dr. Gavrelle.) Each lozenge contains nearly $\frac{1}{2}$ gr. of extract of garana or paullinia, and is flavoured with vanilla. 12 to 20 daily, as an alternative and tonic; in chlorosis, diarrhoea, &c.

Lozenges, Pec'toral. *Syn.* TROCHISCI PECTORALES, T. BECHICI, L. *Prep.* 1. (Dr. Grunn.) Powdered squills, 4 parts; extract of lettuce, 8 parts; ipecacuanha, 18 parts; manna, 125 parts; sugar, 250 parts; mucilage of tragacanth, q. s. to mix.

2. (Magendic.) See EMETINE LOZENGES.

3. (BLACK; T. BECHICI NIGRI.) See LIQUORICE LOZENGES.

4. (WHITE; T. BECHICI ALBI.) Orris root, 4 drs.; liquorice powder, 6 drs.; starch, $1\frac{1}{2}$ oz.; sugar, 18 oz.; mucilage of tragacanth, q. s. to make a lozenge-mass.

5. (YELLOW; T. BECHICI FLAVI.) Powdered orris root, 6 drs.; starch, 4 drs.; liquorice powder, 3 drs.; saffron, 2 drs.; sugar, 8 oz.; mucilage of tragacanth, q. s. to mix.

Obs. All the above are used as demulcents in coughs, colds, &c. Nos. 1 and 2 are anodyne as well as demulcent. For other formulae, see COUGH LOZENGES, LIQUORICE L., OPIUM L., &c.

Lozenges, Pel'litory. *Syn.* TROCHISCI PYRETHRI, L. *Prep.* From pellitory, mastic, and tragacanth, of each, in fine powder, equal parts; orange-flower water, q. s. to mix. In toothache.

Lozenges, Pep'permint. *Syn.* TROCHISCI MENTHE PIPERITÆ, L. *Prep.* 1. (P. Cod.) Oil of peppermint, 1 dr.; powdered sugar, 16 oz.; mucilage of tragacanth, q. s.

2. (Ph. U. S.) Oil of peppermint, 1 fl. dr.; sugar, 12 oz.; mucilage of tragacanth, q. s.

3. (Wholesale.) 1 fl. dr. of the finest Mitcham oil of peppermint to each lb. of the finest double refined white sugar, with mucilage of either gum arabic or tragacanth to mix.

Obs. The best peppermint lozenges are made of the very finest double refined sugar, and of English oil of peppermint only; carefully mixed up with very clean mucilage. The commoner qualities are made by employing inferior lump sugar and foreign oil of peppermint, or, what is better, English oil of peppermint, but in a less proportion than for the better sorts. The addition of starch, in quantity varying from $\frac{1}{2}$ to $\frac{3}{4}$ of the whole mass is also commonly made to them; and in the

cheapest varieties even plaster of Paris or chalk is occasionally introduced by unprincipled makers. The addition of a very small quantity of blue smalts, reduced to an impalpable powder, is commonly made to the sugar, to increase its whiteness. 'TRANSPARENT' or 'SEMI-TRANSPARENT PEPPERMINT LOZENGES' are made from the same materials as the opaque ones; but the sugar is not reduced to quite so fine a powder, and the cake is rolled thinner before cutting it. A little oil of almonds or of olives is also occasionally mixed with the ingredients, to promote the transparency; but it tends to render the lozenges less white.

Peppermint lozenges and drops are useful in flatulency, nausea, and griping; and judging from the enormous and constantly increasing demand for them, they are more highly esteemed by the public than all other lozenges and confections.

Lozenges, Pontefract. These are made of the purest refined juice or extract of liquorice, and have long been esteemed as a demulcent.

Lozenges, Poppy. *Syn.* TROCHISCI PAPAVERIS, L. *Prep.* From extract of poppies, 3 oz.; sugar, 15 oz.; powdered gum tragacanth, 2 oz.; rose water, q. s. to mix. *Used* in coughs as an anodyne and demulcent, in lieu of opium lozenges.

Lozenges, Pulmonic. See COUGH LOZENGES, PECTORAL L., WAFERS, &c.

Lozenges, Quinine. *Syn.* TROCHISCI QUININE SULPHATIS, L. *Prep.* (Soubeiran.) Each lozenge contains about $\frac{1}{10}$ gr. of sulphate (disulphate) of quinine. Tonic, and stomachic, in dyspepsia, &c.; but to render them useful, the quantity of the alkaloid should be doubled.

Lozenges, Reduced Iron. *Syn.* TROCHISCI FERRI REDACTI. (B. P.) Reduced iron, 720 grs.; refined sugar, in powder, 25 oz.; gum arabic, in powder, 1 oz.; mucilage, 2 oz.; distilled water, 1 oz., or a sufficiency. Mix the iron, sugar, and gum, and add the mucilage and water to form a proper mass. Divide into 720 lozenges, and dry them in a hot-air chamber with a moderate heat. Each lozenge contains 1 gr. of reduced iron.—*Dose.* 1 to 6 lozenges.

Lozenges, Rhu'barb. *Syn.* DIGESTIVE LOZENGES; TROCHISCI RHEI, L. *Prep.* (P. Cod.) Powdered rhu'barb, 1 oz.; sugar, 11 oz.; mucilage of tragacanth, q. s.; divide into 12-gr. lozenges. Stomachic and laxative. Sucked before dinner, they excite the appetite, and after it promote digestion. They are frequently aromatized with a little cinnamon or vanilla. See Candy (Digestive).

Lozenges, Rosé. *Syn.* TROCHISCI ROSÆ, L. *Prep.* 1. (ACIDULATED; T. R. ACIDÆ.) From otto, 5 to 10 drops; citric or tartaric acid, 3 drs.; sugar, 1 lb.; mucilage, q. s.

2. (Ph. E. 1746.) Red-rose leaves (powdered), 1 oz.; sugar, 12 oz.; mucilage, q. s.

3. (PÂTE DE ROSE LOZENGES.) As No. 1, using one half of the acid.

4. (RED; T. R. RUBRI.) As No. 1; but coloured with liquid lake, or infusion of cochineal.

Obs. Some makers add of starch, 4 oz., substitute oil of rhodium for otto of roses, and use mucilage made with rose water; but the quality of course suffers. They are chiefly used to perfume the breath.

Lozenges, Saffron. *Syn.* TROCHISCI CROCI, L. *Prep.* From hay saffron (in fine powder), 1 oz.; white sugar, 1 lb.; mucilage of gum tragacanth, q. s. to mix. Anodyne, pectoral, and emmenagogue; but chiefly used to raise the spirits in hypochondriasis.

Lozenges, Santonine. *Syn.* TASTELESS WORM LOZENGES; TROCHISCI SANTONINI, L. Each lozenge contains $\frac{1}{4}$ gr. (nearly) of santonine. 5 to 10 daily, as a vermifuge.

Lozenges, So'da. *Syn.* TROCHISCI SODA BICARBONATIS (Ph. E.), L. *Prep.* 1. (Ph. E.) Bicarbonate of soda, 1 oz.; powdered gum arabic, $\frac{1}{2}$ oz.; sugar, 3 oz.; mucilage, q. s.

2. (Wholesale.) From bicarbonate of soda and powdered gum tragacanth, of each, 2 oz.; double refined lump sugar, $\frac{1}{2}$ lb.; rose water, q. s. to mix. In acidity, heartburn, &c. See VICHY LOZENGES.

3. (With GINGER; TROCHISCI SODÆ ET ZINGIBERIS, L. To the last, add of ginger (in very fine powder), 1½ oz.; powdered gum, $\frac{1}{2}$ oz.

Lozenges, Squills. *Syn.* TROCHISCI SCILLÆ, L. 1. Each lozenge contains $\frac{1}{2}$ gr. of powdered squills and 2 grs. of extract of liquorice.

2. (With IPECACUANHA; TROCHISCI SCILLÆ ET IPECACUANHÆ, L. As the last, adding for each lozenge $\frac{1}{4}$ gr. of powdered ipecacuanha. Both the above are useful cough lozenges.

Lozenges, Starch. *Syn.* TROCHISCI AMYLI, T. BECHICI ALBI, L. See PECTORAL LOZENGES.

Lozenges, Steel. *Syn.* TROCHISCI FERRI, T. CHALYBEATI, L. *Prep.* (P. Cod.) Levigated iron filings, 1 oz.; sugar, 10 oz.; cinnamon, 2 drs.; mucilage of tragacanth, q. s.; mix, and divide into 480 lozenges. Tonic. See IRON LOZENGES.

Lozenges, Sulphur. *Syn.* TROCHISCI SULPHURIS, L. *Prep.* (P. Cod.) From sulphur (pure precipitate), 2 oz.; sugar, 16 oz.; mucilage of tragacanth (made with rose water), q. s. to mix. Useful in piles and some skin diseases.

Lozenges, Tannic Acid. *Syn.* TROCHISCI ACIDI TANNICI (B. P.) Tannic acid, 360 grs.; tincture of tolu, $\frac{1}{2}$ oz.; refined sugar, 25 oz.; gum acacia, 1 oz.; mucilage, 2 oz.; distilled water, 1 oz. Dissolve the tannic acid in the water; add first the tincture of tolu previously mixed with the mucilage, then the gum and the sugar, also previously well mixed. Form the whole into a proper mass, divide into 720 lozenges, and dry them in a hot-air chamber with a moderate heat. Each lozenge contains $\frac{1}{2}$ gr. of tannic acid.—*Dose.* 1 to 6 lozenges.

Lozenges, Tartaric Acid. See **ACIDULATED LOZENGES.**

Lozenges, Tolu'. *Syn.* **BALSAMIC LOZENGES; TROCHISCI TOLUTANI, T. BALSAMICÆ, L.** *Prep.* 1. (P. Cod.) Balsam of tolu and rectified spirit, of each, 1 oz.; dissolve, add of water, 2 fl. oz., heat the mixture in a water bath, and filter; make a mucilage with the filtered liquid, and gum tragacanth (in powder), 80 gr.; add of sugar, 16 oz.; make a mass, and cut it into lozenges.

2. (Wholesale.) As the last, but using only one half the weight of balsam of tolu. Pectoral and balsamic.

Lozenges, Tronchin's. *Syn.* **TABLETTES DE TRONCHIN, Fr.** See **COUGH LOZENGES.**

Lozenges, Vanil'la. *Syn.* **TROCHISCI VANILLÆ, L.** *Prep.* 1. Essence of vanilla, 3 fl. dr., to each lb. of sugar.

2. (Guibourt.) From vanilla triturated to a fine powder with 7 times its weight of sugar. Antispasmodic, nervine, and stomachic. *Used* to sweeten the breath, to flavour chocolate, &c.

Lozenges, Vichy. *Syn.* **D'ARCET'S LOZENGES; TROCHISCI SODÆ, L.; PASTILLES DE VICHY, Fr.** *Prep.* 1. (P. Cod.) Bicarbonate of soda, 1 oz.; powdered sugar, 19 oz.; mucilage of gum tragacanth, q. s.; mix, and divide into 20-gr. lozenges.

2. (D'Arcet.) As the last, adding a little oil of peppermint to give a slight flavour. Antacid or absorbent; in heartburn, &c.

Lozenges, Violet. *Syn.* **TROCHISCI VIOLÆ, T. VIOLARUM, L.** *Prep.* Orris lozenges coloured with the juice of violets.

Lozenges, Wistar's Cough. *Prep.* Gum arabic, extract of liquorice, and sugar, of each, 2½ oz.; powdered opium, 1 dr.; oil of aniseed, 40 drops; for 60 lozenges. One, three or four times a day.

Lozenges, Worm. *Syn.* **TROCHISCI ANTHELMINTICI, MORSULI CONTRA VERMES, L.** Most of the advertised nostrums under this name have a basis of calomel (about 1 gr. per lozenge), and require to be followed by a purge a few hours afterwards.

1. (Ph. Austr. 1836.) Ethereal extract of wormseed, 1 dr.; jalap, starch, and sugar, of each, 2 drs.; mucilage of gum tragacanth, q. s.; divide into 60 lozenges.

2. (Ph. Dan. 1840.) Wormseed, 1 oz.; ethiops mineral and jalape, of each, 3 drs.; cinnamon, 2 drs.; sugar, 7 oz.; rose water, q. s. See **CALOMEL, CHING'S, SANTONINE LOZENGES, &c. (above).**

Lozenges, Zinc. *Syn.* **TROCHISCI ZINCI, T. Z. SULPHATIS, L.** *Prep.* (Dr. Copland.) Each lozenge contains ½ gr. of sulphate of zinc. Antispasmodic, expectorant, and tonic; and in quantity emetic.

LUCIFERS. See **MATCHES.**

LUMBA'GO. Rheumatism of the loins. It is distinguished from nephritis, or inflammation of the kidneys, by the pain being aggravated on stooping. The treatment consists of

strong stimulant embrocations or liniments, or of blisters over the part affected, with active aperients, warmth, and diaphoretics (as Dover's powder) at bedtime. The hot or vapour bath often gives almost immediate relief. See **RHEUMATISM.**

LUMINOUS PHIAL. See **PHOSPHORUS.**

LUNA CORNEA. [L.] *Syn.* **HORN SILVER.** Fused chloride of silver.

LUNAR CAUSTIC. Fused nitrate of silver. See **CAUSTIC and SILVER.**

LUNGS. In anatomy, the organ of respiration occupying the thorax or chest. See **RESPIRATION.**

LUPULIN. *Syn.* **LUPULINA, LUPULINE.** Under this name two products are known, namely—1. (**LUPULINIC GRAINS, L. GLANDS.**) The yellow powder obtained from the dried strobiles or catkins of the hops, by gently rubbing and sifting them.—*Dose.* 5 to 10 grs.; as an anodyne, tonic, &c.

2. The aromatic bitter principle of hops.

Prep. The aqueous extract of the yellow powder or lupulinic grains of the strobiles, along with a little lime, are treated with rectified spirit; the filtered tincture is evaporated to dryness, redissolved in water, and the solution is again filtered, and evaporated to dryness; the residuum is, lastly, washed with ether, and allowed to dry.

Prop., &c. The latter product is a yellowish-white, bitter, uncrystallisable substance, soluble in 20 parts of water, very soluble in alcohol, and slightly so in ether. The yellow powder above alluded to (No. 1) is improperly called lupulin; a name which appears more appropriate to the pure bitter principle than to the lupulinic grains.

Adult. The lupulin sold to brewers is largely adulterated with quassia. In some samples, lately examined, the quassia amounted to 70 per cent.

LUPUS. In pathology, a disease affecting the skin, remarkable for eating away the parts which it attacks with extreme rapidity. It is generally confined to the face, and commences with small, spreading ulcerations, which become more or less concealed beneath bran-like scabs, and end in ragged ulcers, which gradually destroy the skin and muscular tissue to a considerable depth.

LUSTRE. See **PLUMBAGO.**

LUTE. *Syn.* **LUTING; LUTUM, CÆMENTUM, L.** A composition employed to secure the joints of chemical vessels) or as a covering to protect them from the violence of the fire.

Prep. 1. Linseed meal, either alone or mixed with an equal weight of whiting, and made into a stiff paste with water. It soon becomes very hard and tough.

2. Ground almond cake, from which the oil has been pressed, mixed up as the last. Both the above are much used for stills, retorts, and other vessels that are not exposed to a heat higher than about 320° Fahr. They are capable of resisting the action of the fumes of

volatile oils, spirits, weak acids, &c., for some time.

3. Fresh-skalded lime made into a paste with strained bullock's blood or size. As the last.

4. Plaster of Paris made into a paste with water, and at once applied. It bears a nearly red heat, but becomes rather porous and friable.

5. Powdered clay or whiting made into putty with water and boiled linseed oil. This is commonly known as 'fat lute.'

6. A mixture of powdered clay and ground bricks, made up with water or a solution of borax. For joining crucibles, &c., which are to be exposed to a strong heat.

7. Pipe-clay and horse-dung, made into a paste with water. As a coating for glass vessels, to preserve them from injury from exposure to the fire. This composition is used by the pipe-makers, and will stand unharmed the extremest heat of their kiln for 24 hours. It is applied by spreading it on paper.

8. As the last, but employing shredded tow or plumbago for horse-dung.

Obs. For the joints of small vessels, as tubes, &c., especially those of glass or earthenware, pieces of vulcanized Indian tubing, slipped over and tied above and below the joint, are very convenient substitutes for lutes, and have the advantage of lasting for a long time, and bearing uninjured the heat at which oil of vitriol boils. Flat rings or "washers" of vulcanised rubber are also excellent for still heads, &c., whenever the parts can be pinched together by screws or clamps.

LYCOPODIUM. The fine powder known in commerce under this name consists of the minute spores of the common club moss, or *Lycopodium clavatum*. It is exceedingly combustible; thrown suddenly from a powder-puff or bellows across the flame of a candle, it produces the imitation flashes of lightning of our theatres. The powder is also employed as a 'dusting powder' in excoriations, and to roll up boluses and pills.

MACARONI. This only differs from VERMICELLI in the size of the pipes, which are about as large as a goose-quill. When properly dressed, it is very wholesome and nutritious. A pleasant dish may be made by boiling macaroni in water until soft, either with or without a little salt, draining off the water, and then stewing it with a little butter, cream, or milk, and grated cheese, adding spice to palate. It may be made into a 'form' and browned before the fire.

MACAROONS. (English). *Prep.* Take of sweet almonds, 1 lb.; blanch and beat them to a paste, add of lump sugar 1½ lb.; whites of 6 eggs; the grated yellow peel of 2 lemons; mix well, make it into 'forms,' cover with wafer paper, and bake in a moderate oven.

MACE. *Syn.* MACIS, L. The tough membranous, lacerated, covering (arillode) of the NUTMEG. It has a flavour and odour more

agreeable than that of nutmeg, which in its general properties it resembles. It is used as a flavouring by cooks, confectioners, and liquorists; and in medicine as a carminative. See OIL, &c.

MACERATION. *Syn.* MACERATIO, L. The steeping of a substance in cold water, for the purpose of extracting the portion soluble in that menstruum. The word is also frequently applied to the infusion of organic substances in alcohol or ether, or in water, either alkalinised or acidulated.

MACKEREL. The *Scorpaenops scombrus* (Linn.), a well-known spiny-finned sea-fish, much esteemed at certain seasons for the table. Though nutritious, it is very apt to disagree with delicate stomachs, and occasionally induces symptoms resembling those of poisoning.

MADDER. *Syn.* RUBIA, RUBRÆ RADIX, L. The root of *Rubia tinctorum* (Linn.), or dyer's madder. The best madder has the size of a common goose-quill, a reddish appearance, and a strong odour. As soon as the roots are taken from the ground they are picked and dried; and before use they are ground in a mill. Levant, Turkey, and Smyrna madder, is imported whole; French, Dutch, and Zealand madder, ground. The finest quality of ground madder is called 'crop' or 'grappe;' 'ombro' and 'gamene' are inferior sorts, and 'mull' the worst.

Madder contains several distinct principles, as—madder red, or alizarin;—madder purple, or purpurin;—madder orange, or rubiacin;—madder yellow, or xanthin, &c. The first of these (noticed below) is by far the most important.

• *Prep.* Madder is frequently adulterated with logwood, Brazil wood, and other dye-stuffs of inferior value; and also, not unfrequently, with brick-dust, red ochre clay, sand, mahogany saw-dust, bran, &c. These admixtures may be detected as follows:

1. When dried at 212° Fahr., and then incinerated, not more than 10% to 12% of ash should be left.

2. It should not lose more than 50% to 56% by exhaustion with cold water.

3. When assayed for alizarin (see below), the quantity of this substance obtained should be equal to that from a sample of the same kind of madder which is known to be pure, and which has been treated in precisely the same manner. The operation may be conducted as follows:—500 grs. of the sample are weighed, and, after being dried by the heat of boiling water or steam, are gradually added to an equal weight of concentrated sulphuric acid, contained in a glass vessel, and stirred with a glass rod; after a few hours the charred mass is washed with cold water, collected on a filter, and dried by the heat of boiling water; the carbonised mass ('garacine') is next powdered, and treated with successive portions of rectified spirit, to which a little ether has been added, at first in the cold, and afterwards

with heat, until the liquid is no longer coloured by it, when the mixed tincture is filtered, and evaporated (distilled) to dryness; the weight of the residuum, divided by 5, gives the percentage of red colouring matter present. Or,—The dried carbonized matter is exhausted by boiling it in a solution of 1 part of alum in 5 or 6 parts of water, and the decoction, after being filtered whilst in the boiling state, is treated with sulphuric acid as long as a precipitate falls, which is washed, dried, and weighed as before.

Uses, &c. Madder has been given in jaundice and rickets, and as an emmenagogue.—*Dose.* $\frac{1}{2}$ dr. to 2 drs., twice or thrice a day. It is principally employed as a dye-stuff. See RED DYES, IVORY, PURPURIN, &c., also below.

MADDER RED. *Syn.* ALIZARIN. $C_{14}H_8O_4$. 2 Aq. The red colouring principle of madder, first obtained in a separate form by Robiquet.

Prep. 1. The aqueous decoction of madder is treated with dilute sulphuric acid as long as a precipitate falls, which, after being washed, is boiled in a solution of chloride of aluminum as long as it gives out colour; the liquid is then filtered, precipitated with hydrochloric acid, and the precipitate washed and dried. It may be purified from a little adhering purpurin, by dissolving it in alcohol, again throwing it down with hydrate of aluminum, boiling the precipitate with a strong solution of soda, and separating the alizarin from its combination with alumina by means of hydrochloric acid; it is lastly crystallised from alcohol.

2. (Meillet.) Alum, 3 parts, is dissolved in water at 140° Fahr., 30 parts, and madder, $\frac{1}{2}$ parts, added to the solution; the whole is then gently boiled for 30 or 40 minutes, after which it is thrown upon a filter, and submitted to strong pressure; this treatment is repeated with fresh solutions a second and a third time; the mixed filtrates are then decanted, and when nearly cold, oil of vitriol, 1 part, diluted with twice its bulk of water, is added, care being taken to stir the liquid all the time; the supernatant fluid is next decanted, and the residuum well washed, and, lastly, dried in the air. If required quite pure, it is dissolved, whilst still moist, in a solution of $1\frac{1}{2}$ times its weight of carbonate of potassa in 15 parts of water, and, after reprecipitation with sulphuric acid, is washed and dried as before.

3. (Robiquet & Colin.) Powdered madder is exhausted with water of a temperature not exceeding 68° Fahr., and, after being dried, 1 part of it is boiled for 15 or 20 minutes in a solution of alum, 8 parts, in water, 40 parts; the liquid is filtered whilst boiling, the marc well washed with a fresh solution of alum, the mixed liquids precipitated with sulphuric acid, and the precipitate washed and dried, as before.

Obs. Alizarin has recently been produced artificially by Græbe and Liebermann from

anthracene ($C_{14}H_{10}$), a liquid hydrocarbon existing in coal-tar. For a description of the process see the 'Journal of the Chemical Society.'

4. Madder exhausted by 2 or 3 macerations in 5 or 6 times its weight of cold water, is submitted to strong pressure, to remove adhering water, and the marc, whilst still moist, is mixed with $\frac{1}{2}$ its weight of oil of vitriol diluted with an equal quantity of water; the whole is kept at the temperature of 212° for an hour, and after being mixed with cold water is thrown on a linen strainer, well washed with cold water, and dried.

5. From powered madder and oil of vitriol, equal parts, without heat, as described under MADDER.

6. (F. Steiner.) The 'used madder' of the dye-works is run into filters, and precipitated with sulphuric acid; the matter thus obtained is put into bags and rendered as dry as possible by hydraulic pressure; the pressed cake is next crumbled to pieces, placed in a leaden vessel, and treated with 1.5th of its weight of oil of vitriol, afterwards assisting the action of the acid by introducing steam to the mixture; the resulting dark brown carbonized mass is, lastly, well washed, dried, powdered, and mixed with about 5% of carbonate of soda, when it is ready for sale.

Obs. The last three formulæ produce the 'GARANCE' or 'GARANCINE' of commerce, now so extensively used in dyeing.

Prop., &c. Pure anhydrous alizarin crystallises in magnificent orange-red crystals, which may be fused and sublimed; it is freely soluble in alkaline solutions, which it colours purple or violet; and in oil of vitriol, giving a rich red colour; water throws it down from the last unchanged; it is also soluble in hot alcohol, a hot solution of alum, and, less freely, in hot water. Hydrated alizarin occurs in small scales resembling mosaic gold. When impure, it generally forms shining reddish-brown scales. Commercial 'garancine' is a deep brown or puce-coloured powder, and will probably, ere long, entirely supersede crude madder for dyeing. The properties of garancine as a dye-stuff are precisely similar to those of madder. A solution of alum added to a solution of alizarin, and precipitated by carbonate of potassa, furnishes a rose lake; which, after being washed with water and dried, possesses a most charming tint.

MAGILP. *Syn.* MEGELLUP. A mixture of pale linseed oil and mastic varnish, employed by artists as a 'vehicle' for their colours. The proportions vary according to the work. It is thinned with turpentine.

MAGISTERY. *Syn.* MAGISTERIUM, L. The old name of precipitates. The following are the principal substances to which this term has been applied:—**MAGISTERY OF ALUM**, hydrate of alumina; **M. OF BISMUTH**, sub-nitrate of bismuth; **M. OF DIAPHORETIC ANTIMONY**, washed diaphoretic antimony; **M. OF**

OPTUM (Ludolphi's), crude 'morphia'; M. OF LAPIS CALAMINARIS or M. OF ZINC, hydrated oxide of zinc.

MAGNESIA. See MAGNESIUM, OXIDE OF. **MAGNESIAN APERIENT** (Effervescing).

Prep. 1. Heavy carbonate of magnesia, 2 lbs.; tartaric acid and double refined lump sugar, of each $1\frac{1}{2}$ lb.; bicarbonate of soda (dried without heat), 1 lb.; each separately dried and in very fine powder; essential oils of orange and lemon, of each, $\frac{1}{2}$ fl. dr.; mix well in a warm, dry situation, pass the whole through a sieve, put it into warm, dry bottles, and keep them well corked.

2. As the last, but substituting calcined magnesia, 1 lb., for the heavy carbonate, and adding sugar, $\frac{3}{4}$ lb. The preceding furnish a very pleasant effervescing saline draught.

3. (Moxon's).—a. Take of sulphate of magnesia, 2 lbs.; dry it by a gradually increased heat, powder, add of tartaric acid (also dried and powdered), $1\frac{1}{2}$ lb.; calcined magnesia, $\frac{1}{2}$ lb.; finely powdered white sugar, 3 lbs.; bicarbonate of soda (dried without heat), 1 lb.; essence of lemon, 1 dr.; mix, and proceed as before.

b. (Durande.) Carbonate of magnesia, 1 part; bicarbonate of soda, tartrate of soda and potassa (sel de Seignette), and tartaric acid, of each, 2 parts; mix as before.

c. (Pharm. Journ.) Sulphate of magnesia and bicarbonate of soda, of each, 1 lb.; tartaric acid, $\frac{1}{2}$ lb.; mix as before. The last two are much less agreeable than the others.

4. Carbonate of magnesia, 2 parts; calcined magnesia, 4 parts; citric acid, 13 parts; lump sugar, 25 parts; essence of lemon, q. s. to flavour. Very agreeable. This is known as 'ROGÉ'S PURGATIF.'

Obs. The above are very useful and popular medicines in indigestion, heartburn, nausea, habitual costiveness, dyspepsia, &c.—*Dose.* $\frac{1}{2}$ to 2 dessert-spoonfuls, thrown into tumbler 3 parts filled with cold water, rapidly stirred and drunk whilst effervescing, early in the morning fasting, or between breakfast and dinner.

MAGNESIAN LEMONADE. See CITRATE OF MAGNESIA (above) and LEMONADE (Aperient).

MAGNESIUM. Mg. *Syn.* MAGNIUM, TALCIUM. The metallic radical of magnesia. The existence of this metal was demonstrated by Sir H. Davy, in 1808; but it was first obtained in sufficient quantity to examine its properties by Bussy, in 1830.

Prep. 5 or 6 pieces of sodium, about the size of peas, are introduced into a test-tube, and covered with small fragments of chloride of magnesium; the latter is then heated to near its point of fusion, when the flame of the lamp is applied to the sodium, so that its vapour may pass through the stratum of heated chloride; when the vivid incandescence that follows is over, and the whole has become cold, the mass is thrown into water, and the insoluble metallic portion collected and dried.

Commercial magnesium is prepared by eva-

porating solution of the chlorides of sodium and magnesium, in the proportion of 1 to 3, to dryness, mixing with one quarter of its weight of fluor spar and a like amount of sodium, and heating to bright redness in an iron crucible of proper construction.

On a larger scale it is prepared by heating to redness a mixture of chloride of magnesium, 9 parts; fused chloride of sodium, $1\frac{1}{2}$ parts; fluoride of calcium, $1\frac{1}{2}$ parts; and sodium in slices, $1\frac{1}{2}$ parts.

Prop., &c. In colour and lustre it resembles silver, but in chemical properties is more like zinc; its sp. gr. is only 1.743; it is malleable; fusible at a red heat, and can be distilled like zinc; unaffected by dry air and by cold water; burns with brilliancy when heated to dull redness in air or oxygen gas, yielding oxide of magnesium; inflames spontaneously in chlorine, yielding chloride of magnesium; it dissolves in the acids with the evolution of hydrogen gas, and pure salts of magnesium result.

It has been used somewhat extensively as an illuminating agent for photographing at night, and also for the purpose of affording a brilliant light for microscopic and magic lantern effects.

Magnesium, Carbonate of (Light). *Syn.* LIGHT CARBONATE OF MAGNESIA; CARBONATE OF MAGNESIA; MAGNESIA; MAGNESIÆ CARBONAS LEVIS (B. P.) *Prep.* 1. (Ph. L.) Sulphate of magnesium, 4 lbs., and carbonate of sodium, 4 lbs. 9 oz.; boiling distilled water, 4 galls.; dissolve the salts separately in one half the water, filter, mix the solutions, and boil for 2 hours, constantly stirring with a spatula, distilled water being frequently added to compensate for that lost by evaporation; lastly, the solution being poured off, wash the precipitated powder with boiling distilled water, and dry it. The formulae of the Ph. E. & D. are essentially the same, except that the ebullition is limited to from 10 to 20 minutes.

2. (B. P.) Similar to the foregoing except that precipitation takes place in the cold. The formula of this compound is $(Mg. CO_3)_2 \cdot Mg(HO)_2 \cdot 4H_2O$.

3. (HENRY'S.) Ordinary carbonate of magnesia, the washing of which has been finished with a little rose water.

4. Add a solution of carbonate of potassium or sodium to the bittern or residuary liquor of the sea-salt works, and well wash and dry the precipitate as before. This is known in commerce as 'Scotch magnesia.'

Obs. The carbonate of magnesia of commerce is usually made up into cakes or dice, while drying; or it is permitted to drain and dry in masses, which are then cut into squares with a thin knife. It is powdered by simply rubbing it through a wire sieve. The presence of iron in the solution of the sulphate of magnesium, when the crude salt is employed, and which is destructive to the beauty of the preparation may be got rid of by the addition of lime water until the liquor acquires a slight

alkaline reaction and subsequent decantation after repose.

Magnesium, Carbonate of (Heavy). *Syn.* HEAVY CARBONATE OF MAGNESIA; MAGNESIÆ CARBONAS (B. P.). *Prep.* 1. Apothecaries' Hall. A saturated solution of sulphate of magnesium, 1 part, is diluted with water, 3 parts, and the mixture heated to the boiling-point; a cold saturated solution of carbonate of sodium, 1 part (all by measure), is then added, and the whole is boiled with constant agitation until effervescence ceases; boiling water is next freely poured in, and after assiduous stirring for a few minutes, and repose, the clear liquid is decanted, and the precipitate thrown on a linen cloth and thoroughly washed with hot water; it is, lastly, drained, and dried in an iron pot.

2. (Ph. D.) Dissolve sulphate of magnesium, 10 oz., in boiling distilled water, $\frac{1}{2}$ pint; and carbonate of sodium (cryst.), 12 oz., in boiling distilled water, 1 pint; mix the two solutions, and evaporate the whole to dryness by the heat of a sand bath; then add of boiling water, 1 quart, digest with agitation for half an hour, and wash the insoluble residuum as before; lastly, drain it, and dry it at the temperature of boiling water.

3. (B. P.) White granular powder precipitated from a boiling solution of sulphate of magnesium by a solution of carbonate of sodium, the whole evaporated to dryness, and the dry residue digested in water, collected on a filter, and washed.

Prop. The ordinary or light carbonate of magnesia is a white, inodorous, tasteless powder, possessing similar properties to calcined magnesia, except effervescing with acids, and having less saturating power. An ounce measure is filled by 45 to 48 grs. of the powder lightly placed in it. The heavy carbonate is sometimes fully thrice as dense (see *below*), but in other respects is similar.

Dose. As an antacid, $\frac{1}{2}$ to a whole teaspoonful, 3 or 4 times daily; as a laxative, $\frac{1}{2}$ dr. to 2 drs. It is commonly taken in milk. It is apt to produce flatulence, but in other respects is preferable to calcined magnesia.

General remarks. Although commonly called 'carbonate of magnesia,' the above substance, whether in the light or heavy form, appears to be a compound of carbonate with hydrate, in proportions which are not perfectly constant. (For B. P. formula see preceding article.) On account of the excess of base in its composition, it was formerly regarded as a subsalt (subcarbonate of magnesia). A great deal has been written uselessly respecting the preparation of these carbonates, about which, however, there is neither mystery nor difficulty, as some writers would lead their readers to suppose. If the solutions are very dilute, the precipitate is exceedingly light and bulky; if otherwise, it is denser. By employing nearly saturated solutions, and then heating them and mixing

them together whilst very hot, a very heavy precipitate is obtained, but it is apt to be gritty or crystalline. The same occurs when cold solutions are mixed, and no heat is employed. The lightest precipitate is obtained from cold, highly dilute solutions, and subsequent ebullition of the mixture.

Mr. Pattinson, a chemist of Gateshead, prepares a very beautiful and pure heavy carbonate from magnesian limestone. The latter is calcined at a dull red heat (not hotter) for some time, by which the carbonic anhydride is expelled from the carbonate of magnesium, but not from the carbonate of calcium, which hence continues insoluble. The calcined mass is next reduced to a milk with water in a suitable cistern, and the carbonic anhydride resulting from its own calcination forced into it under powerful pressure. The result is a saturated solution of carbonate of magnesium, the lime remaining unacted on so long as the magnesia is in excess. The solution by evaporation yields the heavy carbonate, whilst carbonic anhydride is expelled, and may be again used in the same manufacture. 154 to 160 grs. of the heavy carbonate are required to fill an ounce measure when lightly placed in it, by which it appears to be fully thrice as dense as the light carbonate. The bicarbonate of magnesium (magnesiæ bicarbonas, L.) exists only in solution. The so-called 'fluid magnesia' of Murray, Dinneford, Husband, &c., are solutions of this salt. The small prismatic crystals which are deposited when 'fluid magnesia' is exposed to the air for some time consist of hydrated neutral carbonate, and not bicarbonate, as is sometimes stated.

Magnesium, Chloride of. MgCl_2 . *Syn.* MAGNESIÏ CHLORIDUM, L. *Prep.* (Liebig.) By dissolving magnesia in hydrochloric acid, evaporating to dryness, adding an equal weight of chloride of ammonium, projecting the mixture into a red-hot platinum crucible, and continuing the heat till a state of tranquil fusion is attained. On cooling, it forms a transparent, colourless, and very deliquescent mass, which is anhydrous, and soluble in alcohol.

Obs. Without the addition of the chloride of ammonium, it is impossible to expel the last portion of the water, without at the same time driving off the chlorine, in which case nothing but magnesia is left. The fused mass should be poured out on a clean stone, and when solid, broken into pieces, and at once transferred to a warm, dry bottle. The P. Cod. orders the solution to be evaporated to the sp. gr. 1.384, and to be put, whilst still hot, into a wide-mouthed flask to crystallise.—*Dose.* 1 to 4 drs.; as a laxative.

Magnesium, Citrate of. $\text{Mg}_3(\text{C}_6\text{H}_5\text{O}_7)_2$. *Syn.* MAGNESIÏ CITRAS, L. *Prep.* There is some difficulty in obtaining this salt in an eligible form for medicinal purposes. When precipitated from a solution, it is insoluble. The following formulæ can be highly recommended.

1. (Parrish.) Dissolve crystallized citric acid, 100 gr., in water, 15 drops, and its own 'water of crystallization' by the aid of heat; then stir in calcined magnesia, 35 gr.; a pasty mass will result, which soon hardens, and may be powdered for use.

Obs. The chief practical difficulty in this process results from the great comparative bulk of the magnesia, and the very small quantity of the fused mass with which it is to be incorporated. A part of the magnesia is almost unavoidably left uncombined, and the salt is consequently not neutral. The uncombined earth should be dusted off the mass before powdering the latter. A high temperature must be avoided.

2. (Robiquet.) Citric acid, $35\frac{1}{2}$ parts, is powdered and dissolved in boiling water, $10\frac{5}{8}$ parts; when the solution is cold, and before it crystallizes, it is poured in a wide earthen vessel, kept cold by surrounding it with water; then, by means of a sieve, carbonate of magnesium, $21\frac{1}{2}$ parts, is distributed evenly and rapidly over the surface without stirring; when the reaction ceases, the mixture is beaten rapidly as long as it retains its pasty consistence. The salt should be dried at a temperature not exceeding 70° Fahr.

3. Effervescing; *MAGNESIÆ CITRAS EFFERVESCENS*, L.)—*a.* Citric acid (dried and powdered), 7 parts; heavy carbonate of magnesium, 5 parts; mix, and preserve in well-corked bottles.

b. (Ellis.) Mix powdered citric acid $2\frac{1}{2}$ oz., with powdered sugar, 8 oz.; triturate to a fine powder, and drive off the water of crystallization by the heat of a water bath; add citrate of magnesium (prepared by fusion), 4 oz., and oil of lemons, 10 drops, and mix intimately; then add bicarbonate of sodium, 3 oz., and again triturate until the whole forms a fine powder, which must be preserved in stoppered bottles. From 1 to 3 table-spoonfuls, mixed in a tumbler of water, furnishes an effervescing draught in which the undissolved portion is so nicely suspended, that it can be taken without inconvenience.

c. (Extemporaneous.) Citric acid (cryst.), 20 grs.; carbonate of magnesium, 14 grs.; mix in a tumbler of cold water, and drink the mixture whilst effervescing. A pleasant saline.

Obs. A dry white powder, sometimes sold as citrate of magnesia in the shops, is quite a different preparation to the above, and does not contain a particle of citric acid. The following formula is that of a wholesale London drug-house that does largely in this article:—

Calcined magnesia, magnesium oxide, $1\frac{1}{2}$ lb. (or carbonate, 2 lbs.); powdered tartaric acid, $1\frac{1}{2}$ lb.; bicarbonate of sodium, 1 lb.; dry each article by a gentle heat, then mix them, pass the mixture through a fine sieve in a warm dry room, and keep it in well-corked bottles. A few drops of essence of lemon and 3 lbs. of

finely powdered sugar are commonly added to the above quantity. This addition renders it more agreeable.

Prop. &c. Citrate of magnesium is a mild and agreeable laxative; its secondary effects resemble those of the carbonate.—*Dose.* As a purgative, $\frac{1}{2}$ to 1 oz. The dose of the effervescing citrate must depend on the quantity of magnesia present. A solution of this salt in water, sweetened and flavoured with lemon, forms magnesium lemonade.

Magnesium, Boro-cit'rate of. *Syn.* *MAGNESIÆ BORO-CITRAS*, L. *Prep.* (Cadet.) Boracic acid (in powder), 113 grs.; oxide of magnesium, 80 grs.; mix in a porcelain capsule, and add enough of a solution of citric acid, 260 grs., in water, $3\frac{1}{2}$ pints, to form a thin paste; then add the remainder of the citric solution, and gently evaporate, with constant stirring, to dryness. A cooling saline, and, in small doses, emmenagogue and lithontriptic.—*Dose.* As an aperient, 3 to 6 drs.

Magnesium, Oxide of. *MgO.* *Syn.* *OXIDE OF MAGNESIUM, CALCINED MAGNESIA, MAGNESIA* (B. P., Ph. L.).

Prep. 1. (B. P.) Magnesium carbonate, heated in a crucible until all the carbonic anhydride is driven off.

Prop. &c. White heavy powder, scarcely soluble in water, but readily soluble in acids without effervescence. Its solution in hydrochloric acid, neutralised by a mixed solution of ammonia and ammonium Chloride, gives a copious crystalline precipitate when sodium phosphate is added to it. See next preparation.

Magnesia levis. (B. P.) *Syn.* *LIGHT MAGNESIA.* *Prep.* (B. P.) 1. Light carbonate of magnesium heated in a cornish crucible until all the carbonic anhydride is driven off.

A bulky white powder, differing from the magnesia (B. P.) only in its density, the volume occupied by the same weight being $3\frac{1}{2}$ to 1.

The properties of the two varieties of magnesium oxide are identical, and are used in medicine as antacids, laxatives, and antitithics, and much used in dyspepsia, heartburn, &c.—*Dose.* 10 to 20 grs. as an antacid and 20 to 60 grs. as a purgative.

Magnesium, Phosphate of. *MgHPO₄, 6Aq.* *Syn.* *MAGNESIÆ PHOSPHAS*, L. *Prep.* From the mixed solutions of phosphate of sodium and sulphate of magnesium, allowed to stand for some time. Small, colourless, prismatic crystals, which, according to Graham, are soluble in about 1000 parts of cold water. Phosphate of magnesium exists in the grains of the cereals, and in considerable quantity in beer. It is also found in guano.

Magnesium and Ammonium, Phosphate of. *MgNH₄PO₄, 6Aq.* *Syn.* *AMMONIO-PHOSPHATE OF MAGNESIA; MAGNESIÆ ET AMMONIÆ PHOSPHAS*, L. This compound falls as a white crystalline precipitate whenever ammonia or carbonate of ammonium is added, in excess, to a solution of a salt of magnesium

which has been previously mixed with a soluble phosphate, as that of soda. It subsides immediately from concentrated solutions, but only after some time from very dilute ones.

Prop., &c. Ammonio-phosphate of magnesium is very slightly soluble in pure water; when heated, it is resolved into pyrophosphate of magnesium, and is vitrified at a strong red heat. It is found in wheaten bran, guano, potatoes, &c., and occasionally forms one of the varieties of urinary calculi.

Magnesium, Silicates of. There are several native silicates of magnesia, more or less pure, of which, however, none is directly employed in medicine. Meerschaum and steatite or soapstone are well-known varieties. Serpentine is a compound of silicate and hydrate of magnesium. The minerals augite and hornblende are double salts of silicic acid, magnesium, and calcium with some ferrous oxide. The beautiful crystallized mineral called chrysotile is a silicate of magnesium, coloured with ferrous oxide. Jade is a double silicate of magnesium and aluminum, coloured with chromic oxide.

Magnesium, Sulphate of. MgSO_4 , 7 Aq. *Syn.* EPSOM SALT, MAGNESIÆ SULPHAS (B. P. Ph. L. E. & D.), SAL EPSOMENSIS, L. This compound was originally extracted from the saline springs of Epsom, Surrey, by Dr. Grew, in 1695. It is now exclusively prepared on the large scale, and from either magnesian limestone or the residual liquor of the sea-salt works.

Prep. 1. From dolomite or magnesian limestone.—*a.* The mineral, broken into fragments, is heated with a sufficient quantity of dilute sulphuric acid to convert its carbonates into sulphates; the sulphate of magnesium is washed out of the mass with hot water, and the solution, after defecation, is evaporated and crystallized.

2. The 'limestone,' either simply broken into fragments or else calcined (burnt), and its constituent quicklime and oxide magnesium converted into hydrates by sprinkling (slaking) it with water, is treated with a sufficient quantity of dilute hydrochloric acid to dissolve out all the calcium hydrate without touching the magnesium hydrate; the residuum of the latter, after being washed and drained, is dissolved in dilute sulphuric acid, and crystallized as before.

3. From bittersn.—*a.* The residual liquor or mother-water of sea-salt is boiled for some hours in the pans which are used during the summer for the concentration of brine; the saline solution is then skimmed and decanted from some common salt which has been deposited, after which it is concentrated by evaporation, and, finally, run into wooden coolers; in about 36 hours, 1-8th part of Epsom salts usually crystallizes out. This is called 'singles.' By re-dissolving this in water, and re-crystallization, 'doubles,' or Epsom salts fit for the market, are obtained. A second crop of crystals may be procured by adding sulphuric acid

to the mother-liquor, and re-concentrating the solution, but this is seldom had recourse to in England. Bittersn yields fully 5 parts of sulphate of magnesia for every 100 parts of common salt that has been previously obtained from it.

b. A concentrated solution of sulphate of sodium is added to bittersn, in equivalent proportion to that of the chloride of magnesium in it, and the mixed solution is evaporated at the temperature of 122° Fahr. (Ure); cubical crystals of common salt are deposited as the evaporation proceeds, after which, by further concentration and repose, regular crystals of sulphate of magnesia are obtained.

c. A sufficient quantity of calcined and slaked magnesian limestone is boiled in bittersn to decompose the magnesium salts, and the liquid is evaporated, &c., as before. This is a very economical process.

Prop. Small acicular crystals, or (by careful crystallization) large four-sided rhombic prisms; colourless; odourless, transparent; slightly efflorescent; extremely bitter and nauseous; when heated, it fuses in its water of crystallization, the larger portion of which readily passes off, but one equivalent of water is energetically retained; at a high temperature it runs into a species of white enamel; it dissolves in its own weight of cold water, and in 3-4ths of that quantity of boiling water; it is insoluble in both alcohol and ether. Sp. gr. 1.66.

Pur. Sulphate of magnesium is soluble in an equal weight of water at 60° Fahr., by which it may be distinguished from sulphate of sodium, which is much more soluble.

An aqueous solution in the cold is not precipitated by oxalate of ammonium. The precipitate given by carbonate of sodium from a solution of 100 grs. should, after well washing and heating to redness, weigh 16.26 grs. (B. P.)

Digested in alcohol, the filtered liquid does not yield a precipitate with nitrate of silver, nor burn with a yellow flame, and evaporates without residue. "Not deliquescent in the air." (Ph. L.) 100 grs. of the pure crystallized sulphate yield 16½ grs. of calcined magnesium oxide. (Pereira.) 10 grs., dissolved in 1 fl. oz. of water, and treated with a solution of carbonate of ammonium, are not entirely precipitated by 280 minims of solution of phosphate of sodium. (Ph. E.)

Uses, &c. Sulphate of magnesium is an excellent cooling purgative, and sometimes proves diuretic and diaphoretic.—*Dose.* 1 dr to 1 oz., as a purgative, or an antidote in poisoning by lead. Large doses should be avoided. Instances are on record of their having proved fatal. Dr. Christison mentions the case of a boy 10 years old, who swallowed 2 oz. of salts, and died within 10 minutes. The best antidote is an emetic. A small quantity of Epsom salts, largely diluted with water (as a drachm to ½ pint or ¾ pint), will usually purge as much

as the common dose. This increase of power has been shown by Liebig to result rather from the quantity of water than the salt. Pure water is greedily taken up by the absorbents; but water holding in solution saline matter is rejected by those vessels, and consequently passes off by the intestines.

Obs. Oxalic acid has occasionally been mistaken for Epsom salt, with fatal results. They may be readily distinguished from each other by the following characteristics:—

EPSOM SALT.	OXALIC ACID.
Tastes extremely bitter and nauseous.	Tastes extremely sour.
Turns milky when dissolved in water and mixed with carbonate of sodium or carbonate of potassium; and after a time, a white sediment subsides.	Effervesces when mixed with carbonate of sodium or carbonate of potassium, and the liquid in a few seconds becomes transparent.

Magnesium, Tar'trate of. *Syn.* MAGNESIÆ TARTRAS, MAGNESIA TARTARICA, L. *Prep.* By saturating a solution of tartaric acid with carbonate of magnesium, and gently evaporating to dryness. It is only very slightly soluble in water.—*Dose.* 20 to 60 grs., or more; in painful chronic maladies of the spleen. (Pereira, *ex* Radmacher.) The effervescing tartrate of magnesium, commonly sold under the name citrate has already been noticed.

Magnesium and Potas'sium, Tartrate of. *Syn.* POTASSIO-TARTRATE OF MAGNESIA; MAGNESIÆ POTASSIO-TARTRAS, M. ET POTASSÆ TARTRAS, L. *Prep.* From acid tartrate of potassium (in powder,) 7 parts; carbonate of magnesium, 2 parts; water 165 parts; boiled until the solution is complete, and then evaporated and crystallized. A mild aperient.—*Dose.* 1 to 5 drs.; in scurvy, &c.

MAG'NET. *Syn.* MAGNES, L. Besides its application to the loadstone, this name was formerly given to several compounds used in medicine.—**ARSENICAL MAGNET** (MAGNES ARSE-NICALIS), a substance once used as a caustic, consisted of common antimony, sulphur, and arsenious acid, fused together until they formed a sort of glass. **MAGNES EPILEPSIÆ** was native cinnabar.

MAHOG'ANY. This is the wood of *Swietenia Martagoni* (Linn.), a native of the hotter parts of the new world. It is chiefly imported from Honduras and Cuba. •The extract is astringent, and has been used in tanning, and as a substitute for cinchona bark. The wood is chiefly employed for furniture and ornamental purposes, and, occasionally, in ship-building.

Imitations of mahogany are made by staining the surface of the inferior woods by one or other of the following methods:

1. Warm the wood by the fire, then wash it over with aquafortis, let it stand 24 hours to dry, and polish it with linseed oil reddened by

digesting alkanet root in it; or, instead of the latter, give the wood a coat of varnish, or French polish which has been tinged of a mahogany colour with a little aloes and annotta.

2. Socotrine aloes, 1 oz.; dragon's blood, $\frac{1}{2}$ oz.; rectified spirit, 1 pint; dissolve, and apply 2 or 3 coats to the surface of the wood, previously well smoothed and polished; lastly, finish it off with wax or oil tinged with alkanet root.

3. Logwood, 2 oz.; madder, 8 oz.; fustic, 1 oz.; water, 1 gal.; boil 2 hours, and apply it several times to the wood boiling hot; when dry, slightly brush it over with a solution of pearlash, 1 oz.; in water, 1 quart; dry, and polish as before.

4. As the last, but using a decoction of logwood, 1 lb., in water, 5 pints. The tint may be brightened by adding a little vinegar or oxalic acid, and darkened by a few grains of copperas.

Stains and spots may be taken out of mahogany furniture with a little aquafortis or oxalic acid and water, by rubbing the part with the liquid, by means of a cork, till the colour is restored; observing afterwards to well wash the wood with water, and to dry it and polish it as before.

MAIZE. *Syn.* INDIAN CORN. The seeds of *Zea Mays* (Linn.). Like the other corn plants, it belongs to the Grass family (*Graminaceæ*), and has albuminous grains sufficiently large and farinaceous to be ground into flour.

Maize is extremely nutritious, and although it is poorer in albuminoid matters than wheat, it is, of all the cereal grains, the richest in fatty oil, of which it contains about 9%. (Dumas and Payen.) It is remarkable for its fattening quality on animals, but is apt to excite slight diarrhoea in those unaccustomed to its use. Its meal is the 'POLENTA' of the shops. The peculiar starch prepared from it is known as 'CORN FLOUR,' 'MAIZENA,' &c. In America, the young ears are roasted and boiled for food.

The centesimal composition of maize is as follows:—Flesh formers (albuminoid bodies), 9.9; heat and fat formers (starch, dextrin, and fat), 71.2; fibre, 4.0; ash, 1.4; water, 13.5.

MALAG'MA. In *pharmacy*, a poultice or emollient application.

MAL'IC ACID. $H_2C_4H_2O_5$. *Syn.* ACIDUM MALICUM, L. This acid exists in the juice of many fruits and plants, either alone, or associated with other acids, or with potassa or lime. In the juice of the garden rhubarb, it exists in great abundance, being associated with acid oxalate of potassa.

Prep. (Everitt.) The stalks of common garden rhubarb are peeled, and ground or grated to a pulp, which is subjected to pressure; the juice is heated to the boiling-point, neutralized with carbonate of potassa, mixed with acetate of lime, and the insoluble oxalate of lime which

falls is removed by filtration; to the clear and nearly colourless liquid, solution of acetate of lead is next added as long as a precipitate ('malate of lead') continues to form; this is collected on a filter, washed, diffused through water, and decomposed by sulphuric acid, avoiding excess, the last portion of lead being thrown down by a stream of sulphuretted hydrogen; the filtered liquid is, lastly, carefully evaporated to the consistence of syrup, and left in a dry atmosphere until it becomes converted into a solid and somewhat crystalline mass of malic acid. If perfectly pure malic acid is required, the malate of lead must be crystallised before decomposing it with sulphuretted hydrogen. *Prod.* 20,000 grs. of the peeled stalks yield 12,500 grs. of juice, of which one imperial gallon contains 11,139½ grs. of dry malic acid.

Obs. By a similar process, malic acid may be prepared from the juice of the berries of the mountain ash (*Sorbus aucuparia*), just when they commence to ripen, or from the juice of apples, pears, &c.

Prop., &c. Malic acid is slightly deliquescent, very soluble in water, soluble in alcohol, and has a pleasant acidulous taste. The aqueous infusion soon gets mouldy by keeping. When kept fused for some time at a low heat, it is converted into fumaric acid; and when quickly distilled, it yields maleic acid, while fumaric acid is left in the retort. With the bases malic acid forms salts called malates. Of these the acid malate of ammonia is in large, beautiful crystals; malate of lead is insoluble in cold water, but dissolves in warm dilute acid, from which it separates on cooling in brilliant silvery crystals; acid malate of lime also forms very beautiful crystals, freely soluble in water; neutral malate of lime is only sparingly soluble in water; the first is obtained by dissolving the latter in hot dilute nitric acid, and allowing the solution to cool very slowly.

MALLEABILITY. The peculiar property of metals which renders them capable of extension under the hammer.

MALT. *Syn.* BINA, BYNE, BRASIUM, MALTUM, L. The name given to different kinds of grain, such as barley, bere or bigg, oats, rye, maize, &c., which have become sweet, from the conversion of a portion of their starch into sugar, in consequence of incipient germination artificially produced. Barley is the grain usually employed for this purpose.

Var. Independently of variations of quality, or of the grain from which it is formed, malt is distinguished into varieties depending on the heat of the kiln employed for its desiccation. When dried at a temperature ranging between 90 and 120° Fahr., it constitutes 'PALE MALT,' when all the moisture has exhaled, and the heat is raised to from 125 to 135°, 'YELLOW,' or 'PALE AMBER MALT,' is formed; when the heat ranges between 140° and 160°, the product receives the name of

'AMBER MALT,' at 160° to 180°, 'AMBER-BROWN,' or 'PALE BROWN MALT,' is obtained. ROASTED, PATENT, or BLACK MALT, and CRYSTALLISED MALT, are prepared by a process similar to that of roasting coffee. The malt is placed in sheet iron cylinders over a strong fire, and the cylinders made to revolve at the rate of about 20 revolutions per minute if roasted malt is required, or 120 if for crystallised malt. In the former case the finished malt has a dark brown colour; in the latter, the interior of the grain becomes dark brown, whilst the husk assumes a pale amber hue. The temperature must never exceed 420°, or the malt will become entirely carbonised.

Qual. Good malt has an agreeable smell and a sweet taste. It is friable, and when broken discloses a floury kernel. Its husk is thin, clean, and unshrivelled in appearance, and the acrospire is seen extending up the back of the grain, beneath the skin. The admixture of unmalted with malted grain may be discovered, and roughly estimated, by throwing a little into water, malt floats on water, but barley sinks in it. The only certain method, however, of determining the value of malt is to ascertain the amount of soluble matter which it contains, by direct experiment. This varies from 62 to 70%, and for good malt is never less than 66 to 67%. If we assume the quarter of malt at 32½ lbs., and the average quantity of soluble matter at 66%, then the total weight of soluble matter will be fully 213½ lbs. per quarter; but as this, "in taking on the form of gum and sugar" during the process of mashing, "chemically combines with the elements of water, so the extract, if evaporated to dryness, would reach very nearly 231 lbs.; and this reduced to the basis of a barrel of 36 gallons, becomes in the language of the brewer, 87 lbs. per barrel, which, however, merely means that the wort from a quarter of malt, if evaporated down to the bulk of a barrel or 36 gallons, would weigh 87 lbs. more than a barrel of water." (Ure.)

Assay. 1. A small quantity of the sample being ground in a coffee or pepper mill, 100 grs. are accurately weighed, and dried by exposure for about 1 hour at the temperature of boiling water. The loss in weight, in grains, indicates the quantity of moisture per cent. This, in good malt, should not exceed 6½ grs.

2. A second 100 grs. is taken and stirred up with about ½ pint of cold water; the mixture is then exposed to the heat of boiling water for about 40 minutes; after which it is thrown on a weighed filter, and the undissolved portion washed with a little hot water; the undissolved portion, with the filter, is then dried at 212° Fahr., and weighed. The loss in weight, less the per-centage of moisture last found, taken in grains, gives the per-centage of soluble matter. This should not be less than 66 grs. The same result will be arrived at by evaporating the filtered liquid and 'washings' to dryness, and weighing the residuum.

3. A third 100 grs. is taken and mashed with about $\frac{1}{2}$ pint of water at 160° Fahr., for 2 or 3 hours; the liquid is then drained off, the residue gently squeezed, and the strained liquid, evaporated to dryness, as before, and weighed. This gives the per-centage of saccharine matter, and should not be less than about 71 grs., taking the above average of malt as the standard of calculation.

Uses, &c. Malt is chiefly employed in the arts of brewing and distillation. Both roasted and crystallised malt are merely used to colour the worts produced from pale malt. 1 lb. of roasted malt, mashed with 79 lbs. of pale malt, imparts to the liquor the colour and flavour of 'porter.' The paler varieties of malt contain the largest quantity of saccharine matter. After the malt has been kiln-dried, the rootlets may be removed by means of a sieve. Before malt is mashed for beer, it must be broken up, and the law requires that it be bruised or crushed by smooth metal rollers, and not ground by mill stones. It has also been proposed to employ malt, instead of raw grain, for fattening domestic animals, and as food for their young and those in a sickly state. Infusion of milk (sweet wort, malt tea) is laxative, and has been recommended as an antiscorbutic and tonic. It has been given with great advantage in scurvy; but for this purpose good, well-hopped, mild beer is equally serviceable and more agreeable. See BREWING, DISTILLATION, FERMENTATION, &c.

MALT LIQUORS. The qualities of ale, beer, and porter, as beverages, the detection of their adulteration, and the methods of preparing them, are described under their respective names and in the article upon 'BREWING'; the present article will, therefore, be confined to a short notice of the cellar management, and the diseases of malt liquors generally.

AGE. The appearance and flavour to which this term is applied can, of course, be only given to the liquor by properly storing it for a sufficient time. Fraudulent brewers and publicans, however, frequently add a little oil of vitriol (diluted with water) to new beer, by which it assumes the character of an inferior liquor of the class 1 or 2 years old. Copperas, alum, sliced lemons, Seville oranges, and cucumbers, are also frequently employed by brewers for the same purpose.

BOTTLING. Clean, sweet, and dry bottles, and sound and good corks, should be had in readiness. The liquor to be bottled should be perfectly clear; and if it be not so, it must be submitted to the operation of 'fining.' When quite fine, and in good condition, the bung of the cask should be left out all night, and the next day the liquor should be put into bottles, which, after remaining 12 or 24 hours, covered with sheets of paper to keep out flies and dust, must be securely corked down. Porter is generally wired over. The wire for this purpose should be 'annealed,' and not resilient. If the liquor is intended for exportation to a

hot climate, the bottles should remain filled for 2 or 3 days, or more, before corking them. The stock of bottled liquor should be stored in a cool situation; and a small quantity, to meet present demands only, should be set on their sides in a warmer place to ripen. October beer should not be bottled before Midsummer, nor March beer till Christmas.

CLOUDINESS. Add a handful of hops boiled in a gallon of the beer, and in a fortnight fine it down.

FINING. See CLARIFICATION and BREWING.

FLATNESS. When the liquor is new, or has still much undecomposed sugar left in it, a sufficient remedy is to remove it into a warmer situation for a few days. When this is not the case, 2 or 3 pounds of moist sugar (foots) may be 'rummaged' into each hogshead. In this way a second fermentation is set up, and in a few days the liquor becomes brisk, and carries a head. This is the plan commonly adopted by publicans. On the small scale, the addition of a few grains of carbonate of soda, or of prepared chalk, to each glass, is commonly made for the same purpose; but in this case the liquor must be drunk within a few minutes, else it becomes again flat and insipid. This may be adopted for home-brewed beer which has become sour and vapid.

FOXING or BUCKING. The spontaneous souring of worts or beer during their fermentation or ripening, to which this name is applied, may generally be remedied by adding to the liquor some fresh hops (scalded), along with some black mustard seed (bruised). Some persons use a little made mustard, or a solution of alum or of catechu, and in a week or 10 days afterwards further add some treacle, or moist sugar.

Frosted beer is recovered by change of situation; by the addition of some hops boiled in a little sweet wort; or, by adding a little moist sugar or treacle to induce a fresh fermentation.

HEADING. This is added to thin and vapid beer to make it bear a frothy head. The most innocent, pleasant, and effective addition of this sort is a mixture of pure ammonio-citrate of iron and salt of tartar, about equal parts, in the proportion of only a few grains to a quart.

IMPROVING. This is the trade synonym of 'ADULTERATION' and 'DOCTORING.' Nevertheless there are cases in which 'improvement' may be made without affecting the wholesome character of the liquor. Of this kind is the addition of hops, spices, &c., during the maturation of beer that exhibits a tendency to deteriorate. For this purpose some persons cut a half-quartern loaf into slices, and after toasting them very high, place them in a coarse linen bag along with $\frac{1}{2}$ lb. of hops, and 2 oz. each of bruised ginger, cloves, and mustard seed, and suspend the bag by means of a string a few inches below the surface of the beer (a hogshead), which is then bunged close. The

addition of a little ground capsicum in the same way is also a real improvement to beer, when judiciously made.

MUSTINESS. To each hogshead, racked into clean casks, add 1 lb. of new hops boiled in a gallon of the liquor, along with 7 lbs. of newly-burnt charcoal (coarsely bruised, and the fine dust sifted off), and a 4-lb. loaf of bread cut into thin slices and toasted rather black; 'rouse up' well every day for a week, then stir in of moist sugar 3 or 4 lbs., and bung down for a fortnight.

RECOVERING. This is said of unsaleable beer when rendered saleable, by giving it 'head' or removing its 'tarniness.'

RIPENING. This term is applied to the regular maturation of beer. It is also used to express the means by which liquors already mature are rendered brisk, sparkling, or fit and agreeable for immediate use. In the language of the cellar, malt liquors are said to be 'up' when they are well charged with gaseous matter, and bear a frothy head. These qualities depend on the undecomposed sugar undergoing fermentation, which, when active, can only be of comparatively short duration, and should, therefore, be repressed rather than excited in beers not required for immediate consumption. When we desire to give 'briskness' to these liquors, whether in cask or bottle, it is only necessary to expose them for a few days to a slight elevation of temperature, by removing them, for instance, to a warmer apartment. This is the plan successfully adopted by bottlers. The addition of a small lump of white sugar to each bottle of ale or beer, or a teaspoonful of moist sugar to each bottle of porter, just before corking it, will render it fit for drinking in a few days in ordinary weather, and in 2 or 3 days in the heat of summer. A raisin or a lump of sugar candy is often added to each bottle with a like intention. The Parisians bottle their beer one day and sell it the next. For this purpose, in addition to the sugar as above, they add 2 or 3 drops of yeast. Such bottled liquor must, however, be drunk within a week, or else stored in a very cold place, as it will otherwise burst the bottles or blow out the corks.

ROPINESS. A little infusion of catechu or of oak bark, and some fresh hops, may be added to the beer, which in a fortnight should be rummaged well, and the next day 'fined' down.

SOURNESS. Powdered chalk, carbonate of soda, salt of tartar, or pearlash, is commonly added by the publicans to the beer, until the acidity is nearly removed, when 4 or 5 lbs. of moist sugar or foots per hogshead are 'rummaged' in, together with sufficient water to disburse double the amount of the outlay and trouble. Such beer must be soon put on draught, as it is very apt to get flat by keeping. Oyster shells and egg shells are also frequently used by brewers for the same

purpose. To remove the acidity of beer, on the small scale, a few grains of carbonate of soda per glass may be added just before drinking it.

STORING. The situation of the beer-cellar should be such as to maintain its contents at a permanently uniform temperature, ranging between 44° and 50° Fahr., a condition which can only be ensured by choosing for its locality an underground apartment, or one in the centre of the basement portion of a large building.

VAMPING. Half fill casks with the old liquor, fill them up with some newly brewed, and bung close for 3 weeks or a month.

MALTING. The method of converting barley, wheat, oats, or any other description of grain into malt. There are four successive stages in the process of malting, viz. steeping, couching, flooring, and kiln-drying.

1. *Steeping or moistening.*—The grain is placed in a large wooden or stone cistern, and sufficient water run in to cover it. Here it remains for a period of from 40 to 60 hours, depending on the temperature of the weather, or until it becomes soft enough to be easily pierced with a needle, or crushed between the thumb and finger without yielding a milky juice. While in steep the grain swells, increasing nearly one fifth in bulk, and about 50 per cent. in weight. The water is then drained off, and the grain is ready for the next operation,

2. *Couching or germinating.*—From the cistern the swollen barley is thrown out into the couch frame to the depth of from 14 or 20 inches, where heat is generated and germination induced. Here it is allowed to remain for from 20 to 30 hours, according to the state of the weather, until the acrospire or pumule shoots forth. Were the grain to remain long in the couch, particularly in warm weather, it would be either unduly forced or turn sour. Whilst in couch it rises in temperature about 15 degrees, and gives off some of its extra moisture. This is called sweating, and as the rootlets now begin to shoot out, means must be taken to check the germination.

2. *Flooring or regulating.*—This consists in spreading the heated barley on the floor at different depths, according as it is required to increase or retard germination. During this stage of the operation the art of the maltster may be more properly said to commence, as now all his judgment is brought into requisition. The grain must be turned three or four times a day, and at each turning the layer is spread out more and more, until it is reduced to the depth of about three or four inches. The chief object to be attained by this operation is a regular germination of the grain.

4. *Kiln-drying.*—The sprouted barley is next spread in a thin layer on the malt kiln, and heat applied. The temperature to which the kiln is raised varies according to the pur-

pose for which the malt is required, the difference between pale, amber, and brown malt, depending solely on the degree of heat to which each has been subjected, and the manner in which the heat has been applied (see MALT). If the malt were not kiln-dried it would not keep, but would become mouldy. By the process of drying, the vitality of the seed is destroyed, and it may then be preserved without suffering further change.

Product.—Good barley yields about 80% by weight and 109% by measure, of dried and sifted malt. Of the loss by weight, 12% must be referred to water existing in the raw grain.

MAN'GANESE. Mn. *Syn.* MANGANESEUM, L. A hard, brittle metal, discovered by Gahn in the black oxide of manganese of commerce.

Prep. Reduce manganous carbonate to fine powder, make it into a paste with oil, adding about 1-10th of its weight of calcined borax, place the mixture in a Hessian crucible lined with charcoal, lute on the cover, and expose it to the strongest heat of a smith's forge for 2 hours; when cold, break the crucible and preserve the metallic button in naphtha.

Obs. The product is probably a carbide of manganese, just as steel is a carbide of iron. Deville has lately prepared pure manganese by reducing the pure oxide by means of an insufficient quantity of sugar charcoal in a crucible made of caustic lime.

Prop. As prepared by Deville, metallic manganese has a reddish lustre, like bismuth; it is very hard and brittle; when powdered, it decomposes water, even at the lowest temperature. Dilute sulphuric acid dissolves it with great energy, evolving hydrogen. *Sp. gr.* 7.13. In an oxidised state manganese is abundant in the mineral kingdom, and traces of it have been found in the ashes of plants and in mineral waters.

The salts of manganese may be easily prepared in a state of purity by dissolving the precipitated carbonate in the acids. Most of them are soluble, and several are crystallisable.

Tests. Manganous salts are distinguished as follows:—The hydrates of potassium and sodium give white precipitates insoluble in excess, and rapidly turning brown. The presence of ammonium salts interferes with these tests. Ammonia gives similar results.

Ferrocyanide of potassium gives a white precipitate. Sulphuretted hydrogen gives no precipitate in acid solutions, and precipitates neutral solutions only imperfectly; but in alkaline solutions it gives a bright, flesh-coloured, insoluble precipitate, which becomes dark brown on exposure to the air. Sulphide of ammonium in neutral solutions, also yields a similar precipitate, which is very characteristic. A compound of manganese fused with borax in the outer flame of the blowpipe gives a bead, which appears of a violet-red colour

whilst hot, and upon cooling acquires an amethystine tint; this colour is lost by fusion in the inner flame. Heated upon platinum foil with a little carbonate of sodium, in the outer flame, it yields a green mass whilst hot, which becomes bluish green when cold.

Manganous Ace'tate. $\text{Mn}(\text{C}_2\text{H}_3\text{O}_2)_2$. *Syn.* ACETATE OF PROTOXIDE OF MANGANESE; MANGANII ACETAS, L. *Prep.* 1. By neutralising concentrated acetic acid with manganous carbonate, and evaporating the solution so that crystals may form.

Prop., &c. The crystals, when pure, are of a pale red colour; permanent in the air; soluble in alcohol, and in $3\frac{1}{2}$ parts of water, and possess an astringent and metallic taste.—*Dose.* 5 to 10 grs., as an alternative, hæmatinic, &c.

Manganous Car'bonate. MnCO_3 . *Syn.* CARBONATE OF PROTOXIDE OF MANGANESE; MANGANESII CARBONAS, L. *Prep.* Reduce the black oxide of manganese of commerce to fine powder, and after washing it in water acidulated with hydrochloric acid, dissolve it in strong hydrochloric acid, and evaporate the resulting solution to dryness; dissolve the residue in water, and add to the solution sufficient sodium carbonate to precipitate all the iron present; digest the mixed precipitate in the remainder of the liquid, filter, add ammonium sulphide until it begins to produce a flesh-coloured precipitate, then filter, and add sodium carbonate as long as a precipitate falls; lastly, well wash the newly-formed carbonate in water, and dry it by a gentle heat.

2. By directly precipitating a solution of the chloride with sodium carbonate, and washing and drying the powder, as before.

Prop., &c. A pale buff or cream-coloured powder; insoluble in water; freely soluble in acids; exposed to a strong heat, it loses its carbonic acid, absorbs oxygen, and is converted into the red oxide. It is chiefly employed in the preparation of the other salts of manganese.

Manganous Chlo'ride. MnCl_2 . *Syn.* PROTOCHLORIDE OF MANGANESE, MURIATE OF M.; MANGANESII CHLORIDUM, L. *Prep.* 1. By saturating hydrochloric acid with manganous carbonate; the solution is gently concentrated by evaporation, when crystals may be obtained, or it is at once evaporated to dryness; in either case the product must be placed in warm, dry, stoppered bottles, and preserved from the air.

2. From the dark brown residual liquid of the process of obtaining chlorine from bin-oxide of manganese and hydrochloric acid; this liquid is evaporated to dryness, and then slowly heated to dull redness in an earthen vessel, with constant stirring, and kept at that temperature for a short time; the grayish-looking powder thus obtained is treated with water, and the solution separated from the ferric oxide and other insoluble matter by filtration; if any iron still remains, a little

manganous carbonate is added, and the whole boiled for a few minutes; the filtered solution is then treated as before. This is the least expensive and convenient source of this salt.

Prop., &c. Rose-coloured tabular crystals; inodorous; very soluble both in water and alcohol; very deliquescent; when gradually heated to fusion, the whole of the water is expelled, and at a red heat it slowly suffers decomposition. Astringent, tonic, hæmatinic, and alterative.—*Dose.* 3 to 10 grs.; in scorbutic, syphilitic, and certain chronic cutaneous affections; anæmia, chlorosis, &c.

Manganous Hydrate. $Mn(HO)_2$. *Syn.* HYDRATED PROTOXIDE OF MANGANESE. *Prep.* Formed by adding potassium hydrate to manganous sulphate, and filtering and drying, the precipitate in vacuo. White powder rapidly absorbing oxygen and burning first green and then brown from formation of higher oxides.

Manganous Iodide. MnI_2 . *Syn.* MANGANESII IODIDUM, L. *Prep.* By dissolving the carbonate in hydriodic acid, and evaporating the filtered liquid in vacuo or out of contact with air.—*Dose.* 1 to 3 grs.; in anæmia, chlorosis, &c., occurring in scrofulous subjects.

Manganous Oxide. MnO . *Syn.* PROTOXIDE OF MANGANESE. *Prep.* By passing a current of hydrogen over manganous carbonate heated to whiteness in a porcelain tube. Olive green powder rapidly oxidizing on exposure to air, and soluble in acids forming manganous salts.

There are four other oxides and two oxyhydrates that may be treated of here, but of which only the peroxyde and the manganates and permanganates are of practical importance.

Manganous-manganic Oxide. Mn_3O_4 , or MnO, Mn_2O_3 . *Syn.* RED OXIDE OF MANGANESE, PROTOSSESQUIOXIDE OF MANGANESE. Found native as "Hansmanite." It is produced by igniting manganous carbonate, or manganic, oxide, or manganic peroxide. Reddish-brown, coloured crystals or powder, and communicates an amethyst colour to glass when fused with it.

Manganous-manganic Peroxide. Mn_2O_7 , or MnO_3, Mn_2O_5 . *Syn.* INTERMEDIATE OXIDE OF MANGANESE. Found native as "Varicille," as a black hard crystalline mass. Decomposed when heated into a lower oxide and oxygen.

Manganous Phosphate. $MnH.PO_4 + 6Aq$. *Syn.* PHOSPHATE OF PROTOXIDE OF MANGANESE; MANGANESII PHOSPHAS, L. *Prep.* By precipitating a solution of manganous sulphate with a solution of sodium phosphate. It must be preserved from the air.—*Dose.* 3 to 12 grs.; in anæmia, rickets, &c.

Manganous Sulphate. $MnSO_4$. *Syn.* SULPHATE OF PROTOXIDE OF MANGANESE; MANGANESII SULPHAS, L. *Prep.* 1. By dissolving manganous carbonate in dilute sulphuric acid, and evaporating the filtered solution so that

crystals may form, or at once gently evaporating it to dryness. Pure.

2. (Commercial.) By igniting manganic peroxide (pyrolusite) mixed with about 1-10th of its weight of powdered coal in an iron crucible or gas-retort, and digesting the residuum of the calcination in sulphuric acid, with the addition after a time of a little hydrochloric acid; the solution of manganous sulphate thus obtained, after defecation, is evaporated to dryness, and heated to redness as before; the mass, after ignition, is crushed small, and treated with water; the solution is nearly pure, the whole of the iron having been reduced into the state of insoluble peroxide. Used by the calico-printers. Cloth steeped in the solution, and afterwards passed through a solution of chloride of lime, is dyed of a permanent brown.

Prop., &c. Pale rose-coloured crystals of the formulæ $MnSO_4, 7Aq$; $MnSO_4, 5Aq$; or $MnSO_4, 4Aq$, according to the method of crystallizing, furnishing a solution of a rich amethystine colour. With sulphate of potassa, it forms a double salt ('manganese alum').—*Dose.* As an alterative and tonic, 5 to 10 grs.; as a cholagogue cathartic, 1 to 2 drs., dissolved in water, either alone or combined with infusion of senna. According to Ure, its action is prompt and soon over; 1 dr. of it occasions, after the lapse of an hour or so, one or more liquid bilious stools. In large doses it occasions vomiting, and in excessive doses it destroys life by its caustic action on the stomach. (Dr. G. C. Mitscherlich.) It has been administered with manifest advantage in torpor of the liver, gout, jaundice, syphilis, and certain skin diseases; and, combined with iron, in anæmia, chlorosis, rickets, &c.

Manganous Tartrate. $MnC_4H_4O_6$. *Syn.* MANGANESII TARTRAS, L. *Prep.* By saturating a solution of tartaric acid with moist manganous carbonate. Alterative and tonic.—*Dose.* 4 to 12 grs.

Manganic Acid. H_2MnO_4 . This acid has not yet been obtained free, but some of its salts are extensively employed as disinfectants, as "green Condy's fluid." The chief compounds are the following:

Manganate of Barium. $BaMnO_4$. Green insoluble powder, obtained by fusing barium hydrate, potassium chlorate, and manganic peroxide together, and washing the product.

Manganate of Potassium. K_2MnO_4 . Finely powdered manganic peroxide, potassium chlorate, and potassium hydrate, made into a thick paste with water, and heated to dull redness. The fused product is treated with a small quantity of water, and crystallized by evaporation in vacuo.

Dark green, almost black crystals, readily soluble in water, but decomposed by excess, or by acids into manganic peroxide, and potassium permanganate.

Manganate of Sodium. M_2MnO_4 . Prepared on the large scale by heating a mixture of

manganic peroxide and sodium hydrate to redness in a current of air. *Used* in strong solution as a disinfectant under the name of "Condy's green fluid."

Manganic Hydrate. $Mn_2(HO)_6$. *Syn.* HYDRATED SESQUIOXIDE OF MANGANESE. Found native as "manganite," in reddish-brown crystals. *Prep.* By passing a current of air through recently precipitated and moist manganous hydrate. Soft dark brown powder converted into the oxide by heat.

Manganic Oxide. Mn_2O_3 . *Syn.* SESQUIOXIDE OF MANGANESE. Found native as "Braunite," and readily formed by exposing manganous hydrate to the action of air, and drying, or by gently igniting the peroxide brown or black powder decomposed by heat.

Manganic Peroxide. MnO_2 . *Syn.* PERMANGANIC OXIDE, BINOXIDE OF MANGANESE, PEROXIDE OF MANGANESE, BLACK OXIDE OF MANGANESE, OXIDE OF MANGANESE, MANGANESII OXIDUM NIGRUM (B. P.), MANGANESII BINOXIDUM (Ph. L.), MANGANESE OXYDUM (Ph. E.).

It is the only oxide of manganese that is directly employed in the arts. It is a very plentiful mineral production, and is found in great abundance in some parts of the West of England. The manganese of the shop is prepared by washing, to remove the earthy matter and grinding in mills. The blackest samples are esteemed the best. It is chiefly used to supply oxygen gas, and in the manufacture of glass and chlorine; in dyeing and to form the salts of manganese. It has been occasionally employed in medicine, chiefly externally, in itch and porrigo, made into an ointment with lard. It has been highly recommended by Dr. Erigeron in scrofula. Others have employed it as an alterative and tonic with variable success. When slowly introduced into the system during a lengthened period, it is said to produce paralysis of the motor nerves. (Dr. Coupar.)—*Dose.* 3 to 12 grs., or more, thrice daily, made into pills.

Pur. Native binoxide of manganese (pyrolusite) is usually contaminated with variable proportions of argillaceous matter, calcium carbonate, ferric oxide, silica, and barium sulphate, all of which lower its value as a source of oxygen, and for the preparation of chlorine. The richness of this ore can, therefore, be only determined by an assay for its principal ingredient.

Assay. There are several methods adopted for this purpose, among which the following recommend themselves as being the most accurate and convenient.

1. A portion of the mineral being reduced to very fine powder, 50 grs. of it are put into the little apparatus employed for the analysis of carbonates described at page 295, together with about $\frac{1}{2}$ fl. oz. of cold water, and 100 grs. of strong hydrochloric acid, the latter contained in the little tube (b); 50 grs. of crystallized oxalic acid are then added, the cork carrying

the chloride of calcium tube fitted in, and the whole quickly and accurately weighed or counterpoised; the apparatus is next inclined so that the acid contained in the small tube may be mixed with the other contents of the flask, and the reaction of the ingredients is promoted by the application of a gentle heat; the disengaged chlorine resulting from the mutual decomposition of the hydrochloric acid and the manganic peroxide converts the oxalic acid into carbonic acid gas, which is dried in its passage through the chloride of calcium tube before it escapes into the air. As soon as the reaction is complete, and the residual gas has been driven off by a momentary ebullition, the apparatus is allowed to cool, when it is again carefully and accurately weighed. The loss of weight in grains, if doubled, at once indicates the per-centage richness of the mineral examined in manganic peroxide; or, more correctly, every grain of carbonic anhydride evolved represents 1.982 gr. of the peroxide.

2. (Fresenius and Will.) The apparatus employed is the 'alkalimeter' figured at page 24. The operation is similar to that adopted for the assay of alkalis, and is a modification of the oxalic acid and sulphuric acid test for manganese, originally devised by M. Berthier. The standard weight of manganic peroxide recommended to be taken by Fresenius and Will is 2.91 grammes, along with 6.5 to 7 grammes of neutral potassium oxalate. The process, with quantities altered to adapt it for employment in the laboratories of these countries, is as follows:—Manganic peroxide (in very fine powder), 50 gr.; neutral potassium oxalate (in powder), 120 grs.; these are put into the flask A (see engr., p. 24), along with sufficient water to about 1-4th fill it; the flask A and B (the latter containing the sulphuric acid) are then corked air-tight, and thus connected in one apparatus, the whole is accurately weighed. The opening of the tube b being closed by a small lump of wax, a little sulphuric acid is sucked over from the flask B into the flask A; the disengagement of oxygen from the manganese immediately commences, and this reacting upon the oxalic acid present, converts it into carbonic anhydride gas, which passing through the concentrated sulphuric acid in the flask B, which robs it of moisture, finally escapes from the apparatus through the tube d. As soon as the disengagement of carbonic acid ceases, the operator sucks over a fresh portion of sulphuric acid, and this is repeated at short intervals, until bubbles of gas are no longer disengaged. The little wax stopper is now removed, and suction is applied at h until all the carbonic acid in the apparatus is replaced by common air. When the whole has become cold, it is again weighed. The loss of weight, doubled, indicates the amount of pure manganic peroxide, in the sample, as before.

3. (Otto.) 50 grs. of the sample reduced to

very fine powder, are mixed in a glass flask, with hydrochloric acid, $1\frac{1}{2}$ fl. oz., diluted with $\frac{3}{4}$ oz. of cold water, and portions of ferrous sulphate, from a weighed sample, immediately added; at first in excess, and afterwards, in smaller doses, until the liquid ceases to give a blue precipitate with red prussiate of potash, or to evolve the odour of chlorine; heat being employed towards the end of the process. The quantity of ferrous sulphate consumed is now ascertained by again weighing the sample. If the peroxide examined was pure, the loss of weight will be 317 grs.; but if otherwise, the per-centage of the pure peroxide may be obtained by the rule of three. Thus: suppose only 298 grs. of the sulphate were consumed, then

$$317 : 100 :: 298 : 94,$$

and the richness of the sample would be 94%. The per-centage value of the oxide for evolving chlorine may be obtained by multiplying the weight of the consumed ferrous sulphate by .2588, which, in the above case, would give 76% of chlorine. For this purpose as well as for chlorometry, the ferrous sulphate is best prepared by precipitating it from its aqueous solution with alcohol, and drying it out of contact with air until it loses its alcoholic odour.

Obs. Before applying the above processes, it is absolutely necessary that we ascertain whether the peroxide examined contains any carbonates, as the presence of these would vitiate the results. This is readily determined by treating it with a little dilute nitric acid:—if effervescence ensues, one or more carbonates are present, and the sample, after being weighed, must be digested for some time in dilute nitric acid in excess, and then carefully collected on a filter, washed, and dried. It may then be assayed as before. The loss of weight indicates the quantity of carbonates present, with sufficient accuracy for technical purposes. The determination of this point is the more important, as these contaminations not merely lessen the richness of the mineral in pure manganic peroxide, but also cause a considerable waste of acid when it is employed in the manufacture of chlorine.

Permanganic Acid. HMnO_4 . Obtained by distilling cautiously potassium permanganate and sulphuric acid. Dark violet—black liquid, green by reflected light, and rapidly absorbing water forming a violet solution. Oxidises organic matter with explosive violence.

Permanganate of Barium. $\text{Ba}(\text{MnO}_4)_2$. Black soluble prisms, formed by decomposing silver permanganate by means of barium chloride, and cautiously evaporating.

Permanganate of Potassium. KMnO_4 . *Prep.* Potassium chlorate, or nitrate, and potassium hydrate is made into a paste with water, and manganic peroxide added; the mass is dried and heated to redness. The residue is boiled with water, filled through asbestos, and evaporated down and recrystallized.

Dark purple, red, almost black anhydrous long prisms, readily soluble in 16 pints of

water. Decomposed in presence of acids by most organic matter.

Permanganate of Silver. AgMnO_4 . *Prep.* Precipitate a strong solution of silver nitrate by means of a concentrated solution of potassium permanganate. Small black prisms, soluble in 100 parts of water, with a purple colour.

Permanganate of Sodium. NaMnO_4 . Obtained as a dark purple liquid by passing a current of carbonic anhydride through sodium manganate. Condry red fluid is chiefly a sodium permanganate dissolved in water.

MANGE. An eruptive disease, corresponding to the itch in man, resulting from the burrowing into the skin of minute animalcules (mites or *acari*), and common to several domestic animals, more especially the dog and horse. Like the itch, it is contagious. The causes are confinement, dirt, and bad living. The treatment should consist in the immediate removal of the cause, the frequent use of soft soap and water, followed by frictions with sulphur ointment or by solution of chloride of lime, the administration of purgatives, and a change to a restorative diet. *Dun* states, that in India a very efficient remedy for mange is employed by the native farriers, which consists of castor oil seeds well bruised, steeped for twelve hours in sour milk, and rubbed into the skin, previously thoroughly cleansed with soap and water. "The itchiness disappears almost immediately, and the acari are speedily destroyed." A dressing consisting of 1 oz. of chloride of zinc (*Burnett's* disinfectant fluid) and 1 quart of water may also be applied with advantage.

MAN'GEL WURZEL. *Syn.* MANGOLD-WURZEL, HYBRID BEET, ROOT OF SCARCITY. The *Beta vulgaris*, var. *campestris*, a variety of the common beet. The root abounds in sugar, and has been used in Germany as a substitute for bread in times of scarcity. In these countries it is chiefly cultivated as food for cattle. The young leaves are eaten as spinach. The per-centage composition of mangold wurzel is as follows:—Flesh-formers (albuminoid bodies), 1.54; heat and fat-formers (sugar, &c.), 8.60; indigestible fibre, 1.12; ash, 0.96; 87.78.

MANHEIM GOLD. A gold-coloured brass. See GOLD (Dutch).

MAN'NA. *Syn.* MANNA (B. P., Ph. L. E. & D.), L. A concrete exudation from the stem of *Fraxinus ornus*, and *F. rotundifolia*, obtained by incision. (B. P.) "The juice flowing from the incised bark" of "*Fraxinus rotundifolia* and *F. ornus*, hardened by the air." (Ph. L.) The finest variety of this drug is known as flake manna, and occurs in pieces varying from 1 to 6 inches long, 1 or 2 inches wide, and $\frac{1}{2}$ to 1 inch thick. It has a yellowish-white or cream colour; an odour somewhat resembling honey, but less pleasant; a sweet, mawkish taste; and is light, porous, and friable. It is laxative in doses of 1 to 2 oz.

Manna, Factitious, made of a mixture of sugar, starch, and honey, with a very small quantity of scammony to give it odour and flavour, and to render it purgative, has been lately very extensively offered in trade, and met with a ready sale.

MAN'NACROUP. A granular preparation of wheat deprived of bran, used as an article of food for children and invalids. (Brande.)

MAN'NITE, $C_6H_{14}O_6$. *Syn.* MANNA SUGAR, MUSHROOM S.; MANNITA, L. A sweet, crystallizable substance, found in manna and in several other vegetable productions. It has been formed artificially by the action of sodium-amalgam upon an alkaline solution of cane sugar.

Prep. 1. Digest manna in boiling rectified spirit, and filter or decant the solution whilst hot; the mannite crystallizes as the liquid cools in tufts of slender, colourless needles.

2. (Ruspini.) Manna, 6 lbs.; cold water (in which the white of an egg has been beaten), 3 lbs.; mix, boil for a few minutes, and strain the syrup through linen whilst hot; the strained liquid will form a semi-crystalline mass on cooling; submit this to strong pressure in a cloth, mix the cake with its own weight of cold water, and again press it; dissolve the cake thus obtained in boiling water, add a little animal charcoal, and filter the mixture into a porcelain dish set over the fire; lastly, evaporate the filtrate to a pellicle, and set the syrup aside to crystallize. Large quadrangular prisms; perfectly white and transparent.

Prop., &c. Mannite has a powerfully sweet and agreeable taste; dissolves in 5 parts of cold water, and about half that quantity of boiling water; freely soluble in hot, and slightly so in cold alcohol; fuses by heat without loss of weight; with sulphuric acid it combines to form a new acid-compound. It is distinguished from the true sugars by its aqueous solution not being susceptible of the vinous fermentation, and not possessing the property of rotary polarization. When pure, it is perfectly destitute of purgative properties. It is now extensively imported from Italy, and is chiefly used to cover the taste of nauseous medicines, and as a sweetmeat.

MANURES. Substances added to soils to increase their fertility. The food of vegetables, as far as their organic structure is concerned, consists entirely of inorganic compounds; and no organized body can serve for the nutrition of vegetables until it has been, by the process of decay, resolved into certain inorganic substances. These are carbonic acid, water, and ammonia, which are well known to be the final products of putrefaction. But even when these are applied to vegetables, their growth will not proceed unless certain mineral substances are likewise furnished in small quantities, either by the soil or the water used to moisten it. Almost every plant, when burned, leaves ashes, which commonly contain silica, potassa, and phosphate of lime; often,

also, magnesia, soda, sulphates, and oxide of iron. These mineral bodies appear to be essential to the existence of the vegetable tissues; so that plants will not grow in soils destitute of them, however abundantly supplied with carbonic acid, ammonia, and water. The carbon of plants is wholly derived from carbonic acid, which is either absorbed from the atmosphere, and from rain water, by the leaves, or from the moisture and air in the soil, by the roots. Its carbon is retained and assimilated with the body of the plant, while its oxygen is given out in the gaseous form; this decomposition being always effected under the influence of light at ordinary temperatures. The hydrogen and oxygen of vegetables, which, when combined with carbon, constitute the ligneous, starchy, gummy, saccharine, oily, and resinous matters of plants, are derived from water chiefly absorbed by the roots from the soil. The nitrogen of vegetables is derived chiefly, if not exclusively, from ammonia, which is supplied to them by rain, and in manures, and which remains in the soil till absorbed by the roots.

According to the celebrated 'mineral theory' of agriculture, advanced by Liebig, a soil is fertile or barren for any given plant according as it contains those mineral substances that enter into its composition. Thus, "the ashes of wheat-straw contain much silica and potassa, whilst the ashes of the seeds contain phosphate of magnesia. Hence, if a soil is deficient in any one of these, it will not yield wheat. On the other hand, a good crop of wheat will exhaust the soil of these substances, and it will not yield a second crop till they have been restored, either by manure or by the gradual action of the weather in disintegrating the subsoil. Hence the benefit derived from fallows and from the rotation of crops.

"When, by an extraordinary supply of any one mineral ingredient, or of ammonia, a large crop has been obtained, it is not to be expected that a repetition of the same individual manure next year will produce the same effect. It must be remembered that the usual crop has exhausted the soil probably of all the other mineral ingredients, and that they also must be restored before a second crop can be obtained.

"The salt most essential to the growth of the potato is the double phosphate of ammonia and magnesia; that chiefly required for the phosphate of lime; while for almost all plants potassa and ammonia are highly beneficial."

From these principles we "may deduce a few valuable conclusions in regard to the chemistry of agriculture. First, by examining the ashes of a thriving plant, we discover the mineral ingredients which must exist in a soil to render it fertile for that plant. Secondly, by examining a soil, we can say at once whether it is fertile in regard to any plants the ashes

of which have been examined. Thirdly, when we know the defects of a soil, the deficient matters may be easily obtained and added to it, unmixed with such as are not required. Fourthly, the straw, leaves, &c., of any plant, are the best manure for that plant, since every vegetable extracts from the soil such matters alone as are essential to it. This important principle has been amply verified by the success attending the use of wheat-straw, or its ashes, as manure for wheat, and of the chippings of the vines as a manure for the vineyard. When these are used (in the proper quantity), no other manure is required.* Fifthly, in the rotation of crops, those should be made to follow which require different materials; or a crop which extracts little or no mineral matter, such as peas, should come after one which exhausts the soil of its phosphates and potassa." (Liebig.)

The experiments of Messrs. Lawes and Gilbert have forced upon them opinions differing from those of Baron Liebig on some important points in relation to his 'mineral theory,' which endeavours to prove that "the crops on a field diminish or increase in exact proportion to the diminution or increase of the mineral substances conveyed to it in manure." The results obtained by the English investigators appear to prove that it is impossible to get good crops by using mineral manures alone, and that nitrogenous manures (farm-yard manure, guano, ammoniacal salts, &c.) are fertilizing agents of the highest order.

Of the chemical manures now so much used, bone-dust is, perhaps, the most important, as it supplies the phosphates which have been extracted by successive crops of grass and corn, the whole of the bones of the cattle fed on these crops having been derived from the soil; its gelatin also yields ammonia by putrefaction. Guano acts as a source of ammonia, containing much oxalate and urate of ammonia, with some phosphates. Nightsoil and urine, especially the latter, are most valuable for the ammonia they yield, as well as for phosphates and potassa; but are very much neglected in this country, although their importance is fully appreciated in Belgium, France, and China. Nitrate of soda is valued as a source of nitrogen.

All organic substances may be employed as manures; preference being, however, given to those abounding in nitrogen, and which readily decay when mixed with the soil.

The analysis of manures, soils, and the ashes of plants, for the purpose of ascertaining their composition and comparative value, is not easily performed by inexperienced parties; but a rough approximation to their contents, sufficiently accurate for all practical purposes, may be generally made by such persons with proper care and attention. See AGRICULTURE, BONE-DUST, GUANO, &c.

Manures, Artificial. Various formulæ belonging to this head will be found dispersed,

under their respective names, throughout this work. The following are additional ones:—

1. (Anderson.) Sulphate of ammonia, common salt, and oil of vitriol, of each, 10 parts; chloride of potassium, 15 parts; gypsum and sulphate of potassa, of each, 17 parts; salt-petre, 20 parts; crude Epsom salts, 25 parts; sulphate of soda, 33 parts. For clover.

2. (Huxtable.) Crude potash, 28 lbs.; common salt, 1 cwt.; bone-dust and gypsum, of each, 2 cwt.; wood-ashes, 15 bushels. For either corn, turnips, or grass.

3. (Johnstone.) Sulphate of soda (dry), 11 lbs.; wood-ashes, 28 lbs.; common salt, $\frac{1}{2}$ cwt.; crude sulphate of ammonia, 1 cwt.; bone-dust, 7 bushels. As a substitute for guano.

4. (Lawes' 'Superphosphate.') See COPROLITE.

5. (Fertilizing powder.) A mixture of very fine bone-dust, 18 parts; calcined gypsum and sulphate of ammonia, of each, 1 part. The seed is ordered to be steeped in the 'drainings' from a dunghill, and after being drained, but whilst still wet, to be sprinkled with the powder, and then dried. See FLOWERS, LIME (Superphosphate), &c.

MAPS. These, as well as architect's and engineer's designs, plans, sections, drawings, &c., may be tinted with any of the simple liquid colours mentioned under 'VELVET COLOURS,' preference being given to the most transparent ones, which will not obscure the lines beneath them. To prevent the colours from sinking and spreading, which they usually do on common paper, the latter should be wetted 2 or 3 times with a sponge dipped in alum water (3 or 4 oz. to the pint), or with a solution of white size, observing to dry it carefully after each coat. This tends to give lustre and beauty to the colours. The colours for this purpose should also be thickened with a little gum water. Before varnishing maps after colouring them, 2 or 3 coats of clean size should be applied with a soft brush—the first one to the back.

MARASCHINO (-kē'-no). *Syn.* MARASQUIN, Fr. A delicate liqueur spirit distilled from a peculiar cherry growing in Dalmatia, and afterwards sweetened with sugar. The best is from Zara, and is obtained from the marasca cherry only. An inferior quality is distilled from a mixture of cherries and the juice of liquorice root.

MARBLE. *Syn.* LIMESTONE, HARD CARBONATE OF LIME; MARMOIR, CALCIS CARBONAS DICTUS, M. ALBUM (B. P., Ph. E. & D.), L. Marbles are merely purer and more compact varieties of limestone, which admit of being sawn into slabs, and are susceptible of a fine polish. White marble is employed for the preparation of carbonic acid and some of the salts of lime. It contains about 65% of lime. Sp. gr. 2.70 to 2.85. The tests of its purity are the same as those already noticed under CHALK.

Marble is best cleaned with a little soap-and-water, to which some ox-gall may be added. Acids should be avoided. Oil and grease may be generally removed by spreading a paste made of soft soap, caustic potash lye, and fuller's earth, over the part, and allowing it to remain there for a few days; after which it must be washed off with clean water. Or, equal parts of American potash (crude carbonate of potash) and whiting are made into a moderately stiff paste with a sufficiency of boiling water, and applied to the marble with a brush. At the end of two or three days the paste is removed and the marble washed with soap and water. Any defect of polish may be brought up with tripoli, followed by putty powder, both being used along with water.

Marble is mended with one or other of the compounds noticed under CEMENTS.

Marble may be stained or dyed of various colours by applying coloured solutions or tinctures to the stone made sufficiently hot to make the liquid just simmer on the surface. The following are the substances usually employed for this purpose:—

BLUE. Tincture or solution of litmus, or an alkaline solution of indigo.

BROWN. Tincture of logwood.

CRIMSON. A solution of alkanet root in oil of turpentine.

FLESH COLOUR. Wax tinged with alkanet root, and applied to the marble hot enough to melt it freely.

GOLD COLOUR. A mixture of equal parts of white vitriol, sal ammoniac, and verdigris, each in fine powder, and carefully applied.

GREEN. An alkaline solution or tincture of sap green, or wax strongly coloured with verdigris; or the stone is first stained blue, and then the materials for yellow stain are applied.

RED. Tincture of dragon's blood, alkanet root, or cochineal.

YELLOW. Tincture of gamboge, turmeric, or saffron; or wax coloured with annotta. Success in the application of these colours requires considerable experience. By their skilful use, however, a very pleasing effect, both of colour and grain, may be produced.

MARBLING (of Books, &c.). The edges and covers of books are 'marbled' by laying the colour on them with a brush, or by means of a wooden trough containing mucilage, as follows:—Provide a wooden trough, 2 inches deep, 6 inches wide, and the length of a super-royal sheet; boil in a brass or copper pan any quantity of linseed and water until a thick mucilage is formed; strain this into the trough, and let it cool; then grind on a marble slab any of the following colours in table beer. For—blue, Prussian blue or indigo;—red, rose-pink, vermillion, or drop lake;—yellow, king's yellow, yellow ochre, &c.;—white, flake white;—black, ivory black, or burnt lamp-black;—brown umber, burnt u., terra di sienna, burnt s.; black, mixed with yellow or

red, also makes brown;—green, blue and yellow mixed;—purple, red and blue mixed. For each colour provide two cups—one for the ground colours, the other to mix them with the ox-gall, which must be used to thin them at discretion. If too much gall is used, the colours spread; when they keep their place on the surface of the trough, on being moved with a quill, they are fit for use. All things being in readiness, the prepared colours are successively sprinkled on the surface of the mucilage in the trough with a brush, and are waved or drawn about with a quill or a stick, according to taste. When the design is thus formed, the book, tied tightly between cutting boards of the same size, is lightly pressed with its edge on the surface of the liquid pattern, and then withdrawn and dried. The covers may be marbled in the same way, only the liquid colours must be allowed to run over them. The film of colour in the trough may be as thin as possible; and if any remains after the marbling, it may be taken off by applying paper to it before you prepare for marbling again. This process has been called **FRENCH MARBLING**.

To diversify the effect, a little sweet oil is often mixed with the colours before sprinkling them on, by which means a light halo or circle appears round each spot. In like manner, spirit of turpentine, sprinkled on the surface of the trough, produces white spots. By staining the covers with any of the liquid dyes, and then dropping on them, or running over them, drops of the ordinary liquid mordants, a very pleasing effect may be produced. Vinegar black, or a solution of green copperas, thus applied to common leather, produces black spots or streaks, and gives a similar effect with most of the light dyes. A solution of alum or of tin in like manner produces bright spots or streaks, and soda or potash water dark ones. This style has been called **EGYPTIAN MARBLE**.—**SOAP MARBLING** is done by throwing on the colours, ground with a little white soap to a proper consistence, by means of a brush. It is much used for book-edges, stationery, sheets of paper, ladies' fancy work, &c.—**THREAD MARBLE** is given by first covering the edge uniformly of one colour, then laying pieces of thick thread irregularly on different parts of it, and giving it a fine dark sprinkle. When well managed, the effect is very pleasing.—**RICE MARBLE** is given in a similar way to the last by using rice.—**TREE MARBLE** is done on leather book-covers, &c., by bending the board a little in the centre, and running the marbling liquid over it in the form of vegetation. The knots are given by rubbing the end of a candle on those parts of the cover.—**WAX MARBLE** is given in a similar way to thread marble, but using melted wax, which is removed after the book is sprinkled and dried; or a sponge charged with blue, green, or red, may be passed over. This, also, is much used for stationery work, especially for folios and quartos. The

'vinegar black' of the bookbinders is merely a solution of acetate of iron, made by steeping a few rusty nails or some iron filings in vinegar. All the ordinary liquid colours that do not contain strong acids or alkalies may be used either alone or thickened with a little gum, for marbling or sprinkling books.

SPRINKLING is performed by simply dipping a stiff-haired painter's brush into the colour, and suddenly striking it against a small stick held in the left hand over the work. By this means the colour is evenly scattered without producing 'blurs' or 'blots.'

PAPER, PASTEBOARD, &c., in sheets, are marbled and sprinkled in a similar manner to that above described, but in this case the gum trough must, of course, be longer.

MARGARIC ACID. This term was formerly applied to a mixture of palmitic and stearic acids, produced by decomposing the alkaline soaps of solid fats with an acid, but it is now given to a fatty acid which can only be obtained artificially.

MARGARIN. *Syn.* MARGARATE OF GLYCERYLE. A constituent formerly supposed to exist in solid fats, but now regarded as a mixture of stearin and palmitin.

MARINE ACID. See HYDROCHLORIC ACID.

MARL. A natural mixture of clay and chalk, with sand. It is characterised by effervescing with acids. According to the predominance of one or other of its component parts, it is called argillaceous, calcareous, or sandy marl. It is very generally employed as a manure for sandy soils, more particularly in Norfolk. See **SOILS**.

MARMALADE. Originally, a conserve made of quinces and sugar; now commonly applied to the conserves of other fruit, more especially to those of oranges and lemons.

Prep. Marmalades are made either by pounding the pulped fruit in a mortar with an equal or a rather larger quantity of powdered white sugar, or by mixing them together by beating, passing them through a hair sieve whilst hot, and then putting them into pots or glasses. The fruit-pulps are obtained by rubbing the fruit through a fine hair sieve, either at once or after it has been softened by simmering it for a short time along with a little water. When heat is employed in mixing the ingredients, the evaporation should be continued until the marmalade 'jellies' on cooling. See **CONSERVES, CONFECTIONS, ELECTUARIES, JAMS, JELLIES, and below**.

Marmalade, Apricot. From equal parts of pulp and sugar.

Marmalade, Mixed. From plums, pears, and apples, variously flavoured to palate.

Marmalade, Orange. *Prep.* 1. From oranges (either Seville or St. Michael's, or a mixture of the two), by boiling the peels in syrup until soft, then pulping them through a sieve, adding as much white sugar, and boiling them with the former syrup and the juice of the fruit

2. By melting the confection of orange peel (*Ph. L.*), either with or without the addition of some orange or lemon juice, and then passing it through a sieve.

3. (**CANDIED ORANGE MARMALADE.**) From candied orange peel, boiled in an equal weight each of sugar and water, and then passed through a sieve.

4. (**SCOTCH MARMALADE.**)—a. Seville orange juice, 1 quart; yellow peel of the fruit, grated; honey, 2 lbs.; boil to a proper consistence.

b. Seville oranges, 8 lbs.; peel them as thinly as possible, then squeeze out the juice, boil it on the yellow peels for $\frac{1}{4}$ hour, strain, add white sugar, 7 lbs., and boil to a proper consistence.

Marmalade, Quince. *Syn.* DIACYDONIUM. From quince flesh or pulp and sugar, equal parts; or from the juice (*miva cydoniorum, gelatina c.*), by boiling it to $\frac{1}{2}$, adding an equal quantity of white wine and $\frac{1}{3}$ ds of its weight of sugar, and gently evaporating the mixture.

Marmalade, Tomato. Like APRICOT MARMALADE, adding a few slices of onions and a little parsley.

MARMORATUM. Finely powdered marble and quicklime, well beaten together; used as a cement or mortar.

MARROW (Beef). This is extensively employed by the perfumers in the preparation of various pomades and other cosmetics, on account of its furnishing an exceedingly bland fat, which is not so much disposed to rancidity as the other fats. It is prepared for use by soaking and working it for some time in lukewarm water, and afterwards melting it in a water bath, and straining it through a piece of muslin whilst hot. When scented, it is esteemed equal to bear's grease for promoting the growth of the hair.

MARSH GAS. Light carbonetted hydrogen.

MARSH'S TEST. See ARSENIUS ACID.

MARSH-MALLOW. *Syn.* ALTHÆA (*Ph. L. & E.*), *L.* The root (leaves and root—*Ph. E.* of *Althæa officinalis*, Linn., or common marsh-mallow. (*Ph. L.*) It is emollient and demulcent; the decoction is useful in irritation of the respiratory and urinary organs, and of the alimentary canal. The flowers as well as the root are reputed pectoral.

MARTIN'S POWDER. A mixture of white arsenic and the powdered stems of *Orobanchë virginiana* (Linn.), a plant common in Virginia. An American quack remedy for cancer.

MASS. *Syn.* MASSA, *L.* This term is commonly applied in pharmacy and veterinary medicine to certain preparations which are not made up into their ultimate form. Thus, we have 'ball-masses,' 'pill-masses,' &c.; of which, for convenience, large quantities are prepared at a time, and are kept in pots or jars, ready to be divided into balls or pills, as the demands

MASSES (Veterinary).¹

Massa Aloes. MASS OF ALOES. *Syn.* CATHARTIC MASS. *Prep.* Take of Barbadoes aloes, in small pieces, 8 parts; glycerin, 2 parts; ginger, in powder, 1 part; melt together in a water-bath, and thoroughly incorporate by frequent stirring.—*Use.* Cathartic for the horse.—*Dose.* From 6 to 8 drs.

Massa Aloes Composita. COMPOUND MASS OF ALOES. *Syn.* ALTERNATIVE MASS. *Prep.* Take of Barbadoes aloes, in powder, 1 oz.; soft soap, 1 oz.; common mass, 6 oz.; thoroughly incorporate by beating in a mortar, so as to form a mass.—*Use.* Alternative for the horse.—*Dose.* 1 oz.

Massa Antimonii Tartarata Composita. COMPOUND MASS OF TARTARATED ANTIMONY. *Syn.* FEVER BALL. *Prep.* Take of tartarated antimony, in powder, $\frac{1}{2}$ dr.; camphor, in powder, $\frac{1}{2}$ dr.; nitrate of potash, in powder, 2 drs.; common mass, a sufficiency; mix so as to form a bolus.—*Use.* Febrifuge for the horse.—*Dose.* The above mixture constitutes 1 dose.

Massa Belladonna Composita. COMPOUND MASS OF BELLADONNA. *Syn.* COUGH BALL. *Prep.* Take of extract of belladonna, $\frac{1}{2}$ to 1 dr.; Barbadoes aloes, in powder, 1 dr.; nitrate of potash, in powder, 2 drs.; common mass, a sufficiency; mix so as to form a bolus.—*Use.* For the horse in chronic cough.—*Dose.* The above mixture constitutes 1 dose.

Massa Catechu Composita. COMPOUND MASS OF CATECHU. *Syn.* ASTRINGENT MASS. *Prep.* Take of extract of catechu, in fine powder, 1 oz.; cinnamon bark, in fine powder, 1 oz.; common mass, 6 oz.; mix.—*Use.* Astringent for the horse.—*Dose.* 1 oz., in the form of bolus.

Massa Communis. COMMON MASS. *Prep.* Take of linseed, finely ground, and treacle, of each, equal parts; mix together so as to form a mass.—*Use.* An excipient for medicinal agents when they are to be administered in the form of bolus.

Massa Cupri Sulphatis. MASS OF SULPHATE OF COPPER. *Syn.* TONIC MASS. *Prep.* Take of sulphate of copper, finely powdered, 1 oz.; ginger, in powder, 1 oz.; common mass, 6 oz.; mix.—*Use.* Tonic for the horse.—*Dose.* 6 to 8 drs.

Massa Digitalis Composita. COMPOUND MASS OF DIGITALIS. *Syn.* COUGH BALL. *Prep.* Take of Barbadoes aloes, in powder, 2 oz.; digitalis, 1 oz.; common mass, 13 oz.; mix.—*Use.* For the horse in chronic cough.—*Dose.* 1 oz. once or twice a day.

Massa Ferri Sulphatis. MASS OF SULPHATE OF IRON. *Syn.* TONIC MASS. *Prep.* Take of sulphate of iron, in powder, 2 oz.; ginger, in powder, 1 oz.; common mass, 5 oz.; mix.—*Use.* Tonic for the horse.—*Dose.* 6 to 8 drs.

Massa Resina Composita. COMPOUND MASS OF RESIN. *Syn.* DIURETIC MASS. *Prep.* Take of resin, in powder, nitrate of potash, in powder, hard soap, of each, equal parts; mix.—*Use.* Diuretic for the horse.—*Dose.* 1 oz.

¹ Reprinted from Tuson's 'Veterinary Pharmacopoeia.'

Massa Zingiberis Composita. COMPOUND MASS OF GINGER. *Syn.* CORDIAL MASS. *Prep.* Take of ginger, in powder, gentian root, in powder, treacle, of each, equal parts, a sufficiency; mix so as to form a mass.—*Use.* Stomachic for the horse.—*Dose.* 1 oz.

MAS'SICOT. *Syn.* MASTICOT, YELLOW PEROXIDE OF LEAD; PLUMBI OXYDUM FLAVUM, CEBUSSA CITRINA, L. The dross that forms on melted lead exposed to a current of air, roasted until it acquires a uniform yellow colour. Artists often apply the same name to white lead, roasted until it turns yellow. Used as a pigment.

MAS'TIC. *Syn.* MASTICH, GUM MASTIC; MASTICHE, L. The "resin flowing from the incised bark of *Pistacia Lentiscus*, var. *Chia*," (Ph. L.) It occurs in pale yellowish, transparent, rounded tears, which soften between the teeth when chewed, and giving out a bitter, aromatic taste. Sp. gr. 1.07. It is soluble in both rectified spirit and oil of turpentine, forming varnishes. It is chiefly used as a 'masticatory,' to strengthen and preserve the teeth, and perfume the breath.

Mastic. Fine mortar or cement used for plastering walls, in which the ingredients, in a pulverulent state, are mixed up, either entirely or with a considerable portion of linseed oil. It sets very hard, and is ready to receive paint in a few days. See CEMENTS.

MASTICA'TION. The act of chewing food, by which it not only becomes comminuted, but mixed with the saliva, and reduced to a form fit for deglutition. It has been justly regarded by the highest authorities as the first process of digestion, and one without which the powers of the stomach are overtasked, and often performed with difficulty. Hence the prevalence of dyspepsia and bowelly complaints among persons with bad teeth, or who 'bolt' their food without chewing it.

MAS'TICATORIES. *Syn.* MASTICATORIA, L. Substances taking by chewing them. They are employed as intoxicants, cosmetics, and medicinals; generally with the first intention. The principal masticatory used in this country is tobacco. In Turkey, and several other Eastern nations, opium is taken in a similar manner. In India, a mixture of areca nut, betel leaf, and lime, performs the same duties; whilst in some other parts of the world preparations of the cacao are employed. As cosmetics, orris root, cassia, cinnamon, and sandal wood, are frequently chewed to scent the breath. Among medicinals, mastic and myrrh are frequently chewed to strengthen the teeth and gums; pellitory, to relieve the toothache; and rhubarb, ginger, and gentian, to relieve dyspepsia and promote the appetite.

Prep. 1. (Augustin.) Mastic, pellitory (both in powder), and white wax, of each, 1 dr.; mixed by heat and divided into 6 balls. In toothache, loose teeth, &c.

2. (W. Cobley.) Mastic, myrrh, and white wax, of each, 1 part; rhubarb, ginger, and

extract of gentian, of each, 2 parts; beaten up with tincture of tolu, q. s., and divided into boluses or lozenges of 10 grs. each. One or two to be chewed an hour before dinner; in dyspepsia, defective appetite, &c.

3. (Quincy.) Mastic, 3 oz.; pellitory and stavesacre seed, of each, 2 drs.; cubebs and nutmegs, of each, 1 dr.; angelica root, $\frac{3}{4}$ dr.; melted wax, q. s. to make it into small balls. As a stimulant to the gums, and in toothache.

4. Opium, ginger, rhubarb, mastic, pellitory of Spain, and orris root, of each, 1 dr.; melted spermaceti, q. s. to mix; for 6-gr. pills. As the last, and in toothache and painful gums.

MASTICOT. See MASSICOT.

MATCHES (Cooper's). *Syn.* SWEETENING MATCHES. These are made by dipping strips of coarse linen or canvas into melted brimstone. For use, the brimstone on one of them is set on fire, and the match is then at once suspended in the cask, and the bung loosely set in its place. After the lapse of 2 or 3 hours the match is removed, and the cask filled with liquor. Some persons pour a gallon or two of the liquor into the cask before 'matching' it. The object is to allay excessive fermentation. The operation is commonly adopted in the Western Counties for cider intended for shipment, or other long exposure during transport. It is also occasionally employed for inferior and 'doctored' wines.

MATCHES (Instantaneous Light). Of these there are several varieties, of which the one best known, and most extensively used, is the common phosphorus match, known as the 'congreve' or 'lucifer.'¹ We need not describe the 'chemical matches,' 'phosphorus bottles,' and 'prometheans,' in use during the early part of the present century, as these are quite obsolete. We will simply sketch the general process of manufacture now in use for phosphorus matches:

Manuf. The wooden splints are cut by steam machinery from the very best quality of pine planks, perfectly dried at a temperature of 400° Fahr. English splints are of two sizes—'large' and 'minnikins'; the former 2 $\frac{1}{2}$ inches longer, and the latter somewhat shorter. In the manufacture double-lengths are used, so that each splint may be coated with the igniting composition at both ends, and then cut asunder in the middle to form two matches. In England the splints are usually cut square in form, but in Germany they are cylindrical, being prepared by forcing the wood through circular holes in a steel plate. The ends of the double splints having

being slightly charred by contact with a red-hot plate, are coated with sulphur by dipping them to the requisite depth in the melted material. In some cases the ends are saturated with melted wax or paraffin instead of sulphur. The splints are then arranged in a frame between grooved boards in such a manner that the prepared ends project on each side of the frame. These projecting ends are then tipped with the phosphorus composition, which is spread to a uniform depth of about $\frac{1}{8}$ inch on a smooth slab of stone, kept warm by means of steam beneath. When partially dry, the tipped splints are taken from the frames, cut through the middle, and placed in heaps of 100, ready for 'boxing.'

The different compositions for tipping the matches in use in different countries and factories all consist essentially of emulsions of phosphorus in a solution of glue or gum, with or without other matters for increasing the combustibility, for colouring, &c. In England the composition contains a considerable quantity of chlorate of potassa, which imparts a snapping and flaming quality to the matches tipped with it, and but little phosphorus, on account of the moisture of the climate. In Germany the proportion of phosphorus used is much larger, and nitre, or some metallic peroxide, replaces chlorate of potassa. The German matches light quietly, with a mild lambent flame, and are injured quickly by damp. The following formulæ have been carefully selected:

1. (ENGLISH.) Fine glue, 2 parts, broken into small pieces, and soaked in water till quite soft, is added to water, 4 parts, and heated by means of a water bath until it is quite fluid, and at a temperature of 200° to 212° Fahr. The vessel is then removed from the fire, and phosphorus, 1 $\frac{1}{2}$ to 2 parts, is gradually added, the mixture being agitated briskly and continually with a 'stirrer' having wooden pegs or bristles projecting at its lower end. When a uniform emulsion is obtained, chlorate of potassa, 4. to 5 parts, powdered glass, 3 to 4 parts, and red lead, smalt, or other colouring matter, a sufficient quantity (all in a state of very fine powder) are added, one at a time, to prevent accidents, and the stirring continued until the mixture is comparatively cool.

Obs. According to Mr. G. Gore, the above proportions are those of the best quality of English composition. The matches tipped with it deflagrate with a snapping noise. (See above.)

2. (GERMAN.)—*a.* (Böttger.) Dissolve gum arabic, 16 parts, in the least possible quantity of water, add of phosphorus (in powder), 9 parts, and mix by trituration; then add of nitre, 14 parts; vermilion or binocide of manganese, 16 parts, and form the whole into a paste, as directed above; into this the matches are to be dipped, and then exposed to dry. As soon as the matches are quite dry, they are

¹ The original 'LUCIFERS,' or 'LIGHT-BEARING MATCHES,' invented in 1826, consisted of strips of paste-board, or flat splints of wood, tipped first with sulphur, and then with a mixture of sulphide of antimony and chlorate of potassa, and were ignited by drawing them briskly through folded glass-paper. They required a considerable effort to ignite them, and the composition was apt to be torn off by the violence of the friction. The term 'lucifer' having become familiar, was applied to the simpler and more effective match afterwards introduced under the names of 'CONGREVE' and 'CONGREVE LIGHT.'

to be dipped into very dilute copal varnish or lac varnish, and again exposed to dry, by which means they are rendered waterproof, or at least less likely to suffer from exposure in damp weather.

b. (Bottger.) Glue, 6 parts, is soaked in a little cold water for 24 hours, after which it is liquefied by trituration in a heated mortar; phosphorus, 4 parts, is now added, and rubbed down at a heat not exceeding 150° Fahr.; nitre (in fine powder), 10 parts, is next mixed in, and afterwards red ochre, 5 parts, and smalt, 2 parts, are further added, and the whole formed into a uniform paste, into which the matches are dipped, as before. Cheaper than the last.

c. (Diesel.) Phosphorus, 17 parts; glue, 21 parts; red lead, 24 parts; nitre, 38 parts. Proceed as above.

Obs. Matches tipped with the above (*a*, *b*, and *c*) inflame without fulmination when rubbed against a rough surface, and are hence termed 'noiseless matches' by the makers.

3. (SAFETY MATCHES.) The latest improvement of note in the manufacture of matches is that of Landstrom, of Jonkoping, in Sweden, adopted by Messrs. Bryant and May (Patent). It consists in dividing the ingredient of the match-mixture into two separate compositions, one being placed on the ends of the splints, as usual, and the other, which contains the phosphorus, being spread in a thin layer upon the end or lid of the box. The following are the compositions used by the patentee:—*a.* (For the splints.) Chlorate of potassa, 6 parts; sulphuret of antimony, 2 to 3 parts; glue, 1 part.—*b.* (For the friction surface.) Amorphous phosphorus, 10 parts; sulphuret of antimony or peroxide of manganese, 8 parts; glue, 3 to 6 parts; spread thinly upon the surface, which has been previously made rough by a coating of glue and sand.

Obs. By thus dividing the composition, the danger of fires arising from ignition of the matches by accidental friction is avoided, as neither the portion on the splint nor that on the box can be ignited by rubbing against an unprepared surface. Again, by using the innocuous red or amorphous phosphorus, the danger of poisoning is entirely prevented.

MATERIA MEDICA. A collective name of the various substances, natural and artificial, employed as medicines or in the cure of disease. In its more extended sense it includes the science which treats of their properties, classification, and applications. The *materia medica of the Pharmacopœia* is a mere list, with occasional notes, "embracing the animal, vegetable, and chemical substances, whether existing naturally, prepared in official chemical preparations, or sold in wholesale trade, which we (the College), direct to be used either in curing diseases or in preparing medicines." (Ph. L.)

MATICO. *Syn.* SOLDIER'S HERB; MATECO (B.P., Ph. D.); MATICA, HERBA MATICÆ, L.

The dried leaves of a Peruvian plant, generally believed to be the *Artanthe elongata*, one of the *Piperaceæ*. The leaves have been employed with considerable success as a mechanical external styptic; applied to leech-bites, slight cuts, and other wounds, &c., and pressed on with the fingers, they seldom fail to arrest the bleeding. Matico has also been much lauded as an internal astringent and styptic, in hæmorrhages from the lungs, stomach, bowels, uterus, &c.; but as it is nearly destitute of astringent properties, its virtues in these cases must have been inferred from its external action. As an aromatic, bitter stimulant, closely resembling the peppers, it has been proposed as a substitute for cubebs and black pepper, in the treatment of diseases of the mucous membranes, piles, &c.—*Dose.* $\frac{1}{2}$ to 2 drs.; in powder; or under the form of infusion, tincture, or boluses.

MATURATION. Growing ripe. Amongst surgeons, this term is applied to the process of suppuration, or that which succeeds inflammation, and by which pus or matter is collected in an abscess. Warmth, irritation, and a liberal diet, promote this change; cold, sedatives, and depletion, retard it. The maturation of fermented liquor is noticed under BREWING, MALT LIQUORS, WINES, &c.

MEAD. *Syn.* MELLINA, L. An old English liquor, made from the combs from which the honey has been drained, by boiling them in water, and fermenting the saccharine solution thus obtained. It is commonly confounded with metheglin. Some persons add 1 oz. of hops to each gallon; and, after fermentation, a little brandy. It is then called sack mead. See METHEGLIN.

MEAL. The substance of edible grain ground to powder, without being bolted or sifted. Barley meal and oat meal are the common substances of this class in England. In North America the term is commonly applied to ground Indian corn, whether bolted or not. (Goodrich.) The four resolvent meals of old pharmacy (*quatuor farina resolventes*) are those of barley, beans, linseed, and rye.

MEALS. The "periods of taking food, usually adopted, in conformity with convenience and the recurrence of hunger, are those, which are best adapted to the purposes of health; namely, the morning meal, the midday meal, and the evening meal." "That these are the proper periods for meals is evident from the fact of their maintaining their place amid the changes which fashion is constantly introducing." "If we look at these periods in another point of view, we shall find an interval of four hours left between them for the act of digestion and subsequent rest of the stomach. Digestion will claim between two and three hours of the interval; the remaining hour is all that the stomach gets of rest, enough, perhaps, but not too much, nor to be justly infringed." (Eras. Wilson.)

MEASLES. *Syn.* RUEROLA, MORBILLI, L.

This very common disease is characterised by feverishness, chilliness, shivering, head-pains, swelling and inflammation of the eyes, defluxion of sharp tears, with painful sensibility to light, oppressive cough, difficulty of breathing, and sometimes vomiting or diarrhoea. These are followed about the fourth day by a crimson rash upon the skin, in irregular crescents or circles, and by small red points or spots, which are perceptible to the touch, and which, after four or five days, go off with desquamation of the cuticle. The fever, cough, &c., often continue for some time; and unless there have been some considerable evacuations, either by perspiration or vomiting, they frequently return with increased violence, and occasion great distress and danger.

Treat. When there are no urgent local symptoms, mild aperients, antimonial diaphoretics, and diluents, should be had recourse to; but when the inflammatory symptoms are emergent, and the lungs are weak, especially

in plethoric habits, blood may be taken. The cough may be relieved by expectorants, demulcents, and small doses of opium; and the diarrhoea by the administration of the compound powder of chalk and opium; the looseness of the bowels, however, had better not be interfered with, unless it be extreme.

Measles are most prevalent in the middle of winter, and though common to individuals of all ages, are most frequent amongst children. The plethoric, and those of a scrofulous habit, or one which has a syphilitic taint, suffer most from them.

Like the smallpox, the measles are contagious, and seldom attack the same person more than once during life. See RASH.

MEASURE. *Syn.* MENSURA, L. The unit or standard by which we estimate extension, whether of length, superficies, or volume. The following tables represent the values and proportions of the principal measures employed in commerce and the arts:—

TABLE I. *English Lineal Measures.*

Inches.	Feet.	Yards.	Poles.	Furlongs.	Miles.
1.	·083	·028	·00505	·00012626	·0000157828
12.	1.	·333	·06060	·00151515	·00018939
36.	3.	1.	·1818	·004545	·00056818
198.	16·5	5·5	1.	·025	·003125
7920.	660.	220.	40.	1.	·125
63360.	5280.	1760.	320.	8.	1.

. The unit of the above table is the yard, of which no legal standard has existed since that established by the statute of 1824 was destroyed by the fire which consumed the two Houses of Parliament, in 1834.

TABLE II. *English Measures of Superficies.*

Square Feet.	Square Yards.	Poles.	Roods.	Acres.

			512	256	64	32	8	1	—	640

** The standard unit of the above table is the gallon, which is declared, by statute, to be capable of "containing ten pounds avoirdupois weight of distilled water, weighed in the air at the temperature of 62° Fahr, the barometer being at 30 inches." The pound avoirdupois contains 7000 grains, and it is declared that a cubic inch of distilled water, under the above conditions, weighs 252·458 grains; hence the capacity of the imperial gallon and its divisions are as follows:—

Imperial gallon = 277·274 cubic inches.

" quarts = 69·3185 "

" pint = 34·65925 "

Fluid ounce = 1·73296 "

" drachm = ·21662 "

††† The imperial gallon is 1·5th larger than the old wine gallon,—1·60th smaller than the old beer gallon, and—1·32nd larger than the old dry-measure gallon.

TABLE IV. *French Metrical or Decimal Measures of Length.*

Names.	Eq. in Mètres.	Equivalents in			
		English Inches, at 32° Fahr.	English Long Measure, at 62° Fahr.		
Millimètre . . .	·001	·03937	Miles. Fur.	Yds. Feet.	Inch.
Centimètre . . .	·01	·39371			
Décimètre . . .	·1	3·93708			
Mètre . . .	1	39·37079		1 0	3·37
Decamètre . . .	10	393·70790		10 2	9·7
Hectomètre . . .	100	3937·07900		109 1	1·078
Kilomètre . . .	1000	39370·79000	4	213 1	10·3
Myriamètre . . .	10000	393707·90000	6 1	156 0	9·17

** The standard unit of the above table is the mètre, which has been determined to be 39·37079 inches, at 32° Fahr. (Capt. Kater); the English foot is taken at 62° Fahr. The true length of the mètre, reduced to the latter temperature, is 39·370091 English inches; a number which varies from that in the table only at the fourth decimal figure. It will be perceived that the principle of nomenclature adopted in applying the names, was to prefix the Greek numerals to the decimal multiples, and the Latin numerals to the decimal subdivisions.

TABLE V. *French Metrical or Decimal Measures of Volume.*

Names.	Eq. in Litres.	Eq. in English Cubic Inches.	Equivalent in English Measures.			
			Gall.	Pints.	Oz.	Dr. Minims.
Millilitre	·001	. . . ·0610				16·9
Centilitre	·01	. . . ·6103			2	49·
Decilitre	·1	. . . 6·1028			3 4	10·36
Litre	1·	. . . 61·028		1	15 1	43·69
Decalitre	10·	. . . 610·28	2	1	12 1	16·9
Hectolitre	100·	. . . 6102·8	22	0	1 4	49·
Kilolitre	1000·	. . . 61028·	220	0	16 6	40·
Myrialitre	10000·	. . . 610280·	2201 (= 275 $\frac{1}{5}$ bushels).			

** The standard unit in the above table is the litre, or the cube of the $\frac{1}{10}$ of a mètre. The French centiare contains 1 square mètre,—the are, 100 do.,—the hectare, 10,000 do. The old Paris pint is equal to 1·678 English imperial pint.

†† The capacity of solids and æriform fluids is taken in cubic inches, or feet, in England. In France, the stere, or mètre cube, equal to 35·31658 English cube feet, is the standard unit.

TABLE VI. *Miscellaneous Measures, and their Equivalents :*

Tea or coffee spoonful	(average) =	1 fl. dr.
Dessert "	=	2 "
Table "	=	4 "
Wine-glassful	=	2 fl. oz.
Tea-cupful	=	5 "
Breakfast-cupful	=	8 "
Tumblerful	=	8 "
Basinful	=	12 "
Thimbleful	=	$\frac{3}{4}$ fl. dr.
Pinch (of leaves and flowers)	=	1 dr.
Handful "	=	10 "
Cubic inch of water, at 62° Fahr.	=	252·458 gr.
" foot "	=	62·32106 lb.
Line	=	$\frac{1}{12}$ inch.
Barleycorn	=	$\frac{1}{3}$ "
Hand	=	4 "
Chain	=	4 poles or 22 yards.

MEAT BISCUITS. *Prep.* 1. The flour is mixed up with a rich fluid extract of meat, and the dough is cut into pieces and baked in the usual manner.

2. Wheaten flour (or preferably the whole meal), 3 parts; fresh lean beef or other flesh (minced and pulped), 2 parts; thoroughly incorporate the two by hand-kneading or machinery, and bake the pieces in a moderately heated oven. Both the above are very nutritious; the last, more especially so. 1 oz. makes a pint of good soup.

MEAT EXTRACTS. Some preparations of this nature have been already noticed under the heads **ESSENCE** and **EXTRACT**; the following are additional and highly valuable formulae:—

Prep. 1. (Dr. Breslau.) Young ox-flesh (free from fat) is minced small, and well beaten in a marble mortar, at first alone, and afterwards with a little cold or lukewarm water; the whole is then submitted to the

action of a press, and the solid residuum is treated in the same manner, with a little more cold water; the juice (reddish in colour) is now heated to coagulate the albumen, strained, and finally evaporated in a water bath to the consistence of an extract. As ordinary flesh contains only 1% of kreatine, while that of the heart, according to Dr. Gregory, contains from 1·37% to 1·41%, this is the part employed by Dr. Breslau. The product possesses an agreeable odour and taste; and is easily soluble in water.

2. (Falkland.) Fresh lean beef (or other flesh), recently killed, is minced very fine, and digested, with agitation, in cold water, 1 pint, to which hydrochloric acid, 6 drops, and common salt, 1 dr., have been added; after about an hour, the whole is thrown upon a fine hair sieve, and the liquid portion allowed to drain off without pressure, the first portions that pass through being returned until the fluid, at first turbid, becomes quite clear and trans-

parent; when all the liquid has passed through, cold water, $\frac{1}{2}$ pint, is gently poured on, in small portions at a time, and allowed to drain through into that previously collected. The product is about $\frac{3}{4}$ pint of cold extract of flesh, having a red colour, and a pleasant, soup-like taste. It is administered cold to the invalid—a teacupful at a time, and must on no account be warmed, as the application of even a very slight heat causes its decomposition and the separation of a solid mass of coagulated albumen. This cold extract of flesh is not only much more nutritious than ordinary beef tea, but also contains a certain quantity of the red colouring matter of blood, in which there is a much larger proportion of the iron requisite for the formation of blood-particles. The hydrochloric acid also greatly facilitates the process of digestion. This formula is a modification of the one recently recommended by Liebig for the preparation of a highly nutritive and restorative food for invalids.

3. (EXTRACTUM SANGUINIS BOVIS—Dr. Mauthner.) Pass fresh blood (caught from the slaughtered animal) through a sieve, evaporate it to dryness in a water bath, and when cold, rub it to powder.—*Dose*. 10 to 20 grs., or more, per diem, in a little water.

Obs. The above preparations are intended to supersede the inefficient compounds—beef tea, meat soups, &c., during sickness and convalescence. MM. Breslau and Mauthner describe their extracts of flesh and blood as being peculiarly advantageous in scrofulous exhaustion, exhaustion from anæmia, diarrhoea, &c. The extract of Falkland or Liebig is represented as having been employed both in the hospitals and in private practice at Munich, with the most extraordinary success. It is said to be capable of assimilation with the least possible expenditure of the vital force.

Meat, Fluid. This preparation consists of lean meat, in which the albumen has been changed so as to be non-coagulable by heat, and the fibrin and gelatin from their normal insoluble condition to one admitting of their being dissolved in water.

In this soluble condition, the first stage effected in stomach digestion, the several bodies are known as peptones or albuminose, and the proportion of their simple constituents remains the same as in ordinary fibrin, albumen, and gelatin.

The alteration is effected by finely mincing meat and digesting it with peptone hydrochloric acid and water at a temperature of about 100° Fahr.—until dissolved.

The solution is then filtered, the bitter principle, formed during the digestion, removed by the addition of a little pancreatic emulsion, and the liquor which has been neutralized by the addition of carbonate of soda, evaporated to a thick syrup or extractive consistence.

Fluid meat is the only preparation which entirely represents, and yields the amount of

nourishment afforded by, lean meat; it differs altogether from beef tea and extracts of meat, as all of these contain only a small portion of the different constituents of meat. A patent has been granted to its inventor, Mr. Darby.

MEAT PRESERVING. “The Belgian *Musée de l’Industrie* notes the following methods of preserving meats as the most deserving of attention amongst those communicated to the French Academy of Sciences, and published in the *Comptes Rendus*. 1. M. Budet’s method, by which the meat is kept in water acidulated with carbolic acid in the proportion of 1 to 5 parts of acid per 1000 of water. A series of experiments proved that all kinds of meat could thus be kept fresh, for lengthened periods, without acquiring any ill taste or odour.

“The meat may be placed in barrels or air-tight tin cases, filled with acidulated water of the strength above specified and headed up; or the pieces may be packed in barrels or cases in alternate layers with charcoal, pounded small, and saturated with water containing $\frac{1}{1000}$ of carbolic acid. The charcoal serves as a vehicle for the antiseptic fluid, and as an absorbent of any gaseous matters given off by the meat. The latter should be wrapped in thin linen covers to prevent the charcoal working its way into the tissues.

“This method, it is suggested, might be employed in curing pork in place of ‘salting,’ or of the more lengthy and costly process of ‘smoking;’ and also for the preservation of poultry, game, butter, eggs, &c.

“2. In the case of South American meat M. Budet proposes the use of large sacks of caoutchouc. The meat should be packed in them, with alternate layers of charcoal as above described, and each sack, when filled, should be hermetically closed by drawing another empty caoutchouc sack, cap-wise, over it. The caoutchouc, it is supposed, would fetch enough in the market—its low price notwithstanding—to cover expenses of packing and freight, and so permit the meat to be sold in Europe at a very small advance on cost price. If intended for use a second time, the empty bags should be steeped in boiling water for a few minutes, to remove any organic impurities adhering to them.

“3. M. Gorge’s method, which is in use in La Plata, consists in washing and drying the meat, and afterwards steeping in successive waters containing hydrochloric acid and sulphite of soda, and then packing it in air-tight cases holding 1, 5, or 10 kilog. each. Meat thus treated requires to be soaked in warm water for about half an hour before use.

“4. M. Leon Soubeiran has recommended braying and drying, in the fashion adopted by the Chinese and Mongols, as described by M. Simon, French Consul in China, in a communication made by him to the *Société d’Acclimatation*. The pemmican of our Arctic voyagers and the *charqui* of South America are familiar examples of meat preserved by analo-

METHEGLIN. *Syn.* HYDROMELI, H. VINOSUM, MELLIS VINUM, L. *Prep.* From honey, 1 cwt.; warm water, 24 galls.; stir well until dissolved; the next day add of yeast, 1 pint, and hops, 1 lb., previously boiled in water, 1 gall.; along with water, q. s. to make the whole measure 1 barrel; mix well, and ferment the whole with the usual precautions adopted for other liquors. It contains on the average from 7% to 8% of alcohol. See MEAD.

METHYL. CH_3 . The hypothetical radical of PYROXYLIC SPIRIT (WOOD-SPIRIT, METHYLIC ALCOHOL) and the methyl series. It forms a number of compounds analogous to those of ethyl.

METHYLATED SPIRIT. A mixture of 1 part of methylic alcohol (wood spirit) and 9 parts of ethylic alcohol (spirit of wine). See SPIRIT.

METHYLIC ALCOHOL. See WOOD SPIRIT.

MEZE'REON. *Syn.* GAROU; MEZE'REON BARK, MEZEREI CORTEX (B. P.); MEZE'REUM.—Ph. L. E. & D. The dried bark of the *Daphne Mezereum*, mezereum; or *Daphne Laureola*, spurge, or wood-laurel. The "bark of the root of *Daphne Mezereum*," or spurge olive. (Ph. L.) A stimulant and diuretic. It is employed as a sudorific and alterative, in syphilis, rheumatism, scrofula, and chronic cutaneous diseases, usually in conjunction with sarsaparilla. It has also been used as a masticatory, in toothache, paralysis of the tongue, &c. On the Continent it is used as a vesicant. For this purpose it is softened by soaking it in hot vinegar, and is then bound on the part, and renewed after intervals of some hours, until vesication is produced.

MICE. See RATS.

MICROCOSMIC SALT. $\text{NaNH}_2\text{HPO}_4$. *Syn.* TRIBASIC PHOSPHATE OF SODIUM AND AMMONIA. *Prep.* 1. Phosphates of soda and ammonia, equal parts; water, q. s.; dissolve separately, mix the solutions, evaporate, and crystallize. A slight excess of phosphate of ammonia aids the crystallisation.

2. (Fownes.) Phosphate of sodium, 6 parts; water, 2 parts; liquefy by heat, and add of sal ammoniac (in powder), 1 part; common salt separates, and after its removal the liquid is concentrated so that crystals may form. *Used* as a flux in blowpipe assays.

MICROSCOPE. The value of the microscope in chemistry and the collateral sciences is now so generally acknowledged, that it would be folly to do more than merely to allude to the subject here.

In the COMPOUND MICROSCOPE, which has quite superseded the 'simple microscope' as an instrument of research, the object is magnified in the first instance by the object-glass, and then remagnified by the eye-piece. It follows, therefore, that the magnifying power of the instrument may be increased either by increasing the power of the object-glass or that of the eye-piece. It must be borne in mind, however, that in increasing the power of the eye-

piece, we do not magnify the object itself in a greater degree, but simply increase the image of the object formed by the object-glass. Any imperfections which may exist in the latter are thus greatly increased. At first the great drawback to the use of the compound microscope was its deficiency in achromatism; but the researches of Mr. Lester and Dr. Goring led to the achromatising of the object-glass, which was the first of the rapid strides towards perfection made by this instrument during the last twenty years. The two most useful object-glasses are the 'quarter-inch,' which should magnify from 200 to 220 diameters, and the 'inch,' which should magnify from 80 to 40 diameters. The definition of these glasses should be good, and they should transmit plenty of light. Any lines in a structure examined by them should appear sharp and distinct, and there should be no coloured fringes around the object. It is of great importance that the object-glasses are kept perfectly free from dust. A few shreds of wash-leather of the finest quality should be kept in a pill-box for cleaning them. Before rubbing them with the leather they may be breathed upon, but no whiting or liquid of any kind should be used, as each object-glass, being achromatic, is a very delicate piece of workmanship, consisting of two lenses of flint- and crown-glass cemented together by Canada balsam. Compound microscopes are now sold by the best London makers at very low prices. A really good instrument, adapted to most of the wants of the chemical, pharmaceutical, or medical student, may be obtained for five guineas.

MIL'DEW. *Syn.* RUST, BLIGHT. The mouldy appearance on the leaves of plants produced by innumerable microscopic fungi. The hop, wheat, and the choicest garden fruit trees, are those most commonly attacked. The causes are said to be excess of moisture, and absence of the free circulation of air and sunshine. On the small scale, finely powdered sulphur is occasionally dusted over the parts affected, as a remedy.

MILI'ARY FEVER. *Syn.* MILLARIA, L. Among the other symptoms are—anxiety and frequent sighing, the perspiration has a strong and peculiar smell, and there is a sensation of pricking on the neck and breast, followed by an eruption of small red pimples, which in two or three days become white vesicles, dry up, peel off, and are succeeded by others. The moist weather of spring and autumn are the period in which it is most prevalent; and delicate females, particularly in child-bed, are those most liable to its attacks. Sometimes it assumes a malignant character. The treatment of this affection consists chiefly in combating the depression of the system by a supporting diet; but everything that heats or stimulates the skin should be avoided. The apartment should be kept cool and well ventilated, and cooling salineatives and bitter

tonics, with cooling drinks, should also be had recourse to.

MILK. *Syn.* LAC, L. The value of milk as an article of food is clearly shown by the fact of it being sufficient to support, and to increase the growth of, the young of every species of the mammalia; at once supplying materials for the formation of the osseous, fleshy, and liquid portions of the body. "The substances present in milk are wonderfully adapted to its office of producing materials for the rapid growth and development of the animal frame. It contains an azotized matter, casein, nearly identical in composition with muscular flesh, fatty principles, and a peculiar sugar, and, lastly, various salts, among which may be mentioned phosphate of lime, held in complete solution in a slightly alkaline liquid.

"The white, and almost opaque, appearance of milk is an optical illusion. Examined by a microscope of even moderate power, it is seen to consist of a perfectly transparent fluid, in which float about numbers of minute transparent globules; these consist of fat surrounded by an albuminous envelope, which can be broken mechanically, as in the churning, or dissolved by the chemical action of caustic potassa, after which, by agitating the milk with ether, the fat can be dissolved." (Fownes.)

Comp. Cows' MILK, of average quality, contains from 10% to 12% of solid matter when evaporated to dryness by steam heat, and has the mean sp. gr. 1·030; while that of the skimmed milk is about 1·035; and of the cream, 1·0244. (Ure.) The average CREAM of cows' milk contains 4·5% of butter; 3·5% of curd, and 92% of whey. (Berzelius.) The SKIMMED MILK consists of water, 92·9%; curd, 2·8%; sugar of milk, 3·5%; lactic acid, lactate of potassa, and a trace of lactate of iron, ·6%; chloride of potassium, phosphate of potassa, and earthy phosphates (lime), ·2%. (Berzelius.)

The following analysis of fresh milk is by M. Haidlen:—

Water	•	873·00
Butter	•	30·00
Casein	•	48·20
Milk sugar	•	43·90
• Phosphate of lime	•	2·31
„ magnesia	•	·42
„ iron	•	·07
Chloride of potassium	•	1·44
„ sodium	•	·24
Soda in combination with casein	•	·42

1000·

Prop. These are well known. Perfectly fresh milk is slightly alkaline, but soon becomes acid on exposure to the air, and after a time white coagula of casein (CURDS) sepa-

rate from it. This change is immediately effected by the addition of rennet or an acid. That from the first, when dried and pressed, constitutes cheese.

Pur., tests, &c. The common frauds practised by the milk-dealers are the addition of water and the subtraction of part of the cream. Sometimes potato starch is added to the milk, to give it a creamy or rich appearance, and this addition is still more frequently made to cream, to increase its consistence and quantity. The method of detecting the first two of these frauds is noticed under 'LACTOMETER.' The presence of potato starch may be determined by boiling some of the milk with a little vinegar, and after separating the coagula by a strainer, and allowing the liquid to become cold, testing it with solution or tincture of iodine. If it turns blue, starch, flour, or some other amylaceous substance, has been used to adulterate it. In most cases it will be sufficient to apply the test to the unprepared suspected milk.

It has frequently been stated that chalk, plaster of Paris, gum, gelatin, sugar, flour, mucilage of hemp-seed, the brains of animals, and other similar substances, are often added to London milk, but there is no reason to suppose there is any truth in these assertions, as some of these articles are too costly to be used, and the presence of others would so alter the flavour or appearance of the milk, or would so soon exhibit themselves by subsidence, as to lead to their detection.

Pres. Milk may be preserved in stout bottles, well corked, and wired down, by heating them, in this state, to the boiling-point, in a water bath, by which means the oxygen of the small quantity of enclosed air becomes absorbed. It must be afterwards stored in a cool situation. By this method, which is also extensively adopted for the preservation of green gooseberries, green peas, &c., milk will retain its properties unaltered for years. A few grains of carbonate of magnesia, or, still better, of bicarbonate of potassa or soda, may be advantageously dissolved in each bottle before corking it.

Under Bethel's patent the milk or cream is scalded, and, when cold, strongly charged with carbonic acid gas, by means of a soda-water machine, and the corks are wired down in the usual manner. The bottles should be kept inverted, in a cool place.

An excellent method of preventing milk from turning sour, or coagulating, is to add to every pint of it about 10 or 12 grs. of carbonate or bicarbonate of soda. Milk thus prepared may be kept for eight or ten days in temperate weather. This addition is harmless, and, indeed, is advantageous to dyspeptic patients. According to D'Arcot, $\frac{1}{1000}$ th part of the bicarbonate is sufficient for the purpose. An excess of alkali used in this manner may be detected by the milk turning turmeric paper brown, even after it has been kept

some hours, and by the ash obtained by evaporating a little to dryness, and then heating it to dull redness, effervescing with an acid. (See *below*.)

. Milk should not be kept in lead or zinc vessels, as it speedily dissolves a portion of these metals, and becomes poisonous.

Concluding remarks. The principal difference between cows' milk and human milk consists in the former containing more casein and less sugar of milk than the latter. The remarkable indisposition to coagulate is another character which distinguishes human milk from cows' milk. Prof. Falkland, who has practically investigated the subject has prepared a nutritive fluid for infants from cows' milk, closely resembling that of the healthy adult woman. His process is, however, unnecessarily complicated, and, therefore, unsuited to those who would have to employ it in the nursery. To remove this objection we have adopted the following formula;—Sugar of milk, 2 oz.; hot water, $\frac{1}{2}$ pint; dissolve, and, when the liquor has become quite cold, add it to fresh cows' milk, $\frac{3}{4}$ pint, and stir them together. This quantity, prepared morning and evening, will constitute the proper food for an infant of from 5 to 8 months old. More may be allowed if it 'craves' it; but there must be no 'cramming.' At first it will be advisable to remove a little of the cream from the milk before adding to it the saccharine solution; but after a few days this will be found to be unnecessary, and, indeed, injurious. One very important particular to be attended to is, the employment of pure cows' milk, obtained from a healthy grass-fed animal only. With this precaution, and the use of a good FEEDING-BOTTLE, the infant will thrive nearly as well as on the breast of any human female, excepting its mother's. (See *below*.)

ASSES' MILK closely resembles human milk in colour, smell, and consistence, but it contains rather less cream. (See *below*.)

EWES' MILK closely resembles cows' milk, than which, however, it is slightly richer in cream.

GOATS' MILK, for the most part, resembles cows' milk, but its consistence is much greater, and it contains much more solid matter. (See *below*.)

MARES' MILK, in consistence, is between that of cows' and human milk. Its cream is not converted into butter by agitation. See BUTTER, CHEESE, LACTIC ACID, &c.

Almond Milk. See EMULSION and MIXTURE.

Arrow-root Milk. *Prep.* From arrow-root, 1 table-spoonful, first wetted and stirred with a little cold water, afterwards adding, gradually, of boiling water, $\frac{1}{2}$ pint; and, lastly, of boiling milk, $\frac{1}{2}$ pint; with sugar, spice, wine, &c., to palate. Very nutritious, and excellent in chronic diarrhoea. Some persons employ all milk.

Chocolate Milk. *Prep.* Dissolve chocolate (scraped), 1 oz., in boiling new milk, 1 pint. Nutritious; but apt to offend delicate stomachs.

Coffee Milk. *Prep.* 1. Coffee, 1 oz.; boiling water, $\frac{1}{2}$ pint; infuse for 10 or 15 minutes in a warm situation, and add the strained liquid to boiling milk, $\frac{3}{4}$ pint.

2. Coffee, 1 oz.; tie it loosely in a piece of muslin, and simmer it for 15 minutes in milk, 1 pint. Both the above have been recommended for persons of spare habits, and for those disposed to affections of the lungs, more especially for the asthmatic.

Factitious Milk. *Syn.* ARTIFICIAL MILK. Of the numerous compounds which have been proposed as substitutes for natural milks, the following are examples:—

1. (FACTITIOUS ASSES' MILK; LAC ASININUM FACTITIUM, LAC A. ARTIFICIALE, L.)—*a.* Cows' milk, 1 quart; ground rice, 1 oz.; oringo root (bruised), 1 dr.; boil, strain, and add sugar candy (or white sugar), 1 oz.

b. Whites of 2 eggs; lump sugar, 1 oz.; cows' milk (new), $\frac{3}{4}$ pint; mix, then add syrup of tolu, $\frac{1}{2}$ oz.

c. Water, 1 pint; hartshorn shavings, 1 oz.; boil to a jelly; then add lump sugar, 2 oz.; cool, add new milk, 1 pint; syrup of tolu, $\frac{1}{2}$ oz. Used as substitutes for asses' milk, taken freely as a beverage. A cupful, with or without a spoonful of rum, 3 or 4 times daily, is a popular remedy in consumption and debility.

2. (F. GOATS' MILK—A. T. Thomson.) Fresh mutton suet (minced), 1 oz.; tie it in a muslin bag, and boil it in cows' milk, 1 quart; lastly, add of sugar candy, 2 gr. In scrofulous emaciation, and in the latter stages of phthisis. The proportion of suet in the above may be advantageously increased a little. The LAC CUM SERO of Guy's Hospital is a similar preparation.

3. (F. HUMAN MILK; LAC HUMANUM FACTITIUM, L.)—*a.* See *above*.

b. (Rosenstein.) Almonds (blanched), 2 in number; white sugar, 1 dr.; water, 4 fl. oz.; make an emulsion, strain, and add of fresh cows' milk, 6 fl. oz. As a substitute for the breast in nursing.

Preserved Milk. *Syn.* MILK POWDER; LACTIS PULVIS, LAC PULVERATUM, L. *Prep.*

1. Fresh skimmed milk, 1 gall.; carbonate of soda (in very fine powder), $1\frac{1}{2}$ dr.; mix, evaporate to 1-3rd by the heat of steam or a water bath, with constant agitation, then add of powdered white sugar, 3 $\frac{1}{2}$ lbs., and complete the evaporation at a reduced temperature; reduce the dry mass to powder, add the cream (well drained) which was taken from the milk, and after thorough admixture put the whole into well-stoppered bottles or tins, which must be at once hermetically sealed.

2. (Legrip.) Carbonate of soda, $\frac{1}{2}$ dr.; water, 1 fl. oz.; dissolve, add of fresh milk, 1 quart; sugar, 1 lb.; reduce it by heat to

the consistence of a syrup, and finish the evaporation on plates by exposure in an oven.

Obs. About an ounce of the powder agitated with a pint of water, forms an agreeable and nutritious drink, and a good substitute for milk at sea. It may also be used for tea or coffee in the solid form. This process, which is very old, has been recently patented. See *MILK* (*above*).

Milk of Roses. *Syn.* LAC ROSÆ, L. *Prep.*

1. (ENGLISH.)—*a.* Almonds (blanched), 1 oz.; oil of almonds and white soft soap, of each, 1 dr.; rose water, 1 pint; make an emulsion.

b. From liquor of potassa and oil of almonds, of each, 1 fl. oz.; hot water, 2 fl. oz.; agitate together until mixed, then add of rose water and distilled or filtered soft water, of each, $\frac{1}{2}$ pint, and again agitate well.

c. As the last, but using half a teaspoonful of salt of tartar for the liquor of potassa.

d. (Redwood.) Blanched almonds, 8 oz.; rose water, 3 pints; make an emulsion, add of white Windsor soap, white wax, and oil of almonds, of each, $\frac{1}{2}$ oz.; previously melted together by a gentle heat; triturate until united, and strain; lastly, add a solution of oil of bergamot, $\frac{1}{2}$ oz.; oil of lavender, 1 dr.; and attar of roses, $\frac{1}{2}$ dr.; (dissolved in) rectified spirit, 12 oz.

2. (FRENCH.)—*a.* From rose water, 1 quart; tinctures of benzoin and styrax, of each, 1 fl. oz.; spirit of roses, $\frac{1}{2}$ fl. oz.; rectified spirit, 2 fl. oz.; mix.

b. (Augustin.) Tincture of benzoin, $\frac{1}{2}$ fl. oz.; liquor of carbonate of potassa, $2\frac{1}{2}$ fl. dr.; rose water, $\frac{1}{2}$ pint; agitate well together. As a lotion in acne.

c. (Gianinni.) Tincture of benzoin, 1 dr.; tincture of balsam of Peru, 20 drops; rose water, 1 pint; as the last.

d. (Schubarth.) Almond paste, 3 drs.; rose water, $\frac{1}{2}$ pint; tincture of benzoin, $\frac{1}{2}$ fl. oz. As before. The addition to the last 3 of a little rectified spirit is an improvement.

3. (GERMAN.) From dilute solution of diacetate of lead (Goulard water), and spirit of lavender, of each, 1 fl. oz.; rose water, 6 fl. oz.; soft water, 1 pint.

Obs. All the above are used as cosmetic washes, and to remove scurf, pimples, and eruptions, in slight cases.

Sa'go Milk. *Syn.* LAC SAGO, L. *Prep.* (Dr. A. T. Thomson.) Sago, 1 oz.; cold water, 1 pint; macerate half an hour, pour off the water, add of milk, $1\frac{1}{2}$ pint, and boil slowly until the sago is dissolved. Very nutritious; also in lieu of arrow-root milk.

Milk of Sulphur. See SULPHUR (Precipitated).

Vanilla Milk. *Syn.* LAC VANILLE, L. *Prep.* 1. Essence of vanilla, 12 drops; lump sugar, 1 oz.; triturate, and add gradually, new milk, 1 pint.

2. (Beral.) Vanilla sugar, $\frac{1}{2}$ oz.; milk, 16 oz.; dissolve.

MILK FEVER. *Syn.* FEBRIS LACTEA, L.

A febrile condition of the system that sometimes occurs at the time the milk begins to be secreted after parturition. It often assumes a malignant character. See PUERPERAL FEVER.

MILLET. *Syn.* MILIUM, L. Several varieties of grain are known by this name. That commonly referred to under the name is the produce of *Panicum miliaceum* ('Indian millet'). The husked seeds (MILIUM MUNDATUM) are used to make gruel, and are ground for flour. 'Turkish millet,' or 'Guinea corn,' is produced by *Sorghum vulgare*; and the 'German' and 'Italian millet' by species of *Setaria*. In some parts of the world millet flour is used for bread, but it is chiefly cultivated as food for domestic animals.

MINCE MEAT. *Prep.* From stoned raisins, currants, sugar, and suet, of each, 2 lb.; sultana raisins and boiled beef (lean and tender), of each, 1 lb.; apples, 4 lbs.; juice of 2 lemons; the rind of 1 lemon, chopped very fine; mixed spice, $\frac{1}{4}$ lb.; candied citron and lemon peel, of each, 2 oz.; brandy, a glassful or two; the whole chopped very fine. It may be varied by adding other spice or flavouring, and by the addition of eggs, or the substitution of chopped fowl or veal for beef, according to the taste of the cuisinier.

MINDERER'S SPIRIT. See AMMONIA (Acetate of), and SOLUTION.

MINERAL CHAME'LEON. *Prep.* From a mixture of binocide of manganese and potassa and nitre, equal parts, heated to redness. It must be preserved in a well-corked bottle until required for use.

Prop., &c. When dissolved in water, its solution, at first green, passes spontaneously through all the coloured rays to the red, when, if potassa be added, the colour retrogrades until it reaches the original green. The addition of oil of vitriol, or of chlorine, renders the solution colourless. The addition of a weak acid, or even boiling or agitating the liquid, turns it from green to red. See MAN-GANIC ACID.

MINERALIZERS. Substances which, by association with metallic bodies, deprive them of their usual properties, and impart to them the character of ores. Their removal belongs to metallurgy. The term 'MINERALIZED' has been applied to caoutchouc, gutta percha, bitumen, &c., which has been combined with sulphur, silica, or metallic matter.

MINIM. *Syn.* MINIMUM, L. A measured drop, of which 60 are equal to a fluid drachm. The size of drops vary so greatly with different liquids, and are also so much influenced by the size and shape of the vessels from which they are poured, that they afford no reliable measure of quantity for medicinal purposes. The poured drop has, in some cases, only $\frac{1}{3}$ rd the volume of the measured drop, or minim; whilst, in others, it is nearly 3 times as large. According to Mr. Durande, "liquids which contain a small proportion of water, afford a small

drop; while, on the contrary, liquids containing a large quantity of water furnish a large drop." "Among liquids containing a large proportion of water, those which are not charged with remedial substances, give a larger and heavier drop than the same liquids when containing extraneous bodies in solution." In all cases in which the word 'drop' is mentioned in this work a minim is intended, and the quantity should be determined by means of a graduated minim measure.

MINIUM. See RED PIGMENTS.

MINT. *Syn.* SPEARMINT, GREEN M.; *MENTHA VIRIDIS* (Ph. L.), L. "The recent and the dried flowering herb" of *Mentha viridis*. It is aromatic and carminative, but its flavour is less agreeable than that of peppermint. It is employed in flatulence, colic, nausea, diarrhoea, &c.; also to make sauce.

MIRBORS. See AMALGAM (Silvering), SILVERING, SPECULUM METAL, &c.

MITES. See ACARI.

MITHRIDATE. *Syn.* DAMOCRATES'S CONFECTION; MITHRIDATIUM, CONFECTIO DAMOCRATIS, L. "This composition originally consisted of but few ingredients; viz., 20 leaves of rue, 2 walnuts, 2 figs, and a little salt. Of this we are informed that Mithridates took a dose every morning, to guard himself against the effects of poison. It was afterwards altered, and the number of the ingredients increased to sixty-one. In this more complex form it contained opium, and was, in effect, an aromatic opiate, of which the confection of opium of the present day may be considered as a simplification. The 'mithridate' is still prepared in some shops, and is occasionally, though very rarely, prescribed." (Med. Lex.) "The formulæ for CONFECTIO OR ELECTUARIUM OF CATECHU may be considered as the representatives, in our modern Pharmacopœias, of the once celebrated recipes for CONFECTIO DAMOCRATIS and THERIACA ANDROMACHI." (Redwood.) Mithridate was formerly conceived to be good for nearly every disease, and an antidote for every known poison.

MIXTURE. *Syn.* MISTURA, L. A compound liquid medicine, taken in divided doses.

Mixtures are usually extemporaneous preparations, and in prescribing them care should be taken not to bring together substances that decompose each other, nor to order heavy powders, that speedily separate from the body of the liquid, by subsidence. EMULSIONS, JULEPS, and MUCILAGES, are included in the 'MISTURÆ' of the London Pharmacopœia.

Mixtures are usually dispensed in flat octagonal 6 or 8-oz. bottles, with long necks; or in regular 'octagons,' with short necks, having the doses marked on the glass, to which the strength of the medicine is made to correspond.

Our remarks respecting 'DRAUGHTS' equally apply here. By putting the active ingredients of six draughts into a 6-oz. mixture bottle, and filling it up with distilled water, a mixture

will be made of corresponding properties, of which the dose will be 2 table-spoonfuls. When the formula for the draughts includes a decoction or infusion as the vehicle, instead of water, four of them only must be taken, which will then fill the 6-oz. bottle, and the proper dose will be 3 table-spoonfuls, or a small wine-glassful.

The following formulæ embrace the whole of the 'MISTURÆ' of the British Pharmacopœias, as well as a few others in general use. These will serve as examples for the like preparations of medicinals which are not included in the list. (See also DRAUGHT, EMULSION, JULEP, WATER, &c.)

Mixture, Absorbent. See ANTACID MIXTURE.

Mixture, Aca'cia. See GUM MIXTURE.

Mixture, Acetate of Ammonia. *Syn.* MINDERERUS'S MIXTURE; MISTURA AMMONIÆ ACETATIS, L. *Prep.* From solution of acetate of ammonia, 1½ fl. oz.; nitre, 40 grs.; camphor mixture, 6 fl. oz.; rose syrup, ½ fl. oz.—*Dose.* 1 to 3 table-spoonfuls, every third or fourth hour, as a diaphoretic in inflammatory fevers, &c.

Mixture, Al'kaline. See ANTACID MIXTURE.

Mixture, Al'mond. *Syn.* EMULSION OF ALMONDS, MILK OF A.; MISTURA AMYGDALÆ (B. P., Ph. L. E. & D.), LAC AMYGDALÆ, L. *Prep.* 1. (Ph. L.) Confection of almonds, 2½ oz.; distilled water, 1 pint; gradually add the water to the confection while triturating, until they are mixed; then strain the liquid through linen.

2. (Ph. E.) From almond confection, 2 oz., and water, 1 quart; as the last. Or, from sweet almonds (blanched), 10 drs.; white sugar, 5 drs.; mucilage, ½ fl. oz. (or powdered gum, 3 drs.); made into an emulsion with water, 1 quart.

3. (Ph. D.) Sweet almonds (blanched), 5 drs.; refined sugar, 2 drs.; powdered gum, 1 dr.; distilled water, 8 fl. oz.; as the last.

4. (B. P.) Compound powder of almonds (sweet), 1; water, 8; triturate and strain.

Obs. The last formula produces the article usually employed in dispensing in the shops. The addition of a little more sugar renders it more pleasant; and 2 or 3 bitter almonds, as in the formula of the Ph. D. 1826, or 1 or 2 fl. drs. of rose or orange-flower water, may occasionally be added, to diversify the flavour.—*Dose.* 2 or 3 table-spoonfuls, *ad libitum*; as a demulcent and emollient in coughs and colds, or as a vehicle for more active medicines.

Mixture, Ammoniacum. *Syn.* EMULSION OF AMMONIACUM, MILK OF A.; MISTURA AMMONIACI (B. P., Ph. L. & D.), LAC AMMONIACI, L. *Prep.* 1. (Ph. L.) Prepared ammoniacum, 5 drs.; distilled water, 1 pint; rub the ammoniacum with the water, gradually added, until they are perfectly mixed.

2. (Ph. D.) Ammoniacum, ¼ oz.; water, 8 fl. oz.; as the last, but straining through muslin.

3. (B. P.) Ammoniacum, $\frac{1}{2}$ oz.; rubbed down with water, 8 oz., and strain.—*Dose.* $\frac{1}{2}$ to 1 gr.

Obs. The last formula produces the best and most effective mixture, owing to the use of the raw instead of the strained drug.—*Dose.* 1 to 2 table-spoonfuls, either alone or combined with squills or ipecacuanha; as an expectorant and demulcent in chronic coughs, humoral asthma, &c.

Mixture, A'nodyne. *Syn.* MISTURA ANODYNA, JULEPUM CALMANS, L. *Prep.* 1. Prepared chalk, 2 drs.; syrup of poppies, 1 oz.; fetid spirit of ammonia, $1\frac{1}{2}$ dr.; oils of dill and aniseed, of each, 3 drops; water, $4\frac{1}{2}$ fl. oz.—*Dose.* A teaspoonful 3 or 4 times a day; in the diarrhoea and colic of infancy.

2. (P. Cod.) Syrup of opium, 2 drs.; syrup of orange flowers, 6 drs.; lettuce water, 4 fl. oz. To allay pain, induce sleep, &c. *Dose.* 1 table-spoonful.

3. (Vicat.) Ammoniated alcohol, $\frac{3}{4}$ fl. oz.; powdered opium, 1 dr.; powdered camphor, $\frac{1}{2}$ dr.; proof spirit, $1\frac{1}{2}$ fl. oz.; digest, with agitation, for 3 or 4 days, and filter. In toothache arising from caries, and as a lotion to the temples in headache.

Mixture, Anti-emetic. *Syn.* MISTURA ANTI-EMETICA, L. *Prep.* 1. Creasote, 12 drops; acetate of morphia, $1\frac{1}{2}$ gr.; camphor, 10 grs.; rectified spirit, $\frac{1}{2}$ fl. oz.; syrup of orange peel, $1\frac{1}{2}$ fl. oz.; distilled vinegar, 4 fl. oz. In seasickness, &c.—*Dose.* 1 table-spoonful on the approach of vomiting, and repeated at intervals of $\frac{1}{2}$ an hour until the vomiting ceases.

2. (Dr. Barker.) Compound tincture of camphor, 1 fl. dr.; burnt brandy, 1 fl. oz.; sugar, $\frac{1}{2}$ oz.; infusion of mint, 6 fl. oz.—*Dose.* $\frac{1}{2}$ to 1 table-spoonful, every $\frac{1}{2}$ hour, until the vomiting ceases.

Mixture, Antacid. *Syn.* ABSORBENT MIXTURE, ALKALINE M.; MISTURA ALKALINA, M. ANTACIDA, L. *Prep.* 1. Liquor of potassa and spirit of nutmeg, of each, 2 fl. drs.; tincture of rhubarb, 3 fl. drs.; tincture of opium, 1 fl. dr.; water, 5 fl. oz. In dyspepsia, heartburn, &c., accompanied with flatulence.

2. Spirit of sal volatile and orange-flower water, of each, 1 fl. oz.; simple syrup, $1\frac{1}{2}$ fl. oz.; water, $2\frac{1}{2}$ fl. oz. In acidity, &c., accompanied with languor and low spirits.

3. Sesquicarbonate of ammonia, 2 drs.; syrup of orange peel and tincture of gentian, of each, 1 fl. oz.; water, 4 fl. oz. In dyspepsia, heartburn, &c., arising from excessive indulgence in spirituous or fermented liquors. It also possesses considerable stimulating properties, and will partially remove the fit of drunkenness.

4. (Collier.) Prepared chalk, 2 drs.; tincture of ginger, 2 fl. drs.; compound tincture of cardamoms, $1\frac{1}{2}$ fl. oz.; pimento water, 6 fl. oz. In diarrhoea accompanied with acidity.

5. (Collier.) Chalk mixture, 5 fl. oz. tinctures of catechu and cinnamon, of each, $\frac{1}{2}$ fl. oz. In chronic diarrhoea.

6. (Ryan.) Liquor of potassa, 2 fl. dr.; tincture of opium, 1 fl. dr.; calcined magnesias, 1 dr.; oil of peppermint, 5 drops; lime water, 8 fl. oz. In dyspepsia accompanied with acidity, flatulence, and constipation.

Mixture, Anticroup'al. *Syn.* MISTURA SENE-GÆ, L. *Prep.* (Jadelot.) Infusion of senega, 4 oz.; syrup of ipecacuanha, 1 oz.; oxymel of squills, 3 drs.; tartarized antimony $1\frac{1}{2}$ gr.; mix. By spoonfuls, in croup.

Mixture, Anti-epileptic. *Syn.* MISTURA ANTI-EPILEPTICA, L. *Prep.* (M. Lemoine.) Liquor of ammonia, 12 drops; syrup of orange flowers, 1 oz.; distilled water of linden flowers, 2 oz.; do. of cherry laurel, $\frac{1}{2}$ oz.; mix. According to M. Lemoine, this is a specific in epilepsy.—*Dose.* 1 table-spoonful, or more.

Mixture, Antihysteria. *Syn.* MISTURA ANTIHYSTERICA, L.; POTION ANTIHYSTERIQUE, Fr. *Prep.* (Dr. Josat.) Cyanide of potassium, $1\frac{1}{2}$ gr.; distilled lettuce water, $4\frac{1}{2}$ fl. oz.; syrup of orange flowers, $1\frac{1}{2}$ fl. oz.—*Dose.* 1 or 2 teaspoonfuls every ten minutes, when the fit is expected; during the fit it may be given in double doses. Dr. Josat declares its efficacy to have been indisputably proved, in upwards of 55 cases.

2. (Magendie.) Cyanide of potassium, 2 grs.; lettuce water (distilled), 4 oz.; syrup of marsh-mallow, 2 oz. Resembles the last.

3. (Dr. Paris.) Assafoetida, 1 dr.; peppermint water, 5 fl. oz.; make an emulsion, and add of ammoniated tincture of valerian, 2 fl. drs.; tincture of castor, 3 fl. drs.; sulphuric ether, $1\frac{1}{2}$ fl. dr.—*Dose.* 1 table-spoonful, 3 or 4 times a day, or oftener.

4. (P. Cod.) Syrup of wormwood, 1 oz.; tincture of castor, $\frac{1}{2}$ dr.; valerian water and orange-flower water, of each, 2 oz.; ether, 1 dr. As the last.

Mixture, Antimo'nial. See CONTRA-STIMULANT MIXTURE.

Mixture, Antipertussic. *Syn.* MISTURA ANTIPERTUSSIIENS, L. *Prep.* 1. COCHINEAL (powdered), 2 drs.; carbonate of potassa, 1 dr.; boiling water, 8 fl. oz.; infuse for 1 hour, strain, and add of lump sugar, $1\frac{1}{2}$ oz.

2. (Dr. Bird.) Extract of hemlock, 12 grs.; alum, 25 grs.; syrup of red poppies, 2 fl. drs.; dill water, 3 fl. oz.

3. (Dr. Reece.) Tincture of assafoetida, 1 fl. dr.; tincture of opium, 10 or 12 drops; powdered ipecacuanha, 10 grs.; water, 2 fl. oz.—*Dose.* A teaspoonful every 3 hours, in whooping cough, for a child 2 or 3 years old, and other ages in proportion.

Mixture, Antiscrofulous. *Syn.* MISTURA ANTISCRUFULOSA, L. *Prep.* From tincture of bichloride of gold, 30 drops; tincture of iodine, 40 drops; tincture of gentian, 1 fl. dr.; simple syrup, 7 fl. drs.; rose water, 5 fl. oz.—*Dose.* A dessert-spoonful, 3 or 4 times daily, in a wine-glassful of water; observing to shake the bottle before pouring out the liquid. Mr. Cooley states that he has seen repeated instances of the excellent effects of this medicine

in scrofula, syphilis, and various glandular diseases, even under all the disadvantages of a salt-meat diet and confinement on shipboard.

Mixture, Antispasmodic. *Syn.* MISTURA ANTISPASMODICA, L. *Prep.* 1. Tincture of castor, 6 fl. drs.; sulphuric ether and laudanum, of each, 1 fl. dr.; syrup of saffron, 1 fl. oz.; cinnamon water, 4 fl. oz.

2. (Dr. Collier.) Assafœtida and camphor mixtures, of each, 2½ fl. oz.; tincture of valerian, 1 fl. oz.

3. (P. Cod.) Lime or linden-flower water and orange-flower water, of each, 2 oz.; syrup of orange flowers, 1 oz.; ether, ½ dr.—*Dose.* (Of each of the above) 1 to 2 table-spoonfuls.

Mixture, Ape'riant. *Syn.* MISTURA APERIENTIS, L. *Prep.* 1. (Abernethy.) Sulphate of magnesia, 1 oz.; manna, ½ oz.; infusion of senna, 1½ fl. oz.; tincture of senna, ½ fl. oz.; mint water, 2 fl. oz.; distilled water, 4 fl. oz.; mix. This is the true 'ABERNETHY BLACK DRAUGHT.'

2. (Dr. Christison.) Sulphate of magnesia, 1½ oz.; water, 4 fl. oz.; dissolve, and add, of tincture of senna, 1 fl. oz.; infusion of roses, 4 fl. oz.—*Dose.* A wine-glassful hourly, until it begins to operate.

3. (Dr. Collier.) Sulphate of iron, 20 grs.; Epsom salt, 1 oz.; pennyroyal water, 1 pint; dissolve.—*Dose.* A wine-glassful twice a day, in atonic amenorrhœa.

Mixture, Aromatic. *Syn.* MISTURA AROMATICA, L. *Prep.* 1. (P. Cod.) Syrup of clove gillyflowers, 1 oz.; spirit of cinnamon, ½ oz.; confection of hyacinth, 2 drs.; peppermint water and orange-flower water, of each, 2 oz.

2. (Guy's Hosp.) Aromatic confection (Ph. L., in powder), 3 drs.; peppermint water, 9 fl. oz. Sometimes a little tincture of calumba is added.

3. (St. B. Hosp.) Aromatic confection, 2½ drs.; water, 5 fl. oz.; pimento water, 3 fl. oz.; mix. The last two are excellent aromatic absorbents in diarrhœa, heartburn, flatulence, acidity, &c.—*Dose.* 1 or 2 table-spoonfuls every 2 or 3 hours, or as required.

Mixture, Aromatic Iron. Pale bark, in powder, 4; calumba, in powder, 2; cloves, bruised, 1; iron wire, 2; compound tincture of cardamoms, 12; tincture of orange peel, 2; peppermint water, 50; macerate the first four ingredients in the last one for three days, agitating occasionally, filter, add the tinctures, and make up to 50. *Used* as a tonic.—*Dose.* 1 to 2 oz.

Mixture, Arsenical. *Syn.* MISTURA ARSENICALIS, L. *Prep.* From liquor of arsenite of potassa—Ph. L., 2 fl. drs.; compound tincture of cardamoms, 4 fl. drs.; cinnamon water, 2 fl. oz.; pure water, 3 fl. oz.; mix.—*Dose.* A small table-spoonful, twice a day, after a full meal; in agues, periodic headaches, lepra, psoriasis, chronic rheumatism, &c. It should be exhibited with caution, and its effects watched; and after 5 or 6 days the dose should be reduced to half the quantity.

Mixture, Astringent. *Syn.* MISTURA ASTRINGENS, L. *Prep.* 1. (Pradel.) Tannin, 12 grs.; tincture of rhatany, 1 dr.; simple syrup, 7 drs.; mucilage, 1 oz.; camphor mixture, 4 oz.

2. (A. T. Thomson.) Extract of catechu, 2 drs. (or tincture, 1 oz.); cinnamon water, 8 oz.; dissolve.—*Dose.* 1 to 3 table-spoonfuls, after every liquid dejection, in diarrhœa and dysentery.

Mixture, Atroph'ic. *Syn.* MISTURA ATROPHICA, L.; POTION ATROPHIQUE, Fr. *Prep.* (Magendie.) Iodide of potassium, 4 drs.; lettuce water, 8 oz.; peppermint water, 2 drs.; syrup of marsh-mallow, 1 oz.—*Dose.* 1 table-spoonful, twice a day; in hypertrophy (enlargement) of the heart. Sometimes 1 to 2 drs. of tincture of foxglove is added to the mixture.

Mixture, Bar'ley. *Syn.* MISTURA HORDEI, L. See DECOCTION.

Mixture, Brandy. *Syn.* MIXTURE OF SPIRIT OF FRENCH WINE, EGG FLIP†; MISTURA SPIRITUS VINI GALLICI (B. P., Ph. L.), L. *Prep.* 1. (Ph. L.) Brandy and cinnamon water, of each, 4 fl. oz.; yolks of 2 eggs; white sugar, ½ oz.; oil of cinnamon, 2 drops; mix. A valuable stimulant and restorative, in low fevers, and in extreme exhaustion from hemorrhages, &c.; but scarcely a fitting subject for the labours of the College of Physicians, since almost every cook and housewife could produce a better compound than the product of the College formula.

2. (B. P.) Brandy, 4 grs.; cinnamon water, 4 oz.; the yolks of 2 eggs; sugar, ½ oz.; mix.—*Dose.* ½ to 1½ oz., in prostration and last stages of fever.

Mixture, Camphor. *Syn.* CAMPHOR JULEP, CAMPHOR WATER; MISTURA CAMPHORÆ (Ph. L. & D.), EMULSIO CAMPHORÆ (Ph. E.), MISTURA CAMPHORATA, L. *Prep.* 1. (Ph. L.) Camphor, ½ dr.; rectified spirit, 10 drops; triturate together, gradually adding of water, 1 pint; and strain through linen.

2. (Ph. D.) Tincture of camphor, 1 fl. oz.; distilled water, 3 pints; agitate well together, and after 24 hours filter through paper.

3. (Ph. E.) See EMULSION.

Uses, &c. Camphor julep is chiefly used as a vehicle for other medicines.—*Dose.* ½ to 1 wine-glassful.

4. (With MAGNESIA: MISTURA CAMPHORÆ CUM MAGNESIA—Ph. E. & D., AQUA CAMPHORÆ—Ph. U. S.)—*a.* (Ph. E.) Camphor, 10 grs.; carbonate of magnesia, 25 grs.; triturate together, then gradually add of water, 6 fl. oz., still continuing the trituration.

b. (Ph. D.) Camphor, 12 grs.; carbonate of magnesia, ½ dr.; water, 6 fl. oz.; as last.

c. (Ph. U. S.) Camphor, 2 drs.; rectified spirit, 40 drops; triturate, add of carbonate of magnesia, 4 drs., and again triturate, adding, gradually, of water, 32 fl. oz. Antacid, antispasmodic, and anodyne.—*Dose.* 1 to 2 table-spoonfuls. *Used* without straining. It is stronger than the simple mixture.

Mixture, Carmin'ative. *Syn.* MISTURA CARMINATIVA, L. *Prep.* (Dr. Paris.) Calcined magnesia, $\frac{1}{2}$ dr.; peppermint water, $2\frac{1}{2}$ fl. dr.; compound tincture of lavender, $\frac{1}{2}$ fl. dr.; spirit of caraway, 4 fl. drs.; syrup of ginger, 2 fl. drs.; mix. Antacid and carminative. For 1 or 2 doses.

Mixture, Cathar'tic. See APERIENT MIXTURE, SENNA M., &c.

Mixture, Chalk. *Syn.* CRETACEOUS MIXTURE; MISTURA CRETE (B. P.); MISTURA CRETA (Ph. L. E. & D.); M. CRETACEA, L. *Prep.* 1. (Ph. L.) Prepared chalk, $\frac{1}{2}$ oz.; sugar, 3 drs.; mixture of acacia (mucilage), $1\frac{1}{2}$ fl. oz.. triturate together, then add of cinnamon water, 18 fl. oz.

2. (Ph. E.) Prepared chalk, 10 drs.; white sugar, 5 drs.; mucilage, 3 fl. oz.; spirit of cinnamon, 2 fl. oz.; water, 1 quart; as the last.

3. (Ph. D.) Prepared chalk, 2 drs.; syrup and mucilage, of each, $\frac{1}{2}$ oz.; cinnamon water, 7 fl. oz.

4. (B. P.) Prepared chalk, 1; gum arabic, in powder, 1; syrup, 2; cinnamon water, 30; mix by trituration.—*Dose.* 1 to 2 grs., with astringent tinctures and opium.

Obs. The above are antacid and absorbent.—*Dose.* 1 to 3 table-spoonfuls, either alone or combined with aromatic confection; in heartburn, and in diarrhoea after every liquid motion. In the latter affection, a little tincture of catechu or laudanum is often added; and when there is vomiting or nausea, either peppermint or spearmint water is generally substituted for the whole or a part of the simple water ordered in the above formulæ.

Mixture, Cincho'na. *Syn.* BARK MIXTURE; MISTURA CINCHONÆ, L. *Prep.* (Copland.) Confection of roses, $\frac{1}{2}$ oz.; boiling decoction of bark, 1 fl. oz.; triturate, in 10 minutes strain, and add diluted sulphuric acid, $1\frac{1}{2}$ fl. dr.; spirit of nutmeg, 4 fl. drs. Febrifuge, tonic, and stomachic. *Dose.* 1 to 3 table-spoonfuls, 2 or 3 times a day.

Mixture, Col'chicum. *Syn.* GOUT MIXTURE; MISTURA ANTARTHERITICA, M. COLCHICI, L. *Prep.* (Sir C. Scudamore.) Magnesia, $1\frac{1}{2}$ dr.; vinegar of colchicum and syrup of orange peel, of each, 4 fl. drs.; peppermint water, 3 fl. oz. A table-spoonful every 3 or 4 hours during the fit of gout.

Mixture, Contra-stim'ulant. *Syn.* MISTURA CONTRA-STIMULANS, JULEPUM C., M. ANTIMONI POTASSIO-TARTRATIS, L. *Prep.* (Laennec.) Tartar emetic, 3 grs.; infusion of orange leaves, 8 fl. oz.; syrup of do., 1 fl. oz.—*Dose.* A wine-glassful, or more, every 2 hours; in inflammation of the lungs, whooping cough, &c.

Mixture, Cough. *Syn.* MISTURA BECHICA, L. *Prep.* 1. Almond mixture, 4 fl. oz.; oxymel of squills, 1 fl. oz.; ipecacuanha wine and syrup of tolu, of each, $\frac{1}{2}$ fl. oz.

2. Tincture of tolu, $\frac{1}{2}$ fl. oz.; paregoric

elixir and tincture of squills, of each, 1 fl. oz.; syrup of poppies, 2 fl. oz.; water, $3\frac{1}{2}$ fl. oz.

3. Mixture of ammoniacum, 4 fl. oz.; syrup of squills, 2 fl. oz. In the coughs of old persons.

4. Antimonial wine, 3 fl. drs.; syrup of poppies, $1\frac{1}{2}$ fl. oz.; water, 4 fl. oz. In dry, husky coughs.—*Dose.* (of each of the above), 1 table-spoonful, 2 or 3 times a day, or oftener.

5. (Dr. Monro.) Paregoric, $\frac{1}{2}$ fl. oz.; sulphuric ether and tincture of tolu, of each, $\frac{1}{2}$ oz.—*Dose.* A teaspoonful, in water, night and morning, or when the cough is troublesome.

6. (Dr. Radcliff.) Syrup of poppies, syrup of squills, and paregoric, equal parts.—*Dose.* As the last. In all cases the bowels should be kept gently moved by some mild aperient.

Mixture, Creasote. *Syn.* MISTURA CREASOTI, M. CREAZOTI (B. P., Ph. E.), L. *Prep.* 1. (Ph. E.) Creasote and acetic acid, of each, 16 drops; mix, then add of compound spirit of juniper and syrup, of each, 1 fl. oz.; water, 14 fl. oz. and agitate well together.—*Dose.* $\frac{1}{2}$ to 1 wine-glassful, in nausea and vomiting, especially to prevent or relieve sea-sickness.

2. (B. P.) Creasote, 16 minims; glacial acetic acid, 16 minims; spirit of juniper, $\frac{1}{2}$ dr.; syrup, 1 oz.; distilled water, 15 oz.; mix.—1 to 2 oz.

Mixture, Demul'cent. *Syn.* MISTURA DEMULCENS, L. See ALMOND MIXTURE, GUM M., &c.

Mixture, Diaphoret'ic. *Syn.* MISTURA DIAPHORETICA, L. *Prep.* 1. Solution of acetate of ammonia, 3 fl. oz.; antimonial wine, 2 fl. drs.; tincture of henbane, $1\frac{1}{2}$ fl. dr.; camphor mixture, 3 fl. oz.—*Dose.* 1 table-spoonful every 3 or 4 hours; in fevers, &c.

2. To the last add of sweet spirit of nitre, $\frac{1}{2}$ fl. oz. As above.

Mixture, Diarrhœ'a. See CHALK MIXTURE, &c.

Mixture, Diuret'ic. *Syn.* MISTURA DIURETICA, L. *Prep.* 1. Nitrate of potassa, 2 drs.; sweet spirit of nitre, 3 fl. dr.; syrup of squills, $1\frac{1}{2}$ fl. oz.; peppermint water, 4 fl. oz.

2. (A. T. Thomson.) Infusion of foxglove, $5\frac{1}{2}$ fl. oz.; tincture of foxglove, $\frac{1}{2}$ fl. dr.; acetate of potassa, 2 drs.; spirit of juniper, $\frac{1}{2}$ fl. oz.; tincture of opium, $\frac{1}{2}$ fl. dr. In dropsy. *Dose.* 1 to 2 table-spoonfuls, every 2 or 3 hours. The last must be used with caution.

Mixture, Emetic. *Syn.* MISTURA EMETICA, L. *Prep.* 1. (Copland.) Sulphate of zinc, 40 grs.; ipecacuanha wine and tincture of serpentary, of each, 4 fl. drs.; tincture of capsicum, 40 drops; oil of chamomile, 12 drops; peppermint water, $4\frac{1}{2}$ fl. oz. As an excitant emetic; in cases of poisoning by narcotics, &c.

2. (Magendie.) Coloured emetine, 4 grs. (or white emetine, 1 gr.); acetic acid, 8 drops; mix, and add of infusion of orange leaves or lime flowers, $3\frac{1}{2}$ fl. oz.; syrup of marsh-mallows, 1 fl. oz.

3. (A. T. Thomson.) Ipecacuanha, $\frac{1}{2}$ dr.; tartar emetic, 1 gr.; tincture of squills, 1 fl.

dr.; water, 6 fl. oz. *Dose.* 1 to 2 table-spoonfuls, followed by half the quantity every 10 or 15 minutes, until vomiting is produced; at the same time assisting the action of the medicine by drinking copiously of warm water.

Mixture, Emmenagogue. See STEEL MIXTURE, &c.

Mixture, Expectorant. *Syn.* MISTURA EXPECTORANS, L. *Prep.* 1. (Collier.) Oxy-mel of squills and mucilage, of each, 1 oz.; syrup of marsh-mallows, 2 oz.; camphor julep, 3 fl. oz.—*Dose.* 1 to 2 table-spoonfuls, 2 or 3 times a day; in coughs, hoarseness, asthma, &c.

2. (A. T. Thomson.) Almond mixture, 5 fl. oz.; ipecacuanha wine and tincture of squills, of each, 1 fl. dr.; syrup of tolu, 6 fl. drs.—*Dose.* 1 table-spoonful; in humoral asthma, catarrh, &c., when the cough is urgent.

Mixture, Febrifuge. *Syn.* MISTURA FEBRIFUGA, L. See ACETATE OF AMMONIA MIXTURE, DIAPHORETIC M., &c.

Mixture, Gentian (Compound). Gentian, bruised, 1½; bitter orange peel, bruised, ¾; cardamom seeds, bruised, ¼; proof spirit, 20; macerate for forty-eight hours with 15 of the spirit, agitating occasionally, pack in a percolator, let it drain, and then pour on the remaining spirit; when it ceases to drop, wash the marc with spirit to make up 20.—*Dose.* 1 to 2 drachms.

Mixture, Gregory's. See POWDERS.

Mixture, Griffith's. See STEEL MIXTURE.

Mixture, Guaiacum. *Syn.* EMULSION OF GUAIA-CUM, MILK OF G.; MISTURA GUAIA-CI (B. P.), (Ph. L. & E.), LAC G., L. *Prep.* (Ph. L.) Gum guaiacum, 3 drs.; white sugar, ½ oz.; gum acacia, 2 drs. (all in powder); triturate together, and to these, whilst rubbing, gradually add of cinnamon water, 1 pint.

2. (Ph. E.) Guaiacum, 3 drs.; sugar, ½ oz.; mucilage, ½ fl. oz.; cinnamon water, 19½ fl. oz.; as before.—*Dose.* 1 to 3 table-spoonfuls, 2 or 3 times a day; in chronic rheumatism, gout, &c.

3. (B. P.) Guaiac resin, in powder, 2; sugar, 2; gum arabic, in powder, 1; cinnamon water, 80; triturate, adding the cinnamon water gradually.—*Dose.* ¼ to 2 oz.

Mixture, Gum. *Syn.* MUCILAGE; MISTURA ACACIE (Ph. L.), MUCILAGO (Ph. E.), MUCILAGO ACACIE (Ph. D.), MUCILAGO ARABICI GUMMI, L. *Prep.* 1. (Ph. L.) Gum acacia (in powder), 13 oz.; boiling distilled water, 1 pint; rub the gum with the water, gradually poured in, until solution is complete.

2. (Ph. E.) Gum, 9 oz.; cold water, 1 pint; macerate, with occasional stirring, until dissolved, then strain through linen or calico.

3. (Ph. D.) Gum (coarsely powdered), 4 oz.; water (cold), 6 fl. oz.; dissolve, and strain through flannel.

Uses, &c. Mucilage of gum acacia is chiefly employed to render oily and resinous substances miscible with water. "Oils require about ½ their weight; balsams and spermaceti, equal parts; resins, 2 parts; and musk, 5 times

its weight," for this purpose. (Montgomery.) The GUM MIXTURE, Ph. E., will be found under 'EMULSION.'

Mixture, Hydrocyanic. *Syn.* MIXTURE OF PRUSSIC ACID; MISTURA ACIDI HYDROCYANICI, L. *Prep.* From medicinal prussic acid, 15 drops; simple syrup (pure), 1 fl. oz.; distilled water, 5 fl. oz.—*Dose.* 1 table-spoonful, 2 or 3 times daily. Each dose contains 1½ drop of medicinal prussic acid. The bottle should be shaken before pouring out the dose. Magendie's formulae for this mixture are omitted, because the acid which he orders is not kept in the shops in England.

Mixture, Iron. See STEEL MIXTURE.

Mixture, Iron (Compound). See STEEL MIXTURE.

Mixture, Marsh-mallow. *Syn.* MISTURA ALTHEÆ (Ph. E.), L. *Prep.* (Ph. E.) Marsh-mallow root (dried), 4 oz.; stoned raisins, 2 oz.; water, 5 pints; boil to 3 pints, strain through linen, and after the sediment has subsided, decant the clear portion.

2. (Ph. D.) See DECOCTION. Demulcent.—*Dose.* A few spoonfuls *ad libitum*, so as to take 1 to 3 pints in the 24 hours; in strangury, calculus, coughs, fevers, &c.

Mixture, Myrrh. *Syn.* EMULSION OF MYRRH; MISTURA MYRRHÆ, L. *Prep.* (Copland.) Myrrh, 1½ dr.; add to it gradually, triturating all the time, decoction of liquorice, 6 fl. oz., and strain.—*Dose.* 1 to 2 table-spoonfuls, twice or thrice a day, combined with carbonate of soda, dilute hydrochloric acid, or pargoric; in debility, and diseases of the digestive organs.

Mixture, Narcotic. *Syn.* MISTURA NARCOTICA, M. FEBRIFUGA, L. *Prep.* 1. Tincture of henbane, 2 fl. drs.; solution of acetate of ammonia, 3 fl. oz.; water, 2½ fl. oz.; mix.—*Dose.* 1 to 2 table-spoonfuls, to relieve pain, procure sleep in fevers, &c.

2. (W. Cooley.) Laudanum, 1½ fl. dr.; syrup of poppies, sulphuric ether, and spirit of cinnamon, of each, 1 oz.; tincture of henbane, 2½ fl. dr.; tincture of capsicum, 4 fl. drs.; water, 2 fl. oz.—*Dose.* 1 to 2 table-spoonfuls, at the commencement of the hot fit of ague.

Mixture, Oleo-balsamic. *Syn.* MISTURA OLEO-BALSAMICA, L. *Prep.* (Hamb. Cod.) Oils of cedrat, cinnamon, cloves, lavender, mace, and marjoram, of each, 20 drops; oil of rue, 10 drops; balsam of Peru, ½ dr.; rectified spirit, 10 oz.; digest and filter.

Mixture, Purgative. *Syn.* MISTURA CATHARTICA, M. LAXATIVA, M. PURGANS, L. *Prep.* 1. From any of the purging salts (Epsom, Glauber, tasteless, &c.), 2 oz.; infusion of senna, 5 fl. oz.; syrup of orange peel, 1 fl. oz.; tincture of ginger, ½ fl. oz.; spirit of pimento, 2 fl. drs.; mix.—*Dose.* 1 to 3 table-spoonfuls, early in the morning; as an aperient in stomach complaints, &c.

2. (Dr. Copland.) Manna, 1½ oz.; cream of tartar, ½ oz.; whey, 1 quart. By wine-glassfuls, as an aperient drink, in fevers, &c.

3. (Corvisart.) Borotartrate of potassa (soluble tartar), 1 oz.; tartar emetic, $\frac{1}{2}$ gr.; sugar, 2 oz.; water, $1\frac{1}{2}$ pint; dissolve. By wine-glassfuls, until it begins to operate. This has been called 'NAPOLEON'S MEDICINE,' from its having been frequently taken by Napoleon I. See MIXTURES OF SCAMMONY, SENNA, &c.

Mixture, Saline. *Syn.* MISTURA SALINA, L. See DRAUGHT and LEMONADE.

Mixture, Scammony. *Syn.* SCAMMONY MILK; MISTURA SCAMMONII (B. P.), L. *Prep.* 1. (Ph. E.) Resin of scammony, 7 grs.; unskimmed milk, 3 fl. oz.; gradually mix, triturating all the time, so as to form an emulsion. Purgative.—*Dose.* One half.

2. (Planche's PURGATIVE POTION.) To the last add of white sugar, $\frac{1}{2}$ oz.; cherry-laurel (or bitter-almond) water, 4 or 5 drops. The above are the most tasteless and pleasant purgatives of an active character known.

3. (B. P.) Resin of scammony, 4 grs.; fresh milk, 2 oz.; triturate and form an emulsion.—*Dose.* The quantity of the formula for an adult, half for a child.

Mixture, Sen'na (Compound). *Syn.* BLACK DRAUGHT, ABERNETHY'S D., CATHARTIC MIXTURE; MISTURA SENNÆ COMPOSITA (B. P.), L. *Prep.* 1. Infusion of senna, $\frac{1}{2}$ pint; tincture of senna, $1\frac{1}{2}$ fl. oz.; Epsom salts, 4 oz.; carbonate of ammonia, $\frac{1}{2}$ dr.; sugar, 3 oz. agitate until the solids are dissolved.

2. Senna, 13 oz.; boiling water, 2 quarts; digest for 4 hours in a hot place, then press out the liquor in a tincture press, and add, of compound tincture of senna, $\frac{3}{4}$ pint; Epsom salts, 1 lb.

3. East India senna, 2 lb.; boiling water, 9 quarts; tincture of senna and Epsom salt, of each, $3\frac{1}{2}$ lb.; as the last.

4. Senna, 8 lbs.; boiling water, 9 galls.; Epsom salt, 16 lbs.; tincture of senna, $1\frac{1}{2}$ galls.; treacle and colouring, of each, 1 quart.

5. (Guy's Hosp.) Senna and mint, of each, $1\frac{1}{2}$ oz. (say, $1\frac{1}{2}$ oz.); boiling water, 1 quart; Epsom salt, $7\frac{1}{2}$ oz. (say, $\frac{1}{2}$ lb.).

6. (Redwood.) Infusion of senna, 18 oz.; tincture of senna, 3 oz.; sulphate of magnesia, 6 oz.; extract of liquorice and Spirit of sal volatile, of each, $\frac{3}{4}$ oz.; oil of cloves, 6 drops.

7. (B. P.) Infusion of senna, 14; sulphate of magnesia, 4; extract of liquorice, $\frac{1}{2}$; tincture of senna, $2\frac{1}{2}$; compound tincture of cardamoms, $1\frac{1}{2}$: dissolve and mix.—*Dose.* 1 to $1\frac{1}{2}$ oz.

Obs. As the above mixture contains very little spirit, and from its great consumption, being made in large quantities at a time, it frequently spoils before the whole is sold, especially in hot weather. To avoid this, $1\frac{1}{2}$ dr. of cloves and 3 drs. of mustard seed, both bruised, may be added to every gall. of the strained liquor at the same time with the salts, spirit, and colouring, after which it must be shaken up repeatedly for a few days, and then allowed to repose for a few days more,

when it will become quite clear. It may be filtered through a flannel bag, but there is much loss and delay, owing to the consistence of the liquid. It is purgative in doses of 1 to $1\frac{1}{2}$ fl. oz.

It is a singular circumstance, that although an enormous quantity of this preparation is consumed in these countries, there is no standard formula for it in the British Pharmacopœias. See APERIENT MIXTURE, &c.

Mixture, Steel. *Syn.* MISTURA FERRI COMPOSITA (B. P.), MISTURA CHALYBEATA, L. Two compounds of this class are official:—

1. (GRIFFITH'S MIXTURE, COMPOUND IRON M.; MISTURA FERRI, M. F. PROTOXYDI, M. F. COMPOSITA—Ph. L. E. & D.) *Prep.*—a. (Ph. L. & E.) Carbonate of potassa, 1 dr.; powdered myrrh, 2 drs.; spirit of nutmeg, 1 fl. oz.; triturate together, and whilst rubbing, add gradually, of sugar, 2 drs.; rose water, 18 fl. oz.; mix well; then add of sulphate of iron (powdered), 50 grs., and place it at once in bottle, which must be kept closely corked.

b. (Ph. D.) Powdered myrrh and sugar, each, 1 dr.; carbonate of potassa, $\frac{1}{2}$ dr.; essence of nutmeg, 1 fl. dr.; rose water, 7 fl. oz.; sulphate of iron, $\frac{1}{2}$ dr.; (dissolved in) rose water, 1 fl. oz.—*Dose.* 1 to 2 oz., 3 or 4 times a day, as a mild and genial chalybeate tonic and stimulant; in amenorrhœa, chlorosis, debility, &c., when there is no determination of blood to the head.

2. (HEBERDEN'S MIXTURE, H.'S INK; ATRAMENTUM HEBERDII; MISTURA FERRI AROMATICA—Ph. D.) Pale cinchona bark, 1 oz.; calumba root, 3 drs.; (both in coarse powder); cloves (bruised), 2 drs.; iron filings, $\frac{1}{2}$ oz.; peppermint water, 16 fl. oz.; digest in a close vessel for 3 days, agitating frequently, then strain, and add of tincture of cardamoms (comp.), 3 fl. oz.; tincture of orange peel, 3 fl. dr. Bitter, stomachic, and aromatic.—*Dose.* 1 or 2 table-spoonfuls, or more, 3 or 4 times a day. It is very slightly chalybeated. See also AROMATIC IRON MIXTURE.

3. Sulphate of iron, 25 grs.; carbonate of potash, 30 grs.; myrrh, 60 grs.; sugar, 60 grs.; spirit of nutmegs, 4 drs.; rose water, $9\frac{1}{2}$ oz. Reduce the myrrh to powder, add the carbonate of potash of sugar, and triturate them with a small quantity of rose water so as to form a thin paste, then gradually add more rose water, and the spirit of nutmegs, continuing the trituration and further addition of rose water until about eight fluid ounces of milky liquid is formed, then add the sulphate of iron previously dissolved in the remainder of the rose water and cork the bottle immediately.—*Dose.* 1 to 2 oz. as a stimulating tonic.

Mixture, Tonic. *Syn.* STRENGTHENING MIXTURE; MISTURA TONICA, L. *Prep.* 1. Infusion of cascarrilla, 5 fl. oz.; tincture of orange peel, 7 fl. drs.; aromatic sulphuric acid, 2 fl. drs.

2. (Collier.) Decoction of bark, $5\frac{1}{2}$ fl. oz.;

minute pores of the fibres, and rendering them insoluble in the alkaline, soapy, and other liquids, to the action of which they will subsequently be exposed. When an infusion of some dye-stuff, as cochineal or madder, for example, is mixed with alum or acetate of alumina, and a little alkali, a precipitate immediately forms, consisting of alumina in combination with colouring matter, constituting a LAKE. It is by a similar reaction occurring within the fibres that the permanent dyeing of the cloth is effected. Here the colouring matter of the dyeing materials not only passes from the soluble to the insoluble form, but it enters into chemical combination with other substances, and in the new compounds it assumes greater brilliancy and permanency than it previously possessed. Annotta and safflower afford instances of the second mode of action above referred to, by which substances operate as mordants. The colouring matter of these dye-stuffs is soluble in alkaline lyes, and into a solution of this kind the cloth is dipped. It has now received an extremely fugitive colour only; but by passing it through acidulated water the alkaline solvent is abstracted, and the tinctorial matter is precipitated in an insoluble and minutely divided state within its pores, and it becomes permanently dyed. A similar reaction takes place in dyeing with the 'indigo vat,' in which atmospheric oxygen performs the part of a mordant. It is believed that even in these cases the colouring principle, during its transition from the liquid to the solid form, enters into combination with the fibres of the organic substance, and that, in proportion to the affinity existing between the two, is the integrity and excellence of the dye. In wool and silk, the affinity between their filaments and the tinctorial particles of the dye-bath is, in general, so considerable, that a permanent stain is very easily communicated to them; but with cotton and flax, the materials of which calico and linen goods are made, the reverse is the case, and the intervention of a third material, in the shape of a mordant, is absolutely necessary to dye them of a permanent colour.

"Experience has proved that, of all the bases, those which succeed best as mordants are alumina, tin, and oxide of iron; the first two of which, being naturally white, are the only ones which can be employed for preserving to the colour its original tint, at least without much variation. But whenever the mordant itself is coloured, it will cause the dye to take a compound colour quite different from its own. If, as is usually said, the mordant enters into a real chemical union with the stuff to be dyed, the application of the mordant should obviously be made in such circumstances as are known to be most favorable to the combination taking place; and this is the principle of every day's practice in the dye-house.

"In order that a combination may result

between two bodies, they must not only be in contact, but they must be reduced to their ultimate molecules. The mordants to be united with stuffs are, as we have seen, insoluble in themselves, for which reason their particles must be divided by solution in an appropriate vehicle. Now, this solvent or menstruum will exert in its own favour an affinity for the mordant, which will prove to that extent an obstacle to its attraction for the stuff. Hence we must select such solvents as have a weaker affinity for the mordants than the mordants have for the stuffs. Of all acids which can be employed to dissolve alumina, for example, vinegar (acetic acid) is the one which will retain it with the least energy, for which reason the acetate of alumina is now generally substituted for alum, because the acetic acid gives up the alumina with such readiness, that mere elevation of temperature is sufficient to effect the separation of these two substances. Before the substitution of the acetate, alum alone was employed; but without knowing the true reason, all the French dyers preferred the alum of Rome, simply regarding it to be the purest; it is only within these few years that they have understood the real grounds of this preference.

"The two principal conditions, namely, extreme tenuity of particles and liberty of action, being found in a mordant, its operation is certain. But as the combination to be effected is merely the result of the play of affinity between the solvent and the stuff to be dyed, a sort of partition must take place, proportioned to the mass of the solvent, as well as to its attractive force. Hence the stuff will retain more of the mordant when its solution is more concentrated, that is, when the base diffused through it is not so much protected by a large mass of menstruum; a fact applied to very valuable uses by the practical man. On impregnating, in calico printing, for example, different spots of the same web with the same mordant in different degrees of concentration, there is obtained in the dye-bath a depth of colour upon these spots intense in proportion to the strength of their various mordants. Thus, with solution of acetate of alumina in different grades of density, and with madder, every shade can be produced from the fullest red to the lightest pink and with acetate of iron and madder, every shade from black to pale violet." (Ure.)

In the employment of mordants in the ordinary processes of dyeing, the goods are passed through the solution for a period varying, under different circumstances; according to the object in view. The cloth is subsequently aired, dried, and well rinsed, before immersing it in the colouring bath. In *calico printing* the mordant is applied partially or topically to the cloth by means of wooden blocks, or some similar contrivance; or certain parts of the cloth are stopped out by a suitable preparation, or 'resist,' by which means a pattern is

produced, as the colouring matter of the dye-bath is removed from the other portions by the washing or scouring to which it is subsequently subjected. The substances used to thicken the mordant by the calico printers, to prevent them spreading, are starch and British gum. The first is prepared for neutral solutions; the last, for acidulous ones. The removal of the undecomposed particles of the mordant, so as to preserve the other portion of the cloth from their action, is effected by the process of DUNGING (which see).

The process of GALLING or ROOTING, commonly employed as a preparation of cotton and linen for fast dyes, consist in working the stuff for some time, at a good hand heat, in a decoction of galls or an infusion of sumach. In this case the astringent matter plays the part of a mordant. About $2\frac{1}{2}$ oz. of galls, or 5 oz. of sumach, and 3 or 4 pints of water, are commonly taken for every lb. of cotton. See CALICO PRINTING, DYEING, and the respective dye-stuffs and mordants.

Mordant. In *gilding*, any sticky matter by which gold-leaf is made to adhere. *Prep.*

1. Water or beer, rendered adhesive by the addition of a little gum, sugar, or honey, and tinged with a little gamboge or carmine, to mark the parts to which it is applied. *Used* to attach gold leaf to paper, taffety, vellum, &c.

2. (Mixture.) From asphaltum, 1 part; mastic, 4 parts; amber, 12 parts; fused together, and then mixed with hot boiled oil, 1 pint. *Used* for gilding wood, &c. See GOLD SIZE.

MORPHIA. $C_{17}H_{19}NO_3$. *Syn.* MORPHINE (Ph. D.), MORPHINA, MORPHIUM, L. The chief active principle of opium. Morphine was discovered by Ludwig in 1688, but it was first obtained pure, and its precise nature pointed out by Sertuerner, in 1804. It is peculiar to the *Papaveraceae*, or poppy family.

Prep. 1. (Ph. D.) Turkey opium (cut into thin slices), 1 lb., is macerated for 24 hours in water, 1 quart, and the liquid portion decanted; the residuum is macerated for 12 hours with a second quart of water, and the process is repeated with a third quart of water, after which the insoluble portion is subjected to strong pressure; the mixed liquids are evaporated by water or steam heat to a pint, and filtered through calico; to the filtrate is added a solution formed of chloride of calcium, 6 drs., dissolved in distilled water, 4 fl. oz., and the liquid is further evaporated until it is so far concentrated that nearly the whole of it becomes solid on cooling; this is enveloped in a couple of folds of strong calico, and subjected to powerful pressure, the dark liquid which exudes being preserved for subsequent use; the squeezed cake is next treated with about $\frac{1}{2}$ pint of boiling water, and the undissolved portion is washed on a paper filter; the filtered solution is again evaporated, and the solid portion thus obtained submitted to pressure, as before; if the product is not quite

white, this process is repeated a third time; the squeezed cake is now dissolved in boiling water, 6 fl. oz., and the solution filtered through animal charcoal (if necessary); to the clear solution is added ammonia, in slight excess; the crystalline precipitate which forms as the liquid cools, is collected on a paper filter, washed with cold distilled water, and lastly, the filter is transferred to a porous brick, in order that the morphia which it contains may become dry. (From the liquids reserved from the expressions more morphia may be obtained by dilution with water, precipitation with ammonia, resolution in boiling water, and treatment with a little animal charcoal, &c., as before.)

2. (Ph. L. 1836.) Hydrochlorate of morphia, 1 oz., is dissolved in distilled water, 1 pint; and ammonia, 5 fl. drs. (or q. s.), previously diluted with water, 1 fl. oz., is added, with agitation; the precipitate is well washed in distilled water, and dried by a gentle heat. By a similar process morphia may be obtained from its other salts.

3. (Merck.) A cold aqueous infusion of opium is precipitated with carbonate of sodium, in excess; the precipitate washed, first with cold water, and then with cold alcohol of sp. gr. 85; the residuum is dissolved in weak acetic acid, the solution filtered through animal charcoal, and precipitated with ammonia; the precipitate is again washed with cold water, dissolved in alcohol, and crystallized. A good process where spirit is cheap.

4. (Mohr.) Opium, 4 parts, is made into a strong infusion with water, q. s.; lime, 1 part, reduced to the state of milk with water, is then added; the mixture is next heated to boiling, at once filtered through linen, and treated, whilst still hot, with chloride of ammonium, in fine powder, in slight excess (about 1 oz. to each lb. of opium); the morphia is deposited as the liquid cools, and may be purified by a second solution in lime and precipitation by chloride of ammonium. This process is remarkably simple, and in many points is preferable to any other, either on the small or large scale.

5. (PURE.) A filtered solution of opium in tepid water is mixed with acetate of lead in excess; the precipitate (meconate of lead) is separated by a filter, and a stream of sulphuretted hydrogen is passed through the nearly colourless filtrate; the latter is warmed, to expel excess of the gas, once more filtered, and then mixed with a slight excess of ammonia, which throws down narcotine and morphia; these are separated by boiling ether, in which the former is soluble.

Prop. The morphia of commerce is a white crystalline powder; but when crystallized from alcohol, it forms brilliant prismatic crystals of adamantine lustre, and the formula $C_{17}H_{19}NO_3 \cdot H_2O$. It exerts an alkaline reaction on test paper; imparts a perceptible bitter taste to water; requires 1160 parts of cold

water, and 94 parts of boiling water, for its solution; insoluble in ether; dissolves in 90 parts of cold and about 30 parts of boiling alcohol; it also dissolves in the fixed and volatile oils, and in solutions of the alkalies; heated in close vessels, it forms a yellow liquid, like melted sulphur, which becomes white and crystalline on cooling; heated in the air, it melts, inflames like a resin, and leaves a small quantity of charcoal behind. With the acids it forms salts, which are mostly soluble and crystallisable. These may all be made by the direct solution of the alkaloid in the dilute acid. The only ones of importance are the acetate, hydrochlorate, and sulphate.

Pur. Commercial morphia and its preparations are often contaminated with codeine, narcotine, and colouring matter. The proportion of the first two may be estimated by the loss of weight which the sample suffers when digested in ether; or by dissolving out the morphia by digestion in weak liquor of potassa. Pure morphia "is scarcely soluble in cold water, sparingly so in boiling water, and readily so in alcohol. This solution is alkaline to test paper, and by evaporation leaves crystals, which are wholly dissipated by heat. It is soluble in pure potassa." (Ph. L. 1836.)

Tests. 1. Potassium hydrate and ammonia precipitate morphia from solution of its salts, under the form of a white crystalline powder, which is very soluble in excess of hydrate of potassium, and, with somewhat more difficulty, in excess of ammonia. The solution formed by excess of the first is precipitated on the addition of bicarbonate of potassium. The precipitate in either case is soluble in a solution of chloride of ammonium, and in dilute acetic acid, and is insoluble in ether. A careful inspection of the precipitate through a lens of small power shows it to consist of minute prismatic crystals; and seen through a glass which magnifies 100 times, these crystals present the form of right rhombic prisms.—2. The carbonates of potassium and sodium produce the same precipitate as hydrate of potassium, and which is insoluble in excess of the precipitant.—3. The bicarbonates of potassium and sodium also give similar precipitates from neutral solutions, insoluble in excess. In each of the above cases stirring with a glass rod and friction on the sides of the vessel promote the separation of the precipitate.—4. If to a mixture of morphia and oil of vitriol a minute fragment of bichromate of potassium be added, a shade of chromium is set free, and a fine green colour developed.—5. A drop or two of solution of terchloride of gold added to a weak solution of morphia gives a yellow precipitate, which is mostly redissolved on agitating the liquid, which then assumes various hues (green, blue, violet, purple) on the addition of a drop of liquor of potassa.—6. A minute fragment of terchloride of gold and of hydrate of potassium gently dropped into the liquid, occasion purple clouds or streaks in dilute solutions, fol-

lowed by a precipitate, which is violet, purple, or blue-black, according to the strength of the liquid.

The above are the most reliable precipitates for morphia; the first two may, indeed, be regarded as characteristic, and the remainder as almost so. The following are often referred to by medical writers, but are less exclusive and trustworthy:—Morphia and its salts are—7. Reddened by nitric acid, and form orange-red solutions, darkened by ammonia in excess, and ultimately turning yellow, with the production of oxalic acid.—8. They are turned blue by ferric chloride, either at once or on the addition of an alkali, and this colour is destroyed by water and by alkalies, or acids in excess.—9. Iodic acid added to their solutions turns them yellowish-brown, by setting iodine free, and the liquid forms a blue compound with starch.

Uses. Morphia and its salts are exhibited either in substance, made into pills, or in solution, generally the latter; or externally, in fine powder, applied to the dermis denuded of the cuticle. They are principally employed as anodynes and hypnotics in cases in which opium is inadmissible, and are justly regarded as the most valuable medicines of their class. "In cases wherein both opium and the morphia salts are equally admissible, I prefer the former, its effects being better known and regulated; moreover, opium is to be preferred as a stimulant and sudorific, and for suppressing excessive mucous discharges." (Pereira.)—*Dose.* Of pure morphia, $\frac{1}{15}$ to $\frac{1}{2}$ gr.; of its salts, $\frac{1}{2}$ to $\frac{1}{2}$ gr.; externally, $\frac{1}{2}$ to $1\frac{1}{2}$ gr. Morphia is chiefly used for the preparation of the acetate, and some of its other salts.

Good opium yields from 10% to 13% of morphia. See OPIUM.

Morphia, Ac'tetate of. $C_{17}H_{20}NO_3C_2H_3O_2$.
Syn. MORPHINE ACETAS (Ph. L. E. & D.).
Prep. 1. (Ph. L. 1836.) Morphia, 6 drs.; acetic acid (Ph. L.), 3 fl. drs.; distilled water, 4 fl. oz.; dissolve, gently evaporate, and crystallise.

2. (Ph. E.) Hydrochlorate of morphia, 1 part, is dissolved in warm water, 14 parts; and the solution, when cold, is precipitated with ammonia, in slight excess, the precipitate is washed in cold water, and dissolved, by means of acetic acid, in excess, in warm water, 12 parts; from the solution crystals are obtained as before.

3. (Ph. D.) Morphia (in fine powder), 1 oz.; rectified spirit, 8 fl. oz.; mix, apply a gentle heat, and add of acetic acid (sp. gr. 1.044), 4 fl. drs. or q. s., until a neutral or slightly acid solution is obtained; evaporate this to the consistence of a syrup by steam or water heat, and set aside the residuum for a few days until it solidifies.

Pur. "Soluble in water and in rectified spirit" (less so in the former than the latter); "and when the spirit is distilled from the solution, it yields crystals which are totally destroyed by heat." (Ph. L.) "100 measures of a solu-

tion of 10 grs. in $\frac{1}{2}$ fl. oz. of water, and 5 minims of acetic acid, heated to 212° and decomposed by a very slight excess of ammonia, yield by agitation a precipitate which, in 24 hours, occupies $15\frac{1}{2}$ measures of the liquid." (Ph. E.)

Obs. The acetate of morphia of commerce is usually in the form of a whitish powder, and is prepared by the mere evaporation of the solution to dryness by a gentle heat. During the process a portion of the acetic acid is dissipated, and hence this preparation is seldom perfectly soluble in water, unless it has been slightly acidulated with acetic acid. In the Ph. L. 1851 this salt (in crystals) is included in the materia medica. See MORPHIA (*above*).

Morphia, Hydriodate of. $C_{17}H_{19}NO_3.HI$. *Syn.* MORPHIÆ HYDRIODAS, L. *Prep.* (A. T. Thomson). Hydrochlorate of morphia, 2 parts; iodide of potassium, 1 part; dissolve each separately in a little water, mix the solutions, wash the precipitate in a little very cold water, press it in bibulous paper, redissolve it in hot water, and crystallise.

Morphia, Hydrochlorate of. $C_{17}H_{19}NO_3.HI$. *Syn.* MURIATE OF MORPHIA; MORPHIÆ HYDROCHLORAS (Ph. L.), MORPHIÆ MURIAS (Ph. E. D. & U. S.), L. *Prep.* 1. (Ph. L. 1836.) Macerate sliced opium, 1 lb., in water, 4 pints, for 30 hours; then bruise it, digest it for 20 hours more, and press it; macerate what remains a second and a third time in water until exhausted, and as often bruise and press it; mix the liquors, and evaporate at 140° Fahr. to the consistence of a syrup; add of water, 3 pints, and after defecation decant the clear portion; gradually add to this liquid crystallised chloride of lead, 2 oz. (or q. s.), dissolved in boiling water, 4 pints, until it ceases to produce a precipitate; decant the clear liquid, wash the residuum with water, and evaporate the mixed liquids, as before that crystals may form; press these in a cloth, then dissolve them in distilled water, 1 pint, add freshly burnt animal charcoal, $1\frac{1}{2}$ oz., digest at 120° , and filter; finally, the charcoal being washed, cautiously evaporate the mixed liquors, that pure crystals of hydrochlorate of morphia may form. To the decanted liquor from which the crystals were first separated, add of water, 1 pint, and drop in liquor of ammonia, frequently shaking, until all the morphine is precipitated; wash this precipitate with cold distilled water, saturate it with hydrochloric acid, digest with animal charcoal, 2 oz.; filter, wash the filter as before, and evaporate the mixed liquors, cautiously, as above, that pure crystals may be obtained.

2. (Ph. E.) Opium, 20 oz., is exhausted with water, 1 gal., in the quantity of a quart at a time, and the mixed liquors are evaporated to a pint; chloride of calcium, 1 oz., dissolved in water, 4 fl. oz., is added, and, after agitation, the liquid is placed aside to settle; the clear decanted liquid, and the washings of the sediment, are next evaporated, so that they may

solidify on cooling; the cooled mass, after very strong pressure in a cloth, is redissolved in warm water, a little powdered white marble added, and the whole filtered; the filtrate is acidulated with hydrochloric acid, the solution again concentrated for crystallisation, and the crystals submitted to powerful pressure, as before; the process of solution, clarification, with powdered marble and hydrochloric acid, and crystallisation, is repeated until a snow-white mass is obtained. This is the process of Gregory and Robertson, and is one of the easiest and most productive on the large scale. To procure the salt quite white, 2 to 4 crystallisations are required, according to the power of the press employed. The Edinburgh College recommends, on the small scale, the solution, after two crystallisations, to be decoloured by means of animal charcoal; but, on the large scale, to purify the salt by repeated crystallisations alone.

3. (Mohr.) By dissolving the precipitate of morphia (see MORPHIA, *prep.* 4) in dilute hydrochloric acid, and by crystallisation, as before.

Pur., &c. It "is completely soluble in rectified spirit, and in water. What is precipitated from the aqueous solution by nitrate of silver is not entirely dissolved, either by ammonia, unless added in excess, or by hydrochloric or nitric acid." (Ph. L.) "Snowy white; entirely soluble; solution colourless; loss of weight at 212° Fahr. not above 13%; 100 measures of a solution of 10 grs., in water, $\frac{1}{2}$ fl. oz., heated to 212° , and decomposed with agitation by a faint excess of ammonia, yield a precipitate which, in 24 hours, occupies $12\frac{1}{2}$ measures of the liquid." (Ph. E.) It takes 20 parts of cold and about its own weight of boiling water to dissolve it. The hydrochlorate of morphia of the shops is usually, like the acetate, under the form of a white crystalline powder.

Obs. Of all the salts of morphia, this one appears to be that most suitable for medical purposes, from its free solubility, and from its solution not being liable to spontaneous decomposition, at least under ordinary circumstances. "The opium which yields the largest quantity of precipitate by carbonate of sodium yields muriate of morphia, not only in the greatest proportion, but also with the fewest crystallisations." (Ph. E.) Smyrna opium contains the most morphine.

Morphia and Codeia (Hydrochlorate of). *Syn.* GREGORY'S SALT; MORPHIÆ ET CODEIÆ HYDROCHLORAS, L.; SEL DE GREGORY, Fr. This is commercial HYDROCHLORATE OF MORPHINE prepared according to Dr. Gregory's process.

Mec'onates of Morphia. $(C_{19}H_{29}NO_3)_2C_7H_5O_7$. *Prep.* 1. (NEUTRAL MECONATE OF MORPHINE; MORPHIÆ MECONAS, L.) By saturating an aqueous solution of meconic acid with morphia, and evaporating the solution by a gentle heat, so that crystals may be obtained.

2. (BIMECONATE OF MORPHINE; MORPHIÆ BIMECONAS, L.) $C_{17}H_{19}NO_3 \cdot HC_2H_3O_2$. Meconic acid, 11 parts; morphia, 14 parts, q. s.; dissolve each separately, in hot water, q. s.; mix the solutions, and either gently evaporate and crystallize, or at once evaporate to dryness.

Obs. Morphia exists in opium under the form of bimeconate, and hence this preparation of that drug has been preferred by some practitioners. A solution of this salt for medical purposes may be directly prepared from opium, by treating its solution in cold water with a little animal charcoal, filtering, gently evaporating to dryness, redissolving the residuum in cold water, filtering, and repeating the treatment with animal charcoal. The dose of the dry bimeconate is $\frac{1}{2}$ gr., or more; and of the meconate rather less. "A powder is also sold, called 'bimeconate of morphia,' which is of the same strength as powdered opium, and is given in similar doses. It is obviously incorrect to apply this name to a powder which consists principally of foreign matter. It is to be hoped that physicians will not prescribe this powder under the above name, as such a practice might lead to fatal results, if the prescription should be prepared with the substance which the name strictly indicates." (Redwood.)

Sulphate of Morphia. *Syn.* MORPHIÆ SULPHAS, L. *Prep.* Saturate very dilute sulphuric acid with morphia, evaporate to one half, add a little animal charcoal, continue the evaporation for a short time longer at a gentle heat, filter whilst hot, and abandon it to spontaneous evaporation. It is decomposed by driving off the water of crystallization. Sulphate of morphia is included in the Ph. U. S. According to Magendie, this salt sometimes agrees with patients who cannot bear the acetate.

MORPHIOMETEY. A name given to the process of determining the richness of opium in morphia. See OPIUM.

MORISON'S PILLS. See PATENT MEDICINES.

MORSU'LI. An old name applied to lozenges and masticatories. It is still retained in some foreign Pharmacopœias.

MORTAR is the well-known cement, made of lime, sand, and water, employed to bind bricks and stones together in the construction of walls, buildings, &c.

In the composition of mortar, stone lime is preferred to that obtained from chalk, and river sand to pit or road sand. Sea sand is unfitted for mortar until it has been well soaked and washed in fresh water. Sifted coal ashes are frequently substituted for the whole or a part of the sand.

HYDRAULIC MORTARS OR CEMENTS are those which, like Roman cement, are employed for works which are either constantly submerged or are frequently exposed to the action of water. The poorer sorts of limestone are

chosen for this purpose, or those which contain from 8% to 25% of alumina, magnesia, and silica. Such limestones, though calcined, do not slake when moistened; but if pulverized, they absorb water without swelling up or heating, like fat lime, and affords a paste which hardens in a few days under water, but in the air they never acquire much solidity.

"The essential constituents of every good hydraulic mortar are caustic lime and silica; and the hardening of this composition under water consists mainly in a chemical combination of these two ingredients through the agency of the water, producing a hydrated silicate of lime. But such mortars may contain other ingredients besides lime, as, for example, clay and magnesia, when double silicates of great solidity are formed; on which account dolomite is a good ingredient in these mortars. But the silica must be in a peculiar state for these purposes, namely, capable of affording a gelatinous paste with acids; and if not so already, it must be brought into this condition, by calcining it along with an alkali or an alkaline earth, at a bright red heat, when it will dissolve and gelatinize in acids. Quartzose sand, however fine its powder may be, will form no water mortar with lime; but if the powder be ignited with the lime, it then becomes fit for hydraulic cement. Ground felspar or clay forms with slaked lime no water cement; but when they are previously calcined along with the lime, the mixture becomes capable of hardening under water."

"All sorts of lime are made hydraulic, in the humid way, by mixing the slaked lime with solutions of common alum or sulphate of alumina; but the best method consists in employing a solution of the silicate of potash, called liquor of flints or soluble glass, to mix in with the slaked lime or lime and clay. An hydraulic cement may also be made which will serve for the manufacture of architectural ornaments, by making a paste of pulverized chalk, with a solution of the silicate of potash. The said liquor of flints likewise gives chalk and plaster a stony hardness, by merely soaking them in it after they are cut or moulded to a proper shape. On exposure to the air, they get progressively indurated. Superficial hardness may be readily procured by washing over the surface of chalk, &c., with liquor of flints, by means of a brush. This method affords an easy and elegant method of giving a stony crust to the plastered walls and ceilings of apartments; as also to statues and busts, cast in gypsum mixed with chalk."

Under Prof. Kuhlman's patent, dated April, 1841, "instead of calcining the limestone with clay and sand alone, as has been hitherto commonly practised, this inventor introduces a small quantity of soda, or, preferably, potash, in the state of sulphate, carbonate, or muriate; salts susceptible of forming silicates when the earthy mixture is calcined. The alkaline salt, equal in weight to about 1-5th that of the

lime, is introduced in solution among the earths." (Ure).

The hardening of the common mortars and cements is in a great measure due to the gradual absorption of carbonic acid; but even after a very great length of time, this conversion into carbonate is not complete. Good mortar, under favorable circumstances, acquires extreme hardness by age.

Attempts have been made at various times to introduce the use of bituminous cements into this country, and thus to restore both to land and submarine architecture a valuable material which has now lain neglected for a period of fully 30 centuries; but, unfortunately, owing to the interest of our great building and engineering firms lying in another direction, these attempts have been hitherto unsuccessful. See ASPHALTUM, CEMENT, LIME, &c.

MORTIFICATION. *Syn.* GANGRENE; GANGRENA, MORTIFICATION, L. Local death; the loss of vitality in one part of the animal body, whilst the rest continues living. "The terms gangrene and mortification are often used synonymously; but gangrene properly signifies the state which immediately precedes mortification, while the complete mortification, or absolute death of a part, is called sphacelus. A part which has passed into the state of sphacelus is called a slough.

MOSAIC GOLD. See BRASS, GOLD, &c.

MOSSES. *Syn.* MUSCI, L. Several vegetables of the natural orders *Alga*, *Fungi*, *Lichenes*, and *Musci*, commonly pass under this name with the vulgar. Of these the following are the principal.—

BOG MOSS (*Sphagnum palustre*). Very retentive of moisture. Used to pack up plants for exportation.

CEYLON MOSS (*Gracilaria candida*). Very nutritive; made into a decoction or jelly, which is highly esteemed as an article of diet for invalids and children, more especially for those suffering under affections of the mucous membranes or phthisis.

CLUB MOSS (*Lycopodium clavatum*). See LYCOPODIUM.

CORSICAN MOSS, C. WORM M. (*Gracilaria Helminthocorton*). Dose. $\frac{1}{2}$ to 2 drs., in powder, mixed up with sugar; as a vermifuge.

CUP MOSS, C. LICHEN (*Cladonia pyxidata*). Astringent and febrifuge. A cupful of the decoction, taken warm, generally proves gently emetic. Used in hooping-cough, &c.

FIR CLUB MOSS (*Lycopodium Selago*). Violently emetic and purgative. It is also irritant and narcotic.

ICELAND MOSS (*Cetraria Islandica*). Highly nutritious and easy of digestion. The decoction is a favourite alimentary substance in affections of the lungs and digestive organs. In Iceland, after the bitter has been removed by soaking it in hot water, it is made into jelly, or dried, ground to flour, and made into bread.

IRISH MOSS, PEARL M., CARRAGEEN 1 (*Chondrus crispus*). Very nutritious. The decoction or jelly is a useful and popular demulcent and emollient in pulmonary affection, dysentery, scrofula, rickets, &c. It is often employed by cooks and confectioners instead of isinglass, and by painters to make their size.

REIN-DEER MOSS (*Cladonia rangiferina*). Esculent, very nutritious.

MOTHER OF PEARL. See PEARL.

MOTHER WATER. See CRYSTALLIZATION

MOULDS. Numerous materials and compositions are employed for the purpose of taking moulds, among which are the following:—

1. (COMPO.)—*a.* From spermaceti, stearine or hard tallow, and white wax, equal parts, melted together. For fine work, as medals, small casts, &c.

b. From black resin, $\frac{1}{2}$ lb.; hard tallow, $\frac{1}{2}$ lb.; bees' wax, 6 oz.; as the last. For coarse work, as architectural ornaments, &c. The above are poured on the objects to be copied (previously oiled) whilst in the melted state. Articles in plaster of Paris are first soaked in water, observing that none of it remains on the surface so as to interfere with the design.

2. (ELASTIC.)—*a.* Flexible or elastic moulds may be made of gutta percha softened in boiling water, and after being freed from moisture, pressed strongly against the object to be copied, by means of a screw press. A ring or support should be employed to prevent undue lateral spreading.

b. By the use of gelatin or glue, elastic moulds are formed capable of reproducing, with accuracy, and in a single piece the most elaborately sculptured objects, of exquisite finish and delicacy. Casts from these are now common in the streets. The credit of the application of this substance to this purpose is due to M. H. Vincent. The process of casting consists in simply dissolving a certain quantity of gelatin in hot water until it is reduced to the state of liquid paste, when it is run over the object, previously oiled, intended to be reproduced. As it cools, the gelatin assumes a consistency offering a considerable degree of resistance, and is highly elastic, which latter quality enables it to be easily detached from the work on which it has been fitted. In the hollow formed by the gelatin, the finest plaster, mixed to a thick cream with water, is next run; and when the plaster has acquired the requisite hardness, the gelatin mould is detached in the same manner as from the original. From this apparently fragile mould as many as six copies may be taken, all reproducing the original with unerring fidelity.

3. (METALLIC.)—*a.* From fusible metal.¹

b. (CHICHEE MOULDS.) From a fusible alloy formed of bismuth, 8 parts; lead, 5 parts; tin, 4 parts; antimony, 1 part; repeatedly melted together. The above are poured out in the

¹ See FUSIBLE ALLOYS.

melted state on a plate or slab, and after being stirred until in a pasty state, the object to be copied is strongly pressed on the alloy at the moment it begins to solidify. They are chiefly used for medals and other like objects.

c. (Chamero's Patent.) By melting together one part of some easily fusible metal in a crucible, and then mixing with it four parts of a metal far less readily fusible, steeped in ammonia and reduced to powder. Such a compound is stated to be of great solidity, hardness, facility of soldering, melts at a low temperature, and has great tractability in moulding to any form; and in casting takes the sharpest impressions, whilst in its nature it is peculiarly unchangeable. See ELECTROTYPE.

MOUTH COSMETICS. See BREATH, TEETH, LOZENGE, PASTE, POWDER, WASHES, &c.

MOXAS. Substances burnt upon the body, for the purpose of acting as counter-irritants, and allaying deep-seated pains and inflammation. They have been used in gout, rheumatism, &c. The small cone constituting the *of* *oxa* is placed upon a part, lighted, and allowed to burn to its base. The CHINESE and JAPANESE *mozas* are made of the downy portion of the leaves of a species of wormwood (*Artemisia sinensis*); but various other substances, as the pith of the sunflower, cotton, or paper, soaked in a weak solution of nitrate, chloride, or chromate of potassium, answer as well. The actual cautery is said to be preferable to any of them.

MUCILAGE. *Syn.* MUCILAGO, L. An aqueous solution of gum, or other like substance, that gives a considerable consistency to water. See DECOCTION, MIXTURE, &c.

Tragacanth, Mucilage. *Syn.* MUCILAGO TRAGACANTHÆ (B. P., Ph. E., and Ph. D. 1826), L. *Prep.* 1. (Ph. E.) Tragacanth, 2 drs; boiling water, 9 fl. oz. (8 fl. oz.—Ph. D.); macerate for 24 hours, triturate, and press through linen.

2. (B. P.) Tragacanth, in powder, 60 grs.; distilled water, 10 oz. To the water contained in a pint bottle add the tragacanth, agitate briskly for a few minutes, and again at short intervals, until the tragacanth is perfectly diffused, and has finally formed a mucilage.—*Dose.* 1 oz. (Should be made as required. One part of tragacanth gives more viscosity to water than twenty-five parts of gum arabic.—Squire.) *Used* in medicine as a demulcent, and as an application to burns, &c., and in pharmacy in making up pills, and to suspend heavy powders in liquids.

MUDARIN. *Syn.* MADARINE. A peculiar substance, possessing powerful emetic properties, extracted from the root bark of *Calotropis gigantea*, in which it exists to the extent of 11½. (Duncan.) It is soluble in water and in alcohol, and its aqueous solution, unlike that of most other substances, gelatinises by heat, and becomes fluid again on cooling.

MUFFINS. *Prep.* Take of fine flour, ½

peck; warm milk-and-water, 1 quart; yeast, a wine-glassful; salt, 2 oz.; mix for 15 minutes, then further add of flour, ¼ peck, make a dough, let it rise 1 hour, roll it up, pull it into pieces, make them into balls, put them in a warm place, and when the whole dough is made into balls, shape them into muffins, and bake them on tins; turn them when half done, dip them into warm milk, and bake them to a pale brown.

MUFFLE. See ASSAYING.

MULBERRY. *Syn.* MORUM, L. Mulberries (MORA, MORI BACCÆ) are the fruit of *Morus nigra*, or black mulberry tree. They are cooling and laxative; but when eaten too freely, are apt to disorder the stomach and bowels. Mulberry juice (*mori succus*) is official in the Ph. L. A syrup (SYRUPUS MORI) is made of it. It is also, occasionally, made into wine.

MULTUM. A mixture of extract of quassia and liquorice, used by fraudulent brewers instead of malt and hops.

MUM. A beverage prepared from wheat malt, in a similar way to ordinary beer from barley malt. A little oat and bean meal is frequently added. It was formerly much drunk in England; but its use at the present day is chiefly confined to Germany, and to Brunswick more particularly.

MUMPS. *Syn.* PAROTITIS, L. Inflammation of the parotid gland, which is situated under the ear. There is little constitutional derangement, but the cheeks become swollen and painful, and there is some difficulty in opening the mouth, and in swallowing. The treatment consists in simply keeping the part warm with flannel, and the use of warm fomentations, at the same time that the bowels are kept freely open with some mild laxative.

The mumps are said to be contagious, as, when the affection appears in a school, it generally goes through every member of it. Low, damp situations are those most favorable to this affection.

Prop., &c. It is only very slightly soluble in cold water; freely soluble in solutions of ammonia and the fixed alkalies; the first, by exposure to, the air, becomes purple, and deposits brilliant crystals of murexide. These compounds are the purpurates of Dr. Prout.

MUREXIDE. $C_8N_2H_8O_6$. *Syn.* PURPURATE OF AMMONIUM.

Prep. (Gregory.) Alloxan, 7 parts; alloxantin, 4 parts; boiling water, 240 parts; dissolve, and add the solution to a cold and strong solution of carbonate of ammonia, 80 parts; crystals of murexide will separate as the liquid cools.

Obs. Murexide can be obtained directly from uric acid by the action of nitric acid and subsequent treatment with ammonia. This process is, however, very precarious, and often fails altogether.

Prop., &c. It forms iridescent crystals, having a metallic lustre, of a magnificent

green colour by reflected light, and an equally beautiful reddish-purple by transmitted light. It is soluble in boiling water, only very slightly soluble in cold water, and insoluble in alcohol and ether. A few years ago murexide was extensively used in dyeing; it is now almost superseded by rosaniline or magenta. An analogous substance, formed as above, by treating amalic acid with ammonia, is called 'cafein-murexide.'

MU'RIATE. An old name for hydrochlorate and chloride.

MURIATIC ACID. *Syn.* HYDROCHLORIC ACID, which see.

MURIDE. The name originally given to bromine, by M. Balard.

MUR'RAIN. *Syn.* BLACK-LEG, BLACK-QUARTER. A disease affecting neat cattle, more especially young animals, in the spring and autumn. The common symptoms are tumefaction and discoloration of one of the hind quarters of the animal, with consequent lameness and inability to move; a peculiar emphysema and intumescence of various parts of the body, particularly over the region of the spine, accompanied with all the common indications of putrid fever. In severe cases, gangrene soon follows, and death frequently ensues in from 12 to 24 hours.

The rapid progress of this disease admits of little being done in the way of cure. Extensive scarifications of the affected part, charcoal or hot yeast poultices, or fomentations, and active purgatives, appear to constitute the most useful treatment. The following drenches have been recommended for this affection:—

1. (Blaine.) Sweet spirit of nitre, $\frac{1}{2}$ fl. oz.; powdered cascarrilla, 2 oz.; solution of acetate of ammonia, 4 fl. oz.; yeast, 8 fl. oz.; given every 3 or 4 hours.

2. (Clater.) Laudanum and sweet spirit of nitre, of each, $\frac{1}{2}$ fl. oz.; solution of chloride of lime, $\frac{1}{4}$ fl. oz.; prepared chalk, 1 oz.; warm gruel, 1 pint.

The apparent incurability of this disease renders it of the utmost importance to the farmer to adopt preventive measures. These should consist of the supply of wholesome food and pure water, the adoption of extreme cleanliness, and the free access of pure air to all the stalls, sheds, and other buildings in which the cattle may be sheltered. As the disease is regarded as contagious by many persons, it is prudent to separate, as speedily as possible, the healthy animals, from those affected. The free use of chloride of lime, as a disinfectant, is also advisable.

Other and more immediate preventives consist of the occasional exhibition of a saline aperient, and the introduction of a seton into the dewlap.

MUSH ROOMS. Edible fungi. The species commonly eaten in England are the *Agaricus campestris*, or common field or garden mushroom, used to make ketchup, and eaten either raw, stewed, or broiled;—the *Morchella escu-*

lenta, or morel, used to flavour soups and gravies;—and the *Tuber cibarium*, or common truffle, also used as a seasoning.

Several fungi, which to the inexperienced closely resemble the common edible mushroom, possess poisonous narcotic properties, and their use has not unfrequently been productive of serious, and, in some cases, fatal results. Unfortunately, no simple tests exist by which the edible and poisonous varieties can be distinguished from each other. So strongly was the late Professor L. C. Richards, the eminent botanist, impressed with this feeling, that though no one was better acquainted with the distinctions of fungi than he was, yet he would never eat any except such as had been raised in gardens, in mushroom beds. Certainly all mushrooms may be regarded as suspicious which are either not so raised, or not collected from a known pasture or meadow by a competent judge.

The following general characters given by Professor Bentley enable us, in most cases, to distinguish the edible species:—

EDIBLE MUSHROOMS.

1. Grow in dry, airy places.
2. Generally white or brownish.
3. Have a compact, brittle flesh.
4. Do not change colour when cut by the action of the air.
5. Juice watery.
6. Odour agreeable.
7. Taste not bitter, acrid, or astringent.

POISONOUS MUSHROOMS.

1. Grow in clusters, in woods, and dark, damp places.
2. Usually with bright colours.
3. Flesh tough, soft, and watery.
4. Acquire a brown, green, or blue tint, when cut and exposed to the air.
5. Juice often milky.
6. Odour commonly powerful and disagreeable.
7. Have an acrid, astringent, acid, salt, or bitter taste.

In cases of poisoning by fungi, vomiting should be immediately induced by an emetic and tickling the fauces with the finger or a feather; after which a purgative clyster or a strong cathartic should be administered, with $\frac{1}{2}$ to 1 fl. dr. of ether in a glassful of water or weak brandy. As an antidote, a solution of tannin, $\frac{1}{2}$ dr., in water, 1 $\frac{1}{2}$ pint, or a decoction of $\frac{1}{2}$ oz. of powdered galls, or of 1 oz. of powdered cinchona bark, in a like quantity of water, has been strongly recommended by M. Chansarel.

Alexis Soyer recommended the excellent method of cooking mushrooms by baking them under a glass or basin on toast, along with scalded or clotted cream, or a little melted butter, with one clove, and salt, pepper, &c., to taste. They take about $\frac{1}{2}$ of an hour in a gentle oven or before the fire. When they are

taken up, do not remove the glass for a few minutes, by which time the vapour will have become condensed and gone into the bread; but when it is, the aroma, which is the essence of the mushroom, is so powerful as to pervade the whole apartment.

MUSK. *Syn.* MOSCHUS. (B. P., Ph. L. E. & D.), L. "A secretion deposited in a follicle of the prepuce of *Moschus moschiferus*, Linn." Ph. L.), an animal inhabiting the mountains of Eastern Asia. It is imported from Bengal, China, and Russia; and, latterly, from the United States of America. That known as TONQUIN MUSK is the most esteemed for its odour; but that from Russia is the only kind which reaches us in perfect bags, or which has not been tampered with. POD MUSK (MOSCHUS IN VESICIS) is the bag in its natural state, containing the musk. The average weight of one of the pods is about 6 drs.; that of the grain musk which it contains, about 2½ drs.

Pur., &c. The musk of the shops is generally adulterated. Dried bullock's blood or chocolate is commonly employed for this purpose, along with a little bone-black. The extent of these additions varies from 25% to 75% of the gross weight of the mixture. The blood is dried by the heat of steam or a water bath, then reduced to coarse powder, and triturated with the genuine musk in a mortar along with a few drops of liquor of ammonia. It is then either replaced in the empty pods, or it is put into bottles, and sold as grain musk. There are only three certain ways of detecting this fraud, viz.—by the inferiority of the odour, by an assay for the iron contained in the blood, or—by the microscope. Genuine musk often becomes nearly inodorous by keeping, but recovers its smell on being exposed to the vapour of ammonia, or by being moistened with ammonia water. The perfumers sometimes expose it to the fetid ammoniacal effluvia of privies for the same purpose.

Pure musk, by trituration or digestion with boiling water, loses about 75% of its weight, and the boiling solution, after precipitation with nitric acid, is nearly colourless. A solution of acetate of lead, and a cold decoction of galls, also precipitate the solution; but one of corrosive sublimate does not disturb it. The ashes left after the incineration of pure musk are neither red nor yellow, but gray, and should not exceed 5 to 6%. The Chinese appear to be the most skilful and successful adulterators of musk. One of the best solvents for musk is ether.

Uses, &c. Musk is chiefly employed for its odour. As a medicine, it is a powerful stimulant and antispasmodic, and is a valuable remedy in various diseases of a spasmodic or hysterical character, or attended with low fever. *Dose.* 5 to 10 grs., made into an emulsion.

Musk, Factitious. *Syn.* RESIN OF AMBER; RESINA SUCCINI, MOSCHUS ARTIFICIALIS, M. FACITIVUS, L. *Prep.* 1. Oil of amber, 1 fl. dr.; nitric acid, 3½ fl. drs.; digest in a cold tumbler,

and, after 24 hours, wash in cold water the orange-yellow resinous matter which has formed, and carefully dry it.

2. (Elsner.) From oil of amber, 1 part; fuming nitric acid, 3 parts; as the last, but employing artificial cold to prevent any portion of the oil being carbonised.

Obs. Resin of amber smells strongly of musk, and is said to be antispasmodic and nervine. A tincture (TINCTURA RESINÆ SUCCINI) is made by dissolving 1 dr. of it in rectified spirit, 10 fl. drs., of which the *dose* is 1 fl. dr.; in whooping-cough, low fevers, &c.

Dr. Collier mentions an artificial musk, prepared by digesting for 10 days nitric acid, ½ oz., on fetid animal oil, obtained by distillation, 1 oz.; then, adding of rectified spirit, 1 pint, and digesting the whole for a month.

MUSK SEED. *Syn.* GRAINS D'AMBRETTE. The seed of *Abelmoschus moschatus*, or musk-mallow. They are chiefly used for their odour, in perfumery, hair powder, coffee, &c.

MUSSEL. See SHELL-FISH.

MUST. *Syn.* MUSTUM, L. The expressed juice of ripe grapes, before fermentation. When boiled to 2-3 drs, it is called CARENUM; when boiled to ½, it is called SAPA. On further concentration, it yields a species of granular sugar (grape sugar).

Must, Factitious. *Syn.* MUSTUM FACITIVUM, L. *Prep.* Dissolve cream of tartar, ½ oz., in boiling water, 7 pints; when cold, add of lump sugar, 2½ lbs.; raisins (chopped small, ½ lb.; digest for 3 or 4 hours, strain through flannel as quickly as possible, and add of lemon juice, ½ pint.

MUSTARD. *Syn.* SINAPIS, L. "The seed of *Sinapis nigra* and *S. alba*." (Ph. L.) "Flour of the seeds of *Sinapis nigra*, generally mixed with those of *Sinapis alba*, and deprived of fixed oil by expression." (Ph. E.) "The flour of the seeds." (Ph. D.) "The seeds of the *Sinapis nigra* and *S. alba* reduced to powder and mixed." (B. P.) That of the shops is very frequently adulterated with wheat flour. When this is the case it does not readily make a smooth paste with water, but exhibits considerable toughness, and somewhat of a stinging appearance, especially when little water and much heat is employed. The common proportions taken by some grocers are—dried common salt, wheat flour, and superfine mustard, equal parts; with turmeric, to colour, and cayenne, q. s. to give it piquancy and fire.

Uses, &c. Pure flour of mustard is used in medicine, to make stimulating poultices, pediluvia, &c. As a condiment, it is useful in torpor and coldness of the digestive organs. A few years since the use of mustard seed, by spoonfuls, *ad libitum*, was a common and fashionable remedy in torpor or atony of the digestive organs. The practice was a revival of that recommended by Dr. Cullen; but it has now again sunk into disuse. Sir John Sinclair also approved of the use of mustard

seed in this way, especially for the preservation of the health of the aged. ('Lancet,' Jan., 1834.) See *POULTICES*, &c.

Mustard for the Table. The common practice of preparing mustard for the table with vinegar, or still more, with boiling water, materially checks the development of those peculiar principles on which its pungency or strength almost entirely depends. To economise this substance, we should use lukewarm water only; and when flavouring matter is to be added to it, this is better deferred until after the paste is made. The following forms for 'made mustard' are much esteemed for their flavour:—

Prep. 1. Mustard (ground), $3\frac{1}{2}$ lbs.; water, q. s. to form a stiff paste; in $\frac{1}{2}$ hour, add of common salt (rubbed very fine), 1 lb.; with vinegar, grape juice, lemon juice, or white wine, q. s. to reduce it to a proper consistence. 2. To the last add a little soluble cayenne pepper or essence of cayenne.

3. (Lenormand.) Best flour of mustard, 2 lbs.; fresh parsley, chevril, celery, and tarragon, of each, $\frac{1}{2}$ oz.; garlic, 1 clove; 12 salt anchovies; (all well chopped;) grind well together, add of salt, 1 oz.; grape juice or sugar, q. s. to sweeten; with sufficient water to form the mass into a thin paste by trituration in a mortar. When put into pots, a red-hot poker is to be thrust into each, and a little vinegar afterwards poured upon the surface.

4. (MOUTARDE A L'ESTRAGON.) From black mustard seed (gently dried until friable, and then finely powdered), 1 lb.; salt, 2 oz.; tarragon vinegar, q. s. to mix. In a similar way the French prepare several other 'mustards,' by employing vinegars flavoured with the respective substances, or walnut or mushroom ketchup, or the liquors of the richer pickles.

5. (MOUTARDE SUPERBE.) Salt, $1\frac{1}{2}$ lb.; scraped horseradish, 1 lb.; garlic, 2 cloves; boiling vinegar, 2 galls.; macerate in a covered vessel for 24 hours, strain, and add of flour of mustard, q. s.

6. (Patent.) Black ginger (bruised), 12 lbs.; common salt, 18 lbs.; water, 15 galls.; boil, strain, and add to each gallon, flour of mustard, 5 lbs.

MUSTARD LEAVES (Rigollot's) are made by spreading moistened mustard on paper, and drying.

MUSTINESS. See *MALT LIQUORS* and *WINES*.

MUTAGE. The term applied to the 'matching' of grape must to arrest the progress of fermentation. See *ANTI-FERMENT*, *MATCHES*, &c.

MUTTON. The flesh of sheep. That of the first quality is "between four and five years old; but at present it is rarely got above three, and often under two. The flesh ought to be of a darkish, clear, red colour, the fat firm and white, the meat short and tender when pinched, and it ought not to be too fat." The flesh of the 'Southdown wether' is esteemed the finest flavoured. Mutton is one

of the most wholesome of the 'red meats,' and in commercial importance is second only to beef.

MYCOSE. A peculiar variety of sugar, extracted by alcohol from ergot of rye. It crystallises in colourless prisms, and is distinguished from cane sugar by not reducing the acetate of copper, when boiled with a solution of that salt.

MYRICIN. The portion of bees' wax which is least soluble in alcohol, and saponified with difficulty.

MYRISTIC ACID. $\text{HC}_{14}\text{H}_{27}\text{O}_2$. A monobasic fatty acid, obtained by the saponification of myristin. It melts at 120° Fahr.

MYRISTIN. $\text{C}_{26}\text{H}_{50}\text{O}_6$. *Syn.* **SERICINE.** The white, solid portion of the expressed oil of nutmegs, which is insoluble in cold alcohol. See *MYRISTO ACID*.

MYROLES. In French pharmacy, solutions of oleaginous or resinous substances in the volatile oils.

MYRONIC ACID. $\text{HC}_{10}\text{H}_{18}\text{NS}_2\text{O}_{10}$. Bussy has given this name to an inodorous, bitter, non-crystallisable acid, obtained by him from black mustard, in which it exists as myronate of potassium. It is soluble in water and alcohol.

MYROSIN. *Syn.* **EMULSIN OF BLACK MUSTARD.** A name given by Bussy to a peculiar substance, soluble in water, and which possesses the power of converting myronic acid, in the presence of water, into the volatile oil of mustard seed.

MYROSPERMIN. The name given by Richter to the portion of the oil of balsam of Peru, which is soluble in alcohol.

MYROXILIN. The name given by Richter to the portion of the oil of balsam of Peru which is insoluble in alcohol. By oxygenation, it forms myroxilic acid.

MYRRH. *Syn.* **MYRRHA** (B. P., Ph. L. E. & D.), L. "Gum resin exuded from the bark of *Balsamodendron myrrha*." (B. P., Ph. L.)

Pur.—1. Triturate a small quantity of the powder of the suspected myrrh with an equal amount of chloride of ammonium, adding, water, gradually; if the whole is readily dissolved, the myrrh is genuine; otherwise it is sophisticated with some inferior substance. (Righini).—2. When incinerated, it should not leave more than $3\frac{1}{2}$ to $4\frac{1}{2}$ of ashes.

Uses, &c. Myrrh is a stimulating aromatic bitter and tonic, and is given in several diseases accompanied by relaxation and debility; especially in excessive secretions from the mucous membranes, and in disorders of the digestive organs. *Externally*, as an ingredient in dentrifices and rashes, in caries of the teeth, spongy and ulcerated gums, &c. *Dose.* 10 to 30 grs.; either alone or combined with aloes or chalybeates.

NAILS (The) should be kept clean by the daily use of the nail-brush and soap-and-water. After wiping the hands, but whilst they are still soft from the action of the water, the

skin, which is apt to grow over the nails, should be gently loosened and pressed back, which will not only preserve them neatly rounded, but will prevent the skin cracking around their roots (agnails, nail-springs), and becoming sore. The free ends or points of the nails should be pared about once a week; and biting them should be particularly avoided, as being at once destructive to their beauty and usefulness. "The (free) edge of the scarf-skin should never be pared, the surface of the nail never scraped, or the nails cleaned with any instrument whatever, saving the nail-brush." (Eras. Wilson.)

The consequences of wearing a shoe that is obviously too short for the foot are thus described by the above authority. "In this case Nature gives us warning, by means of her agent, pain, that such a proceeding is contrary to her laws. We stop our ears, and get accustomed to the pain, which, perhaps, is not severe, and soon goes off; the shoes get a scolding for their malice, and we forget all about it for a time. But does Nature check her course to suit the convenience of thoughtless man? No, no. In a short time we find that the nail, intercepted in its forward course, has become unusually thick and hard, and has spread out so much upon the sides, that it is now growing into the flesh, and so makes a case for the doctor. Or, perhaps, the continuance of pressure may have inflamed the sensitive skin at the root, and caused a sore and painful place there. And instances are by no means infrequent in which the power of production of the nail at the root becomes entirely abrogated, and then it grows in thickness only."

When the nails are stained or discoloured, a little lemon juice, or vinegar-and-water, is the best application. Occasionally a little pumice-stone, in impalpable powder, or a little 'putty powder,' may be used along with water and a piece of soft leather or flannel for the same purpose. The frequent employment of these substances is, however, injurious to the healthy growth of the nail.

NANKEN. The coloured cotton cloth especially in this name was originally brought from Nankin, the ancient capital of China, and was prepared from a native cotton, of a brownish-yellow hue. It is now successfully imitated in England, and at the present time the English manufacturers supply the Canton market. In this country the colour is generally given to the cloth by successive baths of sulphate of iron and crude carbonate of soda or lime water.

NANKEEN DYE. The liquid sold under this name in the shops is a solution of annotta. It is employed to dye white calicoes of a nankeen colour; but chiefly to restore the colour of faded nankeen clothing.

NAPHTHA. *Syn.* MINERAL NAPHTHA; NAPHTHA, L. A name given to the limpid and purer varieties of PETROLEUM (which see),

or ROCK OIL, which exudes from the surface of the earth in various parts of the world.

Prop. Naphtha possesses a penetrating odour and a yellow colour, but may be rendered colourless by distillation; it usually begins to boil at a temperature of about 180° Fabr.; but, being a mixture of several different hydrocarbons, it has no fixed boiling-point; it is very inflammable; it does not mix with water, but imparts to that fluid its peculiar taste and smell; mixes with alcohol and oils, and dissolves sulphur, phosphorus, camphor, iodine, most of the resins, wax, fats, and syncumacet; and forms with caoutchouc a glutinous varnish, which dries with very great difficulty.

Pur. Mineral naphtha is very frequently adulterated with oil of turpentine, a fraud which may be detected by—1. The addition of some oil of vitriol, which will, in that case, thicken and darken it.—2. Hydrochloric acid gas passed through the liquid for an hour will occasion the formation of hydrochlorate of camphine, either at once or after a few hours' repose, even if only 5% of oil of turpentine is present. (Dr. Bolley).—3. If a few grains of iodide of potassium and a little water are rubbed with the suspected sample, the colour of the water should continue unchanged; the presence of $\frac{1}{100}$ th part of oil of turpentine will cause it to assume a red or orange colour. (Saladin.)

Uses. Naphtha is chiefly employed for the purposes of illumination, as a solvent for India rubber, and in the preparation of a very superior black pigment. It has been highly spoken of as a remedy for cholera, by Dr. Andreevsky, a Russian physician. See PETROLEUM, and below.

Naphtha, Coal-tar. *Syn.* NAPHTHA, COAL N. A mixture of volatile hydrocarbons, obtained by distilling coal-tar. It is one of the first products which comes over, and flows from the still as crude coal naphtha. To obtain rectified coal naphtha, this crude liquid is distilled, and the product agitated with 10% of concentrated sulphuric acid; when cold, the mixture is treated with 5% of peroxide of manganese, and the upper portion is submitted to further distillation. The specific gravity of this purified product is .850. It is extensively used as a solvent of caoutchouc, and other allied substances, also of resins for the preparation of varnishes. By repeated purification and fractional distillation, benzol, the chief and most important constituent of coal naphtha, is obtained. See BENZOLE.

Naphtha, Wood. See PYROXYLIC SPIRIT.
NAPHTHALIN. $C_{10}H_8$. *Syn.* NAPHTHALINE, NAPHTHALENE. A white crystallizable, odorless, volatile substance, obtained from coal-tar.

Prep. The last portion of the volatile oily product is collected separately, and allowed to repose, when crude naphthalin separates in the solid state. By pushing the distillation

until the residuum in the still begins to char, a further portion of dark-coloured naphthalin may be obtained. It is purified by resublimation a second, or even a third time.

Prop., &c. Soluble in alcohol and ether; slightly soluble in boiling water; melts at 176° Fahr.; boils at 413° ; highly inflammable, burning with a red and smoky flame; with sulphuric acid, it unites to form sulpho-naphthalic acid. By the action of nitric acid upon naphthalin, numerous substances may be formed, the most interesting being nitro-naphthalin. Naphthalin has lately been extensively employed as a stimulating expectorant. *Dose.* 5 to 20 grs.; or, preferably, $\frac{1}{2}$ gr., frequently. *Externally*, made into an ointment, in dry tetters, psoriasis, &c.

NAPLES YELLOW. See **YELLOW PIGMENTS**.

NARCEIA. $C_{22}H_{20}NO_9$. *Syn.* NARCEINA, NARCEIA. A peculiar substance discovered by Pelletier in opium. It is obtained from the aqueous solution of opium, after it has been freed from morphia, and narcotina by ammonia, by adding to it hydrate of lime, or preferably, baryta. On boiling the filtered solution to expel the ammonia, and evaporating the liquid, crystals of narceine are gradually deposited. It may be purified by solution in hot alcohol and recrystallisation.

Prop., &c. White, silky, acicular prisms; neutral; inodorous; bitter; pungent; soluble in 375 parts of water at 60° , and in 230 parts at 212° Fahr.; insoluble in ether; does not neutralize the acids, and is destitute of basic properties. It is distinguished from morphia by its easier fusibility (198°), and by forming a blue liquid with the dilute mineral acids, which on gradual dilution changes to violet and rose red, and ultimately becomes colourless. It does not strike a blue colour with ferric chloride, like morphia, but forms a blue compound with iodine which is decomposed by boiling water. It appears to be inert, and has not been applied to any useful purpose.

NARCOTICS. *Syn.* STUPEFACIENTS; NARCOTICA, STUPEFACIENTIA, L. Medicines which produce drowsiness, sleep, and stupor. In small doses, narcotics mostly act as stimulants, but in larger ones they produce calmness of mind, drowsiness, and torpor; and in poisonous doses, delirium, coma, and death. The general objects in the administration of these agents are the production of sleep and the alleviation of pain. Their action is modified to a greater degree by idiosyncrasy and habit than that of, perhaps, any other class of medicines. Hence the care necessary in their administration. Alcohol, camphor, chloroform, chloral hydrate, ether, foxglove, hemlock, henbane, morphia, opium, and tobacco, are narcotics.

NARCOTINA. $C_{20}H_{23}NO_7$. *Syn.* NARCOINE, L.; SEL D'OPIMUM, MATIERE DE DEPOSENE, Fr. A peculiar crystalline substance, found by Derosne in opium, and on which its

stimulant property was at first supposed to depend.

Prep. 1. From opium exhausted of soluble matter by cold water, by treating it with water acidulated with acetic or hydrochloric acid, filtering, neutralizing with ammonia, and dissolving the washed precipitate in boiling alcohol; the narcotine is deposited as the liquid cools, and may be purified by solution in ether.

2. By acting on opium, previously exhausted by cold water, with ether.

Prop., &c. White, inodorous, fluted or striated prisms; neutral to test paper; insoluble in cold water; sparingly soluble in boiling water; freely soluble in boiling alcohol and in ether. It is only feebly basic.

Narcotine is distinguished from morphia by its insipidity, solubility in ether, insolubility in alkalies, giving an orange tint to nitric acid, and a greasy stain to paper when heated on it over a candle. Another test for narcotina, said by Orfila to be characteristic, is to add to a little of the suspected substance a drop or two of oil of vitriol, and then to add a very small fragment of nitrate of potassium; the liquid speedily acquires a deep blood-red colour if nicotina is present. Morphia treated in the same way strikes a brown or olive-green colour.

Obs. The physiological action of narcotina is differently stated by different authorities. 1 gr. of it, dissolved in olive oil, killed a dog in 24 hours; but 24 grs. dissolved in acetic acid were given with impunity. (Magendie.) In the solid state it is inert; 129 grs. at a dose scarcely produce any obvious effects. (Bally.) Scruple doses have been given without injury. (Dr. Roots.) It has been recently proposed as a substitute for quinine in the cure of agues. For this purpose the sulphate or hydrochlorate is preferable. 200 cases of intermittent and remittent fevers have been thus successfully treated in India. (Dr. O'Shaughnessy.)—*Dose.* 3 to 10 grs., as an antiperiodic sedative, &c.

Turkey opium contains about 1%, and East Indian opium, about 3%, of narcotine.

NATRIUM. See **SODIUM**.

NATRON. Native carbonate of soda.

NAUSEA. See **SICKNESS**.

NAUSEANTS. *Syn.* NAUSEANTIA, L. Substances which induce an inclination to vomit, without effecting it. See **EMETICS**.

NECTAR. The fabled drink of the mythological deities. The name was formerly given to wine dulcified with honey; it is now occasionally applied to other sweet and pleasant beverages of a stimulating character. The following **LIQUEURS** are so called:—

Prep. 1. Chopped raisins, 2 lbs.; loaf sugar, 4 lbs.; boiling water, 2 galls.; mix, and stir frequently until cold, then add 2 lemons, sliced; proof spirit (brandy or rum), 3 pints; macerate in a covered vessel for 6 or 7 days, occasionally shaking, next strain with pressure, and let the strained liquid stand in a cold

place for a week to clear; lastly, decant the clear portion, and bottle it.

2. Red ratifa, 3 galls.; oils of cassia and carraway, of each, 25 drops; (dissolved in) brandy, $\frac{1}{2}$ pint; orange wine, 1 gall.; sliced oranges, 6 in no.; lump sugar, 2 lbs.; macerate for a week, decant and bottle. See **ARBACK** (Facitious).

NEGUS. A well-known beverage, so named after its originator and patron, Colonel Negus. It is made of either port or sherry wine, mixed with about twice its bulk of hot water, sweetened with lump sugar, and flavoured with a little lemon juice and grated nutmeg, and a small fragment only of the yellow peel of the lemon. The addition of about 1 drop of essence of ambergris, or 3 or 10 drops of essence of vanilla, distributed between about a dozen glasses, improves it.

NEPENTHE. A drink calculated to banish the remembrance of grief. In the "Odyssey" Homer describes Helen as administering it to Telemachus. Nothing is known respecting the composition of the ancient nepenthe. The name is applied to a preparation of opium by many old writers, and is now employed by a Bristol firm to designate a preparation resembling in all essential points Battley's 'LIQUOR OPII SEDATIVUS.'

NERVOUSNESS. The indescribable derangement of health, and the complication of disagreeable sensations which are popularly described under this name, quite as much deserve the serious attention of both patient and physician as any other affection to which the human frame is liable. Although, in itself, not a definite disease, it is indicative of the vital system being out of order, that its energies are failing or overtaken, and that the functions of some of its organs are languidly or imperfectly performed. This condition, if not removed, may gradually lead to the development of actual disease, and imperil life if the conditions whereon it is dependent be not detected and subdued.

The treatment of nervousness consists mainly in restoring the healthy action of the stomach and bowels, and in the use of proper exercise, especially in the open air. The stomach should not be overloaded with indigestible food, and the bowels should be occasionally relieved by the use of some mild aperient. Mental as well as bodily relaxation should be sought, and the pleasures, without the vices of society, should be indulged in as discretion and inclination may direct. Abernethy's injunction to a nervous and dyspeptic lady, "Dismiss your servants, madam, and make your own beds," should be recollected by all, and may be taken as a proof of the importance that eminent surgeon attached to exercise; his advice to the indolent and nervous dyspeptic should not be forgotten, "Live on sixpence a day—and earn it." See **EXERCISE**, **FLATULENCE**, **HYPOCHONDRIASIS**, **HYSTERICIS**, **INDIGESTION**, &c.

NESSLER'S TEST for ammonia, &c. This, the

most delicate test for ammonia, was devised by Nessler. It is prepared by saturating a solution of iodide of potassium with the biniodide of mercury, and then adding a weak solution of hydrate of sodium. The addition of a few drops of this solution, to one containing ammonia, produces a yellowish tint when only a trace of ammonia is present, but a dark brown precipitate when the ammonia is present in larger quantity. The composition of the precipitate may be represented thus: NH_4I . A modification of this test is applied to the detection of wood spirit in common alcohol. A dilute solution of the iodides in question in pure alcohol is formed, in the proportion of 2 or 3 grs. of the salts to 100 c.c. of alcohol. About 4 c.c. of the suspected alcohol are taken, to which are added 2 or 3 drops of the best solution, a few drops of alcoholic ammonia, and lastly, a little alcoholic potash; if wood spirit be present, the solution will remain clear, but if the alcohol be pure, the characteristic reddish brown precipitate will appear. The precipitate is soluble in acetone, which is always present in wood spirit.

NETTLE RASH. See **RASHES**.

NEURALGIA. Literally, pain in a nerve. "Various parts of the body are liable to be affected with excruciating pain, which is quite independent of any inflammation of the part, and which may often be traced in the course of the nerves." These affections constitute neuralgia. One of the most distressing forms of this disease is **FACIAL NEURALGIA** or **TIC DOULOUREUX** (**NEURALGIA FACIALIS**), which, when it assumes a marked intermittent character, is popularly known as 'FACE AGUE.' Sometimes it attacks the nerves of the female breast; or those of the hand, feet, hip, or loins, in which cases it is often confounded with acute rheumatism of those parts, occurring towards the inner extremity of the eyebrow and extending over the forehead, it is known as "Brow-ague."

The treatment, when neuralgia is symptomatic of any other affection, must be directed to the primary disease. When it is idiopathic, or an independent affection, powerful tonic medicines and powerful local counter-irritation are generally found the most successful remedies. Of tonics, carbonate of iron and bark (both in very large doses) are generally preferred; the last, more particularly when the affection is of an intermittent kind. As a counter-irritant, caustic ammonia has been much relied on. When all other means fail, a current of mild streaming electricity through the part will often give immediate relief. In the present day quinine in large doses is much depended on, although the affection should not present the intermittent type.

NEUTRALIZATION. The admixture of an alkali or base with an acid in such proportions that neither shall predominate. A neutral compound neither turns red litmus paper blue, nor blue litmus paper red.

NICK'EL. Ni. *Syn.* NICKELIUM, L. A metal obtained from kupfernickel, a native arsenide of nickel found in Westphalia; also from nickel-speiss, an impure arsenio-sulphide of nickel left after the manufacture of cobalt blue from its ores.

Prep. The powdered ore is roasted first by itself, and next with charcoal powder, until all the arsenic is expelled, and a galling odour ceases to be evolved; the residuum is mixed with sulphur, 3 parts, and potassium hydrate, 1 part, and the compound is melted in a crucible with a gentle heat; the fused mass, when cold, is reduced to powder,edulcorated with water, dissolved in sulphuric acid mixed with a little nitric acid, and precipitated with potassium carbonate; the precipitate (nickelous carbonate) is washed, dried, mixed with powdered charcoal, and, lastly, reduced by the heat of a powerful furnace.

When nickel predominates in the ore, after the arsenic, iron, and copper have been separated, ammonia is digested in the mixed nickelous and cobaltous oxides, and the resulting blue solution, after dilution with boiled pure water, is treated with potassium hydrate until the colour disappears, when the whole is put into an air-tight vessel, and set it aside for some time. The powder (nickelous hydrate) which subsides, afteredulcoration, is mixed with charcoal, and reduced by fusion in a crucible containing some crown glass.

On the small scale, for chemical purposes, pure nickel is best obtained by moderately heating nickelous oxalate in a covered crucible lined with charcoal.

Prop. White; hard; malleable; magnetic; capable of receiving the lustre of silver; sp. gr., when hammered, about 8.82; fusibility between that of manganese and iron; it is not oxidized in the air; and is little attacked by dilute acids unless when nitric acid is present; this last acid dissolves it freely. With the acids, &c., it forms numerous compounds, most of which may be prepared by the direct solution of the carbonate. A specimen of the metal reduced from the pure oxide in a current of hydrogen was beautifully white and silvery; its sp. gr. was 8.575, and it was almost as soft as copper.

Tests. The salts of nickel in the anhydrous state are for the most part yellow; when hydrated, green,—and furnish solutions possessing a pale-green colour. Solutions of its salts exhibit the following reactions:—Alkaline hydrates give a pale apple-green precipitate, insoluble in excess, but soluble in a solution of carbonate of ammonium, yielding a greenish-blue liquid. Ammonia gives a similar precipitate, soluble in excess, yielding a deep purplish-blue solution. The presence of ammonium salts or free acids interferes with this reaction. Cyanide of potassium produces a green precipitate, soluble in excess, forming an amber-coloured liquid, which is reprecipitated by hydrochloric acid. This last precipitate is scarcely soluble

in excess of the acid in the cold, but readily so upon boiling the liquid. Ferrocyanide of potassium gives a greenish-white precipitate. Sulphuretted hydrogen occasions no change in solutions of nickel containing free mineral acid; but in alkaline solutions gives a black precipitate. Sulphide of ammonium in neutral solutions gives a black precipitate, soluble with difficulty in hydrochloric acid; but freely soluble in aqua regia.

Estim. Nickel may be thrown down from its ore in the form of either carbonate or hydrate, and after ignition may be weighed as oxide, each grain of which is equal to $\frac{1}{2}$ gr. of pure nickel; or, more accurately, .7871 gr.

According to Rose, nickel may be separated from cobalt as follows:—The mixed metals are dissolved in considerable excess of hydrochloric acids, and the solution is diluted with a very large quantity of water; a current of chlorine is then passed through the liquor for several hours, and the upper part of the flask is left filled with the gas after the current has ceased; barium carbonate is next added, in excess, the whole digested together, with frequent agitation for 15 or 18 hours, and then thrown on a filter. The filtrate yields pure nickelous oxide by precipitation with hydrate of potassium; whilst the residuum on the filter after being washed in water, dissolved in hydrochloric acid, and the barium precipitated with sulphuric acid, furnishes, with hydrate of potassium, a precipitate of cobaltous hydrate, free from nickel, which, when washed and dried, is reduced in a platinum or porcelain crucible by hydrogen gas.

Uses. Nickel is chiefly employed in the manufacture of German silver. Some of its salts have been recently introduced into medical practice, and appear likely to prove most valuable additions to the materia medica. It has also been recently used for deposition by electrolysis on other metals, forming a hard, brilliant, non-tarnishing coating.

Nick'elous Ac'etate. $\text{Ni}(\text{C}_2\text{H}_3\text{O}_2)_2$. *Syn.* NICKELII ACETAS, L. *Prep.* By neutralizing acetic acid with nickelous carbonate, and gently concentrating by evaporation, so that crystals may form. Small green crystals, soluble in 6 parts of water.

Nickelous Car'bonate. NiCO_3 . *Syn.* NICKELII CARBONAS, L. *Prep.* This salt may be obtained in the manner described above in connection with the preparation of metallic nickel, or by simply adding carbonate of sodium to a solution of nickelous chloride or sulphate, but in this case some hydrate is precipitated along with it. The following is another formula which produces a nearly pure carbonate, but one which may still contain a little cobalt, the entire separation of which is a matter of extreme difficulty, and can best be effected in the manner recommended by Rose, described above:—

The mineral (crude speiss or kupfernickel) is broken into small fragments, mixed with

from one fourth to one half its weight of iron filings, and the whole dissolved in aqua regia; the solution is gently evaporated to dryness, the residue treated with boiling water, and the insoluble ferrous arseniate removed by filtration; the liquid is next acidulated with hydrochloric acid, treated with sulphuretted hydrogen, in excess, to precipitate the copper, and, after filtration, is boiled with a little nitric acid, to bring back the iron into ferric salts; to the cold and largely diluted liquid a solution of bicarbonate of sodium is gradually added, and the ferric oxide separated by filtration; lastly, the filtered solution is boiled with carbonate of sodium in excess, and the pale green precipitate of carbonate collected, washed, and dried.

Uses, &c. It is freely soluble in the acids, and is chiefly employed to prepare the salts and other compounds of nickel.

Nickelous Chloride. NiCl_2 . *Syn.* NICKELLI CHLORIDUM, L. *Prep.* From nickelous carbonate and hydrochloric acid, as the acetate. Small green crystals, of the formula $\text{NiCl}_2 \cdot 9\text{Aq.}$, which are rendered yellow and anhydrous by heat, unless they contain cobalt, when the salt retains a tint of green.

DOUBLE CHLORIDES. Nickelous chloride unites with the chlorides of ammonium, potassium, and sodium, to form pale green crystallizable salts, which have been used for depositing nickel in iron, lead, copper, &c.

Nickelous Hydrate. $\text{Ni}(\text{HO})_2$. By precipitating a soluble salt of nickel with caustic potassa. Hydrated. An ash-gray powder, freely soluble in acids, forming the ordinary salts of nickel.

Nickelous Oxalate. NiC_2O_4 . *Syn.* NICKELLI OXALAS, L. *Prep.* By adding a strong solution of oxalic acid to a like solution of nickelous sulphate, and collecting the pale bluish-green precipitate which forms after a time. *Used* to prepare both metallic nickel and its oxide.

Nickelous Oxide. NiO . *Syn.* PROTOXIDE OF NICKEL. *Prep.* 1. By heating the nitrate, carbonate, or oxalate, to redness in open vessels. Anhydrous.

Nickelic Oxide. Ni_2O_3 . *Syn.* SESQUIOXIDE OF NICKEL, PEROXIDE OF NICKEL. *Prep.* By passing chlorine through water holding the hydrate in suspension; or by mixing a salt of nickel with bleaching powder. An insoluble, black powder, which is decomposed by heat.

Nickelous Sulphate. NiSO_4 . *Syn.* SULPHATE OF NICKEL. *Prep.* Dissolve nickelous carbonate or oxide in dilute sulphuric acid, evaporate down, and crystallize. Pale green prismatic crystals, and of the formula $\text{NiSO}_4 \cdot 7\text{Aq.}$, or small pale green octahedrons, when crystallized at a higher temperature, containing $\text{NiSO}_4 \cdot 6\text{Aq.}$

Nickelous and Potassium Sulphate. $\text{NiSO}_4 \cdot \text{K}_2\text{SO}_4 \cdot 6\text{Aq.}$ *Syn.* DOUBLE SULPHATE OF NICKEL AND POTASSIUM. *Prep.* By crystallizing a mixture of nickelous and potassium sulphates. Pale green crystals, readily soluble

in water. Sodium and ammonium sulphates form similar compounds with nickelous sulphate.

NICK'EL SILVER. See GERMAN SILVER.

NICOTINE, Nicotina. $\text{C}_{10}\text{H}_{14}\text{N}_2$. *Syn.* NICOTIA, L. A volatile base, discovered by Reiman and Posselt in tobacco.

Prep. (Ortigosa.) Infuse tobacco leaves for 24 hours in water acidulated with sulphuric acid, strain, evaporate to a syrup, add $\frac{1}{2}$ of its volume of a strong solution of potassa, and distil in an oil bath at 288° , occasionally adding a little water to assist the process, and prevent the too great concentration of the solution of potassa in the retort; next saturate the distilled product with oxalic acid, evaporate to dryness, digest in boiling absolute alcohol, evaporate the resulting tincture to a syrup, and decompose the oxalate of nicotine thus obtained by adding potassa to it in a close vessel, and agitate the mass with ether, repeating the process with more ether until all the nicotine is dissolved out; lastly, distil the mixed ethereal solution in an oil bath. At first ether comes over, then water, and, lastly, nicotina, which, towards the end of the process, assumes a yellowish tint.

2. (Schloesing.) This chiefly differs from the preceding by directing the concluding distillation to be conducted in a retort, by the heat of an oil bath, at the temperature of 284° Fabr., in a current of hydrogen, for 12 hours; after which, by raising the heat to 356° Fabr., the nicotine distils over pure, drop by drop.

Prop., &c. Nicotina is a colourless, volatile liquid; highly acrid and pungent; smelling strongly of tobacco; boiling at 375° Fabr. (482° —Pereira); soluble in water, ether, alcohol, and oils; and combining with the acids, forming salts, many of which are crystallizable. It is a frightful poison; $\frac{1}{4}$ of a drop will kill a rabbit; a single drop will kill a large dog. Nicotina is the substance which was employed by the Count Bocarmé for the purpose of poisoning his brother-in-law, Gustave Fougues, the particulars of which were developed in the celebrated trial, in Belgium, of that nobleman, in 1851. Good Virginia and Kentucky tobacco, dried at 212° Fabr., contain from $6\frac{1}{2}\%$ to $7\frac{1}{2}\%$ of nicotina; Havannah tobacco (*cigars*) less than $2\frac{1}{2}\%$. (Schloesing.)

NIGHTMARE. *Syn.* INCUBUS, EPHYALTES, L. The common causes of nightmare are indigestion and the use of narcotic and intoxicating substances. Its prevention consists in the selection of proper food, and in duly attending to the state of the stomach and bowels. Heavy and late suppers should be particularly avoided, as well as all articles of diet that are of difficult digestion, or apt to induce flatulency. When it arises from strong drink, tobacco, or opium, these should be abandoned, or employed in smaller quantities. A teaspoonful of aromatic spirits of ammonia, magnesia, or bicarbonate of soda, taken in a glass of cold water on going to bed, is a good and simple

preventive. In cases accompanied by restlessness, a few drops of laudanum or tincture of henbane may be added. An occasional aperient is also excellent. See CHAMOMILE.

NIGHTSHADE (Deadly). *Syn.* BELLADONNA (B. P., Ph. L. E. & D.). "The leaf, fresh and dried (leaves and root—Ph. D.), of *Atropa belladonna*, Linn." "The fresh leaves and branches to which they are attached; also the leaves separate from the branches, carefully dried, of *Atropa belladonna*, gathered, when the fruit has begun to form, from wild or cultivated plants in Britain" (B. P.). "Oval, acute, very perfect, glabrous, when bruised exhaling a disagreeable odour. The herb which grows spontaneously in hedges and uncultivated places is to be preferred to that which is cultivated in gardens." (Ph. L.)

Belladonna is a powerful narcotic, and is used as an anodyne, antispasmodic, and discutient, in a variety of diseases,—neuralgia, arthritic pains, migratory rheumatic pains, spasmodic rigidity and strictures, angina pectoris, whooping-cough, fevers, phthisis, &c.; also as a prophylactic of scarlet fever, as a resolvent in enlarged and indurated glands, to produce dilatation of the pupil, &c., &c.—*Dose.* Of the powder, commencing with 1 gr., gradually and cautiously increased until dryness of the throat or dilation of the pupil occurs, or the head is affected. See ATROPIA.

NIGHTSHADE (Woody). *Syn.* BITTERSWEET; DULCAMARA (B. P., Ph. L. E. & D.). L. The "new shoots (caules) of *Solanum Dulcamara*, Linn." "The dried young branches of the *Solanum Dulcamara* (Bittersweet), from indigenous plants which have shed their leaves" (B. P.). "It is to be collected in autumn, after the leaves have fallen." (Ph. L.) Diaphoretic, diuretic, and (in large doses) narcotic. See INFUSION OF DULCAMARA.

NIOBIUM. See TANTALUM.

NIPPLES (Sore). The most common form of this affection is that termed "chapped nipples," by nurses. As a preventive measure, the part may be moistened morning and evening, for some weeks before the period of lactation, with a little rum or brandy, which is more effective if slightly acidulated with a few drops of dilute sulphuric acid. Some persons employ tincture of tolu, or compound tincture of benzoin (Friar's balsam) for this purpose.

When chaps, cracks, or like sores, arising from lactation, are once developed, one of the safest and most effective remedies is tincture of aitchu, applied 3 or 4 times a day, by means of a camel-hair pencil.

The celebrated *nostrum* of Liebert for cracked nipples, "*Cosmétique infallible et prompt contre sgerçures ou crevasses aux seins et autres,*" a lotion formed of 10 grs. of nitrate of lead dissolved in 4 fl. oz. of rose water, and tinged with a little cochineal. The parts are moistened with the liquid, and are then covered with fine leaden nipple-shields, two of which

are provided for the purpose. This is repeated soon after each time the child leaves the breast; and the nipple is carefully washed with a soft sponge and lukewarm water, and gently dabbed dry with a very soft towel, before the infant is again applied to it. This remedy is very successful, and has acquired great popularity and patronage in Brussels, Paris, Frankfort, and other parts. It must be recollected, however, that all applications of an active or poisonous nature should be employed with the greatest possible caution, as, unless unusual care is taken, a portion of the remedy may remain concealed within the delicate pores of the skin, and be sucked off by the infant, to the serious disturbance of its health.

NITRANILINE. This substance is obtained by acting on nitrobenzol with a mixture of fuming nitric acid and oil of vitriol; Dinitrobenzol is formed, which is dissolved in alcohol, and the resulting solution subjected to the reducing action of ammonia and sulphuretted hydrogen, as described under aniline. Nitraniline forms yellow, acicular crystals, little soluble in cold water, but freely soluble in alcohol and ether. Its salts are crystallizable.

NITRATE. *Syn.* NITRAS, L. A salt of nitric acid (e.g. $\text{Ag} \cdot \text{NO}_3$, nitrate of silver). The nitrates are very easily prepared by the direct solution of the metal, or its oxide, or carbonate, in nitric acid, which, in most cases, should be previously diluted with water. By evaporation, with the usual precautions, they may be obtained either in the pulverulent or crystalline form.

The nitrates are characterised by deflagrating when thrown on red-hot coal, or when heated in contact with inflammable substances. See NITRIC ACID, and the respective metals.

NITRE. Nitrate of Potassa. See POTASSA. **NITRIC ACID.** HNO_3 . *Syn.* AZOTIC ACID; ACIDUM NITRICUM (B. P., Ph. L. E. & D.); AQUAFORTIS.

Prep. 1. (Ph. E., and Ph. L. 1836.) Purified nitre (dried) and sulphuric acid, equal parts; mix in a glass retort, and distil with a moderate heat, from a sand bath (or naked gas-flame—Ph. E.) into a cool receiver, as long as the fused materials continue to evolve vapours. "The pale yellow acid thus obtained may be rendered nearly colourless (if desired) by gently heating it in a retort." (Ph. E.) Sp. gr. 1.500. In the present Ph. L. this acid is included in the *materia medica*. (See below.)

2. (Ph. D.) The nitrate of potassa is dissolved in water, the solution treated with a little nitrate of silver, filtered, evaporated to dryness, weighed, and then treated as above.

3. Nitrate of soda (cubic nitre, Chili saltpetre) is introduced, in quantities varying between 4 and 10 lbs., into a cylindrical iron retort, which it will only half fill, and after the lid is luted on and the connection made with the condensers, an equivalent of oil of vitriol is poured in through an aperture provided for

the purpose, and the charge is worked off with a gradually increased heat. The condensing apparatus consists of a series of 5 or 6 salt-glazed stoneware receivers, about $\frac{3}{4}$ th part filled with cold water. The product of this process is the strongest brown and fuming 'NITROUS ACID' of commerce (AQUAFORTIS, FUMING NITRIC ACID; ACIDUM NITROSUM, ACIDUM NITRICUM FUMANS), and has usually the sp. gr. 1.45. It is rendered colourless by gently heating it in a glass retort, when it forms COMMERCIAL NITRIC ACID (sp. gr. 1.37 to 1.4.)

4. (PURE MONOHYDRATED NITRIC ACID.) By mixing the strongest commercial acid with about an equal quantity of oil of vitriol; re-distilling; collecting apart the first portion which comes over, and exposing it, in a vessel slightly warmed and sheltered from the light, to a current of dry air made to bubble through it until the nitrous acid is completely removed.

Prop. Pure liquid nitric acid is colourless, highly corrosive, and possesses powerful acid and oxygenizing properties. The sp. gr. of the strongest liquid acid (monohydrated nitric acid) has the sp. gr. 1.517 at 60° Fahr. "On boiling nitric acid of different degrees of concentration at the ordinary atmospheric pressure, a residue is left boiling at 249° Fahr., and 29 in. barometer, having a sp. gr. 1.414 at 60° Fahr." (Fownes.) Acid of less density than 1.414 parts with water, and gradually becomes stronger by boiling; but acid of sp. gr. than 1.414 is weakened by exposure to heat. When exposed to intense cold, liquid nitric acid freezes. It is rapidly decomposed, with loss of oxygen, by contact with most organic and many metallic and non-metallic bodies. In many cases these reactions occur with considerable violence, and the production of light and heat.

Pur. The nitric acid of commerce is generally contaminated by hydrochloric acid, nitrous acid, sulphuric acid, or chlorine, or by their soda or potassa salts, and, occasionally, iodine, together with an excess of water. The last is readily detected by the sp. gr., and the others by the appropriate tests. "Colourless. Contains 70% of HNO_3 . Sp. gr. 1.42. 90 grs. by weight, mixed with $\frac{1}{2}$ oz. of distilled water, require for neutralisation 1000 grain measures of the volumetric solution of soda. Evaporated, it leaves no residue. Diluted with six volumes of distilled water, it gives no precipitate with chloride of barium or nitrate of silver—indicating absence of sulphuric and hydrochloric acids." (B. P.) 5 measures of acid, sp. gr. 1.5 mixed with 2 of water, condensed into 6 $\frac{1}{2}$ measures, and makes the sp. gr. 1.42. "Free from colour. Sp. gr. 1.42. Exposed to the air, it emits very acid vapours. Totally volatilized by heat. Diluted with 3 times its volume of water, it gives no precipitate with either nitrate of silver or chloride of barium. 100 gr. of this acid (sp. gr. 1.42) are saturated by 161

gr. of crystallized carbonate of soda." (Ph. L.) The Ph. E. states the density of commercial nitric acid is 1.380 to 1.390. "If diluted with distilled water, it precipitates but slightly, or not at all, with solution of nitrate of baryta or nitrate of silver." The best 'double aquafortis' of the shops (aquafortis duplex) has usually the sp. gr. 1.36; and the single aquafortis' (aquafortis simplex), the sp. gr. 1.22; but both are commonly sold at much lower strengths.

Tests.—1. It stains the skin yellow.—2. When mixed with a little hydrochloric acid or chloride of ammonium, it acquires the power of dissolving gold leaf.—3. Morphia, brucia, and strychnia, give it a red colour, which is heightened by ammonia in excess.—4. When placed in a tube, and a solution of protosulphate of iron is cautiously added, a dark colour is developed at the line of junction, which is distinctly visible when only $\frac{1}{100}$ th part of nitric acid is present. This test may be often conveniently modified by dropping into the liquid a crystal of protosulphate of iron; the fluid immediately surrounding this crystal then acquires a dark brown colour, which disappears upon simple agitation of the fluid, or by heating it.—5. When mixed with a weak solution of sulphate of indigo, and heated, the colour of the latter is destroyed.—6. When saturated with carbonate of potassium or sodium, and evaporated to dryness, the residuum deflagrates when thrown on burning coals.—7. When the mixture of a nitrate with cyanide of potassium, in powder, is heated on a piece of platinum, a vivid deflagration follows, attended with distinct ignition and detonation. (Fresenius.)

The nitrates may all be tested as above by first adding a small quantity of pure sulphuric acid, which will liberate the nitric acid of the salt.

Estim.—The strength of nitric acid may be roughly estimated by its sp. gr.; but more accurately by ascertaining the amount of carbonate of sodium, or other salt of known composition, which is required to neutralize it. To render the assay trustworthy, it must be, in all cases, also tested to detect the presence of impurities. See ACIDIMETRY.

Ant., &c. See ACIDS.

Uses. Nitric acid is employed in assaying, in dyeing, in etching on copper, in the preparation of gun-cotton, oxalic and sulphuric acids, &c. In medicine, it is used as a caustic to corns and warts; and in doses of 1 to 10 drops, in a tumbler of water, in liver complaints, fevers, dyspepsia, syphilis, to remove the effects of mercury, or as a substitute for that drug, &c. Externally, it is employed in the form of baths, lotions, and ointment. Dr. Collier states that a strong lotion of nitric acid is almost a specific in lepra, and several other kindred skin diseases.

Concluding remarks.—The common source of nitric acid is nitrate of potassium, but it may

also be obtained from other nitrates by a similar process. Nitrate of sodium is frequently used instead of nitrate of potassium, and is more convenient in some respects, as the residuum is more easily dissolved out of the retort or cylinder. The residuum of the common process with nitre ('sal enixum') is chiefly employed as a flux by the glass-houses, and as a source of potash in the manufacture of alum.

By proper management, nitre yields more than $\frac{2}{3}$ of its weight of pure nitric acid, sp. gr. 1.500; and nitrate of soda, its own weight of acid, sp. gr. 1.4.

By the patent process of M. Mallet, dried nitrate of soda is decomposed by dried or monohydrated boric acid, by heating the two together. The products are liquid nitric acid, which distills over, and biborate of soda (borax), which remains in the retort.

The crude coloured nitric acid of commerce (aqua fortis) was originally prepared by distilling a mixture of nitre and copperas, and is still sometimes obtained in this way.

The nitric acid of commerce may be freed from the impurities alluded to above by one or other of the following methods:—

1. By the addition of a little nitrate of silver, as long as it produces any cloudiness, and, after repose, decanting the clear acid, and rectifying it at a heat under 212°. To ensure a perfectly colourless product, a small portion of pure black oxide of manganese should be put into the retort. (Murray.)

2. By agitating the acid with a little red oxide of lead, and then rectifying it, as before.

3. By adding $\frac{1}{2}$ of bichromate of potassa to the acid before rectifying it. This answers well for acid not stronger than sp. gr. 1.48.

4. By rectification at a gentle heat, rejecting the first portion that comes over, receiving the middle portion as genuine acid, and leaving a residuum in the retort. (Ure.)

According to Apjohn and others, the strongest liquid nitric acid, sp. gr. 1.520, is a monohydrate; that of the sp. gr. 1.500, a sesquihydrate; that of 1.486, a binhydrate; and that of 1.244, a quadrihydrate; or containing respectively, 1, $1\frac{1}{2}$, 2, and 4 atoms of water. (See below.)

Nitric Acid, Anhydrous. N_2O_5 . *Syn.* NITRIC ANHYDRIDE. This interesting substance was first obtained in a separate form by M. Deville, in 1849.

Prep. (M. Deville.) Nitrate of silver is dried by exposure to a current of dry carbonic acid at a temperature of 356° Fahr., and the tube containing it is then immersed in a water bath heated to 203° Fahr.; pure dry chlorine gas is next passed through the apparatus, and, as soon as the reaction commences, the temperature is reduced to 154° or even 136°, but not lower; the production of crystals in the receiver, which must be cooled by a powerful freezing mixture, soon commences; lastly, the

liquid portion of the product is removed by a current of dry carbonic-acid gas.

Prop., &c. Colourless prismatic crystals, which melt at 86° Fahr., boil at about 115°, and at 122° begin to suffer decomposition; added to water, much heat is generated; it rapidly attacks organic bodies, even caoutchouc; sometimes it explodes spontaneously. The process for its preparation is tedious and difficult.

Nitric Acid, Dilute. **ACIDUM NITRICUM DILUTUM** (B. P., Ph. L. E. & D.), *L.* *Prep.* 1. (Ph. L.) Nitric acid (sp. gr. 1.42), 3 fl. oz.; distilled water, 17 fl. oz.; mix. Sp. gr. 1.082. "1 fl. oz. is saturated by 154 grs. of the crystals of carbonate of soda." It contains about 12% of pure anhydrous nitric acid.

2. (Ph. E.) Nitric acid (1.500), 1 fl. oz.; distilled water, 9 fl. oz. Or, commercial nitric acid (1.390), 1 fl. oz. $5\frac{1}{2}$ drs.; water, 9 fl. oz. Sp. gr. 1.077. It contains 11.16% of pure dry nitric acid.

3. (Ph. D.) Nitric acid (1.500), 4 fl. oz.; water, 29 fl. oz. Contains about 9.7% of pure acid. The above are used for convenience in dispensing.—*Dose.* 15 drops to $\frac{1}{2}$ fl. dr., or more. The above must not be confounded with the acidum nitricum dilutum, Ph. D. 1826, which had the sp. gr. 1.280, nor with the following:—

4. (Henry's.) Sp. gr. 1.143; equal in saturating power to hydrochloric acid sp. gr. 1.074, and sulphuric acid 1.135. *Used* in assaying.

5. (B. P.) Nitric acid, 6; distilled water sufficient to make the mixture when cooled to 60° Fahr., measure 81. Contains 15 per cent. of anhydrous nitric acid. *Test.* Sp. gr. 1.101. Six fluid drachms (361.3 grains) by weight require for neutralisation 1000 grain measures of the volumetric solution of soda, and, therefore, contain exactly one equivalent in grains of anhydrous acid, namely, 54 grs. *Use.* Tonic, astringent, lithonelytic.—*Dose.* 10 to 30 minims.

Nitric Acid, Fuming. *Syn.* NITROUS ACID†; **ACIDUM NITRICUM FUMANS**, *L.* The red fuming nitrous or nitric acid of commerce is simply nitric acid loaded with nitric peroxide (which see). That of the Ph. Bor. is distilled from nitre, 2 parts; oil of vitriol, 1 part.

NITRIC ANHYDRIDE. See NITRIC ACID, ANHYDROUS.

NITRIC OXIDE. See NITROGEN, OXIDES OF.

NITRITE. A salt of nitrous acid; *e.g.* KNO_2 , nitrite of potassium.

NITRO-BENZOL. $\text{C}_6\text{H}_5\text{NO}_2$. *Prep.* By treating benzol with strong fuming nitric acid, with heat; after the violence of the reaction is over, the liquid is diluted with water, and the heavy oily fluid which separates is collected, washed, and dried.

Prop., &c. Yellowish; very sweet; smells of bitter almonds; insoluble in water; little affected by reagents; boils at 415° Fahr.; sp. gr. 1.209. Heated with an alcoholic solution of caustic potassa, and the mixture submitted

to distillation, it yields a red, oily liquid, from which large red crystals of azobenzol separate. These are nearly insoluble in water, freely soluble in alcohol and ether, melt at 149° Fahr., and boil at 559.4° Fahr. BINITROBENZOL is made by dissolving benzol in a mixture of equal volumes of the strongest nitric and sulphuric acids, and boiling the liquid for a few minutes; the crystals (dinitrobenzol) which form as it cools are insoluble in water, but are freely soluble in alcohol.

NITROGEN. N. *Syn.* AZOTE; NITROGENIUM, AZOTUM, L. A gaseous elementary substance, discovered by Rutherford, in 1722, and found to be a constituent of the atmosphere by Lavoisier, 1755. It is found both in the organic and inorganic kingdoms of nature; it forms about $\frac{1}{5}$, or 78% of the bulk of the atmosphere, enters largely into the composition of most animal substances, and is a constituent of gluten, the alkaloids, and other vegetable principles.

Prep. 1. A small piece of phosphorus is placed in a capsule floating on the surface of the water of the pneumatic trough, and after setting it on fire a gas or bell-jar is inverted over it; as soon as the combustion is over, and the fumes of phosphoric anhydride have subsided, the residual gas is washed by agitation with recently boiled distilled water, or with a solution of pure potassa. It may be dried by either letting it stand over fused chloride of calcium, or, what is better, by passing it through concentrated oil of vitriol.

2. A porcelain tube is filled with copper turnings, or, preferably, with spongy copper (obtained by reducing the oxide with hydrogen), and is then heated to redness, a stream of dry atmospheric air being at the same time directed through it. By repeating the process with the same air, and finally passing it over fragments of pumice moistened with strong solution of potassa to absorb carbonic anhydride, the product is rendered quite pure.

3. Chlorine gas is passed into a solution of pure ammonia, care being taken to employ a considerable excess of the latter; the evolved gas, after being dried, is pure nitrogen. There is some danger of producing the explosive compound, chloride of nitrogen, with this process.

4. (Corenwinder.) From solution of nitrate of potassium, 1 volume; concentrated solution of chloride of ammonium, 3 vols.; gently heated together in a flask, and the evolved gas passed through sulphuric acid. Pure.

5. By boiling a solution of nitrite of ammonium, or, which amounts to the same thing, a mixture of one measure of a solution of nitrite of potassium and three measures of a solution of chloride of ammonium. Both solutions must be concentrated. This is the easiest method of preparing nitrogen and of obtaining the gas in a pure state.

Note.—The nitrite of potassium to be employed in this process is best prepared by passing nitrous anhydride, evolved from starch and nitric acid, into a solution of potassa (sp. gr. 1.38) till it imparts an acid reaction to test-paper, and then neutralising by the addition of potassa.

6. From lean flesh digested in nitric acid, at a gentle heat.

Prop., &c. Pure nitrogen is a colourless, odourless, tasteless gas, neither combustible nor capable of supporting combustion or respiration. It is neutral to test-paper, does not affect lime water, and is only slightly absorbed by pure water. Its sp. gr. is .9713. It is recognised by its purely negative qualities.

Nitrogen, Chloride of. NCl_3 . *Syn.* NITROGEN TRICHLORIDE, TRICHLORIDE OF NITROGEN. This compound was discovered by Dulong in 1811, but its nature was first accurately determined by Sir H. Davy.

Prep. (Liebig.) Dissolve chloride of ammonium, 1 oz., in hot water, 12 or 14 oz., and as soon as the temperature has fallen to 90° Fahr., invert a wide-mouthed glass bottle full of chlorine over it. The gas is gradually absorbed, the solution acquires a yellowish colour, and in the course of 15 to 20 minutes yellow, oil-like globules of chloride of nitrogen form upon the surface of the liquid, and ultimately sink to the bottom. The globules, as they descend, should be received in a small leaden saucer, placed under the mouth of the bottle for the purpose.

Prop., &c. Chloride of nitrogen should consequently be only prepared in very small quantities at a time. Both its discoverer and Sir H. Davy met with severe injuries while experimenting on it. Its sp. gr. is 1.653; it volatilises at 160° Fahr., and between 200° and 212° fulminates violently. Contact with combustible bodies at ordinary temperatures immediately causes detonation. *The explosive power of this compound seems to exceed that of every known substance, not even excepting fulminating silver.* A minute globule, no larger than a grain of mustard seed, placed on a platinum spoon, and touched with a piece of phosphorus stuck on the point of a penknife, immediately explodes, and shivers the blades into fragments, at the same time that the vessel that contains it is broken to pieces. Olive oil, naphtha, and oil of turpentine, have a similar effect. See NITROGEN, IODIDE OF (below).

Nitrogen, Iodide of. N_3 . *Syn.* NITROGEN TRI-IODIDE, TRIIODIDE OF NITROGEN. A dark brown or black insoluble powder, which is most safely and conveniently prepared by saturating alcohol (sp. gr. .852) with iodine, adding a large quantity of the strongest pure solution of ammonia, and agitating the mixture; water must now be added, when iodide of nitrogen will be precipitated, and must be carefully washed with cold distilled water. The filter containing the precipitate should be spread out

on a sheet of glass and torn into small pieces while the iodide is still moist. The precipitate should be simply exposed to air only.

Prop., &c. It detonates violently as soon as it becomes dry, by the slightest pressure or friction, even that of a feather, and often spontaneously; but this explosion is scarcely so powerful as that of the chloride of nitrogen. It also explodes whilst moist, though less readily. It should only be prepared in very small quantities at a time. Recent researches induce the belief that both the above compounds contain hydrogen.

Nitrogen, Oxides of. Nitrogen forms 5 distinct compounds with oxygen.

1. Nitrous oxide. *Syn.* PROTOXIDE OF NITROGEN; LAUGHING GAS; NITROGENII PROTOXYDUM, L. *Prep.* From fused nitrate of ammonium, introduced into a glass retort, or a flask furnished with a bent tube, and then exposed, over a spirit-lamp, or charcoal-chauffer, to a temperature of about 380° Fahr.; the evolved gas may be collected in bladders, gas-bags, a gasometer, or in the pneumatic trough over warm water. The gas may be purified by pouring it through three wash-bottles, one containing water, one a solution of sulphate of iron, and the other a solution of potassa.

Prop., &c. Colourless; possesses an agreeable odour, and a sweetish taste; at 32° , under a pressure of 30 atmospheres, it is liquid; this, when exposed under the receiver of a powerful air-pump, changes into a snow-like solid; at -180° Fahr., it is a transparent, colourless, crystalline body; it supports combustion, and is absorbed by cold water. Sp. gr. 1.520. Its most remarkable property is its action on the system when inspired. A few deep inspirations are usually succeeded by a pleasing state of excitement, and a strong propensity to laughter and muscular exertion, which soon subside, without being followed by languor or depression. Its effects, however, vary with different constitutions. From 4 to 12 quarts may be breathed with safety. It produces temporary insensibility to pain, like chloroform or ether; but its use is dangerous when affections of the heart, lungs, or brain are present. This gas is now successfully and extensively employed as an anæsthetic in dental surgery.

Obs. No particular caution is required in preparing the above compound, except the use of too much heat. The temperature should be so arranged as to keep the melted mass in a state of gentle ebullition, and should not be allowed, under any circumstances, to exceed about 500° Fahr. Should white fumes appear within the retort after the evolution of the gas has commenced, the heat should be at once lowered, as, when heated to about 600° , nitrate of ammonia explodes with violence.

Nitrous oxide may also be made in the same way, from crystallised nitrate of ammonia, or

by exposing nitric oxide for some days over iron filings moistened with water, but, without great care, the product is not always fit for respiration. When pure, it is colourless, has an agreeable odour, and does not affect solution of nitrate of silver.

2. Nitric oxide. NO. *Syn.* DEUTOXIDE OF NITROGEN, NITROUS GAS, BINOXIDE OF NITROGEN; NITROGENII BINOXIDUM, L. *Prep.* By pouring nitric acid, sp. gr. 1.2, on metallic copper, in the form of turnings, clippings, or wire. Effervescence ensues, and nitric oxide is evolved, and may be collected over water or mercury in the pneumatic trough. The residual liquid yields crystals of nitrate of copper on evaporation.

Prop., &c. A colourless, tasteless, inodorous, irrespirable, and incombustible gas. In contact with free oxygen, it produces dense orange or red vapours of nitric peroxide (NO_2), which are freely absorbed by water. Nitric oxide is absorbed by a solution of ferrous sulphate, which it turns of a deep brown or nearly black colour, which is removed by boiling. Sp. gr. 1.039.

Nitrous Anhydride. N_2O_3 . *Syn.* NITROGEN TRIOXIDE, ANHYDROUS NITROUS ACID. The easiest method of obtaining this compound consists in heating 1 part of powdered starch with 8 parts of nitric acid of sp. gr. 1.25, and passing the evolved gases, first through a drying tube two feet long containing fused chloride of calcium, and then into a dry and empty U-tube cooled to 20° Fahr. by surrounding it with a mixture of pounded ice and crystallized chloride of calcium. Nitrous anhydride thus produced is a blue liquid which emits red fumes, and which on admixture with water at ordinary temperatures is decomposed, producing nitric acid and nitric oxide. If nitrous anhydride be mixed with water at temperatures below 0° Fahr. the two combine, and a blue solution is formed which (probably contains nitrous acid (HNO_2)). See NITROUS ACID.

Nitrogen Pentoxide. N_2O_5 . *Syn.* NITRIC PENTOXIDE, NITRIC ANHYDRIDE, ANHYDROUS NITRIC ACID. See NITRIC ACID (ANHYDROUS).

Nitrogen Peroxide. NO_2 . *Syn.* NITRIC PEROXIDE, PEROXIDE OF NITROGEN, NITROGEN TETROXIDE, HYPONITRIC ANHYDRIDE. This compound forms the chief constituent of the red fumes which develop on mixing nitric oxide with air or oxygen. It is most readily prepared by heating thoroughly dried nitrate of lead in a retort, and conducting the evolved gases into a U tube surrounded with a freezing mixture of ice and salt for the purpose of condensing the nitric peroxide. If the U tube be perfectly dry, and the cold intense, the nitric peroxide obtained assumes the form of transparent crystals, but the presence of the slightest trace of moisture prevents their formation and produces instead a colourless liquid which, as the temperature rises, acquires a

yellow and ultimately a red colour. Nitric peroxide dissolves in nitric acid and turns it of a yellow or red hue. The so-called '*nitrous acid*' or '*fuming nitric acid*' of commerce owes its deep red colour to the presence of this compound. At very low temperatures water converts nitric peroxide into nitric and nitrous acids; at ordinary temperatures it transforms it into nitric acid, nitrous acid, and nitric oxide.

NITRO-HYDROCHLORIC ACID. *Syn.* NITRO-MURIATIC ACID; AQUA REGIA, ACIDUM NITRO-HYDROCHLORICUM (B. P.) A. NITRO-MURIATICUM, L.; EAU RÉGALE, Fr. *Prep.* (B. P.) Nitric acid, 3; hydrochloric acid, 4; water, 25. Mix the acids twenty-four hours before adding the water, (This precaution is necessary to allow of the development of the chlorine, and the chloronitrous and chloronitric gases which result from the mutual decomposition of the two acids, and upon which the therapeutic activity of the agent depends). Colourless. Keep the mixture in a cool and dark place.

2. (Ph. D. 1826.) Nitric acid, 1 part; hydrochloric acid, 2 parts; (both by measure;) mix in a refrigerated bottle, and keep the mixture in a cool and dark place. Used to dissolve gold and platinum; and in medicine, in liver complaints, syphilis, the exanthemata, &c., either internally, in doses of 5 to 15 drops in water, or externally, as a foot- or knee-bath. It is also occasionally employed as a caustic.

3. (AQUA REGIA WITH SAL AMMONIAC.) Nitric acid (sp. gr. 1.2), 16 fl. oz.; sal ammoniac, 4 oz.; dissolve. Occasionally used by dyers; does not keep well.

4. (DYER'S AQUAFORTIS.) Colourless nitric acid (sp. gr. 1.17), 10 lbs.; hydrochloric acid (sp. gr. 1.19), 1 lb.; mix. Used by dyers.

NITRO-PRUSSIDES. A series of salts discovered by Dr. Playfair, and obtained by the action of nitric acid on the ferrocyanides and ferridecyanides. The most important of these salts is the nitroprusside of sodium ($\text{Na}_2(\text{NO})\text{FeC}_5\text{.2Aq.}$). *Prep.* Dissolve 2 parts of powdered ferrocyanide of sodium in 5 parts of common nitric acid previously diluted with its own volume of water. When the evolution of gas has ceased, digest the solution on a water bath until it no longer yields a blue but a slate-coloured precipitate with ferrous sulphate. Cool the liquid, filter, neutralise the filtrate with carbonate of sodium, and again filter. This filtrate, on evaporation, yields crystals consisting of a mixture of nitro-prusside of sodium and nitrate of potassium; the former, which may be recognised by their rhombic shape and their fine ruling colour, should be picked out and preserved. *Use.* As a test for soluble sulphides, with which nitro-prusside of sodium strikes a beautiful violet tint. According to Playfair this is the most delicate test for alkaline sulphides.

NITROUS ACID. HNO_2 . See NITROUS ANHYDRIDE under NITROGEN, OXIDES OF.

NITROUS OXIDE. See NITROGEN, OXIDES OF.

NODE. *Syn.* NODUS, L. A hard tumour proceeding from a bone, and caused by the swelling of its external membrane. The bones of the leg, forehead, and forearm, are those most commonly attacked. Nodes are generally accompanied with considerable pain, and often with caries and loss of vitality.

NOLI ME TANGERE. See LUPUS.

NOMENCLATURE (Chemical). The following information will doubtless prove useful to many of our readers, as serving to explain terms which are necessarily of frequent occurrence in this work:—

ACIDS.—*a.* When a substance produces only one acid compound, the name of this acid is formed by adding the termination -IC to that of the radical, or to the leading or characteristic portion of it; as sulphuric acid, an acid of sulphur. This is Latinized by changing -IC into ICUM; as, *acidum sulphuricum*.—*b.* When a body forms two acid compounds containing oxygen, the name of the one containing the smaller proportion of that substance ends in -OUS; as, *nitr-ous acid*, which contains 1 atom of nitrogen and 2 of oxygen; *nitric acid*, containing 1 atom of nitrogen and 3 of oxygen. In this case the Latin name ends in -OSUM; as, *acidum nitrosum*.—*c.* When a substance forms more than two acids with oxygen, the Greek preposition HYPO- (below or under) is prefixed to the name of the acid in -OUS or -IC next above it; as, *hypochlorous acid*.—*d.* When a new acid compound of a substance is discovered, containing more oxygen than another acid of the same substance already known, the name of which ends in -IC, the prefix PER- or HYPER- is added; as, *periodic acid*. This may be illustrated by the oxygen acids of chlorine:—

Hypochlorous acid (<i>acidum hypochlorosum</i>)	II Cl O
Chlorous " (" <i>chlorosum</i>)	. H Cl O ₂
Chloric " (" <i>chloricum</i>)	. H Cl O ₃
Perchloric or " (" <i>perchloricum</i>)	III Cl O ₄
Hyperchloric " (" <i>hyperchloricum</i>)	IV Cl O ₅

OXIDES. The names of these have, in general, reference to the number of atoms of oxygen which they contain. When a metal forms only one basic compound with oxygen, this compound is simply called the oxide of such base; but as most substances form more than one compound with oxygen, certain prefixes are introduced to express the proportions. In such cases it is generally found that one out of the number has a strongly marked basic character, and contains 1 atom of each of its constituents. This is called the oxide, protoxide, or monoxide, and forms the standard to which those both above it and below it are preferred. Thus, supposing M to be the metal, we may have:—

closely corresponds to that of the mother of the infant, or that it does not differ, on this point, more than 3 or 4 weeks. In respect of the use of high-flavoured or improper food and beverages, medicine, &c., it appears that all these substances immediately affect the milk, and impart to it more or less of their peculiar flavour and properties; and, except with remedies administered under medical advice, in nearly all cases prove injurious to the infant. The diet of a nurse should be nutritious and succulent, and its healthy digestion should be promoted by exercise and pure air. Strong liquors, more especially spirits, act like slow poisons on the infant, and their habitual use by a nurse should, therefore, be considered as a positive disqualification for the duties of her office. The care of the mother or wet-nurse should be particularly directed to the maintenance of her own health and equanimity, by which both the health and good temper of the infant will be, as far as possible, ensured. A grieving, irritable or angry mother, forces her bad qualities on her offspring, in the shape of fits, convulsions, or hopeless marasmus. See INFANCY, MILK, &c.

NUTMEG. *Syn.* MYRISTICÆ NUCLEUS, NUCISTA, NUX MOSCHATA, N. MYRISTICA, N. AROMATICA, MYRISTICA (B. P., Ph. L.), L. "The shelled seed of *Myristica officinalis* (Linn.; *M. moschata*—Thunberg), or nutmeg-tree." It is chiefly used as a spice and condiment, but it is also esteemed as an aromatic in flatulency and diarrhoea.—*Dose.* Half a teaspoonful, or more, grated. The distilled and expressed oils (OLEUM MYRISTICÆ) are also officinal.

NUTRI'TION. The phenomena of life are accompanied by the constant and unceasing waste of the materials of which the animal body is composed. Every act of volition, every exertion of muscular power, every functional action of the organism, whether perceptible or imperceptible and involuntary, every play of chemical affinity and decomposition, even thought itself, occasions the disorganization and destruction, as living matter, of a portion of ourselves. But the process of respiration, and the various important changes with which it is connected, tends, more than all the other vital functions, to waste the substance of the body, the temperature of which it is its special office to support. This loss, this change, which commences with life and terminates only with death, is compensated for by the constant renewal of the whole frame by the deposition and assimilation, or organization, of matter from the blood, which thus becomes gradually thinner and impoverished, unless, in its turn, it receives a corresponding supply of its vital elements. This it does from the food, which, by the functions of digestion, is converted into 'chyle,' and, after being taken up by the 'lacteals,' passes into the blood, of which it then becomes a

part, and after being animalised and rendered similar to the being it is designed to nourish, by the peculiar action of the vital affinities, it attaches itself to those organs or tissues, the loss of which it is intended to supply. This constitutes nutrition.

The food of animals, or, rather, the nutritious portion of that food on which we live, is wholly organic matter, and is either directly or indirectly produced by the powers of vegetation from the inorganic world. The plant elaborates food for the herbivora, and these, in their turn, serve as food for the flesh-eating animals. In both cases the leading alimentary principles are the same; the difference is in their proportions. Flesh is identical in composition with blood, and with the body of the animal that blood is destined to nourish. It abounds in albumen, casein, and fibrin. The vegetable substances used as food also contain nitrogenised principles of a precisely similar character and chemical constitution to those found in flesh, and which we are, therefore, bound to believe are absolutely the same. The gluten of wheat, when purified from gliadin, presents all the characteristics of pure fibrin. The albumen extracted from vegetable juices, when coagulated by heat, cannot be distinguished from the boiled white of egg in a divided condition. The legumen or vegetable casein of almonds, peas, beans, and many of the oily seeds, bears the most striking resemblance to the casein of milk. These facts clearly show that the leading nitrogenized principles of animal bodies pre-exist in vegetables, and that the substances employed as food must have the same, or nearly the same, chemical composition as the body itself. The striking contrast of animal and vegetable food, as far as this point is concerned, is more apparent than real. The actual difference between the two is to be found in the existence of a large quantity of non-nitrogenized matter (sugar, starch, &c.) in the last, which is not contained in the other—matter which abounds in carbon, and which, by its combustion in the system, serves to support the animal heat at a less sacrifice of the organic fabric. In the flesh-eating animal the waste of the organic tissues is very rapid, and the tax upon the vital energies proportionate; for the temperature of its body is kept up, for the most part, by the burning of the nitrogenised matter of which these tissues are composed.

The process of digestion is that by which the available portions of the food are reduced to a form adapted for absorption by the vessels by which it is introduced into the system. In the flesh-eating animal this process is extremely simple, and consists in the mere comminution of the food by the teeth, and its reduction to the liquid state in the stomach, after which, from the nature of its composition, it is nearly all taken up, and at once conveyed into the blood. In the herbivora, however, the process of digestion is much

more complicated, and occupies a longer period. Besides the ordinary principles of flesh, their food contains starch, sugar, gum, &c., mixed with much inert vegetable fibre and other useless substances, from which it must be separated. The first of these supply materials for the waste and growth of the body, the second meet the requirements of respiration, and the last pass unaltered through the alimentary canal.

The nature of the digestive process is not clearly established. The principal objects effected appear to be the conversion of starch, coagulated albumen, fibrin, casein, &c., into a liquid form. It is known that the saliva contains a peculiar principle (ptyalin) resembling diastase, capable of transmuting starch into sugar, and that when a little starch is held in the mouth for a short time this change actually occurs. It is also known that the gastric juice contains a peculiar organic principles named 'pepsin,' and that this substance, in conjunction with dilute hydrochloric acid, which is likewise present in the stomach, possesses the property of dissolving the albuminous principles of food. (See PEPsin.) These changes occur whenever these conditions are established out of the body, and hence it is inferred that the process of digestion is effected by similar means. Of this, however, there is no direct evidence.

The use of food, as already noticed, is twofold. It supplies the materials of nutrition to balance the waste of the tissues continually taking place in the body, and it conveys into the system those elements which, by their chemical combinations, produce heat. To effect these purposes in the most beneficial manner, the food should not only be sufficient in quantity, but the proportions of its nitrogenised and carbonaceous principles should bear such relations to each other as to amply meet the demands of the system for each without the existence, however, of an undue excess of either.

When the muscular movements of a healthy animal are restrained, a genial temperature kept up, and an ample supply of food containing much amylaceous or oily matter given, an accumulation of fat in the system rapidly takes place; this is well seen in the case of stall-fed cattle. On the other hand, when food is deficient, and much exercise is taken, emaciation results. These effects are ascribed to differences in the activity of the respiratory function. In the first instance, the heat-food is supplied faster than it is consumed, and hence accumulates in the form of fat; in the second, the conditions are reversed, and the creature is kept in a state of leanness by its rapid consumption. The fat of an animal appears to be the provision of nature for the maintenance of life during a certain period under circumstances of privation. Hence it is that a lean animal suffers more from cold than a fat one, and is also sooner starved.

"The origin of fat in the animal body has recently been made the subject of much animated discussion; on the one hand, it was contended that satisfactory evidence exists of the conversion of starch and saccharine substances into fat, by separation of carbon and oxygen, the change somewhat resembling that of the vinous fermentation; it was argued, on the other side, that oily or fatty matter is invariably present in the food supplied to the domestic animals, and that this fat is merely absorbed and deposited in the body in a slightly modified state. The question has now been decided in favour of the first of these views, which was enunciated by Professor Liebig, by the very chemist who formerly advocated the second opinion. By a series of very beautiful experiments, MM. Dumas and Milne-Edwards proved that bees exclusively feeding upon sugar were still capable of producing wax, which was pointed out as a veritable fact."

Professor Liebig has divided the principles found in food into two classes:—plastic elements of nutrition, or flesh-and-blood-making principles; and elements of respiration, or those which, by their decomposition or combustion in the system, generate heat. They are as follows:—

Elements of Nutrition.
(Plastic or Nitrogenous.)

Animal flesh
Blood
Vegetable albumen
" casein
" fibrin.

Elements of Respiration
(Heat-producing.)

Fat
Starch
Sugar
Casein
Grape
Milk
Protein
Gelatin

This division is doubtless in the main warranted by fact, but, no doubt, the nitrogenous elements of food produce heat as well as the non-nitrogenous.

NUX VOMICA. *Syn. Nuxvomica.* *STR.* P. 80. *SON N.* *VOMIT N.* *NG.* *V. MUC.* *NUX VOMICA* (B. P., Ph. L. E. &c.). *J.* "The seed of *Strychnos Nux Vomica* Linn." (Ph. L.), imported from the East Indies (B. P.). This drug is chiefly known as a violent excitant of the cerebro-spinal system. In small doses, frequently repeated, it is tonic, diuretic, and occasionally laxative; in slightly larger ones it is emetic; and, in large doses, it is an energetic and fearful poison.—*Dose.* 1 to 3 grs.; in dyspepsia, nervous affections, impotence, chronic dysentery, chronic diarrhoea, &c. Its frequent use is said to render the system proof against the poison of serpents. See STRYCHNINE for its active principle.

OAK. *T.* of Linnaeus *Q. pedunculata* the oak is a tree, and

oak is the *Quercus Robur* there are two varieties, *sessiflora*. The wood of it is stronger than that of any other tree supporting a weight.

resisting a strain, and not splintering by a cannon shot, it is superior to every other kind." It, nevertheless, "warps and twists much in drying; and, in seasoning, shrinks about 1-32nd of its width." Foreign oak is less durable, but more brittle and workable. The bark (OAK BARK; QUERCUS CORTEX. QUERCUS—B. P., Ph. L. E. & D.) is used as an astringent and febrifuge, in doses of 30 to 120 gr., frequently; an astringent decoction is also made of it, but its chief employment is in tanning leather. The peculiar appearance of old oak or 'wainscoting' is given to the new wood by exposing it, whilst very slightly damp, to the fumes of ammonia.

OAT. *Syn.* AVENA, L. The common cultivated oat is the *Avena sativa* (Linn.), a graminaceous plant, of which there are several varieties, as the *Avena sativa alba*, or white oat; *A. s. nigra*, or black oat; the potato oat, &c. Other species are also cultivated, as *Avena nuda* (Linn.), pilcorn, or naked oat; *A. strigosa*, or Spanish oat, &c. The seed (OATS; CARYOPSIDES, SEMINA AVENÆ CRUDA) form the common horse-corn of this country, but in the northern parts of the country it is extensively used as food for man. The husked grain constitutes GROATS, and its meal OAT-MEAL. The latter does not form a dough with water, as wheaten meal or flour does.

Oats consist of from 24% to 28% of husk, and 74% to 78% of grain. According to M. Payen, they contain of starch 60.59%; azotized matter, 14.39%; saccharine and gummy matter, 9.25%; fatty matter, 5.50%; cellulose, 7.60%; silica and saline matter, 7.25%. The husk contains between 6 and 7% of saline matter. (Prof. Norton.) The ash is 2.18%, and consists of, potassa and soda, 26.16%; lime, 5.95%; magnesia, 9.95%; oxide of iron, .40%; phosphoric acid, 43.84%; sulphuric acid, 10.45%; chlorine, .26%; silica, 2.67%; alumina, .06%. (Johnston.)

The yield of oats is from 20 bushels per acre in poor soils, up to 60, 70, and even 80 bushels per acre in rich soils. The weight per bushel varies from 35 to 45 lb., and the product in meal is about one half the weight of the oats.

A large proportion of the oats given to horses passes off undigested. It has hence been proposed to prevent this loss, by either coarsely bruising them in a mill, or by pouring boiling water over them, and allowing them to macerate till cold, when they are to be given to the horses without straining off the water. It is stated on good authority, that oats thus treated will not only fatten quicker, but go twice as far as without preparation. Oat bruisers are now manufactured by most agricultural implement makers.

OAT-MEAL. *Syn.* AVENÆ FARINA, F. EX SEMINIBUS AVENÆ (Ph. D.), L. Of thirty samples of oatmeal examined by the 'Lancet Sanitary Commissioner,' no fewer than sixteen samples, or more than one half, were adulterated.

The substance generally used for this purpose is barley meal, which is only half the price of oatmeal. That supplied to the army, navy, the workhouses, &c., is also very commonly adulterated with whiting, plaster of Paris, or ground bones. These frauds are readily detected by the microscope.

OBE'SITY. *Syn.* OBESITAS, POLYSARCIA, L. Unhealthy or troublesome fatness or corpulency. Sometimes the secretion of fat, and its accumulation in the adipose membrane, is almost as rapid as that of water in anasarca; on which account some of the old writers have called obesity a dropsy of fat. Persons in easy circumstances, of indolent habits, who live freely, and who are of a cheerful and contented disposition, are those most liable to obesity. The treatment consists in the very gradual reduction of the diet, until it falls rather below the average quantity required by a healthy adult; the very gradual disuse of fermented liquors, more especially beer; the gradual abridgment of the time devoted to repose, until it does not exceed 5 or 6 hours; the employment of several hours daily in exercise in the open air, at first moderate, but increased day by day in energy, until it becomes laborious; and, lastly, arousing the mind from a state of lethargy to one of active or even harassing employment.

In some few cases the accumulation of fat has been enormous. Bright, of Maldon, weighed 728 lb.; Daniel Lambert, of Leicester, 789 lb.; a girl, 4 years old, noticed in the 'Phil. Trans.,' 1813, weighed 256 lb.

Persons affected with obesity are generally short-lived.

O'CHRES. These are native earthy compounds of clay, coloured with oxide of iron, with frequently a little chalk, or magnesia. The differences in the colour arise partly from the quantity of iron present, and partly from the state of oxidation in which the iron is found. Several varieties are known in commerce—BROWN OCHRE, FRENCH O., OXFORD O., RED O., ROMAN O., YELLOW O. All these with the exception of the first and fourth, have a yellow colour. ARMENIAN BOLE, INDIAN RED, VENETIAN R., and SPANISH BROWN, are also ochres.

All the ochres are darkened by calcination. The yellow ochres acquire a red or reddish-brown colour by this treatment. The pigment called 'light red' is thus prepared from yellow ochre.

ODONTALGIA. See TOOTHACHE.

O'DORAMENTS. *Syn.* ODORAMENTA, L. Substances employed in medicine on account of their odour. They differ from disinfectants, in only disguising, but not destroying, noxious vapours, &c. AMMONIA, STRONG VINEGAR, and PASTILLES, furnish the most familiar examples of this class of substances. See DISINFECTANTS, PERFUMES, &c.

O'DOOR. The emanation of an odoriferous or scent-giving body. See PERFUMES.

CEANANTHIC ETHER. See ETHER (Ceananthic).

OFFIC'INAL. *Syn.* OFFICINALIS, L. A term applied to substances or medicines ordered in the Pharmacopœia.

OIL. *Syn.* OLEUM, L.; HUILE, Fr. This name is given to numerous liquid or semi-liquid substances, expressed or drawn from animal or vegetable bodies; to various products of the distillation of bituminous minerals; and to several unctuous mixtures in perfumery and pharmacy. To facilitate reference, we have grouped the principal substances generally called 'oils' into classes, under the following heads:—OILS (Drying); OILS (Empyreumatic); OILS (Fixed); OILS (Medicated); OILS (Mineral); OILS (Mixed); OILS (Perfumed); OILS (Volatile). See these articles, also *below* :—

OIL, CONSOLIDATED. *Syn.* CAMPHICON, FACIETHIOS CAOUTCHOUC. A substance having most of the properties of India rubber, prepared by oxidising boiled linseed oil, or any other oil that hardens on exposure to the atmosphere. To obtain the solid oil, plates of glass are dipped into linseed oil, the films are then allowed to dry, and the process is repeated again and again until the plates are coated with many layers of perfectly oxidised oil. Instead of plates, extensive surfaces of prepared paper are employed when the manufacture is carried out on a large scale. The solid oil, having been scraped or peeled off the surfaces, is worked with a small proportion of shell-lac, by means of a mixing machine with hot rollers, until a material singularly like caoutchouc is produced. The consolidated oil can be rolled on to fabrics, so as to form a waterproof cloth, having the finish and flexibility of rubber-cloth. By the action of heat the consolidated oil may be converted into a hard substance, resembling vulcanite and ebonite. Its useful applications appear to be very numerous, but its manufacture has not as yet made much progress.

OIL-GAS. A mixture of several gaseous hydrocarbons, obtained by passing common whale or other cheap animal oil through red-hot tubes, or by allowing it to fall in drops on red-hot stones or bricks arranged in an iron retort, or other suitable apparatus. The gas has great illuminating power, requires no purification, and is quite free from the ammoniacal and sulphur compounds which vitiate coal-gas. The high price of oil prevents the general use of this gas for illuminating purposes.

OILS (Drying). All the fixed oils have an attraction more or less powerful for oxygen, and, by exposure to the air, they either become hard and resinous, or they only thicken slightly, and become sour and rancid. Those which exhibit the first property in a marked degree, as the oils of linseed, poppy, rape, and walnut, are called 'drying oils,' and are used as vehicles for colours in painting.

The resinifying or drying property of oils is greatly increased by boiling them, either alone or along with some litharge, sugar of lead, or white vitriol, when the product forms the 'boiled oil' or 'drying oil' (oleum desiccativum) of commerce. The efficacy of the process, according to Liebig, depends on the elimination of substances which impede the oxidation of the oil. The following formulæ are adopted for this purpose:—

1. Linseed oil, 1 gall.; powdered litharge, $\frac{3}{4}$ lb.; simmer, with frequent stirring, until a pellicle begins to form; remove the scum, and when it has become cold and has settled decant the clear portion. Dark coloured; used by house-painters.

2. Linseed oil and water, of each, 1 quart; white vitriol, in powder, 2 oz.; boil to dryness. Paler than the last.

3. Pale linseed or nut oil, 1 pint; dry sulphate of lead, in fine powder, mix, agitate frequently for 10 days in the bottle in the sun or a warm place, and decant the clear portion. Very pale.

4. Linseed oil, 3 galls.; calcined vitriol, 3 zinc', in fine powder, 7 lbs.; put in a clean copper boiler, heat the whole to 235° Fahr., and keep it at that temperature, with constant stirring, for at least one hour; then allow it to cool, in 24 hours decant the clear portion, and in 3 or 4 weeks more rack it for use. Used for varnishes.

5. (Liebig.) Sugar of lead, 1 lb., is dissolved in rain water, $\frac{1}{2}$ gall.; litharge, in fine powder, 1 lb., is then added, and the mixture is gently simmered until only a whitish sediment remains; levigated litharge, 1 lb., is next diffused through linseed oil, 2½ galls., and the mixture is gradually added to the lead solution, previously diluted with an equal bulk of water; the whole is now stirred together for some hours, with heat, and is, lastly, left to clear itself by exposure in a warm place. The lead solution which subsides from the oil may be used again for the same purpose, by dissolving in it another lb. of litharge, as before.

6. (Wilks.) Into linseed oil, 236 galls., pour oil of vitriol, 6 or 7 lbs., and stir the two together for 3 hours; then add a mixture of fuller's earth, 6 lbs., and hot lime, 14 lbs., and again stir for 3 hours; next put the whole into a copper, with an equal quantity of water, and boil for about 3 hours; lastly, withdraw the fire, and when the whole is cold, draw off the water, run the oil into any suitable vessel, and let it stand for a few weeks before using it. *Patent.*

7. ('Allg. Polytech. Zeitung.') Binoxide of manganese (in coarse powder, but not dusty), 1 part; nut or linseed oil, 10 parts; mix, and keep the whole gently heated and frequently stirred for 24 to 36 hours, or until the oil begins to harden. Recommended for 'drying oil' and for other purposes.

the oils 'bright' after boiling or heating them with the lead solutions; the best way, on the small scale, is either to filter them through coarse woollen filtering paper, or to expose the bottle for some time to the sun or in a warm place. On the large scale, the finer oils of this kind are often filtered through Canton-flannel bags. The litharge and sulphate of lead used in the above processes may be again rendered available for the same purpose, by washing them in hot water, to remove adhering mucilage.

OILS (Emphyreumatic). *Syn.* OLEA EMPHYREUMATICA, L. The 'emphyreumatic oils' of the old pharmaceutical writers were oily fluids obtained by the dry distillation of various substances, animal, vegetable, and mineral. But few of them are in use at the present day, though formulæ are given for them in some of the foreign pharmacopœias. Two or three have useful applications in the arts, and are more necessary that we should briefly describe. When the ingredients are of a liquid or pasty nature, or when heavy, they are usually mixed with sand, or other inert substance, and thus exposed to the action of the fire. The receiver must also be provided with a tube to carry off the non-condensable gases liberated at the time of the distillation. The products of the first distillation are generally purified by rectification, and are also mixed with water. In general, they are to be preserved from the light and air.

The following are the principal substances belonging to this class:—

Oil of Aloes. *Syn.* ALOETIC OIL; OLEUM ALOETICUM, L. 1. From Socotrine or hepatic aloes distilled along with sand.

2. (Batavian—Cadet de Gassicourt.) Olive oil, 1 lb.; hepatic aloes and myrrh, of each, in powder, 2 oz.; oilbanum, $\frac{1}{2}$ oz.; distil in a sand bath, from a stoneware retort. Used as an external vermifuge for children; a portion is rubbed 2 or 3 times a day over the umbilical regions.

Oil of Amber. *Syn.* OLEUM SUCCINI, L. From coarse pieces of amber, distilled in an iron retort, either alone or reduced to powder and mixed with sand. The oil is separated from the fetid liquor and succinic acid which passes over, and rectified along with about 6 times its volume of water, by a gentle heat. It then forms 'RECTIFIED OIL OF AMBER' (OLEUM SUCCINI—Ph. L. 1836, O. S. RECTIFICATUM—Ph. D. 1826, O. S. PURISSIMUM—Ph. E. 1841). *Prod.* 20 $\frac{1}{2}$.

Prop., &c. It has a pale yellow colour, a strong, ungrateful odour, and a hot, acrid taste; heat and air blacken and thicken it; it boils at 186° Fahr. Sp. gr. 758 at 75°

and convulsive affections. Externally, as a friction, either alone or combined with laudanum or sweet oil, in rheumatism, tic douloureux, whooping-cough, &c. See MUSK (Factitious).

Oil, Animal. 1. (Emphyreumatic or Fetid; OIL OF HARTSHORN, DIPPEL'S O.; OLEUM ANIMALE EMPHYREUMATICUM, O. CORNU CERVI, O. DIPPELLII, L.) Chiefly obtained as a secondary product in the manufacture of bone-black. Fetid and dark coloured. Used chiefly to make lampblack.

2. (Ethereal; RECTIFIED OIL OF HARTSHORN; OLEUM ANIMALE ETHERIUM, O. CORNU CERVI RECTIFICATUM, LOCO OLEI ANIMALIS DIPPELLII, L.)—*a.* A finer kind of animal oil, made by slowly distilling oil of hartshorn, and collecting only the first portion that comes over. Pale and limpid. Exposure to light discolours it.

b. (Ph. Bor.) Fetid animal oil distilled in a sand bath, and the product rectified with four times its volume of water. White, limpid, fragrant. Light discolours it.

Prop. The refined product is said to be antispasmodic, anodyne, and diaphoretic.—*Dose.* 5 to 80 drops, in water; in large doses, it acts as an irritant poison.

Oil of Birch. *Syn.* OLEUM BETULÆ, L. From the inner bark of the birch, by heating it in an earthen pot with a hole in the bottom, to allow the oil to flow through into another jar sunk in the ground and luted to it. Thick, balsamic, fragrant. Used chiefly to dress Russia leather.

Oil of Box-wood. *Syn.* OLEUM BUXI, O. B. EMPHYREUMATICUM (Ph. L. 1746), L. From box-wood sawdust. Reputed resolvent; anodyne, antispasmodic, and diaphoretic.—*Dose.* 5 to 20 $\frac{1}{2}$ drs; in convulsions, epilepsy, gonorrhœa, &c. Externally, in toothache, &c.

Oil of Bricks. *Syn.* OLEUM LATERRITUM (Ph. L. 1746), L. From olive oil, mixed with brickdust, and distilled; or, from hot bricks steeped in olive oil, then broken to pieces, and distilled.

Oil of Bricks (Factitious). *Syn.* OLEUM LATERRITUM FACTITIUM, L. From linseed oil, 1 lb.; oil of turpentine, $\frac{1}{2}$ lb.; oil of bones or of hartshorn and Barbadoes tar, of each, 1 oz.; simply stirred well together. This is generally substituted for the preceding in the shops.

Oil of Cade. *Syn.* OLEUM CADINUM, L.; HUILE DE CADE, Fr. From the *Juniperus oxycedrus* or Languedoc juniper. Used as oil of tar, which is commonly sold for it.

Oil of Coal. *Syn.* COAL OIL. From the gas-works. See NAPHTHA.

Oil of Guaiacum. *Syn.* OLEUM GUAIACI, O. G. EMPHYREUMATICUM, L. From guaiacum shavings or raspings. Reputed balsamic, pectoral, and resolvent.

Oil of Hartshorn. Bone oil and rectified bone oil are commonly sold for it, but are inferior to it. See ANIMAL OIL (*above*).

Oil, Paper. *Syn.* EAG OIL, PYROTHONIDÆ

OLEUM CHARTÆ, L. On the small scale, by burning paper on a cold tin plate, and collecting the oil; on the large scale, by the destructive distillation of paper or linen rags. In baldness, toothache, ear-ache, &c.

Oil, Par'afin. See **MINERAL OILS.**

Oil, Petro'leum. See **MINERAL OILS, PETROLEUM.**

Oil, Rag. See **PAPER OIL (above).**

Oil, Rock. See **NAPHTHA, MINERAL OILS, PETROLEUM.**

Oil, Shale. See **MINERAL OILS.**

Oil of Soot. *Syn.* **OLEUM FULIGINIS (Ph. L. 1746), L.** From wood-*soot*. Fetid; reputed antispasmodic and nervine.

Oil of Tar. *Syn.* **SPIRIT OF T.; OLEUM PITCH, O. P. RUBRUM, O. TÆDÆ, O. PICIS LIQUIDÆ, L.** By simple distillation from wood-tar. Reddish and strong scented. By one or more rectifications it becomes colourless and limpid. It soon gets thick. *Used* in ringworm and several other skin diseases, made into an ointment with lard. It is poisonous if swallowed in large doses.

Oil of Tobac'co (Empyreumatic). *Syn.* **OLEUM TABACI EMPYREUMATICUM (Ph. U. S.), L.** From tobacco, in coarse powder, gradually heated in a green-glass retort to dull redness, and kept at that temperature as long as any oil passes over; the oily portion is then separated from the water in the receiver, and kept for use. Highly narcotic and poisonous.

Oil of Wax. *Syn.* **OLEUM CEREÆ, L.** From bees' wax and sand distilled together; the product is rectified once or oftener. Reputed diuretic.—*Dose.* 3 to 6 drops.

OILS (Fixed). *Syn.* **FAT OILS, UNCTUOUS O.; OLEA FIXA, O. EXPRESSA, L.; HUILES GRASSES, Fr.** The fixed oils are compounds of carbon, hydrogen, and oxygen (ox'ym-dro-carbons), obtained from the organic kingdom, and characterised by their insipidity, unctuousity, insolubility in water, and being lighter than that fluid. Olive oil, which is obtained from the vegetable kingdom, and spermaceti oil, which is obtained from the animal kingdom, may be taken as types of the rest.

The fixed oils are chiefly found in the fruit and seeds of plants, and in thin membranous cells, forming what is called the adipose tissue, in the bodies of animals. According to their consistence, they may be classed into 'OILS,' 'BUTTERS,' and 'TALLOW'S.'

Prop., &c. Among the best-known properties of the fixed oils are—the permanent stain they give to paper, which they render translucent; their non-volatility at the ordinary temperature of the atmosphere, or at that of boiling water, or, indeed, at any temperature insufficient for their decomposition; their constantly floating on the surface of water when added to it; and, lastly, their inability to mix with that fluid. Some of them, as palm oil and cocoa-nut oil, are solid at ordinary temperatures; but the majority are fluid, unless they have been considerably cooled, when they

separate into two portions—the one solid, consisting chiefly of stearin, or some analogous substance, and the other liquid, consisting chiefly of olein or elain. Nearly all of them, when exposed to the air, absorb oxygen rapidly, and either gradually harden or become rancid and nauseous. From the first are selected the 'drying oils' used by painters; the last are used as food, in cookery, and for machinery, lamps, &c. The whole of these oils, when heated to their boiling-points (500° to 600° Fahr.), suffer decomposition, yielding various hydrocarbons; and when suddenly exposed to a red heat, they furnish a gaseous product (oil-gas), which was formerly employed for illumination. It is owing to this property of oil and liquid fats that candles and lamps give their light. The wick is a gas-producing apparatus in miniature. With the caustic alkalis and water, the fixed oils unite to form soap. When some of these oils are absorbed by porous bodies, and thus expose a vastly increased surface to the air, they absorb oxygen with such rapidity as to generate a considerable degree of heat. Paper, tow, cotton, wool, straw, shavings, &c., slightly embed with oil, and left in a heap, freely exposed to the air or sun, often spontaneously inflame. In this way many extensive fires have been kindled. The above is more particularly the case with linseed, rape, nut, and olive oil. These oils, made into a paste with manganese, become hot, and ultimately inflame spontaneously.

The specific gravities of the fixed oils are between .865 and .970, wax being 1.000.

Prep. The fixed oils, except where otherwise directed, are obtained from the bruised or ground fruit or seed, by means of pressure, in screw or hydraulic presses, and are then either allowed to clarify themselves by subsidence or are filtered. Both methods are frequently applied to the same oil. In some cases the impurities are removed by ebullition with water, and subsequent separation of the pure oil. Heat is frequently employed to increase the liquidity of the oil, and thus lessen the difficulty of its expulsion from the mass. With this object the bruised mass, placed in bags, is commonly exposed to the heat of steam, and then pressed between heated plates of metal. This is always necessary with the 'butyraceous oils.'

Another method is by boiling the bruised seed in water, and skimming off the oil as it rises to the surface. This is the plan adopted for castor oil in the West Indies.

In a few cases, for medicinal purposes, the bruised mass is mixed with $\frac{1}{2}$ its weight, or an equal weight, of alcohol or ether, and after 24 hours' digestion the whole is submitted to pressure, and the alcohol or ether removed by distillation at a gentle heat. The first menstruum is commonly employed for croton oil on the Continent; the second, for that of ergot of rye.

TABLE giving the reactions of various OILS with SULPHURIC ACID and with a saturated solution of BICHROMATE OF POTASSA in sulphuric acid. Re-arranged from M. PENOT's table, with additions, by Mr. COOLEY.

* * * The result indicated is obtained in each case by the action of one drop of the REAGENT on twenty drops of OIL.

NAME OF OIL.	REAGENTS.		
	Sulphuric Acid.		Saturated Solution of Bichromate of Potassa in Sulphuric Acid.
	Not stirred.	Stirred.	Stirred.
Almond oil . . .	Greenfinch yellow, with orange spots	Dirty green	Yellowish, small lumps.
Castor oil	Yellow, with slight spots	Little reaction	Slightly green.
Cod-liver oil (<i>fine sample of pale oil</i>)	Deep purple in the centre, whilst violet or purple clouds or streaks spread out towards the circumference, the colour of which remains unaltered for some minutes after the central portion has turned nearly black	Deep purple, passing into purple brown, reddish brown, and gradually deepening to an intense brown, approaching black	Reddish-brown clots, changing to a clear bright green.
Hemp-seed oil . . .	Small brown lumps or clots on a yellow ground	Greenish brown	Small yellow lumps or clots on a green ground.
Linseed oil (<i>from the Upper Rhine</i>)	Dark reddish brown	Brown small lumps on a gray ground	Brown small lumps on an almost colourless ground.
„ (<i>from Paris</i>)	Reddish brown, less dark coloured	Brown clots on a green ground	Brown small lumps on a green ground.
„ (<i>English</i>) .	Chestnut brown	Brown clots on a greenish-gray ground	Brown lumps on a greenish-gray ground.
Liver-train oil . . .	Dark red	Dark red	Dark red.
Madin-sativa oil . . .	Slightly reddish brown underneath a thin grayish film	Olive green	Light brown small lumps on an olive-coloured ground.
Black-mustard oil . . .	Bluish green	Olive green	Olive brown.
Neat's-foot oil . . .	Yellow slight spots	Dirty brown	Brown spots on a brownish ground.
Nat oil (<i>recent</i>) . . .	Yellowish brown	Clotted, dark brown	Small brown lumps or clots.
„ (<i>one year old</i>) . . .	Yellow	Dirty brown, less dark coloured	Small brown lumps.
„ (<i>still older</i>) . . .	Orange yellow	Dirty brown	Small brownish lumps.
Olein, oleic acid, lard, or tallow oil . . .	Reddish spots, with reddish circles	Reddish brown	Bright chestnut colour.
Olive oil . . .	Yellow	Dirty brown	Olive brown.
„ (<i>another sample from fermented olives</i>) . . .	Orange yellow	Brownish gray	Brown.
Poppy oil (<i>recent cold drawn</i>) . . .	Yellow spots	Brownish gray	Brown.
„ (<i>recent, expressed with slight heat</i>) . . .	Greenish-yellow spots	Olive brown, turning more on the green	Small yellow lumps on a greenish-gray ground.
„ (<i>one year old, expressed with heat</i>) . . .	Greenish spots	Olive green	Small yellow lumps on a green ground.
Rape or colza oil (<i>trade</i>) . . .	Yellowish-brown streaks surrounded by a bluish-green ring	Brownish, turning on the olive green	Yellow small lumps on a green ground.
„ (<i>recent</i>) . . .	Green	Bluish green	Yellow small lumps on a green ground.
„ (<i>one year old</i>) . . .	Green	Bluish green	Yellow lumps on a brighter green ground.
„ (<i>one year old, rough hot-pressed</i>) . . .	Green	Olive green	Small yellow lumps, more numerous, on an olive-green ground.
Whale-train oil . . .	Small reddish lumps on a brownish ground	Resembles wine lees	Small, bright, chestnut-coloured lumps on a brown ground.

become cold, is filtered through Canton flannel, and put into canisters. The commoner kinds are prepared by gently heating the crushed seeds, and pressing them whilst hot. Another method, sometimes adopted, is to put the crushed seed into loose bags, to boil these in water, and to skim off the floating oil.

Prop. It is the most viscid of all the fixed oils; when pure, it mixes in all proportions with alcohol and ether, and also dissolves, to a certain extent, in rectified spirit, but a portion of the oil separates on standing. Camphor and benzoic acid increase its solubility in spirit. By long exposure to the air, it becomes rancid, thick, and is ultimately transformed into a transparent yellow mass; light hastens these changes. Exposed to cold, a solid, white, crystalline fat separates from the liquid portion, and when cooled to 0° it congeals into a yellow transparent mass, which does not again liquefy until the temperature rises to about 18° Fahr. Sp. gr. .9611 to .9612, at 60°; .9690, at 55° (Saussure); .9575, at 77° (Saussure). *Prod.* 38 to 40% (62½—Ure).

Pur. Castor oil is sometimes adulterated with rape oil or with lard oil, a fraud which may be detected by its diminished density; and, when the added oil exceeds 33%, by its insolubility in its own weight of alcohol of .820. In many cases croton oil is added to increase the purgative quality of the mixture. A compound of this kind is vended in gelatine capsules under the name of 'CONCENTRATED CASTOR OIL,' the use of which is fraught with danger. "I have heard of several cases in which very violent and dangerous effects were produced by these capsules." (Pereira.) The best is imported from the East Indies in tin canisters. The oil obtained from the seeds of *Ricinus viridis* (Willd.), or lamp-oil seeds, is often mixed with or sold for castor oil.

Uses, &c. Castor oil is an exceedingly useful mild purgative, particularly when abdominal irritation should be avoided, as in inflammations of the stomach and bowels, pregnancy, surgical operations, &c.—*Dose.* 2 fl. drs. to 1 fl. oz.

Oil, Co'coa-nut. *Syn.* COCOA-NUT BUTTER; OLEUM COCOIS NUCIFERÆ, L. By expression from the kerpels of the cocoa nut, or fruit of the *Cocos nucifera*.

Oil, Cod-liver. *Syn.* MORRHUÆ OLEUM (B. P.), COD-FISH OIL; OLEUM JECORIS ASELLI, O. GADI, O. G. MORRHUÆ, OLEUM MORRHUÆ (Ph. L.), L. "The oil extracted from the fresh liver of the *Gadus morrhua* by a steam heat or water-bath not exceeding 180° Fahr. Yellow." "The oil prepared from the liver of *Gadus morrhua*, Linn." (Ph. L.)

The common cod-liver oil of commerce drains from the livers of the cod-fish when freely exposed to the sun, and just beginning to putrefy. It is dark coloured, strong, and nauseous, and is now chiefly employed in this country by the

curriers, for dressing leather. It is the 'OLEUM JECORIS ASELLI FUSCUM' of Continental writers. Formerly, the less fetid varieties of this crude oil, after the impurities were removed, either by subsidence or filtration, constituted the only cod-liver oil used in medicine. As its employment as a remedy increased, its revolting flavour, and its great tendency to permanently disorder the stomach and bowels, was found, however, to be a serious obstacle to its general use. It was observed that the oil, as it exists in the liver of the cod, is bland, and nearly colourless, and has only a slight fishy, but not a disagreeable flavour. The attention of persons interested was therefore immediately directed to the subject, and improved methods of obtaining the oil were suggested, and ere long adopted on the large scale.

The methods of preparing cod-liver oil are noticed in another part of this work, but we think it advisable to add to these a description of the plan adopted by Messrs. Charles Fox and Co., of Newfoundland, Scarborough, and London, the well-known manufacturers and importers of cod-liver oil:—

"The Newfoundland fisheries are entirely carried on in small boats, principally by the hand-line system, and quite close to the shore. The boats go out early in the morning, and return about four o'clock in the afternoon. The fish, on landing, are handed over to a 'fish-room keeper,' whose duty it is to split and open the fish, and to deposit the livers in small tubs, holding 17 or 18 gallons each. These tubs are soon afterwards collected from the different 'fish-rooms,' and conveyed to the manufactory. The livers are here thrown into tubs filled with clean cold water, and, after being well washed and jerked over, are placed on galvanized iron-wire sieves to drain. They are next put into covered steam-jacket-pans, and submitted to a gentle heat for about three quarters of an hour, after which the steam is turned off, cold air again admitted, and the whole allowed to repose for a short time, during which the livers subside, and the oil separates and floats on the top. The oil is then skimmed off into tin vessels, and passed through flannel strainers into tubs, where it is left to subside for about 24 hours. From these the purer upper portion of oil is run into a very deep, galvanized-iron cistern, and again left to clarify itself by defecation for a few days. It is now further refined, by carefully passing it through clean and very stout mole-skin filters, under pressure. The transparent filtered oil is received in a clean, galvanized-iron cistern, containing a pump, from which the casks are filled for exportation. The latter, before being filled, are carefully seasoned and cleaned, to prevent their imparting either flavour or colour to the pure oil."

The superiority of the oil prepared as above consists essentially in every part of the process of extraction being performed whilst the livers

are fresh, and in no chemical means being adopted to give the oil a factitious appearance. Its natural pale colour is thus preserved from contamination, and its medicinal virtues maintained intact.

Much of the light-brown oil of commerce is obtained from *Gadus callarius* (the dorset), *G. carbonarius* (the coal-fish), and *G. pollachius* (the pollack).

Pur., &c. "The finest oil," remarks Dr. Pereira, "is that which is most devoid of colour, odour, and flavour. The oil, as contained in the cells of the fresh liver, is nearly colourless, and the brownish colour possessed by ordinary cod-liver oil is due to colouring matters derived from the composition (putrefying) hepatic tissues and fluids, or from the action of the air on the oil (age). Chemical analysis lends no support to the opinion, at one time entertained, that the brown oil was superior, as a therapeutical agent, to the pale oil. Chemistry has not discovered any substance in the brown oil that would confer on it superior activity as a medicine. On the other hand, the disgusting odour and flavour and nauseating qualities of the brown oil preclude its repeated use. Moreover, there is reason to suspect that, if patients could conquer their aversion to it, its free use, like that of other rancid and empyreumatic fats, would disturb the digestive functions, and be attended with injurious effects." ('Elem. Mat. Med., &c., 3rd edit., iii, 2239.)

Among the tests of purity, that generally relied on is known as the 'sulphuric-acid test.' See OILS. (Fixed) *Purity*.

DORSET OIL and other FISH OILS, sold as 'LIGHT-BROWN COD-LIVER OIL,' exhibit with this test much lighter reactions, which closely resemble those of LIVER-TREIN and WHALE-TREIN OIL.

To detect the presence of combined iodine, upon which, by some, the therapeutic value of cod-liver oil is thought to depend, the sample is saponified by trituration with a little caustic potassa and hot water, the resulting soap cautiously incinerated, the ashes digested with water, and the whole thrown on a filter. The usual tests for iodine may be then applied to the filtered liquid.

The presence of iodine artificially added is best detected by agitating the oil with a little rectified spirit, and then testing this last for iodine. Or, a little solution of starch and a few drops of sulphuric or nitric acid may be at once added to the oil, when a blue colour will be developed if iodine, or an iodide, has been mixed with the sample.

The sp. gr. of the pale oil is .9230 to .9238; of the light-brown oil, .9240 to .9245; of the dark-brown oil, .9290 to .9315. The density is, however, apt to vary a little with the quantity of moisture present.

Uses, &c. Cod-liver oil is a most valuable medicine in a great variety of diseases, more especially in glandular indurations and en-

largements, scrofula, phthisis, rheumatism, gout, certain cutaneous diseases, amenorrhœa, chlorosis, caries, rickets, &c. To be of service, however, its use must be continued for several weeks, and the oil must be recent.—*Dose*. 1 to 2 table-spoonfuls, 3 or 4 times daily, or oftener.

Oil, Col'za. From the seeds of *Brassica campestris*, var. *oleifera*, or *colza de printemps*, a variety of *Brassica campestris* (Linn.). It may be regarded as a superior sort of rape oil. Burns well in lamps, especially after being refined. Sp. gr. .9136. *Prod.* 39%. The term 'colza oil' is commonly applied to ordinary refined rape.

Oil, Cot'ton-seed. *Syn.* OLEUM GOSSYPII SEMINUM, L. From the seed of *Gossypium Barbadosense*. Drying.

Oil, Cro'ton. *Syn.* CROTONIS OLEUM (B. P.), OLEUM CROTONIS (Ph. E.), O. TIGLII (Ph. L.), L. From the shelled seeds of *Croton tiglium* or Mollucca grains. Imported chiefly from the East Indies. It is one of the most powerful cathartics known, and acts when either swallowed or merely placed in the mouth. *Externally*, it is rubefacient and counter-irritant, often causing a crop of painful pustules, like tartar emetic.—*Dose*. 1 to 2 drops, on sugar; in apoplexy, &c. It is poisonous in larger doses. Sp. gr. .947 to .953. *Prod.* Unshelled seeds, 22% to 20%; shelled do., 32% to 35%.

Pure croton oil is soluble in an equal volume of alcohol of '796, but in 2 or 3 days about 96% of the oil separates. In France the marc is exhausted with alcohol, and the oil thus obtained is added to that previously obtained from the same seeds by expression. The East Indian oil (OLEUM CROTONIS EXOTICUM) is usually of a pale yellow; that pressed in England (O. CROTONIS ANGLICANTUM) is much darker.

Oil of Cu'mber. *Syn.* OLEUM CUCURBITÆ, L. From the seeds of *Curcubita pepo*, or squash, and the *C. melopepo* or pumpkin. *Pale*, used in lamps; and, sometimes, as a soothing application to piles. Sp. gr. .9231. *Prod.* 24%.

Oil of Eggs. *Syn.* OLEUM OVI, O. O. VITELLI, O. OVORUM, L. From the yolks of eggs, gently heated until they coagulate and the moisture has evaporated, and then pressed or broken up, digested in boiling rectified spirit, the tincture filtered whilst hot, and the spirit distilled off. Bland; emollient. The common plan is to fry the yolks hard; but the oil is then darker coloured and stronger. The P. Cod. orders them to be exhausted with ether, by displacement. Formerly commonly used to "kill" quicksilver, and still held in great esteem in some parts of England for sore nipples and excoriations. *Prod.* 10 to 12 eggs yield 1 oz. See MIXED OILS.

Oil of Gar'den Cress. *Syn.* OLEUM LEPIDII SATIVI, L. From the seed. Drying. Sp. gr. .9240. *Prod.* 54%.

Oil of Garden Spurge. *Syn.* OLEUM LA-

THYRIS, *O. EUPHORBIA* L., L. From the seeds of *Euphorbia lathyris* or garden spurge. Cathartic. Dose, 3 to 8 drops. Sp. gr. '9281. Prod. 80½ to 41½. Croton oil mixed with 6 times its weight of nut or rape oil is usually sold for it.

Oil of Gingelly. Syn. OIL OF SESAMUM, BENNE OIL, TEL O., TEL O.; OLEUM SESAMI, L. From the seeds of *Sesamum orientale* (Willd.); or gingelly. Pale; bland. Used in salads, paints, &c.; also to adulterate oil of almonds. Prod. 46½.

Oil, Gourd. See CUCUMBER OIL.

Oil of Ground Nuts. From the nuts of *Arachis hypogaea*. Glutinous.

Oil of Hemp. Syn. OLEUM CANNABIS, L. From the seed of *Cannabis sativa* (Linn.), or common hemp. Mawkish. Sometimes used for frying, but chiefly for paints, soaps, &c. Freely soluble in boiling alcohol; does not thicken until cooled to 5° Fahr. Sp. gr. '9276. Prod. 18½ to 24½.

Oil of Jatrophæ. Syn. OIL OF WILD CASTOR SEEDS; OLEUM JATROPHÆ, L. From the seeds of *Jatropha purgans*. Somewhat resembles CROTON OIL. Used for lamps in the East Indies.

Oil, Kun'dah. Syn. TALLIOONAH O.; OLEUM TOLUOCOUNÆ, L. From the fruit of *Carapa Touloucouma*. Rancid, nauseous, vermifuge, rubefacient, emetic, and purgative. Chiefly used in lamps.

Oil, Lard. Syn. TALLOW O., CRUDE OLEIN, C. OLEIC ACID; OLEUM ADIPIS, L. By separating the olein of lard from the stearin by means of boiling alcohol. Only applicable where spirit is cheap. The product is, however, excellent. The crude oleic acid, or lard oil of commerce, is chiefly obtained as a secondary product in the manufacture of stearin. It is purified by agitation with sulphuric acid, and subsequently by steaming it, or washing it with hot water. Burns well in lamps, if the Wick-tube is kept cool. Sp. gr. '9003.

Oil, Linseed. Syn. OLEUM LINI (B. P., Ph. L. E. & D.), L. L. (COLD-DRAWN LINSEED OIL; OLEUM LINI SINE IGNE.) From the seed of *Linum usitatissimum* (Linn.), or common flax, bruised or crushed, and then ground and expressed without heat. Pale, insipid, viscous; does not keep so well as the next. Prod. 17½ to 20½.

2. As the last, but employing a steam heat of about 200° Fahr. Amber coloured; less viscous than the last; congeals at 2°; soluble in 5 parts of boiling and 40 parts of cold alcohol. Both are drying and cathartic.—Dose. 1 to 2 oz.; in piles, &c. Chiefly used in paints, varnishes, &c. Sp. gr. '9347. Prod. 22½ to 27½.

3. (BOILED LINSEED OIL.) See OILS (Drying).

Oil of Mace (Expressed). See OIL OF NUTMEG (Expressed).

Oil of Mustard. Syn. OLEUM SINAPIS, L. 1. (OIL OF WHITE MUSTARD.) From *Sinapis*

alba, or white mustard, but chiefly from *Sinapis arvensis*, *S. chinensis*, *S. dichotoma*, *S. glauca*, *S. ramosa*, and *S. tori*. Sweet. Used for the table. Sp. gr. '9142 ('2160—Ure). Prod. 36½.

2. (OIL OF BLACK MUSTARD; OLEUM SINAPIS NIGRI, L.) From the 'bull's' of black-mustard seed. Viscid, stimulant. Used in rheumatism. Sp. gr. '9168 to '9170. See OILS (Volatile).

3. (OIL OF WHITE MUSTARD; OLEUM RAPHANI, L.) From the seed of *Raphanus Raphanistrum* (Linn.), or jointed charlock or wild mustard. Prod. 30½.

Oil, Neat's-Foot. Syn. NERVE OIL, TROTTER O.; OLEUM BUBULUM, O. NERVINUM, AXUNGIA PEDUM TAURI, L. From neat's-fee and tripe, by boiling them in water, and skimming off the oil. Does not thicken by age. Used to soften leather, to clean fire-arms, and for other purposes.

Oil, Nut. Syn. HAZEL-NUT O.; OLEUM NUCCIS, O. CORYLI, L. From the kernels of *Corylus Avellana* (Linn.), or hazel-nut tree. Pale, mild tasted, drying; superior to linseed oil for paints and varnishes. It is commonly sold for oil of almonds and oil of ben, and is extensively employed to adulterate both. Walnut oil is also frequently sold for nut oil. Sp. gr. '9260. Prod. 60½ (Ure).

Oil of Nutmeg (Expressed). Syn. EXPRESSED OIL OF MACE, BUTTER OF M.; OLEUM MYRISTICÆ (CONCRETUM) (Ph. L.), MYRISTICÆ ADEPS (Ph. E.), M. BUTYRUM, O. MYRISTICÆ EXPRESSUM (B. P.), O. MOSCHATE, O. NUCCISTE, L. "The concrete oil expressed from the seed of *Myristica officinalis*," Linn. (Ph. L.), or common nutmeg. The nutmegs are beaten to a paste, enclosed in a bag, exposed to the vapour of hot water, and then pressed between heated iron plates. Orange coloured, fragrant, spicy; butyraceous, or solid. It is a mixture of the fixed and volatile oils of the nutmeg. When discoloured and hardened by age, it is called 'BANDA SOAP' (OL. MACIS IN MASSIS). When pure, it is soluble in 4 parts of boiling alcohol and in 2 parts of ether. It has been used in rheumatism and palsy, but is now chiefly employed for its odour and aromatic qualities. From the East Indies. Prod. 17½ to 20½.

Oil, Olive. Syn. SALAD OIL, SWEET O.; OLIVÆ OLEUM (B. P.), OLEUM OLIVARUM, O. OLIVÆ (Ph. L. E. & D.), L. The "oil expressed from the fruit" of "*Olea europæa*, Linn." (Ph. L.), or common olive. Five different methods are employed to obtain the oil from the fruit:—

1. (VIRGIN OIL; O. O. VIRGINIUM, L.); HUILE VIERGE, Fr.) From olives, carefully garbled, either spontaneously or only by slight pressure, in the cold. That yielded by the pericarp of the fruit is the finest.

2. (Ordinary 'FINE OIL.') This is obtained by either pressing the olives, previously crushed and mixed with boiling water, or by pressing,

at a gentle heat, the olives from which the virgin oil has been obtained. The above processes furnish the finer salad oils of commerce. The cake which is left is called 'GRIGNON.'

3. (SECOND QUALITY.) By allowing the bruised fruit to ferment before pressing it. Yellow; darker than the preceding; but mild and sweet tasted. Much used for the table.

4. ('GORGON.') By fermenting and boiling the pressed cake or marc in water, and skimming off the oil. Inferior.

5. (OIL OF THE INFERNAL REGIONS; OLEUM OMPHACINUM) is a very inferior quality of oil, which is skimmed off the surface of the water in the reservoirs into which the waste water which has been used in the above operations is received, and allowed to settle. The last two are chiefly used for lamps, and in soap-making, &c.

Of the principal varieties of olive oil known in commerce, and distinguished by the place of their production, 'PROVENCE OIL' is the most esteemed; 'FLORENCE OIL' and 'LUCCA OIL' are also of very fine quality; 'GENOA OIL' comes next, and then 'GALLIPOLI OIL,' which forms the mass of what is used in England; 'SICILY OIL,' which has a slightly resinous flavour, is very inferior; and 'SPANISH OIL' is the worst imported.

Prop., &c. Olive oil is a nearly inodorous, pale greenish-yellow, unctuous fluid, with a purely oleaginous taste, peculiarly grateful to the palate of those who relish oil. It does not suffer active decomposition at a heat not exceeding 600° Fahr.; and when cooled to 36° it congeals into a granular solid mass. It is very slightly soluble in alcohol, but its solubility is increased by admixture with castor oil. It is soluble in 1½ part of ether. When pure, it has little tendency to become rancid. Sp. gr. .9170 to .9173; .9192, at 53½° (Saussure); .9176, at 59° (Heidenreich); and .9109, at 77° Fahr. (Saussure). *Prod.* 32½, of which 21½ is furnished by the pericarp, and the remainder, which is inferior, by the seed and woody matter of the fruit.

Pur. Olive oil, with the exception of that of almonds, being the most costly of the ordinary fixed oils of commerce, is, consequently, the one most subject to adulteration. Nut, poppy, rape, and lard oil, are those most commonly used for this purpose. Refined tallow olein, including that obtained from the 'knackers' yards' of Paris, is said to have been used in the same way. The addition of any other oil to olive oil renders it far less agreeable to the palate, and, by increasing its tendency to rancidity, much more likely to offend and derange the stomach and bowels of those who consume it. Parties who indulge themselves in the use of this luxury would, therefore, do well to ascertain that what they purchase is pure. When pure, and also fresh, olive oil is most wholesome as an article of food or as a condiment.

The detection of the sophistication of salad

oil is a matter of no great difficulty. The palate of the connoisseur will readily perceive the slightest variation in the quality of his favourite condiment. Other methods, however, of a more accurate and certain description, and of more general application, are adopted. Amongst these, in addition to those mentioned above, are the following:—

a. When pure olive oil is shaken in a phial, only half filled, the 'bead' or bubbles rapidly disappear; but if the sample has been mixed with poppy or other oil, the bubbles continue longer before they burst.

b. Olive oil congeals at 36° Fahr., and is completely solidified when a small bottle containing it is surrounded by ice, or a freezing mixture; but when mixed with poppy oil, it remains partly liquid, even when the latter forms only 1-4th of the mass; if more than 1-3rd of poppy oil is present, it does not solidify at all, unless cooled much below the freezing point of water.

c. (Ph. E.) When olive oil is "carefully mixed with 1½th part of its volume of a solution of 4 oz. of mercury in 8 fl. oz. 6 drs. of nitric acid (sp. gr. 1.500), it becomes in 3 or 4 hours like a firm fat, without any separation of liquid oil."

d. M. Pontet recommends the mercurial solution to be made by dissolving 6 parts of mercury in 7½ parts of nitric acid (sp. gr. 1.35), without heat; of this solution he adds 1 part to every 48 parts of the oil, and well shakes the mixture every 30 minutes, until it begins to solidify. This it does after about 7 hours in summer and 4 or 5 hours in winter, and when the oil is pure it will have formed, in 24 hours, a mass so hard that some little force must be employed to thrust a glass rod into it. The other edible oils do not furnish a hard mass with nitrate of mercury. The solidity of the mass is exactly in proportion to the quantity of foreign oil present. When the sophistication is equal to 1-8th of the whole, a distinct liquid layer separates; when the mixture contains ½ its volume of an inferior oil, one half only of the mixture becomes solid, and the other half continues liquid. A temperature of about 90° Fahr. is the best to cause the oil and coagulum to separate then perfectly from each other. When the oil has been adulterated with animal oil, the mixture solidifies in about five hours; but in this case the coagulum consists of the animal oil, whilst the olive oil floats on the surface, and may be decanted for further examination. This coagulum, on being heated, exhales the well-known odour of rancid fat or melted tallow.

Uses, &c. The dietetical uses of olive oil are well known. In Spain and Italy it is commonly employed as a substitute for butter. It is highly nutritious, but is digested with difficulty by some persons, and hence should be avoided by the dyspeptic. Like almond oil, it is occasionally employed as a laxative

and vermifuge, and is, perhaps, one of the mildest known. In pharmacy it is extensively employed in the preparation of cerates, liniments, ointments, and plasters.—*Dose*. For an adult, $\frac{1}{2}$ to 1 wine-glassful as a mild aperient; for an infant, $\frac{1}{2}$ to 1 teaspoonful, mixed up with an equal quantity of honey, syrup of roses, or syrup of violets. The white fibrous sediment which forms in the recently expressed oil is the 'AMURCA' of Pliny, and was formerly highly esteemed in medicine.

Oil, Olive, Droppings. *Syn.* SWEET-OIL D. The 'foots' or 'deposits,' and the 'drippings' of the casks, cisterns, and utensils. *Used* for machinery, making soap, &c.

Oil, Olive (Oxygenated). *Syn.* OLEUM OLIVÆ OXYGENATUM (Ph. Batav.). L. Olive oil, 16 oz., is placed in a receiver surrounded with ice or very cold water, and chlorine is slowly transmitted through it for several days, or until it becomes thick and viscid, after which it is well washed with warm water.

Oil, Palm. *Syn.* PALM BUTTER; OLEUM PALMÆ, L. From the fruit of *Elaeis Guineensis*, and *E. melanococca*, the Guinea oil palms. Orange or red coloured; butyrateous or solid; smells of violets; unchanged by alkalies; bleached by sunlight, age, exposure, chlorine, chromic acid, and oil of vitriol; melts at 117 $\frac{1}{2}$ ° Fahr. Sp. gr. '968. Demulcent. *Used* to colour and scent ointments, pommades, &c.; but chiefly to make soap and candles. From Africa.

Oil, Pi'ney. *Syn.* PINNEY TALLOW, P. DAMMAR, P. RESIN. From *Vateria Indica* (Linn.), or pænone tree. Resinous flavoured, fragrant; made into candles. Sp. gr. '926.

Oil, Pop'py. *Syn.* OLEUM PAPAVERIS, L.; OILITE, HUILE BLANCHE, Fr. From the seeds of *Papaver somniferum* (Linn.), or white poppy. Sweet; pale; dries and keeps well. *Used* for salads, paints, and soaps; also (extensively) to adulterate almond oil, for the inferior qualities of which it is frequently sold. It does not freeze until cooled to 0° Fahr. Sp. gr. '9243 to '9215. *Prod.* 48 $\frac{1}{2}$ to 54 $\frac{1}{2}$.

Oil, Rape. *Syn.* COLZA OIL, BROWN O.; OLEUM RAPÆ, L. From the seed of *Brassica Napus* (Linn.; cole or rape), and from *Brassica campestris* (Linn.; wild navew or rape). Glutinous; buttery at 25° Fahr. Dries slowly; makes soft soaps and good ointments, but, bad plasters; smokes much in burning, unless well refined. Sp. gr. '9135 to '9136. *Prod.* 32 $\frac{1}{2}$.

OIL, REFINED OR PALE RAPE (OLEUM RAPÆ REFINUM, OL. R. ALBUM) is prepared from crude rape oil, by agitating it with about 2 $\frac{1}{2}$ of oil of vitriol, previously diluted with about twice its weight of water, and, after 10 or 12 days' repose, decanting the clear oil, and filtering it through Canton flannel or felt. The quality is improved by washing it with hot water or steam, before filtration. *Used* for lamps, blacking, and machinery; also extensively employed to adulterate both almond and olive oil. It forms the common 'SWEET OIL'

of the oilmen and druggists. Sp. gr. '9136 to '9140.

Oil, Seal. *Syn.* OLEUM PHOCÆ, L. From the hood seal, and harp seal, and other species of *Phocidæ*. PALE SEAL OIL is that which drains from the blubber before putrefaction commences, and forms about 60 $\frac{1}{2}$ of the whole quantity of oil obtained. It is very clear, free from smell and, when recently prepared, not unpleasant in its taste. REFINED SEAL OIL is the last, washed and filtered. Ranks close after sperm oil. BROWN OR DARK SEAL OIL is that which subsequently drains from the putrid mass. It is very strong-scented and nauseous, and smokes in burning. Both are used for lamps and dressing leather. A full-grown seal yields 8 to 12 galls. of oil; a small one, 4 to 5 galls.

Oil of Ses'amum. *Syn.* OIL OF GINGELLY (above).

Oil, Shark-liver. The lightest of the fixed oils. Sp. gr. '865 to '867.

Oil, Skate. *Syn.* OLEUM RALE, L. From the livers of *Raia batis* (Linn.), or common skate, as cod-liver oil; also from *Raia rhinobatus*, or white skate, and *Raia clavata*, or thornback. Often sold and mixed with cod-liver oil.

Oil, Spermace'ti. *Syn.* SPERM OIL; OLEUM CETACI, L. From the 'head matter' of *Physeter macrocephalus*, or spermaceti whale; a species once common in all the principal seas, but now chiefly confined to the Southern Ocean. It is very limpid, smells little, and burns well; and has long been reputed the best oil for lamps and machinery, as it does not thicken by age or friction. It is frequently adulterated with refined seal oil. Sp. gr. '875.

Oil, Sun'flower. *Syn.* OLEUM HELIANTHI, L. From the seeds of *Helianthus annuus* and *H. perennis*. Clear, pale yellow, tasteless; thickens at 60° Fahr. *Used* for salads and lamps. Sp. gr. '9261. *Prod.* 15 $\frac{1}{2}$.

Oil, Teel. See GINGELLY OIL (above).

Oil, Tobac'co-seed. *Syn.* OLEUM TABACI (EXPRESSUM), L. From the seeds of *Nicotiana Tabacum* (Linn.), or true tobacco plant. Pale; dries well; equal to nut oil. Its production has recently been carried on with considerable success in some parts of Russia. Sp. gr. '9232.

Oil of Touloucou'na. See KUNDAR OIL (above).

Oil, Train. See WHALE OIL (below).

Oil, Wal'nut. *Syn.* OLEUM JUGLANDIS, O. NUCIS J., L. From the kernels of the nuts of *Juglans regia* (Linn.), or common walnut tree. Soon gets rank; dries well. *Used* in paints, and occasionally in plasters. When 'cold drawn' and washed, it is sometimes eaten with salad. Sp. gr. '9260 to '9262. *Prod.* 48 $\frac{1}{2}$ to 52 $\frac{1}{2}$.

Oil of Wax. *Syn.* BUTTER OF WAX; OLEUM CERÆ, L. From bees' wax, by quick distillation in a close vessel. Butyrateous. By

rectification along with quicklime it yields a liquid oil.

Oil, Whale. *Syn.* TRAIN OIL, WHALE-TRAIN O.; *OLEUM BALENE*, O. CETI, L. From the blubber of the *Balena mysticetus* (Linn.), or the common or Greenland whale, by heat. Coarse; stinking. SOUTHERN WHALE OIL is the best. *Used* for lamps, machinery, &c. *Sp. gr.* .9231. *Prod.* per fish, about 1½ ton for each foot of bone.

Oil of Wheat. *Syn.* *OLEUM TRITICI*, L. From bruised Colne wheat, with heat. In chilblains, ringworm, and several other skin diseases.

Oil of Wine-stones. *Syn.* GRAPE-STONE OIL; *OLEUM VITIS VINIFERE LAPIDUM*, L. From the seeds of grapes, separated from the marc. Pale yellow, bland, emollient. *Used* for salads and lamps. *Sp. gr.* .9202. *Prod.* 14½ to 18½.

* * The numbers given above, under 'products,' unless when otherwise stated, refer to the respective fruits, kernels, nuts, seeds, &c., deprived of their husks, pods, shells, and every other portion destitute of oil.

OILS (Medicated). *Syn.* *OLEA COCTA*, O. *INFUSA*, O. *MEDICATA*, L. These are prepared by infusion or decoction. The bruised ingredients are either simply digested in 2 to 4 times their weight of olive oil for some days, or they are gently boiled in it until they become dry and crisp, great care being taken that the heat towards the end of the process is not greater than that of boiling water. As soon as the process is complete, the oil is allowed to drain from the ingredients, which are then (if necessary) submitted to the action of the press. The product is commonly run through flannel or a hair sieve whilst still warm, after which it is allowed to repose for a week or ten days, when the clear portion is decanted from the dregs. The green or recent plants are usually employed for this purpose, but, in many cases, the dried plants, reduced to powder, and digested for 6 or 8 hours in the oil, at the heat of hot water, with frequent agitation, yield a much more valuable product. They are nearly all employed as external applications only.

* * The following are the most important preparations of this class:—

Oil of Adder's Tongue. *Syn.* *OLEUM OPHIOGROSSI*, L. From the herb, as OIL OF BELLADONNA. A popular vulnerary.

Oil of Belladonna. *Syn.* *OLEUM BELLADONNÆ* (P. Cod.), L. *Prep.* From the fresh leaves, bruised, 1 part; olive oil, 4 parts; digested together at a gentle heat until the moisture is evaporated; the oil is then strained off, with pressure, and filtered.

Oil of Cantharides. *Syn.* *OLEUM CANTHARIDIS*, O. *CANTHARIDIBUS*, L. *Prep.* (P. Cod. 1839.) From Spanish flies (powdered), 1 part; olive oil, 8 parts; as OIL OF BELLADONNA. Stimulant and rubefacient. *Used* as a dressing to indolent sores, blisters, &c.; and in dropsy,

rheumatism, gout, &c. **OIL OF THE OIL-BEETLE** (*Meloe proscarabæus*—Linn.) is prepared in a similar manner.

Oil of Capsicum. *Syn.* *OLEUM CAPSICI*, L. *Prep.* (Dr. Turnbull.) From powdered capsicum or Cayenne pepper, 4 oz., olive oil, 1 pint; digested together for 6 hours, with heat, and strained. Stimulant; rubefacient in colic, cholera, &c.

Oil of Cham'omile. *Syn.* *OLEUM ANTHEMIDIS*, O. *CHAMEMELI*, L. From the dried flowers (rubbed to pieces), 1 part, olive oil, 8 parts; digested together, with heat, for 6 hours. Stimulant, emollient, and vermifuge.

Oil of Col'ocynth. *Syn.* *OLEUM COLOCYNTHIDIS*, L. From the pulp, as OIL OF CHAMOMILE. Diuretic. In dropsy, neuralgia, rheumatism, worms, &c.

Oil of Elder-flowers. *Syn.* WHITE OIL OF ELDER; *OLEUM SAMBUCCI ALBUM*, O. *SAMBUCCINUM* (P. Cod.), L. *Prep.* From the flowers, as OIL OF CHAMOMILE. Emollient and discutive.

Oil of Elder-leaves. *Syn.* GREEN OIL, GREEN OIL OF ELDER, OIL OF SWALLOW; *OLEUM VIRIDE*, O. *SAMBUCCI VIRIDE*, L. *Prep.* 1. Green elder leaves, 1 lb.; olive oil, 1 quart; boil gently until the leaves are crisp, press out the oil, and again heat it till it turns green.

2. As before, but by maceration, at a heat under 212° Fahr. More odorous than the last.

3. Elder leaves, 1 cwt.; linseed oil, 3 cwt.; as No. 1.

Obs. The last form is the one usually employed on the large scale. It is generally coloured with verdigris, ½ lb. to the cwt., just before putting it into the casks, and whilst still warm; as, without great skill and a very large quantity of leaves, the deep-green colour so much admired by the ignorant cannot be given to it. The oil is got from the leaves by allowing them to drain in the pan or boiler (with a cock at the bottom), kept well heated. Emollient; in great repute among the vulgar as a liniment, in a variety of affections.

Oil of Fen'ugreek. *Syn.* *OLEUM FENUGRECI*, L. *Prep.* (P. Cod.) From the seeds, as OIL OF CANTHARIDES or of CHAMOMILE. Emollient and resolvent.

Oil of Foxglove. *Syn.* *OLEUM DIGITALIS*, L. *Prep.* (P. Cod.) From the fresh leaves, as OIL OF BELLADONNA. *Used* as an application to chronic ulcers and indurations, painful swellings, &c. As usually met with, it is nearly inert.

Oil of Garden Night'shade. *Syn.* *OLEUM SOLANI*, L. *Prep.* (P. Cod.) From the leaves, as OIL OF BELLADONNA. Anodyne and discutive.

Oil of Gar'lic. *Syn.* *OLEUM ALLII INFUSUM*, L. From garlic, as OIL OF BELLADONNA. *Used* as a liniment in deafness, diarrhoea, infantile convulsions, palsy, rheumatism, &c.

Oil, Green. *Syn.* OLEUM VIRIDI, L. From bay leaves, origanum, rue, sea wormwood, and elder leaves, of each, 2½ oz.; olive oil, 1 quart; as OIL OF ELDER. Detergent, stimulant, and resolvent. Green oil of elder is now usually sold for it.

Oil of Hemlock. *Syn.* OLEUM CONII, L. *Prep.* (P. Cod.) As OIL OF BELLADONNA. Anodyne and emollient; in painful ulcers, glandular tumours, &c.

Oil of Henbane. *Syn.* OLEUM HYOSCYAMI, L. *Prep.* (P. Cod.) As OIL OF BELLADONNA. Used as the last, in various painful local affections.

Oil of Ju'niper (by Infusion). *Syn.* OLEUM JUNIPERI INFUSUM, L. From the crushed berries, as OIL OF BELLADONNA. Diuretic and vulnerary; in frictions, &c.

Oil of Lilies. *Syn.* OLEUM LILIORUM, L. From whitelilies, 1 lb.; olive oil, 3 lbs.; as OIL OF BELLADONNA. Emollient; used to soften and ripen tumours, indurations, &c.

Oil of Melilot. *Syn.* OLEUM MELILOTI, L. As the last, avoiding much heat. Emollient and resolvent.

Oil of Mu'cilages. *Syn.* OLEUM MUCILAGINUM, O. CUM MUCILAGINIBUS, L. *Prep.* 1. (Ph. L. 1746.) Marshmallow root, ½ lb.; linseed and fenugreek seed, of each, bruised, 3 oz.; water, 1 quart; boil 1 hour, add of olive oil, 2 quarts, and boil until the water is consumed.

2. Fenugreek seeds, 8 oz.; linseed oil, 1 quart; infuse a week, and strain. Once a highly popular emollient application in various local affections.

Oil of Mu'dar. *Syn.* OLEUM MUDARIS, L. From mudar bark (in coarse powder), 1 dr.; warm olive oil, ½ pint; digest 24 hours and strain. Used as an application to cutaneous ulcers, the bites of venomous animals, &c., and as a friction in worms.

Oil of O'pium. *Syn.* ANODYNE OIL, OPIATED O.; OLEUM OPIATUM, L. *Prep.* From opium (in powder), 1 dr.; olive oil, 2½ fl. oz.; digest at a gentle heat, with frequent agitation, for 5 or 6 hours. The powder should be rubbed in a mortar with a few drops of the oil before adding the remainder. As a local anodyne. The above is the only reliable formula for this preparation. Others are extant, but whilst the products of several are much stronger, those from others have only 1-5th or 1-6th the strength.

Oil of Pel'litory. *Syn.* OLEUM PYRETHRI, L. From bruised pellitory root, as OIL OF BELLADONNA. Used as the last.

Oil of Black Pep'per (by Infusion). *Syn.* OLEUM PIPERIS INFUSUM, L. From black pepper, in coarse powder, as OIL OF CAPSICUM. Stimulant and rubefacient; in frictions.

Oil of Poison Oak. *Syn.* OLEUM RHOIS TOXICODENDRI, L. From the leaves, as OIL OF BELLADONNA. Externally; in paralysis, &c.

Oil of Rhu'barb. *Syn.* OLEUM RHEI, L.

From rhubarb (in powder), 1 part; oil of almonds, 8 parts; digested together in a gentle heat for 4 hours, and strained, with expression. As an application to indolent ulcers, and as a friction over the abdomen in diarrhoea, English cholera, &c., or as a laxative when the stomach will not bear medicine.

Oil of Ro'ses. *Syn.* OLEUM ROSE, O. ROSACEUM, O. R. INFUSUM, O. ROSATUM, L. *Prep.* From the fresh petals, pulled to pieces, crushed, and digested for 2 or 3 days in the sun, or a warm situation, in 4 times their weight of olive oil, and then pressed; the process being repeated with fresh roses. Ph. E. 1744 and P. Cod. are nearly similar. ALMOND, BEN, or OLIVE OIL, coloured with ALKANET, and scented with attar of roses, is now almost universally sold for it. Used for the hair.

Oil of Rue. *Syn.* OLEUM RUTÆ (INFUSUM), L. *Prep.* (P. Cod.) From fresh rue, bruised, as OIL OF CHAMOMILE. Reputed antispasmodic, emmenagogue, stimulant, and vermifuge. In frictions.

Oil of St. John's Wort. *Syn.* OLEUM HYPERICI (Ph. L. 1746), O. H. SIMPLEX, BALSAMUM H., L. From the flowers, 1 part; olive oil, 6 parts; digested together until the oil is well coloured. Antispasmodic, stimulant, and resolvent. A mixture of equal parts of RARE OIL and GREEN ELDER OIL is usually sold for it.

Oil of Scam'mony. *Syn.* OLEUM SCAMMONII, O. PURGANS, L. *Prep.* (Van Mons.) From scammony (in powder), 1 dr.; hot oil of almonds, 3 fl. oz.; triturate together until cold, and the next day decant the clear portion. *Dose.* ½ to 1 table-spoonful.

Oil of Stramo'nium. *Syn.* OLEUM STRAMONII, L. *Prep.* (P. Cod.) From the leaves of thorn apple or stramonium, as OIL OF BELLADONNA. Anodyne and discutient; as an application to painful tumours, joints, &c.

Oil of Tobac'co (by Infusion). *Syn.* OLEUM TABACI, O. T. INFUSUM, L. From fresh tobacco leaves (bruised), like OIL OF CHAMOMILE. As an application in ringworm, irritable ulcers, pediculi, &c.; and as a friction in itch, neuralgia, painful indurations, &c. It must be used with extreme caution, as it is poisonous.

Oil of Tooth'wort. *Syn.* OLEUM SQUAMARIÆ, L. From the herb of *Lathræa squamaria* (Linn), as OIL OF ST. JOHN'S WORT. Astringent and vulnerary. This must not be confounded with another preparation sometimes called 'OIL OF TOOTHWORT' (OLEUM PLUMBAGINIS EUROPEÆ), and which has been occasionally used in itch, as the latter is acrid and apt to cause much irritation.

Oil of Worm'wood. *Syn.* OLEUM ABSINTHII, L. From the fresh herb, as OIL OF LILIES. The P. Cod. and Ph. Wurtem. order only 1 part of the herb to 8 parts of oil. Applied to the abdomen in dyspepsia, diarrhoea, heartburn, worms, &c. It is seldom used in this country.

OILS (Mineral). Syn. HYDROCARBON OILS.

An important class of liquids, consisting solely of carbon and hydrogen—the elements of ordinary coal-gas, and obtained, by the distillation of coal, lignite, petroleum, and other bituminous substances. For the purposes of illumination, many of these oils are in most respects superior to the fixed or fat oils containing oxygen. They give a whiter and more brilliant light, and are produced at a much lower cost. The lamps in which they are burnt, when properly constructed, are less liable to get out of order than those adapted for the combustion of fat oils, and require less attention when in use. The experiments of Dr. Frankland on the relative value of the ordinary illuminating agents,¹ prove that the mineral oils are cheaper than all other portable illuminating agents in common use, and that they give, while burning, the largest amount of light with the least development of heat, and the smallest production of carbonic acid. With the oils adapted for burning in lamps other oils are produced. Some are very volatile and highly inflammable, and the safety of the burning oils depends on their proper extraction. These volatile liquids, when isolated, are used in the arts as substitutes for spirits of turpentine, as solvents for various substances, and to increase the illuminating power of coal-gas. Others are of a greasy nature, and are too heavy to be conveniently used in lamps. These, however, are well adapted for lubricating fine machinery, and are extensively employed instead of sperm oil by the cotton manufacturers of Lancashire. The distillation of coal, lignite, and petroleum, has of late become a very extensive and highly important branch of industry, and although great loss of life and property has resulted from accidents with unpurified and explosive mineral oils, the demand for the products is daily increasing. When the more volatile ingredients are separated from the burning oils, the latter are perfectly safe. (See *Tests, below*.)

Hist. For many years the manufacture of burning oils by the distillation of bituminous schists has been extensively carried out on the Continent, but the discovery which formed the foundation of the modern manufacture was made only fourteen years ago by our countryman, Mr. James Young. This gentleman took the lease of a spring of petroleum in 1847, and after numerous experiments succeeded in obtaining two useful oils from the crude liquid; the one being adapted for lubricating machinery, and the other for burning in lamps. The almost total cessation of the flow of petroleum terminated the business after two years' working, and led Mr. Young to institute a series of experiments, to try if petroleum could be produced artificially by the destructive distillation of coal. These experiments resulted in the discovery of an

oil which Mr. Young named 'Paraffin' as it had many of the chemical properties of the solid body paraffin, discovered twenty years before by Reichenbach in beech-wood tar. Young's patent (dated Oct. 7, 1851) involved the slower distillation of coals, at lower temperature than had hitherto been employed for the purpose, and this novel practice was followed by the novel result of copious production of liquid hydrocarbon. The gas or candle coals were found to yield the liquids in largest quantities, that variety known as Boghead coal or Torbane Hill mineral being specially adapted for the patented process. (See *PARAFFIN OIL, below*) Soon after Young's discovery native petroleum was brought from Rangoon, and purified by distillation, so as to produce oils very similar to the coal products. During the last few years rich sources of petroleum have been discovered in Canada and the North American States, and at the present vast quantities of the native liquid are imported into this country from those sources. An Act of Parliament was passed in 1862, to prevent the storage without a licence, of more than 40 gallons of petroleum, or any product thereof that gives off inflammable vapours under 100° Fahr. This Act has not had the effect intended, and it is notorious that petroleum and its products are recklessly stored in large quantities where their accidental ignition would produce terrible effects. It is estimated that 20,000,000 gallons of petroleum, most of it in the crude and therefore dangerous condition, were brought to this country in 1863.

Tests, Precautions. As there is little demand as yet for the more volatile and dangerous constituents of petroleum, unprincipled dealers frequently allow them to remain in the oils sold for burning. In consequence of this criminal recklessness many frightful accidents have taken place. To ascertain the character for safety possessed by any oil is, therefore, a very important matter. The Sanitary Commission of the 'Lancet' took as the limit of safety an oil that gave off inflammable vapour when heated to 130° Fahr., and this has been generally accepted by dealers. If an oil gives off inflammable vapours before being heated up to 130°, it is considered unsafe for domestic use.

1. The plan for testing this, recommended in the 'Lancet,' is to heat a portion of the suspected oil in a gallipot placed in boiling water, ascertaining by a thermometer suspended in the oil the temperature at which it will take fire on the surface when a lighted wax vesta is applied to it. This is a troublesome and dangerous process, and has little practical value.

2. A rough and ready method of testing the inflammability of a sample is to pour a little out on a dry flat board, and try whether it can be ignited readily by a lighted paper. If it catches fire like turpentine or brandy, the oil is dangerous.

¹ See article ILLUMINATION.

3. The following plan, proposed by Mr. Tegetmeier, requires no scientific knowledge, and no apparatus but what is to be found in every house, while it is sufficiently accurate for all practical purposes:—

Take an earthenware dish, holding about half a pint (a breakfast cup will do), fill the cup full from a kettle of boiling water, pour this into an earthenware quart jug, then fill the same cup again with boiling water from the kettle, and pour it also into the quart jug, then fill the cup with cold water, put it into the jug, shake the jug to mix the hot and cold water, then pour the tepid water from the jug into the cup till the cup is half full, then pour about a table-spoonful of the oil to be tested on the tepid water in the cup, take the oil-can with the oil out of the room, then touch the surface of the oil in the cup with a lighted splinter of wood, or a match without sulphur. If the match causes a flash of flame to appear on the surface of the oil, the oil is below the standard of safety, and should not be used; if no flame appears, the oil is up to the standard. We may mention that in this trial no time should be lost after pouring the boiling water from the kettle, as the water may get too cold, but the whole may be gone through in from two to three minutes. It is well to have a saucer at hand, and if the oil should be a bad oil, and ignite with the match, place the saucer on the mouth of the cup, and the flame is extinguished. This trial should be done by daylight, and at a distance from a fire, and the directions must be followed exactly in the order as given above.

4. Provided that the oils to be examined have been produced by careful fractional distillation, their relative volatility, as indicated by their specific gravity, shows to a great extent the facility with which they ignite. The lightest oils are more volatile and more easily inflamed than those which are heavier. Oils much under '800 inflame directly a lighted match is thrown into them, whereas oils at about '815 to '823 (if unmixed products) cannot be set on fire in this manner. The specific gravity test cannot, however, be depended on to determine the inflaming point of any commercial oil. A heavy oil, badly rectified, may contain a proportion of very volatile vapour, and have a low inflaming-point; whereas a much lighter oil may be perfectly safe, from its having the more volatile portions carefully removed. See PETROLEUM.

To prevent accidents with paraffin or petroleum lamps, the following precautions ought to be observed:—

The lamps should be filled and trimmed by daylight.

They should never be overfilled; the oil should not be allowed to come into contact with the metal work of the burner.

Any portion of oil spilled on the outside of the lamp should be carefully wiped away.

When not in use, the wick should be turned down into the wick-holder.

*** The principal products noticed below rank high among the numerous varieties of mineral oil now in the market, but there are doubtless many others equally good and safe. Their properties are described in accordance with the results obtained by Mr. W. B. Tegetmeier, who has devoted much time to the examination of the mineral oils:—

Oil, Al'bertite. From 'Albertite,' a lustrous black mineral found in New Brunswick. A sample was shown in the Colonial Department of the International Exhibition of 1862, but the oil has not yet appeared in the English market.

Prop. Odour very slight; illuminating power high; boiling-point 338° Fahr., or 126° above that of water.

Oil, American. See PETROLEUM OIL (*below*).
Oil, Apyroec'ic. *Syn.* NON-EXPLOSIVE OIL. A burning oil introduced by F. Tall, of Hull, and prepared, we believe, from American petroleum.

Prop. Slightly coloured; perfectly limpid; odour slight, but not perceivable during combustion. The most remarkable property of this oil is that, in spite of its limpidity, the point at which it gives off inflammable vapour is 180° Fahr., or 80° above the requirements of the Petroleum Act.

Oil, Bel'montine. From Rangoon tar, or Burmese petroleum, by distillation; superheated steam being employed as the heating agent.

Prop. Colourless; odour not unpleasant; sp. gr. '847; but although so heavy, the oil is altogether free from viscosity, and will rise rapidly in a comparatively long wick; inflaming-point 134° Fahr.; burns with an exceedingly white light, and possesses a very high illuminating power.

Obs. The distillation of the Rangoon tar is carried on by Price's Patent Candle Company, under a patent. Besides the above lamp oil, several beautiful and useful products are obtained:—At first there comes over a very volatile liquid, termed SHERWOODOLE, used as a detergent for removing grease from fabrics, cleaning gloves, &c.; then comes the BELMONTINE OIL, already noticed; then two lubricating oils, the one light and the other heavy; and, last of all, when the temperature is considerably elevated, the beautiful white, translucent solid, known as BELMONTINE, distils over. This last is a kind of paraffin, and is used for making ornamental candles.

Oil, Caz'eline. An excellent burning oil, probably prepared from American petroleum, introduced by Cassell, Smith, and Co., of London.

Prop. Bright, limpid, with scarcely a trace of colour; odour very slight, and quite free from any objectionable character; sp. gr. '805; lowest point of ignition 144° Fahr.; burns

with a pure white light, free from smoke and smell.

Oil, Col'zarine. A heavy hydrocarbon oil, adapted for burning in lamps constructed from the old 'Moderators' and 'Carrels,' formerly so much used for the fat oils.

Prop. Limpid; quite inodorous; of a pale amber colour; sp. gr. about '838; temperature at which the vapour can be permanently ignited, 250° Fahr. Tested in the altered moderator, it gives an intense white light, without smoke or smell. Compared with vegetable colza oil, its illuminating power is in the proportion of 8 to 2.

Obs. This oil is manufactured by Cassell, Smith, and Co., under Martin's patent for the modification of mineral oils, to fit them for burning in lamps where 'colza' and other vegetable and animal oils have been usually consumed. Similar oils are prepared by other firms.

Oil, Machin'ery. *Syn.* LUBRICATING OIL, SHAFTING O., SPINDLE O. The heavier hydrocarbon oils obtained in distilling coal, shale, and petroleum, have almost superseded the fat oils for lubricating purposes. They have no chemical action on the ordinary metals, and are not affected by cold. The lightest of these comparatively heavy oils are used for spindles, of other kinds of rapid machinery; the heaviest for the bearing parts of heavy machinery; and those of an intermediate character for such things as printing-presses, agricultural steam-engines, &c. The firm of Whitmore and Craddock is favourably known for the manufacture and purification of these machinery oils. See BELMONTINE OIL (*above*), and PARAFFIN OIL (*below*).

Oil, Paraffin. *Syn.* PARAFFINE OIL. This name was given by Mr. Young to the oil produced by the distillation of cannel coal, Boghead coal, &c., at a temperature considerably lower than that employed in the manufacture of illuminating gas. This product being the most important of the mineral oils, some account of its manufacture will be expected from us. The following is a brief outline of the process adopted at the great paraffin works at Bathgate, Linlithgowshire:—

Manuf. (Young's patent.) Boghead coal, broken into small fragments, is introduced into perpendicular tubes or retorts, about eleven feet in height, by conical hoppers at their upper extremities. Four of these tubes constitute a set, being built into one furnace, and charged by a single workman. They pass completely through the furnace, and are closed below by dipping into shallow pools of water, while the openings into the hoppers above may be shut by spherical valves. The coal in each tube is gradually heated as it descends to that part which passes through the furnace, and when it reaches the bottom of the tube it has parted with its volatile constituents, and is raked away as refuse, the coal from above descending as it is removed.

Thus, the action of these perpendicular retorts is continuous, and the distillation goes on uninterruptedly both day and night. The vapours produced are conducted by iron tubes to the main condensers, which consist of a series of syphon pipes freely exposed to the air. The quantity of incondensable gas formed is inconsiderable; and it is this result, so different from that obtained in the ordinary gas-works, that marks the great value of Young's process. The crude oil, a dark-coloured, thick liquid, is then distilled to dryness in large iron cylindrical stills, and is thus freed from the excess of carbon which is left behind as coke. The oil, after distillation, is further purified by being acted upon by strong sulphuric acid (oil of vitriol), which chars the principal impurities, and causes them to subside in the form of a dense black, heavy acid tar. To separate the remaining impurities, and that portion of the sulphuric acid which remains in the oil, it is next subjected to the action of caustic soda. As thus purified, the paraffin oil contains four distinct commercial products. To effect their separation, the process of fractional distillation is first employed. The first elevation of temperature drives over the lighter and more volatile portions, which, when purified by a subsequent distillation, yields the fluid known as 'paraffin naphtha.' This product is used as a substitute for 'turps,' as a solvent for India rubber, and for burning in those naphtha lamps so much employed by costermongers, and workmen in railway tunnels and similar situations. On the perfect separation of this naphtha the safety of the burning oil depends. This burning oil, the 'paraffin oil' of commerce, comes over at a much higher temperature than the naphtha. It is a perfectly safe lamp oil, and has a greater illuminating value than any other oil in the market. Its properties are noticed *below*. The third product in point of volatility is a comparatively heavy liquid (machinery oil), largely used for lubricating purposes in the Lancashire factories. From this oil, and others which come over at a very high temperature, the fourth commercial product is separated by the action of artificial cold. This last product is the beautiful translucent solid, paraffin, now much used as a candle material.¹ (See PARAFFIN.)

Prop. The paraffin oil of commerce is of a very pale amber colour; is bright, perfectly transparent, and remarkably limpid. Its sp. gr. is '823. Its point of temporary ignition is 150° Fahr., that of permanent ignition being a few degrees higher. Its odour is very slight. Its rate of combustion is slow, as may be inferred from the absence of the lighter oils, as indicated by its high sp. gr. and inflammable-point. At the same time, its limpidity proves the absence of the heavier oils, and

¹ For a detailed account of the processes carried on at the Bathgate works, see Mr. Tegetmeier's paper in 'England's Workshops.'—Groombridge and Sons.

and let it stand over a little alkanet root, until sufficiently coloured.

White Oils. *Syn.* WHITE EGG-OILS. *Prep.*

1. Yolks of eggs, 4 in number; oil of tur-

perme; but even a less quantity than this is commonly employed, on account of its costliness, the deficiency being made up by a mixture of the oils of rhodium, rosemary, and benzoin. Most of the oils of this class are

OILS (MIXED).

accounts for it rising through a long wick with freedom, and burning without charring the cotton.

Oil, Petroleum. *Syn.* KEROSENE OIL, REFINED PETROLEUM. Many of the burning oils now in the market are derived from American petroleum. The native petroleum varies greatly in properties, and numerous methods of refining are employed by the manufacturers. Some make use of both acids and alkalis, others employ alkalis alone, and steam is applied at various degrees of heat. Some of the oils produced are of excellent quality, but others are inferior, and do not ascend the wick in sufficient quantity to afford a constant light. None of the native petroleum contains carbonic acid and other impurities which exist in the oils distilled from coals and shales; hence their purification is simple and comparatively cheap. See PETROLEUM, and above.

Oil, Shale. Products analogous to those derived from cannel or Boghead coal are obtained by the destructive distillation of bituminous shales and schists, and lignites or brown coals. On the Continent shale oils have for some time been manufactured on a large scale.

OILS (Mixed). *Syn.* COMPOUND OILS; OLEA COMPOSITA, OLEA MIXTA, L. Under these names are commonly included various mixtures of oils and other substances that possess an unctuous appearance. When not otherwise stated, they are prepared by simply agitating the ingredients together, and, after a sufficient time, decanting the clear portion, which, in some cases, is then filtered. A few of them only possess any importance. Some of them are highly esteemed as remedies among the vulgar, and the use of others is confined to veterinary medicine.

The following include the principal mixed oils of the shops, to which the names of a few other compounds, which are frequently called 'oils' by the ignorant, are added, for the purpose of facilitating a reference to them:—

Acoustic Oil. *Syn.* EAR OIL; OLEUM ACOUSTICUM, O. TEREBINTHINÆ ACOUSTICUM, L. *Prep.* From oil of turpentine, 1 part; oil of almonds, 6 parts; mix. In atonic deafness, accompanied with induration of the wax, 1 or 2 drops are poured into the ear, or on a piece of cotton wool, which is then gently placed in it.

Black Oil. *Syn.* OLEUM NIGRUM, L. *Prep.* 1. Oil of turpentine, 1 pint; rape oil, 3 pints; oil of vitriol, $\frac{1}{4}$ lb.; agitate well together with care; then add of Barbadoes tar, 3 oz.; again agitate well, and in 10 days decant the clear portion. Linseed oil is preferred for the above by many persons.

2. Sweet oil, 1 pint; oil of turpentine, $\frac{1}{2}$ pint; oil of vitriol, $\frac{1}{4}$ lb.; agitate well together with care; then add of Barbadoes tar, 3 oz.; again agitate well, and in 10 days decant the clear portion. Linseed oil is preferred for the above by many persons.

OLEUM BRITANNICUM, O. PETRÆ VULGARIS, L. *Prep.* From oil of turpentine, 1 quart; Barbadoes tar, 1 lb.; oils of rosemary, anise, and fennel, of each, 1 oz. Stimulant. Pongmerly reputed to possess the most astonishing virtues.

Camphorated Oil. Liniment of camphor. To Caron Oil. Liniment of lime.

Chabert's Oil. *Syn.* CHABERT'S EMPYREUMATIC OIL; OLEUM CHABERTI, O. CONTINUAL TENIAM CHABERTI, L. Oil of turpentine, 16 parts; Dippel's animal oil, 1 part; mix, and distil 3 parts. It must be preserved from when air and light. Used in tapeworm.—Dose, 10 to 20 teaspoonfuls, in water, night and morn- ing, until 5 or 6 fl. oz., or more, have been taken; a cathartic being given every 10th day.

Furniture Oil. *Syn.* MAHOGANY OIL, PERSTAIN. *Prep.* 1. From refined linseed oil, 1 pint; alkanet root, $\frac{1}{4}$ oz.; digested together 20 in a warm place until the former is sufficiently coloured, when it is poured off in a strained.

2. Pale boiled oil, 1 pint; bees' wax, $\frac{1}{4}$ lb.; melted together, and coloured as before. Gimon, a superior polish, which becomes very thick, and by age.

3. Linseed or boiled oil, 1 pint; Venice iron pentine (pure), 6 oz.; as before. The cloth is used for mahogany and other dark-coloured woods.

4. (Pale.)—*q.* As the preceding, or plucked the alkanet.

5. From nut oil, $\frac{1}{2}$ pint; bees' wax, $\frac{1}{4}$ lb.; melted together.

6. To the last, add of copal varnish, 1 day or 4 oz.

The last three are employed for paint is sufficient. They are all applied by means of a brush. The oil is are 'polished off' with a woollen cloth by power-furniture brush. A little strong ammonia in bottles to a few drops of hydrochloric acid, are others for added. See POLISH.

Hair Oil. See OIL (Perfumed). employed in Oil and Hartshorn. Liniment of

Iron Oil. *Syn.* OLEUM FERRI, or JESSA. L. The old name for the liquid ferric-blossom, perchloride of iron is allowed to the general, of by free exposure to the air. It is prepared in caustic and corrosive.

Lime Oil. See CALCIUM (Chloride) prepare Macassar Oil. See OILS (Perfumed), jasmin,

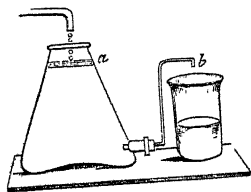

Marrow Oil. *Prep.* From clarified butter, 1 pint; oil of almonds, $\frac{1}{2}$ lb.; melted together, and strained through a cloth. It is usually scented with ambergris or sassafras, and slightly tinged with saffron. Used for the hair.

Marshall's Oils. *Prep.*

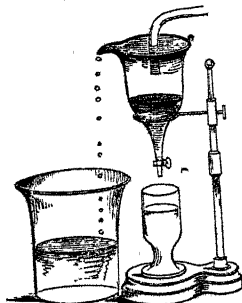

and rape oil, of each, 1 lb.; turpentine, of each, $\frac{1}{2}$ lb.

tected by the gradually decreasing quantity of water towards the end of the process, and empyreuma prevented. When the distilled water is to be repeatedly cohobated on the ingredients, a convenient and economical plan is to so arrange the apparatus that, after the water has separated from the oil in the receiver, it shall flow back again into the still. An ordinary worm-tub, or other like condensing apparatus, may be employed; but in the case of those oils which readily solidify, the temperature of the water in the condenser must not fall below about 55° Fahr.

The mixed vapours which pass over condense and fall as a milky looking liquid into the receiver. This separates after a time into two portions, one of which is a solution of a part of the newly eliminated oil in water, and the other is the oil itself. The latter either occupies the upper or the lower portion of the receiver, according as its specific gravity is less or greater than that of distilled water. The separation of the oil and water is effected by allowing the mixed liquids to drop into a 'Florentine receiver' (see *engr.*) when the oil is the lighter of the two, by which means the latter accumulates at *a*, and the water flows over by the spout *b*.

The same receiver may be employed for oils heavier than water, by reversing the arrangement; but a glass 'separator' (see *engr.*) is, in general, found more convenient. In this case the oil accumulates at the bottom of the vessel, and may be drawn off by the stop-cock provided for the purpose.

The essential oils of lemons and oranges of commerce, and of some other fruits, are chiefly obtained by submitting the yellow rind to powerful pressure; but in this way

they are not so white, nor do they keep so well, as when distilled, although in the case of the fruits referred to the oils are more fragrant than when prepared by any other method.

The London College excluded the usual directions for the preparation of the essential oils from their Pharmacopoeia of 1851, on the ground that these substances are seldom prepared by the druggist or apothecary, or at all on the small scale.

"The fruit of anise, caraway, and juniper, the flowers of chamomile, lavender, and elder, the berries of allspice, the tops of rosemary, and the entire recent plants of the other herbs, are to be employed." "Put any one of these into an alembic, then pour in as much water as will cover it, and distil the oil into a large vessel, kept cool." (Ph. L. 1836.)

The Edinburgh College directs—"As much water only is to be employed as will prevent empyreuma during the distillation. The distillation may be immediately commenced after a proper maceration, and the oil afterwards separated from the water," in the manner already noticed.

"It is also necessary to observe, in preparing these oils, as well as the distilled waters, that the quality of the substances, their texture, the season of the year, and similar circumstances, must occasion so many differences, that it is scarcely possible to give any certain and general rules which shall strictly apply to every example. Many things, therefore, must be regulated by the judgment of the operator."

The Dublin College directs the vegetable substances to be macerated in the still with about 5 times their weight of water, for 24 hours, when one half of the water is to be drawn over. The oil having been separated from this in the usual manner, it is to be returned to the still, and the same quantity drawn over, as before, from which the oil must again be separated.

Chevallier gives the following rules for the distillation of essential oils:—

1. Operate upon as large quantities as possible, in order to obtain a greater product, and one of finer quality.
2. Conduct the distillation rapidly.
3. Divide the substances minutely, in order to facilitate the extrication of the oil.
4. Employ only sufficient water to prevent the matter operated on from burning, and the product from being contaminated with empyreuma.
5. For substances whose oil is heavier than water, saturate or nearly saturate the water in the still with common salt, to raise the boiling-point, and thus to enable the vapour to carry over more oil.
6. Employ, when possible, water which has been already distilled from off the same substances, and has thus become saturated with oil.

7. For oils naturally fluid, keep the water in the refrigeratory cool; but for those oils which easily become solid, preserve it at 80° to 90° Fahr. (?)

To the above may be added:—

8. Collect the oil as soon as possible after it separates from the water with which it passes over, and in its subsequent treatment keep it, as much as possible, from free contact with the air.

Dr. Ure remarks, "The narrower and taller the alembic is, within certain limits, the greater will be the proportion of oil, relative to that of the aromatic water, from like proportions of aqueous and vegetable matter employed." "Some place the plants in baskets, and suspend these immediately over the bottom of the still, under the water, or above its surface in the steam; but the best mode, in my opinion, is to stuff an upright cylinder full of the plants and to drive down through them steam of any desired force, its tension and its temperature being further regulated by the size of the outlet-orifice leading to the condenser. The cylinder should be made of strong copper, tinned inside, and encased in the worst conducting species of wood, such as soft deal or sycamore."

The newly distilled oils may be separated from adhering water, which frequently renders them partially opaque or 'cloudy,' by repose in a temperature between 60° and 70° Fahr., and subsequent decantation; but to render them quite dry (anhydrous), it is necessary to let them stand over some fragments of fused chloride of calcium. This is not, however, required with the commercial oils.

The rectification of the volatile oils is commonly performed without water, by the careful application of a heat just sufficient to make them flow over pretty rapidly, so that they may be kept heated for as short a time as possible. One half, or at most two thirds only, is drawn off, that left in the retort being usually mixed with raw oil intended to be sold in that state. This method often leads to much loss and disappointment, and we have known more than one rather dangerous explosion result from its use. A better plan is to rectify the oil from strong brine, and then to separate any adhering water, either by repose or chloride of calcium.

Pres. Volatile oils should be preserved in well-closed and nearly full bottles, in the shade, and should be opened as seldom as possible. By age they darken, lose much of their odour, increase in density, and become thick and clammy. It is then necessary to distil them, by which the undecomposed portion is separated from the resin. Agitation along with animal charcoal will restore their clearness and original colour, but nothing more.

Pur., Tests. The essential or volatile oils of commerce are very frequently adulterated with the fatty oils, resins, spermaceti, or alcohol, or with other essential oils of a cheaper kind

or lower grade. The presence of the first three of these may be readily detected by placing a drop of the suspected oil on a piece of white paper, and exposing it for a short time to heat. If the oil is pure, it will entirely evaporate; but if adulterated with one of these substances, a greasy or translucent stain will be left on the paper. These substances also remain undissolved when the oil is agitated with thrice its volume of rectified spirit.

The presence of alcohol may be detected by agitating the oil with a few small pieces of dried chloride of calcium. These remain unaltered in a pure essential oil, but dissolve in one containing alcohol, and the resulting solution separates, forming a distinct stratum at the bottom of the vessel. When only a very little alcohol is present, the pieces merely change their form, and exhibit the action of the solvent on their angles or edges, which become more or less obtuse or rounded.

Another test for alcohol in the essential oils is the milkiness occasioned by agitating them with a little water, as well as the loss of volume of the oil when it separates after repose for a short time.

A more delicate test of alcohol in the essential oils than either of the preceding is potassium, as employed by M. Beral:—12 drops of the oil are placed on a perfectly dry watch-glass, and a piece of potassium, about the size of an ordinary pin's head, set in the middle of it. If the small fragment of metal retains its integrity for 12 or 15 minutes, no alcohol is present; but if it disappears after the lapse of 5 minutes, the oil contains at least $\frac{4}{100}$ of alcohol; and if it disappears in less than 1 minute, it contains not less than $\frac{25}{100}$ of alcohol.

This species of adulteration is very common, as it is a general practice of the druggists to add a little of the strongest rectified spirit to their oils, to render them transparent, especially in cold weather. Oil of cassia is nearly always treated in this way.

The admixture of an inferior essential oil with one more costly may be best detected by pouring a drop or two on a piece of porous paper or cloth, and shaking it in the air, when, if occasionally smelled, the difference of the odour at the beginning and the end of the evaporation will show the adulteration, especially if the added substance is turpentine. The presence of the latter may also be detected by agitating the oil with rectified spirit, when it will remain undissolved.

The purity of essential oils may likewise, in many cases, be determined by taking their sp. gr.; or, with still greater accuracy and convenience, by measuring their index of refraction, as suggested by Dr. Wollaston. A single drop of oil is sufficient for the application of the last method.

The adulteration of a heavy oil with a light one, or the reverse, may be detected by agi-

tating the suspected oil with water, when, in most cases, the two will separate and form distinct strata.

Uses, &c. The volatile oils are chiefly used by perfumers and rectifiers, and in medicine. Some of the cheaper kinds are largely employed as vehicles for colours, and in the manufacture of varnishes. The dose of the aromatic and carminative oils is from 1 to 40 drops, on sugar, or dissolved in a little weak spirit. This does not apply to oil of bitter almonds, the dose of which is $\frac{1}{4}$ to $\frac{1}{2}$ a drop.

*** The following list includes short notices of nearly all the volatile oils which have been examined, as well as of some other substances of a similar character, which commonly pass under the name.

Oil of Allia'ria. From the roots of *Alliaria officinalis*, or sauce-alone. Identical with the oil of black mustard.

Oil of All'spice. See OIL OF PIMENTO.

Oil of Al'monds. See OIL OF BITTER ALMONDS.

Oil of American Arbor Vitæ. *Syn.* HUILE CEDRE BLANC, Fr. From the fresh tops of *Thuja occidentalis*, or American arbor-vitæ tree. Yellow; fragrant; stimulant. *Used* in frictions for rheumatism. *Prod.* $1\frac{1}{2}$ to 2½ (nearly).

Oil of Angel'ica. From the dried root of *Angelica Archangelica*. *Prod.* 25½ (fully).

Oil of An'iseed. *Syn.* OLEUM ANISI (Ph. L. E. & D.), O. ESSENTIALE ANISI, L. From the fruit (seeds) of *Pimpinella anisum*, or anise. Nearly colourless. It is very frequently adulterated with one or other of the cheaper oils, in which case spermaceti or camphor is added to it, to make it 'candy.'

Prop., &c. When pure, it congeals into a solid crystalline mass on being cooled to 50° Fahr., and does not melt again until heated to about 63°. Treated with iodine, it quickly congeals into a solid hard mass, with a perceptible increase of temperature, and the development of orange-coloured and gray fumes. Sulphuric acid, with heat, turns it of a rich purple-red colour, and the compound soon afterwards becomes inspissated and hard (resinified). In alcohol of 806 it is soluble in all proportions, but rectified spirit (838) dissolves only 42½ of this oil. Sp. gr. (recent) 9768; (one year old) 9853 to 9855; (old) 9856 to 9900. The foreign oil is generally the heaviest.

Oil of aniseed is carminative and pectoral; and both itself and preparations have long been in favour with the masses in coughs, colds, &c. In preparing it, care must be taken that the temperature of the water in the receiver and refrigerator does not fall lower than about 68° Fahr. *Prod.* (From the dried fruit of commerce) av. 2½ (nearly). See OIL OF STAR-ANISE.

Oil, Ap'ple. See AMYL (Valerianate of), and ESSENCE OF APPLE.

Oil of Arnica. *Syn.* OLEUM ARNICÆ, O. A. RADICUM, L. From the roots of *Arnica mon-*

tana. Yellowish-brown. Sp. gr. 940. *Prod.* 16 lbs. yielded 1 oz. of oil. The oil from the flowers of arnica is blue.

Oil of Asarabac'ca. *Syn.* OLEUM ASARI, O. ASARI LIQUIDUM, L. From the roots of *Asarum Europæum*. Yellow; glutinous. Two butyraceous oils pass over at the same time.

Oil of Assafet'ida. *Syn.* OLEUM ASSAFETIDA, L. From the gum resin. Contains sulphur. Very fetid and volatile.

Oil of Balm. *Syn.* OLEUM MELISSÆ, L. From the herb (*Melissa officinalis*). Pale yellow; fragrant. Sp. gr. 970 to 975. *Prod.* 100 lbs. of the fresh flowering herb yielded ¼ oz. of oil (M. Raybaud). A mixture of oil of lemons and rosemary is commonly sold for it.

Oil of Balsam of Peru. See CINNAMENE.

Oil of Ber'gamot. *Syn.* BERGAMOT, ESSENCE OF B.; OLEUM BERGAMII, O. BERGAMOTÆ, L. By expression from the yellow portion of the rind of the fruit of *Citrus Bergamia*, or bergamot orange. Pale greenish-yellow; highly fragrant. It is obtained purer by distillation, but its perfume is then slightly less delicate. Sp. gr. 875 to 885. *Prod.* The rind of 100 bergamot oranges yielded by distillation nearly 3 oz. of oil. (M. Raybaud.)

Oil of bergamot is frequently adulterated with rectified spirit, or with the oils of lemons, oranges, or turpentine. The presence of these substances may be detected in the manner explained under OILS (Volatile), *Purity and Tests (anté)*, as well as by the altered density of the oil. Pure bergamot oil is much more soluble in rectified spirit than either of the others, and is further distinguished from them by its free solubility in solution of potassa, forming a clear solution.

Oil of Bit'ter Almonds. *Syn.* ESSENCE OF B. A.; OLEUM AMYGDALÆ AMARÆ, O. A. ESSENTIALE, L. From the ground cake of bitter almonds from which the fixed oil has been expressed. The common plan is to soak the cake (crumbled to fragments) for about 24 hours in twice its weight of water, to which $\frac{1}{3}$ rd or $\frac{1}{4}$ th of its weight of common salt has been added, and then to submit the whole to distillation, allowing the first half of the water that passes over to deposit its oil, and to run back again into the still. Pale golden-yellow; colourless when rectified; tastes and smells strongly nutty, like peach-kernels. It consists of 85½ to 90½ of hydride of benzoyl and 8½ to 12½ of hydrocyanic acid, with a variable quantity of benzoic acid and benzoïn. The density varies a little with the age of the oil, and the temperature and rapidity with which it has been distilled. Sp. gr. (recent) 1.0525; (trade crude oil) 1.079 (G. Wippel); (old) 1.081 (1.0836—Pereira). "Essential oil of almonds, free from adulteration, should have a sp. gr. at most of 1.052." (Ure.) According to Prof. Redwood,

the density may vary from 1.0524 to 1.0822. The light oil contains the most hydride of benzoyl, and the heavy oil the most benzoin. *Prod.* From less than 2 to 5%.

Pur. This oil is generally adulterated with cheaper oils, and in nearly every case with alcohol. When it is pure—Mixed with oil of vitriol, it strikes a clear crimson-red colour, without visible decomposition. —Mixed with an alcoholic solution of potassa, crystals are eliminated.—Iodine dissolves only partially and slowly in it, without further visible results. —Chromate of potassa does not affect it. —Nitric acid (sp. gr. 1.42) causes no immediate reaction, and in the course of 3 or 4 days crystals of benzoic acid begin to appear; but if only 8% or 10% of alcohol or rectified spirit is present, a violent effervescence speedily commences, and nitrous fumes are evolved. By using nitric acid, sp. gr. 1.5, the smallest quantity of alcohol may be detected.

Obs. This oil does not pre-exist in the almond, but is formed by the action of water on a peculiar crystallisable substance, called amygdalin. It is essentially the hydride of benzoyl, but it always contains a portion of hydrocyanic or prussic acid, to which it owes its very poisonous properties. It is occasionally employed as a substitute for hydrocyanic acid in medicine; but its principal consumption is as a flavouring ingredient and a perfume by cooks, confectioners, liquorists, and perfumers. For this purpose it is dissolved in rectified spirits. (See ESSENCE.) *Dose.* $\frac{1}{4}$ to 1 drop.

An oil closely resembling that from bitter almonds is obtained by distillation from the leaves of the peach and cherry-laurel, the bark of the plum-tree, the bruised kernels of cherries, plums, and peaches, the pips of apples, and from several other vegetable substances that possess a nutty odour and flavour.

A NON-POISONOUS OIL OF ALMONDS has been introduced. This is simply the ordinary oil of commerce freed from hydrocyanic acid, and is intended to be substituted for the crude, poisonous oil for domestic purposes. Unfortunately, the purified essence does not keep well, and is often converted after a few months into little else than a solution of benzoic acid, almost devoid of the usual odour and flavour of the bitter almond. "No wonder, then, under such circumstances, that the public preferred the preparations they had been accustomed to, which were not so liable to change." (Redwood.) The following methods have been adopted for this purpose:—

1. (Liebig.) Agitate the crude distilled oil with red oxide of mercury, in slight excess, and, after a few days' contact, rectify the oil from a little fresh oxide of mercury. The product is quite pure, when the process is properly managed. The cyanide of mercury thus formed may be either employed as such, or reconverted into mercury and hydrocyanic acid.

2. (Mackay.) Commercial oil of almonds, 1 lb.; fresh-slaked lime, q. s. to form a milk-like liquid; afterwards add, of solution of potassa, $1\frac{1}{2}$ lb.; water, 3 pints; agitate occasionally for 48 hours, then distil over the oil, a fresh mixture of lime and pot.

3. 27 The oil is mixed with an equal q. ater, and the mixture is digested bath with red oxide of mercury, a quantities of fresh-slaked lime and pro de of iron, with as little access of air as le; as soon as decomposition of the acid taken place, the whole is introduced into a per retort, and submitted to distillation. The product is perfectly free from hydrocyanic acid. The first process is, however, the simplest, cheapest, and best.

The sp. gr. of this non-poisonous oil is 1.051. (G. Whippell.) That of pure, colourless hydride of benzoyl is 1.043; it boils at 356° Fahr.; is soluble in 35 parts of water, and in all proportions in alcohol and ether. Exposed to the air, it greedily absorbs oxygen, and becomes converted into a mass of crystallised benzoic acid. The purified oil of almonds does the same, only less rapidly.

Oil of Almonds (Factitious). *Syn.* ESSENCE OF MIRBANE, NITROBENZOL. The preparation of this article on the small scale is explained under NITROBENZOL. It is now extensively prepared as a substitute for the oil of almonds obtained by distillation. The following is Mansfield's process:—The apparatus consists of a large glass worm, the upper end of which is divided into two branches, gradually dilating so as to form two funnel-shaped tubes. Into one of these concentrated nitric acid is poured, and into the other benzol, which need not, for this purpose, be chemically pure. These bodies meet at the point of junction of the two tubes, and the rate of their flow is regulated by any appropriate means. Chemical reaction instantly takes place, and the new compound is cooled by its passage through the worm, which is refrigerated for the purpose. It has then only to be washed with water or a very weak solution of carbonate of soda for the process to be complete. The product has the sp. gr. 1.209, boils at 415° Fahr., has an intensely sweet taste, and an odour closely resembling, but not actually identical with, that of oil of bitter almonds. Unlike genuine oil of almonds or hydride of benzoyl, it is insoluble in water, and does not distil without suffering partial decomposition. It is chiefly used to scent soaps, and to adulterate the genuine oil. The benzol for this purpose is obtained from coal-tar. See BENZOL and NITROBENZOL.

Brand'y Oil. See GRAPE OIL.

Oil of Bu'chu. *Syn.* OLEUM BAROSMÆ, O. DIOSMÆ, L. From the leaves of *Diosma ornata*. Yellow; lighter than water; smells of the leaves.

Oil of Caç'epuit. *Syn.* CAJEPUTI OIL, KYA-ROOTIE O.; CAJEPUTI OLEUM (B. P.), OLEUM

fruit of the orange-tree. Does not keep well. (See *below*.)

Oil of Orange-flowers. *Syn.* NEROLI, OIL OF N., ESSENCE OF N.; OLEUM NAPHÆ, O. AURANTII FLOREM, AURANTII OLEUM (Ph. E. and D.), L. From the flowers of either the bitter (Seville) or sweet orange (*Citrus vulgaris* or *C. aurantium*), by distillation with water. That from the fruit is said to be preferred, but there does not appear any actual difference between the two. Very fluid; lighter than water, in which it is slightly soluble; it is delightfully aromatic and fragrant, but the odour differs slightly from that of the flowers. *Prod.* 100 lbs. of flowers gathered in May or December yield 3 to 6 oz. of oil; 6 cwt. of the fresh flowers yield 1 lb. of oil.

Pur. Neroli is commonly adulterated with alcohol or essence of petit grain, and generally with both of them. The presence of the first is easily determined (see *above*); that of the second can only be discovered by comparing the odour evolved during the evaporation of a drop of the suspected oil, placed on a piece of white paper, with a like drop of pure neroli similarly treated. (See *above* and *below*.)

Oil of Orange-leaf. *Syn.* OLEUM AURANTII FOLII, L.; ESSENCE DE PETIT GRAIN, Fr. From the leaves of either the bitter or sweet orange; that from the first being preferred. Delightfully fragrant. Extensively used to adulterate oil of neroli, and is itself commonly sophisticated with both alcohol and oil of orange-berries. (See *above*.)

Oil of Origanum. *Syn.* OLEUM ORIGANI, O. O. ESSENTIALE, L. From the flowering herb of *Origanum vulgare*, or common or winter marjoram. Pale yellow colour; fragrant; ærid, pungent, and rubefacient. Sp. gr. '927 ('940—Baumé). *Prod.* 5½ to 75½. The dark-coloured oil of origanum of the shops is obtained from *Thymus vulgare*. The oil of origanum (Ph. E.) is oil of *Origanum marjorana*. See OILS OF MARJORAM, THYME, and LEMON THYME.

Oil of Or'ris. *Syn.* ESSENCE OF VIOLET; OLEUM IRIDIS, L. From the dried rhizomes of *Iris Florentina*, or Florentine orris-root. Fragrant. Sold for oil and essence of violets.

Oil of Parsley. *Syn.* OLEUM PETROSELINI, L. From the fresh herb or dried fruit (seed) of *Apium petroselinum*, or garden parsley. Yellowish; smells strongly of the plant. It consists of two oils, separable by agitation with water, one of which is concrete, and melts at 80° Fahr.; the other, liquid. *Prod.* Herb, '50 to 1½ (nearly).

Oil of Partridge-berry. *Syn.* OIL OF WINTER-GREEN, METHYLO-SALICYLIC ETHER, SALICYLATE OF OXIDE OF METHYL; OLEUM GAULTHERIE (Ph. U. S.), L. From the leaves or the whole plant of *Gaultheria procumbens*, a herb common in North America, and otherwise known by the names—Box-berry, checker-berry, partridge-berry, mountain tea,

winter-green, &c. Pale yellow, growing brown by exposure and age; aromatic; sweet; highly pungent; when diluted, agreeably fragrant; mixed with a dilute solution of potassa, it solidifies to a crystalline mass (salicylate of methyl and potassa), from which the oil may be again separated by the addition of an acid. It is the heaviest of all the essential oils. Sp. gr. 1.173. Boils at 412°, and, when purified, at 435° Fahr.

Oil of partridge-berry, dissolved in rectified spirit, is in common use in the United States of America as an antispasmodic, carminative, diuretic, emmenagogue, and stimulant; chiefly as an adjunct to mixtures, &c.; and also with the view of increasing the flow of milk during lactation. It is likewise extensively used in perfumery, and is an object of great interest to the organic chemist, on account of its peculiar constitution and reaction.

Oil of Partridge-berry (Factitious). See SALICYLIC ACID.

Oil, Pearl. See AMYLE (Acetate of), and ESSENCE OF JARGONELLE PEAR.

Oil of Pennyroyal. *Syn.* OLEUM PULEGII (Ph. L.), O. MENTHÆ P. (B. P., Ph. E. & D.), O. P. ESSENTIALE, L. From the flowering herb of *Mentha Pulegium*, or the common pennyroyal of our gardens. Pale yellow, growing reddish-yellow by age and exposure; antispasmodic, carminative, and emmenagogue; Boils at 395° Fahr. Sp. gr. '925 to '931. *Prod.* ¾ to 1½. (See *below*.)

Oil of Pennyroyal (American). *Syn.* OLEUM HEDEOMÆ (Ph. U. S.), L. From *Hedeoma pulegioides*, as the last. Light yellow; closely resembles oil of pennyroyal, for which it passes in the U. S. Sp. gr. '945 to '948.

Oil of Pepper. *Syn.* OIL OF BLACK P.; OLEUM PIPERIS, O. P. NIGRI, L. From bruised black pepper (*Piper nigrum*). Colourless, turning yellow; odorous; pungent; not so hot as the spice. Sp. gr. '9932. *Prod.* 1.25½ to 1.5½. White pepper (of commerce), 1½ (barely).

Oil of Pep'permint. *Syn.* OLEUM MENTHÆ PIPERITÆ (B. P., Ph. L. E. & D.), O. ESSENTIALE M. PIPERITIDIS, L. From the fresh flowering herb of *Mentha piperita*, or garden peppermint. Nearly colourless, or at most a very pale greenish-yellow; powerfully odorous; tastes pungent, at the same time imparting a sensation of coldness to the tongue and palate. Boils at 365° Fahr. Sp. gr. '902 to '905. *Prod.* Fresh flowering herb, '25½ to '4½; dried do., 1½ to 1.25½ (fully). In a warm dry season, 5 lb. of the fresh flowering herb yield 1 oz. of oil; in a wet and unfavorable one, 11 lb. yield barely the same quantity.

Pur. The oil of commerce usually contains fully a third part of rectified spirit, and is also frequently adulterated with the oils of rosemary, spearmint, and turpentine. When pure—1. It is soluble in its own weight of rectified spirit.—2. Mixed with 1.4th its volume of nitric acid, a rich purple-red colour is developed.—3.

Chromate of potash, in solution, turns it of a deep reddish-brown colour, and converts it into a soft coagulum, which assumes a flaky form when divided with a glass rod, whilst the solution of the salt loses its yellow colour or becomes greenish-yellow.—4. With iodine it forms a homogeneous mass, without fulmination. If it explodes with iodine, it contains turpentine. The yellowish, resinous oil, sold under the name of 'American' or 'crude oil of peppermint,' consists chiefly of oil of turpentine, and on evaporation leaves a residuum of pine resin.

Obs. English oil of peppermint is the best, a fact clearly shown by its price in the market being so greatly above that of the imported oil. The oil distilled at Mitcham, in Surrey (Mitcham oil of peppermint), is the most esteemed. It has usually a very pale greenish colour, which is often imitated by steeping a leaf or two of green mint or parsley in the oil. Old dark-coloured oils are commonly bleached by exposure to the light, to the destruction of a portion of their other properties.

Oil of peppermint is stimulant, antispasmodic, and carminative, and has always been a favourite remedy in flatulence, nausea, vomiting, loss of appetite, cramp of the stomach, colic, griping pains, diarrhoea, the early stage of cholera, &c.—*Dose.* 1 to 3 drops, on sugar.

Oil of Petro'leum. See NAPHTHA, OILS (Mineral), PETROLEUM, &c.

Oil of Pim'ento. *Syn.* OIL OF ALLSPICE; OLEUM PIMENTÆ (B. P., Ph. L. E. & D.), L. From the bruised fruit of *Eugenia pimenta*, allspice, or Jamaica pepper. Pale yellow, growing reddish-brown by age; odour, a combination of cloves and cassia; taste, pungent. Sp. gr. 1.021. *Prod.* 5½ to 8½.

Obs. Oil of pimento contains two oils similar to those found in clove oil. When pure, nitric acid turns it red, with active effervescence and the assumption of a rusty brown colour. It combines with the salifiable bases in a nearly similar manner to oil of cloves. It is much used in perfumery, especially in hair cosmetics.

Oil of Pim'pernel. *Syn.* OLEUM PIMPINELLÆ, L. From the root of *Sanguisorba officinalis*, or pimpernel. Blue; carminative.

Oil, Pine-apple. This artificial essential oil dates its commercial importance from the Great Exhibition of 1851. It is essentially butyric ether, and may be regarded as simply the crude form of that substance. On the large scale, it is prepared by saponifying butter or crude butyric acid with a strong lye of caustic potassa, and dissolving the resulting soap in the smallest possible quantity of hot alcohol; to the solution is added a mixture of alcohol and oil of vitriol in excess, and the whole is then submitted to distillation as long as the product has an aromatic fruity odour; the product is rectified from dried chloride of calcium and a little litharge. Dissolved in rectified spirit, it is much used as a flavouring

substance by confectioners and liquoristes. See ETHER (Butyric) and ESSENCE OF PINE-APPLE, &c.

Oil of Pot'a'to Spirit. See AMYL (Hydrate of) and FUSEL OIL.

Oil of Ravens'ara. *Syn.* OLEUM RAVENSARÆ, L. From the roots of *Ravensara aromatica*. Chiefly used to adulterate oil of cloves, which it somewhat resembles.
